## Contents

**Chapter 1. Introduction** ......................................................... 1

**Chapter 2. Getting Started** .................................................. 2

What is Oxygen XML Editor .................................................. 2
Getting Familiar with the Interface ........................................ 3
Supported Document Types .................................................. 4
Resources to Help You Get Started Using Oxygen XML Editor .... 5
Your First Document or Project ............................................. 7

  - Your First XML Document .............................................. 8
  - Getting Started with DITA ............................................ 13
  - Creating a New Project ............................................... 20

Getting Help ............................................................................... 22

  - Help Menu ................................................................. 23
  - Frequently Used Shortcut Keys ..................................... 27
  - Accessibility Support in Oxygen ................................... 30

**Chapter 3. Installation** ......................................................... 33

Installing Oxygen XML Editor on Windows .................................... 34
Installing Oxygen XML Editor on Mac OS X .................................. 38
Installing Oxygen XML Editor on Linux ...................................... 40
Installing Oxygen XML Editor on Windows Server .................... 45
Installing Oxygen XML Editor on a Linux / UNIX Server .................. 47
Site-Wide Deployment .................................................................. 49
Licensing .................................................................................. 50

  - Choosing a License Type ............................................. 51
  - Obtaining a License Key ............................................... 51
  - Register a Named-User or Subscription License ................ 51
  - Floating Licenses ......................................................... 53
  - Transferring a License Key .......................................... 56

License Servers .......................................................................... 56

  - Setting up an HTTP License Server (Floating or Named-User Licenses) 57
Setting up TCP Floating License Server (Deprecated) in 32-bit Windows ........................................... 67
Setting up TCP Floating License Server (Deprecated) All-Platforms ...................................................... 69
Common Problems: License Server Errors ................................................................................................. 71
Upgrading .................................................................................................................................................. 73
Upgrading Oxygen XML Editor on Windows/Linux ............................................................................... 73
Upgrading Oxygen XML Editor on OS X .................................................................................................. 75
Installing and Updating Add-ons .............................................................................................................. 75
Uninstalling .............................................................................................................................................. 77

Chapter 4. Configuration ......................................................................................................................... 79
Preferences ........................................................................................................................................... 79
Global Preferences ................................................................................................................................. 81
Appearance Preferences .......................................................................................................................... 84
Application Layout Preferences ............................................................................................................... 90
Add-ons Preferences ............................................................................................................................... 92
Document Type Association Preferences ................................................................................................. 92
Document Templates Preferences ............................................................................................................ 123
Encoding Preferences ............................................................................................................................. 123
Editor Preferences ................................................................................................................................... 125
CSS Validator Preferences ...................................................................................................................... 188
XML Preferences .................................................................................................................................... 189
DITA Preferences .................................................................................................................................... 224
Data Sources Preferences ......................................................................................................................... 229
SVN Preferences ..................................................................................................................................... 234
Diff Preferences ...................................................................................................................................... 239
Archive Preferences ................................................................................................................................. 244
Plugins Preferences ................................................................................................................................... 245
External Tools Preferences ....................................................................................................................... 246
Menu Shortcut Keys Preferences .............................................................................................................. 248
File Types Preferences ............................................................................................................................. 250
Open/Find Resource Preferences Page ..................................................................................................... 251
Custom Editor Variables Preferences ....................................................................................................... 254
Network Connection Settings Preferences ........................................ 254
XML Structure Outline Preferences ............................................... 259
Views Preferences ..................................................................... 259
Messages Preferences .................................................................. 260
Configuring Options ..................................................................... 261
Customizing Default Options ...................................................... 262
Storing Global and Project Level Options .................................... 265
Sharing Application Settings ....................................................... 266
Importing/Exporting/Resetting Global Options ......................... 268
Configuring the Layout of the Views and Editors ......................... 268
Configuring Toolbars .................................................................. 273
Import/Export Transformation or Validation Scenarios ............... 276
Editor Variables ......................................................................... 276
  Custom Editor Variables ............................................................ 284
Custom System Properties ......................................................... 284
Localizing the User Interface ...................................................... 289
Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor ........................................ 290
  Setting Parameters for the Application Launchers .................. 291
  Setting Parameters in the Command-Line Scripts ................... 292
  Creating Custom Startup Parameters File ............................... 293
How to Increase the Amount of Available Memory ................... 294

Chapter 5. Perspectives ............................................................... 295
  Editor Perspective ..................................................................... 295
  XSLT Debugger Perspective ..................................................... 297
  XQuery Debugger Perspective .................................................. 299
  Database Perspective .............................................................. 300

Chapter 6. Editing Modes ............................................................ 303
  Text Editing Mode ................................................................... 303
    Navigating the Document Content in Text Mode .................... 304
    Smart Editing in Text Mode ................................................... 307
    Shortcut Actions in Text Mode ............................................... 308
Contents | v

Editing XML Markup in Text Mode................................................................. 310
Folding XML Elements in Text Mode............................................................ 315

1. Introduction

Oxygen XML Editor is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful Integrated Development Environment and the intuitive Graphical User Interface of Oxygen XML Editor is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with XSLT and FOP transformation technologies, Oxygen XML Editor offers support for generating output to multiple target formats, including: PDF, PS, TXT, HTML, JavaHelp, WebHelp, and XML.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Editor to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.
2.

Getting Started

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Editor would be to install the software. For detailed information about that process, see the Installation chapter (on page 33).

After installation, when you launch Oxygen XML Editor for the first time, you are greeted with a Welcome dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

Figure 1. Welcome Dialog Box

If you do not want it to be displayed every time you launch Oxygen XML Editor, deselect the Show at startup option in the bottom-left corner of the dialog box. To display it any time, go to Help > Welcome.

What is Oxygen XML Editor

Oxygen XML Editor is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.
You can use Oxygen XML Editor to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, Mac OS X, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Editor, see the Oxygen Website.

**Getting Familiar with the Interface**

Oxygen XML Editor includes several perspectives (on page 3285) and editing modes (on page 303) to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

There are various ways that you can configure the layout of the views or editors (on page 268), and you can customize the toolbars (on page 273).

Regardless of the perspective (on page 3285) or editing mode (on page 303) that you are working with, the default layout consists of the following areas:

**Menus**

Menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents, but Oxygen XML Editor also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

**Toolbars**

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited. All the toolbars can be configured (on page 273) to suit your specific needs.

**Helper Views**

Oxygen XML Editor includes a large variety of dockable (on page 3281) views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suit your specific needs. The layout of the views can also be configured (on page 268) according to your preferences.

**Editor Pane**
The main editing area in the center of the application. Each editing mode (on page 303) provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode (on page 303) also includes a variety of contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them (on page 701).

Perspectives

Oxygen XML Editor includes several different perspectives (on page 295) that you can use to work with your documents. The Editor perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Editor for the first time. Oxygen XML Editor also includes a Database perspective that allows you to manage databases and their connections and a few debugging perspectives that allow you to detect problems in XSLT or XQuery transformations.

Status Bar

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The Unicode value (on page 770) for the character directly to the right of the current cursor position.
- The status of the current document. The status of Modified is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In Text editing mode (on page 303), the current line and character position is displayed.
- If the Check for notifications option (on page 81) is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Editor website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.
- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.
- If the Show memory status option (on page 83) is selected, a Free unused memory icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.
Supported Document Types

You can use the main editing pane in Oxygen XML Editor to edit a large variety of document types.

The supported document types include the following:

- XML documents
- XSLT stylesheets
- XML Schema
- DTD (Document Type Definition) schemas
- RELAX NG full syntax schemas
- RELAX NG compact syntax schemas
- NVDL (Namespace-based Validation Dispatching Language) schemas
- XSL:FO documents
- XQuery documents
- WSDL documents
- Schematron documents
- JavaScript documents
- Python documents
- CSS documents
- LESS documents
- XProc scripts
- SQL documents
- JSON documents
- Ant build scripts
- Markdown documents

Resources to Help You Get Started Using Oxygen XML Editor

Configuring Oxygen XML Editor

There are numerous ways that you can configure Oxygen XML Editor to accommodate your specific needs.

See the Configuring Oxygen section (on page 79) for details on the various ways that you can configure the application and its features.
Video Tutorials

The Oxygen XML Editor website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Editor and show you how to complete specific tasks or how to use the various features.

Go to the Oxygen XML Editor Videos Page to see the list of video tutorials and webinars.

Oxygen XML Editor Documentation

The Oxygen XML Editor documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the F1 key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the other topics in this Getting Started section, the following are links to other sections of the documentation that might be helpful for your specific needs:

• Text Editing Mode Section (on page 303) - Provides information about the Text editor.
• Author Editing Mode Section (on page 402) - Provides information about the visual WYSIWYG-like Author editing mode.
• XML Schema Diagram Editor (on page 623) - Provides information about the schema design mode.
• Editing Specific Document Types Chapter (on page 827) - Includes information about editing numerous different types of documents.
• DITA Authoring Chapter (on page 2981) - Provides information about using DITA to edit and structure your content.
• Publishing Chapter (on page 1640) - Provides information about the various ways that you can publish content.
• Importing Data Chapter (on page 2276) - Provides information about importing data from text files, MS Excel files, database data, and HTML files.
• Tools Chapter (on page 2687) - Details about the various built-in tools that are available in Oxygen XML Editor.
• Add-ons Chapter (on page 2677) - Information about how to extend the functionality of Oxygen XML Editor through add-ons.

Sample Documents

Your installation of Oxygen XML Editor includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies.
They are located in the **samples** folder that is located in the installation directory of Oxygen XML Editor. You will find files and folders for various types of documents, including the following:

- **Sample project file** (*sample.xpr*) - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Project view** *(on page 333).*
- **Sample files** (*personal.xml, etc.*) - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between XML files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

**Other Resources**

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Editor:

- See the [Oxygen XML Editor Blog Site](#) for a large variety of current and archived blogs regarding numerous features, requests, and instructional topics.
- Take advantage of the [Oxygen XML Editor Forum](#) to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful [DITA Style Guide Best Practices for Authors](#).
- To learn about the WebHelp features in Oxygen XML Editor, see the [Publishing DITA and DocBook to WebHelp](#) section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Editor, see the [Tools section](#).
- See the [External Resource Page](#) for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the [Oxygen SDK](#) section for details about the SDK that allows you to extend and develop Oxygen XML Editor **frameworks** *(on page 3282)* and **plugins** *(on page 3285)*, and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Editor, see the [What's New Section of the Website](#)
- You can select the **Tip of the Day** *(on page 25)* action in the **Help menu** *(on page 23)* to display a dialog box that includes a variety of tips for using Oxygen XML Editor.
- You can select **Show Dynamic Help view** *(on page 23)* from the **Help menu** *(on page 23)* to dynamically opens a topic that is relevant to the focused editor, view, or dialog box.

**Your First Document or Project**

This section includes several topics that will help you get started with your first document or project.
Your First XML Document

To create your first XML document, select File > New or click the New button on the toolbar. The New document wizard (on page 676) is displayed:

Figure 2. New Document Wizard

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by choosing a template from the Global templates or Framework templates folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the Framework templates folder. If your company has created its own templates, you can also find them there. After you use this dialog box to create a few documents, those document types will appear in the Recently used folder, which allows you to easily create other new documents of those types.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

Writing Your First Document

Depending on the type of document you choose, the Oxygen XML Editor interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.
Also, depending on the type of document you choose, Oxygen XML Editor may open your document in **Text** (on page 303) or **Author** (on page 402) mode. **Text** mode shows the raw XML source file, while **Author** mode shows a graphical view of the document.

The availability of **Author** mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the **Author** mode. Oxygen XML Editor includes default **Author** mode views for most of the document types it supports. If your company has created its own document types, **Author** mode stylesheets may have also been created for that type. However, if you create a plain XML file, or one based on a schema that is not included in the Oxygen XML Editor built-in support, you need to edit it in **Text** mode or create your own **Author** mode CSS (on page 2477) for it.

You can switch back and forth between **Author** mode and **Text** mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from **Author** to **Text** mode. **Text** and **Author** modes are just different views for the same XML document.

There is also a **Grid** mode (on page 392) available that displays all content in an XML document as a structured grid of nested tables. This is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it when you want to display XML content in a table-like manner (for example, if you need to extract XML content to a spreadsheet (on page 892)).

If you use **Author** mode, you might find that it is similar to word processors that you are used to. Likewise, the **Text** mode is similar to many typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. Oxygen XML Editor assists you with a continuous validation of the XML markup.

### Structuring Your First Document

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Editor helps you determine which elements are allowed. In **Author** mode, when you press **Enter**, Oxygen XML Editor assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press **Enter** to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the **Model** view (on page 353) (Window > Show View > Model).
- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have
just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Editor does its best to help you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Editor creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Editor presents XML Quick Fixes (on page 1109) that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

**Editing Your First Document**

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Editor provides the normal cut, copy, and paste options as well as drag and drop editing. However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Editor provides many tools to help you edit your structure and to keep your structure valid while editing text.

**The Document Breadcrumbs**

Across the top of the editor window, there is a set of breadcrumbs that shows you exactly were the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

![book chapter sect1 sect2 sect3 para figure title]

**Showing Tags**

To see exactly where you are in the structure of the document, you can show the tags graphically in the Author view. There are several levels of tag visibility that you can choose using the Tags Display Mode drop-down menu (on page 441) on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

**Outline View**

The Outline view (on page 347) shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

Figure 3. Outline View
You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the **Outline** view to show only elements with a certain name.

**Figure 4. Outline View Filtered to only Show Element Names**

**Cut and Paste, Drag and Drop**

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in **Author** view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or **Outline** view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Editor warns you and tries to suggest actions that make it valid (such as by removing
surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using Author mode, you can also switch to Text mode to see exactly which bits of XML you are selecting and moving.

**Refactoring actions**

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the Refactoring menu of the contextual menu (or the Document > Markup menu). More advanced refactoring operations are also available using the XML Refactoring tool (on page 1139) that is available in the Tools menu.

**Validating Your First Document**

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Editor knows how to find the schema, it validates the document for you as you type. Oxygen XML Editor finds the schema automatically for most of the document types created from templates. However, in some cases you may have to tell it how to find the schema (on page 1081).

When Oxygen XML Editor validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Editor also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Editor cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the Validate action from the Validation toolbar drop-down menu or the Document > Validate menu. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

**Note:** Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select Show Message.
Proofing Your First Document

Oxygen XML Editor includes an automatic (as-you-type) spell checking feature (on page 764), as well as a manual spell checking action. To check the spelling of your document manually, use the Check Spelling action on the toolbar or from the Edit menu.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such a DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Editor uses transformation scenarios (on page 1640) to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Editor or ones created by your organization.

To see the list of transformations available for your document, select the Apply Transformation Scenario(s) action from the toolbar or the Document > Transformation menu. A list of available transformation scenarios are displayed. Choose one or more scenarios to apply, and click Apply associated. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor. Oxygen XML Editor makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor works to support you as you write.
Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor, along with the features of DITA, in a variety of ways.

**Creating a DITA Topic in Oxygen XML Editor**

To create a DITA topic *(on page 3050)*:

1. Select **File > New** or click the **New** button on the toolbar.
   
   **Step Result:** The **New Document Wizard** *(on page 676)* is displayed:

   ![](image)

2. Go to **Framework templates > DITA > topic** and select the type of topic that you want to create.

   **Note:** If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved. You can also optionally specify a title.

4. Click **Create**.
Result: Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map (on page 16).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents (on page 8) also apply to DITA topics. Oxygen XML Editor also provides additional specific DITA-related support for working with DITA topics (on page 3048), their associated DITA maps (on page 2988), and for creating DITA output (on page 3171).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 3281). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor

To create a map (on page 3007):

1. Select File > New or click the New button on the toolbar.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 2990). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

Figure 6. DITA Maps Manager View
Adding Existing Topics to a Map in Oxygen XML Editor

There are several ways to add a topic reference to a map (on page 3010). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the DITA map in the DITA Maps Manager view (on page 2990) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

**Step Result:** This opens the Insert Reference dialog box (on page 3017) with all of the required fields already filled in for you.

Figure 7. Insert Reference Dialog Box
3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

4. Select **Insert and close** to add a reference to your topic in the map.

5. Save the **DITA map**.

### Adding New Topics to a Map in Oxygen XML Editor

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To **add a new topic to a map** *(on page 3010)*, follow these steps:

1. In the **DITA Maps Manager** *(on page 2990)*, right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:

   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** *(on page 3051)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.

   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** *(on page 3051)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
• **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box (on page 3051)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.

• **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

  **Step Result:** The new topic is now referenced (as a **topicref**) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

• Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.

• Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

**Adding Submaps in Oxygen XML Editor**

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can **break up the content into smaller submaps (on page 3008)**. A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 3008):

1. Right-click the parent **DITA map** in the **DITA Maps Manager view (on page 2990)** and choose **Append child > Map reference**.

  **Step Result:** This opens the **Insert Reference dialog box (on page 3017)** with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select **Insert and close** to add a reference to your submap in the main map.
4. Save the main **DITA map**.

**Validating a Map in Oxygen XML Editor**

Just as it is with your individual topics, it is important to validate your maps ([on page 3036](#)). Oxygen XML Editor provides a validation function for **DITA maps** that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the **Validate and Check for Completeness** button in the **DITA Maps Manager** view ([on page 2990](#)).

   **Step Result:** This opens the **DITA Map Completeness Check** dialog box ([on page 3037](#)).
2. Select any of the various options you want to check.
3. Click **Check** to run the validation process.

**Publishing Your Topics in Oxygen XML Editor**

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output ([on page 3171](#)) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Editor manages them by using transformation scenarios.

To publish output for a map:

1. Click the **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view ([on page 2990](#)).

   **Step Result:** This opens the **Configure Transformation Scenario(s)** dialog box ([on page 1762](#)).
2. Select the appropriate transformation depending on the type of output you desire.

3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

4. Click **Apply associated**.

   **Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

**Related Information:**

- **DITA Authoring** (on page 2981)
- **Editing XML Documents in Author Mode** (on page 893)

**Creating a New Project**

Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also **share your project settings and transformation/**
validation scenarios (on page 723) with other users. Use the Project view (on page 333) to manage projects, and the files and folders contained within.

**Creating a New Project**

To create a new project, select New Project from the Project menu, the New menu in the contextual menu, or the drop-down menu at the top-left of the Project view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the Project view (on page 333).

**Adding Items to the Project**

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the Project view:

- **New > File**
  
  Opens a New file dialog box that helps you create a new file and adds it to the project structure.

- **New > Folder**
  
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the project root:

- **New > Logical Folder**
  
  Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - 🗂).

- **New > Logical Folders from Web**
  
  Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

- **>Add Folder**
  
  Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X - 🗂).

- **>Add Files**
  
  Adds links to files on the local file system.
Add Edited File

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the **Refresh** action from the toolbar or contextual menu and the Project view will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting **Add Folder** in the contextual menu from the project root. Linked folders are displayed in the Project view with bold text. To create a file inside a linked folder, select the **New > File** action from the contextual menu. The linked files presented in the Project view are marked with a special icon.

**Note:** Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Project View.

For more details about how you can share projects with other users, see Sharing a Project - Team Collaboration.

Related Information:

- Using Projects to Group Documents

Getting Help

If you run into specific problems while using Oxygen XML Editor you can take advantage of a variety of support related resources. Those resources include the following:

- The Oxygen XML Editor Support Section of the Website
- The Oxygen XML Editor Forum
- The Oxygen XML Editor Video Tutorials
- The Common Problems and Solutions Section of the User Manual
- The Online Technical Support Form
The application also includes various specific help-related resources in the Help menu.

Help Menu

The Oxygen XML Editor Help menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

Welcome

This option opens the Welcome screen that includes some resources to assist you with using Oxygen XML Editor.

Help (F1)

Use this action (or the F1 key) to open a dialog box that presents a section in the User Manual that is appropriate for the context of the current cursor position. If the Use online help option is selected, this action will open the User Manual in an online mode.

Use online help

If this option is selected, the Help (F1) action will open the Oxygen XML Editor User Manual in an online mode.

Show Dynamic Help view

Use this action to open a view that loads the latest online WebHelp version of the Oxygen XML Editor User Manual, and dynamically opens a topic that is relevant to the focused editor, view, or dialog box. It requires Java 1.8 and an online connection. In Windows, if a Java 1.8 version is not detected, you will be advised to upgrade, while in Linux and Mac OS X with Java 1.7 and lower, Oxygen XML Editor will attempt to load an offline version of the documentation. In all three operating systems, with Java 1.8, if an online connection is not detected, you will receive an error message advising you to check your proxy settings.

You can also open the Dynamic Help view by selecting it from the Window > Show View menu.

Install new add-ons

Opens a dialog box that allows you to install new add-ons (on page 3285) to extend the functionality of Oxygen XML Editor.

Check for add-ons updates

Opens a dialog box that allows you to check for updates on installed add-ons (on page 3285).

Manage add-ons

Opens a dialog box that allows you to manage installed add-ons (on page 3285).
Check for a New Version

Use this action to view information about the latest version of Oxygen XML Editor.

Browse Oxygen Website

Opens the Oxygen XML Editor website in your default internet browser.

Register

If you encounter problems with your Oxygen XML Editor license, you can use this option to open a dialog box that provides options for obtaining or using a license key.

Lock/Unlock floating license

If you are using a Floating License, you can lock it so that it does not get released to the pool (on page 55) unless you or the system administrator unlocks it.

Report problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

• **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.

• **Class Loader URLs** - You can choose whether or not to include the listed Class Loader URLs with your report.

• **System properties** - You can choose whether or not to include the listed system property details with your report.

**Tip:** You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

• **Plugins** - You can choose whether or not to include details about your installed plugins (on page 3285) with your report.

• **Frameworks** - You can choose whether or not to include details about your installed frameworks (on page 3282) with your report.

Support Center

Use this option to open the Oxygen XML Editor Support Section of the Website.

Support Tools > Clipboard Inspector

Opens a dialog box that displays extensive details of all the transferable objects from the clipboard. This is helpful if you experience problems while copying content from other applications and pasting it into Oxygen XML Editor. You can use the Copy button to copy all of this data and then paste it into an email to be sent to the Oxygen support team.
Support Tools > Randomize XML text content

Use this action when you need to send samples to the Oxygen support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the Oxygen support team without fear of compromising sensitive or private data. For more information, see Randomize XML Text Content (on page 25).

⚠️ Warning: Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then process this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Tip of the Day

Opens a dialog box that offers tips for using Oxygen XML Editor.

About

Use this option to open a dialog box that contains information about Oxygen XML Editor and the installed version. This dialog box includes the following tabs:

- **Copyright** - This tab contains general information about the product and the version of the product you are using, along with contact details and the SGN number. Details regarding the memory usage are also presented at the bottom of the dialog box.
- **Libraries** - This tab presents the list of third party libraries that Oxygen XML Editor uses. To view the End User Licence Agreement of each library, double-click it.
- **Frameworks** - This tab contains a list with the framework (on page 3282) that are bundled with Oxygen XML Editor.
- **System Properties** - This tab contains a list with system properties and their values. The contextual menu allows you to select and copy the properties.

Randomize XML Text Content

Oxygen XML Editor includes an action that randomizes the text content of an XML document. This action is available in the Help > Support Tools menu. It is helpful if you need to send XML samples to the Oxygen support team and you want to keep the text content confidential. It opens a dialog
box that allows you to select the resources for which the text content will be randomized. You can then save the resources and send them to the Oxygen support team without fear of compromising sensitive or private data.

**Warning:** Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then perform this operation on the copies instead of the original files. Otherwise, you may lose your original content.

**Figure 9. Randomize XML Text Content Dialog Box**

The **Randomize XML Text Content** dialog box includes the following options:

**Scope**

Allows you to select the set of files whose text content will be randomized by the operation. You can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 3281) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 3288).

**Filters**

This section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
• **Look inside archives** - When selected, the resources inside archives will also be affected.

## Frequently Used Shortcut Keys

Oxygen XML Editor includes numerous shortcut keys that are assigned to actions to help you edit content. All the shortcuts that are assigned to actions are displayed in the table in the [Menu Shortcut Keys preference page](on page 248).

For information about how to assign or configure shortcut keys, see [How to Assign a Shortcut Key or Edit an Existing Shortcut](on page 249).

### Table 1. Frequently Used Shortcut Keys in Oxygen XML Editor

<table>
<thead>
<tr>
<th>Action</th>

<td>Command + Up Arrow</td>
<td>Scrolls the editor up</td>
</tr>
</tbody>
</table>
| Shift Left                    | Shift + Tab                 | Shift + Tab            | • **Author** mode - Moves cursor to the previous XML node
|                               |                             |                        | • **Text** mode - Shifts content to the left |
| Shift Right                   | Tab                         | Tab                    | • **Author** mode - Moves cursor to the next XML node
|                               |                             |                        | • **Text** mode - Shifts content to the right |
| Split Element                 | Alt + Shift + D             | Ctrl + Alt + D         | Splits the element the cursor position |
| Surround With                 | Ctrl + E                    | Command + E            | Surrounds selected content with specified tag |
| Switch Tabs                   | Ctrl + Tab / Ctrl + Shift + Tab | Command + Tab / Command + Shift + Tab | Switches between opened tabs |
| Transform                     | Ctrl + Shift + T            | Command + Shift + T    | Opens a dialog box for selecting a transformation scenario |
| Underline / Open URL          | Ctrl + U                    | Command + U            | • Underlines select content (in main editor)
|                               |                             |                        | • Opens URL (when focus is outside the main editor) |
| Undo                          | Ctrl + Z                    | Command + Z            | Undo last editing action                |
| Validate                      | Ctrl + Shift + V            | Command + Shift + V    | Validates editing action                |
| Zoom In                       | Ctrl + NumPad+              | Command + NumPad+      | Zooms in (increase font size)          |
| Zoom Out                      | Ctrl + NumPad-              | Command + NumPad-      | Zooms out (decrease font size)         |

**Troubleshooting:** If you encounter problems with keyboard shortcuts not working as expected, see Keyboard Shortcuts Result in Unexpected Behavior *(on page 2970)* or Keyboard Shortcuts Do Not Work At All *(on page 2969)*.

## Accessibility Support in Oxygen

The **Oxygen** team is dedicated to developing software products that are usable for everyone, including those with physical challenges and disabilities. Oxygen XML Editor was designed to adhere to the U.S. Government Section 508 accessibility standards: [https://www.oxygenxml.com/xml_editor/section508.html](https://www.oxygenxml.com/xml_editor/section508.html)
Adjusting Fonts and Colors

If you have low vision, go to Options > Preferences > Appearance > Fonts where you can adjust the font styles and sizes used in the entire application, both for the editing areas and UI labels. If you have color blindness, you can also adjust most of the colors used in Oxygen XML Editor by going to Options > Preferences > Appearance and changing the current color theme. You can also search for other color-related setting in the Preferences dialog box.

Text to Speech Narrators (JAWS)

If you are using a text to speech narrator, Oxygen XML Editor support this since it is a Java application and it is periodically tested on Windows using the JAWS screen reader: http://www.freedomscientific.com/Products/Blindness/JAWS.

For JAWS to work, you need to enable the Java access bridge in Oxygen XML Editor: http://docs.oracle.com/javase/7/docs/technotes/guides/access/enable_and_test.html

Since Oxygen XML Editor comes bundled with its own Java VM, you need to open a console in the jre folder bundled with Oxygen XML Editor and run the following command:

D:\PATH\TO\OXYGEN_INSTALLATION_FOLDER\jre>bin\jabswitch -enable

You will receive a notification in the console that the access bridge has been enabled.

Once the Java access bridge is enabled and if the JAWS narrator is active, when Oxygen XML Editor starts, the narrator will start reading content from Oxygen XML Editor and you can interact with the application, read menus, content from opened XML documents, and UI components from dialog boxes and side views.

Hints for the Visually Impaired

Here are a few hints for using Oxygen XML Editor if you are visually impaired:

- The top main menu should contain most of the actions that you need to open, save, and close documents, switch between opened documents, or switch between the various editing modes for XML documents that are already opened.
  - The File menu contains actions to open, save, or close the currently edited XML document.
  - The Edit menu contains actions to undo/redo or cut/copy/paste content. They also have the usual shortcuts that can be used instead of directly invoking the actions from the menu.
  - The Find menu contains an action to show the Find/Replace dialog box. Sometimes the JAWS narrator overloads the CTRL-F shortcut and presents its own find/replace window but
the Oxygen XML Editor **Find/Replace** dialog box provides the ability to perform complex find/replace operations in the opened file.

- In the **Options** menu, you have access to the **Preferences** dialog box that contains global application settings and access to the **Menu Shortcut Keys** table where you can configure shortcuts for the most commonly used actions.
- The **Window** menu includes actions to switch between opened XML documents. Also, you can use the **Show view** submenu open a particular side view and move the focus to that view.

- An opened XML document can be edited with accessibility support either in the **Text** editing mode (where the XML tags are accessible in the edited content) or in the visual **Author** editing mode (where the XML tags are hidden and only the text content is shown). You can switch between these editing modes by using the **Document > Edit Mode** menu.

  - **Text** mode provides access to the entire source document with all of its **XML** content, just like you have in any text editing application. In addition, using the **Window > Show view** submenu, you can change focus to the **Attributes**, **Elements**, or **Outline** view. The **Attributes** view presents the existing and possible attributes that can be inserted in an XML tag. The **Elements** view shows you the list of XML elements that can be inserted at cursor position (also, pressing F2 on a selected element presents its annotation). The **Outline** view shows the current path in the XML structure.

  - **Author** mode is useful for reviewing written XML content because it has support for change tracking and for adding comments. Editing in the **Author** visual editing mode, you have access only to the text content in the XML document. Pressing **Shift-F2** will read to you the location in the XML structure. Again, you can also use the **Outline** view for this. In the **Author** editing mode, you can also use the **Attributes** and **Elements** views similar to using them in the **Text** editing mode. Pressing **ENTER** in the **Author** visual editing mode can also be used to present a list of allowed elements at the current position.
3. Installation

Oxygen XML Editor is available on Windows, Linux, and Mac OS X and there are a variety of methods and options for installing and running Oxygen XML Editor on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing add-ons, and uninstalling.

**Choosing How Oxygen XML Editor Runs**

You can install Oxygen XML Editor to run in several ways:

- As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or Mac OS X.
- As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.

**Choosing an Installer**

You also have a choice of several different installers:

- The native installer for your platform (Windows, Linux, or Mac OS X).
- On Windows and Linux, the native installer can also run in unattended mode.

**Choosing a License Option**

You must obtain and register a license key (on page 50) to run Oxygen XML Editor.

You can choose from two types of licenses:

- A named-user license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

**Upgrading, transferring, and uninstalling.**

You can also upgrade (on page 73) Oxygen XML Editor, transfer a license (on page 56), or uninstall (on page 77) Oxygen XML Editor.
Getting help with installation

If you need help, email support at: support@oxygenxml.com.

Installing Oxygen XML Editor on Windows

Choosing an Installation Method

You can install Oxygen XML Editor on Windows using one of the following methods:

- Windows installer (on page 35)
- Windows installer in unattended mode (on page 36)

System Requirements

Operating systems

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Java 1.8 (or newer) from Oracle

Oxygen XML Editor only supports official and stable Java Virtual Machines with version 1.8 from Oracle. If you use the native Windows installer, Oxygen XML Editor will be
installed with its own copy of Java with the specific update version that has been thoroughly tested.

**All Platforms Package**

If you use the all platforms package, your system must have a compatible Java 1.8 virtual machine installed. To see the exact Java update version that is supported, go to [www.oxygenxml.com](http://www.oxygenxml.com), navigate to the Download page for the particular product you are installing, and click on the tab for your particular platform.

**Note:** Oxygen XML Editor may work with other update versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the `jre` subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your `PATH` environment variable is used.

If you run Oxygen XML Editor using the batch file, `oxygen.bat`, you can edit the batch file to specify a particular version to use.

**Windows Installer**

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the system requirements *(on page 34).*
2. Download the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
   - Use one of the shortcuts created by the installer.
   - Run `oxygen.bat`, which is located in the installation directory.
6. To license your copy of Oxygen XML Editor go to Help > Register and enter your license information (on page 50).

Windows Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the -q parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer command-line parameters.

Windows Installer Command-Line Reference

The Oxygen XML Editor installer for Windows supports a variety of command-line parameters.

Commonly Used Command-Line Parameters

The Oxygen XML Editor installer supports the following commonly used command-line parameters:

- **-q**
  
  Instructs the installer to run in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a response.varfile (on page 38) is specified using the -varfile option.

- **-overwrite**
  
  In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Editor is installed in the same folder. The -overwrite parameter added after the -q parameter forces the overwriting of these files.

- **-console**
  
  Displays a console during the installation.

  **Note:** If you want the installer to run in the foreground, you need to use the start /wait command (for example, start /wait oxygen.exe -q -console). Otherwise, it will run in the background.

- **-varfile**
  
  Specifies the location of a response.varfile (on page 38), normally to be used during an unattended installation.

- **-V**
Used to define a variable parameter (on page 38) to be used by an installation.

**EXAMPLE:**

```shell
oxygen.exe -q -overwrite -console -VautoVersionChecking=false
```

### Command-Line Parameters for Preconfiguring License Server Details

The Oxygen XML Editor installer also supports the following command-line parameters used for preconfiguring license server details:

- **license.servlet.url**
  
  Specifies the URL of the HTTP license server.

- **license.servlet.user.name**
  
  Specifies the user name for the HTTP license server.

- **license.servlet.password**
  
  Specifies the password for the HTTP license server, in clear form (will be stored encrypted).

- **license.servlet.password.encrypted**
  
  Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with same name in an existing license.xml file (found in: `{user_home_directory}`\AppData\Roaming\com.oxygenxml).

- **backup.license.servlet.url**
  
  Specifies the URL of the backup HTTP license server.

- **backup.license.servlet.user.name**
  
  Specifies the user name for the backup HTTP license server.

- **backup.license.servlet.password**
  
  Specifies the password for the backup HTTP license server, in clear form (will be stored encrypted).

- **backup.license.servlet.password.encrypted**
  
  Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with same name in an existing license.xml file (found in: `{user_home_directory}`\AppData\Roaming\com.oxygenxml).

**EXAMPLE:**
Windows Installer response.varfile

The Oxygen XML Editor installer for Windows also creates a file called response.varfile, which records the choices that the user made when running the installer interactively. The generated response file is found in the [OXYGEN_INSTALL_DIR]/.install4j folder. You can use the response.varfile to set the options for an unintended install (on page 36). For more information about the response.varfile format, see install4j site.

Variable Parameters (can be used in the response.varfile or from the command line)

The following variable parameters are supported in the response.varfile (or from the command line):

autoVersionChecking

Used for automatic version checking. Possible values are true (default) or false.

reportProblem

Used to report a problem encountered while using Oxygen XML Editor. Possible values are true (default) or false.

downloadResources

Used to download resources (links to video demonstrations, webinars, and upcoming events) from https://www.oxygenxml.com to populate the application welcome screen. Possible values are true (default) or false.

Installing Oxygen XML Editor on Mac OS X

You can install Oxygen XML Editor on Mac OS X using one of the following methods:

1. Mac OS X installation package (on page 39).
2. Mac OS X installation package in unattended mode (on page 40).
System Requirements

Operating system

OS X version 10.8 64-bit or later

CPU

- Minimum - Intel-based Mac, 1 GHz
- Recommended - Dual Core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

OS X Installation

To install Oxygen XML Editor on OS X, follow these steps:

1. Download the OS X installation package (oxygen.dmg).
2. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
3. Double-click the oxygen.dmg disk image file to mount it.
4. Drag/Copy the Oxygen XML Editor folder to your /Applications folder (or another location if you wish).

⚠️ Warning: If you receive a warning that an Oxygen XML Editor installation folder already exists in the Applications folder, do not attempt to merge the two installations. Instead, select Replace or move the old installation folder to the trash bin before installing the application.

⚠️ Important: Do not copy the files/folders from within the Oxygen XML Editor folder (always copy the folder itself), otherwise you will omit invisible files/folders and the application may no longer start.

5. Start Oxygen XML Editor, using one of the following methods:
   - Double-click Oxygen XML Editor.app.
   - Run sh oxygen.sh in the command-line interface.
6. To license your copy of Oxygen XML Editor, go to Help > Register to enter your license key (on page 50).

**OS X Unattended Installation**

To install Oxygen XML Editor on OS X in unattended mode, follow these steps:

1. Download the OS X installation package (oxygen.dmg).
2. Mount the oxygen.dmg file in the command line.
   ```bash
   hdiutil attach oxygen.dmg|oxygenAuthor.dmg|oxygenDeveloper.dmg
   ```
3. Copy the oxygen folder for the particular version from the mounted volume to the Applications folder (or another folder where you want to install it), as in the following example:
   ```bash
   cp -aR "/Volumes/Oxygen XML Editor 21.0/Oxygen XML Editor" /Applications/
   ```
4. Eject the mounted disc image:
   ```bash
   hdiutil detach "/Volumes/Oxygen XML Editor 21.0"
   ```

**Installing Oxygen XML Editor on Linux**

**Choosing an Installation Method**

You can install Oxygen XML Editor on Linux using one of the following methods:

- Linux installer (on page 42)
- Linux installer in unattended mode (on page 43)

**System Requirements**

**Operating System**

Any 64-bit Unix/Linux distribution with an available Java SE Runtime Environment version 1.8 from Oracle

**CPU**

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor
Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Java 1.8 (or newer) from Oracle

Oxygen XML Editor only supports official and stable Java Virtual Machines with version 1.8 from Oracle. If you use the Linux installer, Oxygen XML Editor will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

**All Platforms Package**

If you use the all platforms package, your system must have a compatible Java 1.8 virtual machine installed. To see the exact Java update version that is supported, go to [www.oxygenxml.com](http://www.oxygenxml.com), navigate to the Download page for the particular product you are installing, and click on the tab for your particular platform.

**Note:** Oxygen XML Editor may work with other update versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

**Attention:** Oxygen XML Editor does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the jre subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable `JAVA_HOME` is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your PATH environment variable is used.
You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, `oxygen.sh`. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:

```
/usr/bin/jre1.8.0_121/bin/java -Xmx1024m ...
```

**X.org**

The version of Java bundled with Oxygen XML Editor requires **X.org** (Wayland is not supported).

**Linux Installer**

To install Oxygen XML Editor using the Linux installer, follow these steps:

1. Make sure that your system meets the system requirements *(on page 40)*.
2. Download the Linux installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.

   **Note:** For example, open a shell, `cd` to the installation directory, and at the prompt type `sh ./oxygen-32bit.sh` or `sh ./oxygen-64bit.sh`, depending on which installer you downloaded.

   **Warning:** If you are running the installer as root and your Linux distribution uses Wayland (such as **Ubuntu 17.10** or **Fedora 25**), before running the installer, the local user must first allow the root user to access the X server by running the following command (as the local user):

   ```
xhost +SI:localuser:root
```

5. Start Oxygen XML Editor using one of the following methods:
   - Use the `oxygen` shortcut created by the installer.
   
   **Note:** For **Ubuntu 17.10** (or later), a security dialog box will appear the first time you start the application where you need to select Trust and Launch to continue. This dialog box will not appear on subsequent launches.
   - From a command line, type `sh oxygen.sh`. This file is located in the installation folder.

6. To license your copy of Oxygen XML Editor go to **Help > Register** and enter your **license information** *(on page 50).*
Linux Unattended Installation

You can run the installation in unattended mode by running the installer from the command line with the `-q` parameter. By default, running the installer in unattended mode installs Oxygen XML Editor with the default options and does not overwrite existing files. You can change various options for the unattended installer using the installer command-line parameters.

Linux Installer Command-Line Reference

The Oxygen XML Editor installer for Linux supports a variety of command-line parameters.

Commonly Used Command-Line Parameters

The Oxygen XML Editor installer supports the following commonly used command-line parameters:

- **-q**
  Instructs the installer to run in unattended mode. The installer will not prompt the user for input during the install. Default settings will be used for all options unless a `response.varfile (on page 45)` is specified using the `-varfile` option.

- **-overwrite**
  In unattended mode, the installer does not overwrite files with the same name if a previous version of the Oxygen XML Editor is installed in the same folder. The `-overwrite` parameter added after the `-q` parameter forces the overwriting of these files.

- **-console**
  Displays a console during the installation.

- **-varfile**
  Specifies the location of a `response.varfile (on page 45)`, normally to be used during an unattended installation.

- **-V**
  Used to define a `variable parameter (on page 45)` to be used by an installation.

**EXAMPLE:**

```bash
oxygen.sh -q -overwrite -console -VautoVersionChecking=false
```

Command-Line Parameters for Preconfiguring License Server Details
The Oxygen XML Editor installer also supports the following command-line parameters used for preconfiguring license server details:

- **license.servlet.url**
  Specifies the URL of the HTTP license server.

- **license.servlet.user.name**
  Specifies the user name for the HTTP license server.

- **license.servlet.password**
  Specifies the password for the HTTP license server, in clear form (will be stored encrypted).

- **license.servlet.password.encrypted**
  Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with same name in an existing `license.xml` file (found in: `[user_home_directory]/.com.oxygenxml`).

- **backup.license.servlet.url**
  Specifies the URL of the backup HTTP license server.

- **backup.license.servlet.user.name**
  Specifies the user name for the backup HTTP license server.

- **backup.license.servlet.password**
  Specifies the password for the backup HTTP license server, in clear form (will be stored encrypted).

- **backup.license.servlet.password.encrypted**
  Specifies the password for the HTTP license server, in encrypted form. Can be obtained from an entry with same name in an existing `license.xml` file (found in: `[user_home_directory]/.com.oxygenxml`).

**EXAMPLE:**

```bash
oxxygen.sh "-Vlicense.servlet.url=http://main.licenseserver:8080/oXygenLicenseServlet/license-servlet"
-"Vlicense.servlet.user.name=user" "-Vlicense.servlet.password=mypass"
-"Vbackup.license.servlet.url=http://backup.licenseserver:8080/oXygenLicenseServlet/license-servlet"
-"Vbackup.license.servlet.user.name=user" "-Vbackup.license.servlet.password=mypass"
```
Linux Installer response.varfile

The Oxygen XML Editor installer for Linux also creates a file called response.varfile, which records the choices that the user made when running the installer interactively. The generated response file is found in the \[OXYGEN_INSTALL_DIR]/.install4j folder. You can use the response.varfile to set the options for an unintended install (on page 43). For more information about the response.varfile format, see install4j site.

Variable Parameters (can be used in the response.varfile or from the command line)

The following variable parameters are supported in the response.varfile (or from the command line):

autoVersionChecking

- Used for automatic version checking. Possible values are true (default) or false.

reportProblem

- Used to report a problem encountered while using Oxygen XML Editor. Possible values are true (default) or false.

downloadResources

- Used to download resources (links to video demonstrations, webinars, and upcoming events) from https://www.oxygenxml.com to populate the application welcome screen. Possible values are true (default) or false.

Installing Oxygen XML Editor on Windows Server

System Requirements

Operating systems

CPU

- Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
- Recommended - Dual Core class processor

Memory
• Minimum values per user - 512 MB of RAM
• Recommended values per concurrent user - 2 GB of RAM

Storage

• Minimum - 400 MB free disk space
• Recommended - 1 GB free disk space

Java

Java 1.8 (or newer) from Oracle

Oxygen XML Editor only supports official and stable Java Virtual Machines with version 1.8 from Oracle. If you use the native Windows installer, Oxygen XML Editor will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 1.8 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the Download page for the particular product you are installing, and click on the tab for your particular platform.

Note: Oxygen XML Editor may work with other update versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you install using the native Windows installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the jre subdirectory of the installation directory is used.
2. Otherwise, if the Windows environment variable JAVA_HOME is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise, the version of Java pointed to by your PATH environment variable is used.

If you run Oxygen XML Editor using the batch file, oxygen.bat, you can edit the batch file to specify a particular version to use.
Windows Installer

To install Oxygen XML Editor using the Windows installer, follow these steps:

1. Make sure that your system meets the system requirements (on page 45).
2. Download the Windows installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.
5. Start Oxygen XML Editor using one of the following methods:
   • Use one of the shortcuts created by the installer.
   • Run oxygen.bat, which is located in the installation directory.
6. To license your copy of Oxygen XML Editor go to Help > Register and enter your license information (on page 50).

Configuring Windows Terminal Server

1. Install Oxygen XML Editor on the server and make its shortcuts available to all users.
2. Make sure you allocate sufficient memory to Oxygen XML Editor by adding the -Xmx parameter either in the .bat startup script (on page 291), or in the .vmoptions configuration file (on page 292) (if you start it from an executable launcher).

Installing Oxygen XML Editor on a Linux / UNIX Server

System Requirements

Operating system

   Any 64-bit Unix/Linux distribution with an available Java SE Runtime Environment version 1.8 from Oracle

CPU

   • Minimum - Intel Pentium III™/AMD Athlon™ class processor, 1 GHz
   • Recommended - Dual Core class processor

Memory

   • Minimum - 2 GB of RAM
   • Recommended - 4 GB of RAM
Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Java 1.8 (or newer) from Oracle

Oxygen XML Editor only supports official and stable Java Virtual Machines with version 1.8 from Oracle. If you use the Linux installer, Oxygen XML Editor will be installed with its own copy of Java with the specific update version that has been thoroughly tested.

All Platforms Package

If you use the all platforms package, your system must have a compatible Java 1.8 virtual machine installed. To see the exact Java update version that is supported, go to www.oxygenxml.com, navigate to the Download page for the particular product you are installing, and click on the tab for your particular platform.

Note: Oxygen XML Editor may work with other update versions of Java, but since Oxygen XML Editor has only been thoroughly tested with specific versions, there is no guarantee that it will be stable with any other Java version.

Attention: Oxygen XML Editor does not work with the GNU libgcj Java Virtual Machine.

Oxygen XML Editor uses the following rules to determine which installed version of Java to use:

1. If you used the Linux installer, which installs a version of Java as part of the Oxygen XML Editor installation, the version in the jre subdirectory of the installation directory is used.
2. Otherwise, if the Linux environment variable JAVA_HOME is set, Oxygen XML Editor uses the Java version pointed to by this variable.
3. Otherwise the version of Java pointed to by your PATH environment variable is used.

You can also change the version of the Java Virtual Machine that runs Oxygen XML Editor by editing the script file, oxygen.sh. Go to the Java command at the end of the script file and specify the full path to the Java executable of the desired JVM version. For example:
Linux Installer

To install Oxygen XML Editor using the Linux installer, follow these steps:

1. Make sure that your system meets the system requirements (on page 47).
2. Download the Linux installer.
3. [Optional] Validate the integrity of the downloaded file by checking it against the MD5 sum published on the download page.
4. Run the installer and follow the instructions in the installation program.

Note: For example, open a shell, cd to the installation directory, and at the prompt type sh ./oxygen-32bit.sh or sh ./oxygen-64bit.sh, depending on which installer you downloaded.

5. Start Oxygen XML Editor using one of the following methods:
   - Use the oxygen shortcut created by the installer.
   - From a command line, type sh oxygen.sh. This file is located in the installation folder.
6. To license your copy of Oxygen XML Editor go to Help > Register and enter your license information (on page 50).

Unix/Linux Server Configuration

1. Install Oxygen XML Editor on the server and make sure the oxygen.sh script is executable and the installation directory is in the PATH of the users that need to use the application.
2. Make sure you allocate sufficient memory to Oxygen XML Editor by setting an appropriate value for the -Xmx parameter in the .sh startup script.

Note: The default value of the -Xmx parameter is 1 GB. To avoid performance issues with large documents (on page 2946), you may need to adjust it.

3. Make sure the X server processes located on the workstations allow connections from the server host. For this, use the xhost command.
4. Start telnet (or ssh) on the server host.
5. Start an xterm process with the display parameter set on the current workstation. For example: xterm -display workstationip:0.0.
6. Start Oxygen XML Editor by typing sh oxygen.sh from the command line. This file is located in the installation folder.
Site-Wide Deployment

If you are deploying Oxygen XML Editor for a group, there are various things you can do to customize Oxygen XML Editor for your users and to make the deployment more efficient.

Creating custom default options

You can create a custom set of default options (on page 262) for Oxygen XML Editor. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen XML Editor, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

Oxygen XML Editor project files (on page 707) are used to configure a project. You can create and deploy default project files (on page 20) for your projects so that your users will have a preconfigured project file to begin work with.

Shared project files

Rather than each user having their own project file, you can create and deploy shared project files (on page 723) so that all users share the same project configuration and settings and automatically inherit all project changes.

Using the unattended installer

You can speed up the installation process by using the unattended installer for Windows (on page 36) or Linux (on page 43) installs.

Using floating licenses

If you have a number of people using Oxygen XML Editor on a part-time basis or in different time zones, you can use a floating license (on page 53) so that multiple people can share a license.

Licensing

Oxygen XML Editor is not free software. To activate and use Oxygen XML Editor, you need a license.

For demonstration and evaluation purposes, a time limited license is available upon request at https://www.oxygenxml.com/register.html. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.
Choosing a License Type

You can use one of the following license types with Oxygen XML Editor:

1. A **Named-User License (on page 51)** may be used by a single Named User (on page 3284) on one or more computers. Named-user licenses are not transferable to a new Named User. If you order multiple named-user licenses, you will receive a single license key good for a specified number of named users. It is your responsibility to keep track of the named users that each license is assigned to.

2. A **Floating License (on page 53)** may be used by any user on any machine. However, the total number of copies of Oxygen XML Editor in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Editor (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.

3. A **Subscription license (on page 51)** that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

4. A special **Academic Group License** (Classroom, Department, or Site license) may be used by students and teachers in academic institutions. These licenses provide a cost effective way of getting access to Oxygen XML Editor for learning purposes.

For definitions and legal details of the license types, consult the End User License Agreement available at [https://www.oxygenxml.com/eula.html](https://www.oxygenxml.com/eula.html).

Obtaining a License Key

You can obtain a license key for Oxygen XML Editor in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Editor website at [https://www.oxygenxml.com/buy.html](https://www.oxygenxml.com/buy.html) or through one of the authorized resellers. A license key will be sent to you by email.
- If your company or organization has already purchased licenses, contact your license administrator to obtain a license key or configuration details to connect to a license server.
- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from [https://www.oxygenxml.com/registerCode.html](https://www.oxygenxml.com/registerCode.html). A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Editor website at [https://www.oxygenxml.com/register.html](https://www.oxygenxml.com/register.html).
Register a Named-User or Subscription License

To register a Named-User License or Subscription License on a machine owned by the Named User (on page 3284), follow these steps:

1. Purchase a license from the Oxygen XML Editor website. You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Start Oxygen XML Editor.
   If this is a new install of Oxygen XML Editor, the registration dialog box is displayed. If the registration dialog box is not displayed, go to Help > Register.

Figure 10. License Registration Dialog Box

4. Select Use a license key as the licensing method.

   Note: If your license key has 20 or more licenses, you must use a license server (on page 56) instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Press OK.
Floating Licenses

The floating license type is commonly used by organizations that have a large number of infrequent users who do not need to use Oxygen XML Editor all at the same time. Instead of each user having their own individual license key to use at their discretion, there are a pool of licenses that are used one at a time by various users upon request.

To use floating licenses, a license server is required and the license key needs to be activated. Your system administrator will most likely be responsible for setting up the license server (on page 56). Then you will need to request a floating license from the server (on page 53). This process is designed to help you comply with the Oxygen End User License Agreement (EULA). This means that the license key will be locked to a particular license server deployment, and the same license key cannot be used with any other license server.

For information about releasing and returning a floating license to the pool for other users, see Releasing a Floating License (on page 55).

For information about reserving (or locking) a floating license so that it does not get returned to the pool, see Reserving a Floating License (on page 56).

Requesting a Floating License from an HTTP License Server

How to Request a Floating License

To request a floating license from an HTTP license server, follow this procedure:

1. Contact your server administrator to make sure the license server has already been set up and get network address and login details for the license server.
2. Start Oxygen XML Editor.
3. Go to Help > Register.
   
   **Step Result:** The license registration dialog box is displayed.
4. Choose Use a license server as licensing method.
5. Select HTTP/HTTPS Server as server type.
6. In the URL field, enter the address of the license server. The URL address has the following format: http://hostName:port/oXygenLicenseServlet/license-servlet.
7. Complete the User and Password fields.
8. Click the OK button.
Result: If a floating license is available, it is registered in Oxygen XML Editor. To display the license details, open the About dialog box from the Help menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

How to Register Floating Licenses for Additional Users

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Editor on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Editor:
   a. Select Register from the Help menu.
   b. Click OK without entering any information in this dialog box.
   c. Click Reset and restart the application.
2. Register the license using one of the floating license registration procedures (on page 53).
3. Copy the license.xml file from the preferences directory (on page 80) and place it in the installation folder on each machine to be registered.

Related Information:

• Setting up an HTTP License Server (Floating or Named-User Licenses) (on page 57)

Requesting a Floating License from a TCP License Server (Deprecated)

Use this procedure if your company uses an Oxygen XML Editor TCP license server and the license server has already been set up by your server administrator:

1. Contact your server administrator to get network address and login details for the license server.
2. Start Oxygen XML Editor.
3. Go to Help > Register .
   The license registration dialog box is displayed.
4. Choose Use a license server as licensing method.
5. Select TCP server as server type.
6. In the Host field, enter the host name or IP address of the license server.
7. In the Port field, enter the port number used to communicate with the license server.
8. Click the **OK** button.

If a floating license is available, it is registered in Oxygen XML Editor. To display the license details, open the **About** dialog box from the **Help** menu. If a floating license is not available, you will get a message listing the users currently using floating licenses.

**Related Information:**

- Setting up TCP Floating License Server (Deprecated) in 32-bit Windows *(on page 67)*
- Setting up TCP Floating License Server (Deprecated) All-Platforms *(on page 69)*

### Releasing a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- You exit the application running on your machine, and no other copies of Oxygen XML Editor running on your machine are using your floating license.
- You register a **Named User** *(on page 3284)* license with your copy of Oxygen XML Editor, and no other copies of Oxygen XML Editor running on your machine are using your floating license.
- Your computer idles for more than 2 hours.
- Your system administrator manually revokes the license *(on page 62)*.

**Tip:** To prevent your floating license from being released, you can use the **Lock floating license** action available in the **Help** menu. You can use the same action to unlock the license. Note that your system administrator also has the ability to **unlock your license** *(on page 62)*.

To release a floating license on demand, follow these steps:

1. Go to **Help > Register**.
   
The license registration dialog box is displayed.

2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.

3. Make sure the **Use a license key** option is selected.

4. Click **OK**.
   
   A dialog box is displayed asking if you want to reset your license key.

5. Select between:
• **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a Named User (on page 3284) license.

• **Reset** - Removes your license key from your user account on the current computer.

The Reset button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor.

Reserving a Floating License

There are instances where you might want to reserve or lock a floating license. For example, you could lock a floating license if you want to use your floating license offline while traveling.

To reserve/lock a floating license, follow these steps:

1. Select **Lock floating license** from the Help menu.

2. Click **OK**.

   Your floating license is now locked. You can use the same action to unlock the license or you can contact your system administrator to unlock it.

Transferring a License Key

If you want to transfer your Oxygen XML Editor license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then register your license (on page 50) on the new computer in the normal way.

To unregister a license, prior to transferring it, follow this procedure:

1. Go to Help > Register.

   The license registration dialog box is displayed.

2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.

3. Make sure the **Use a license key** option is selected.

4. Click **OK**.

   A dialog box is displayed asking if you want to reset your license key.

5. Select between:

   • **Use the last one** - Falls back to your previous license key, if applicable.

   • **Reset** - Removes your license key from your user account on the current computer.

   The Reset button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor.
License Servers

Installing a License Server to Manage Licenses

If you are using floating licenses or a large number of user-based licenses (20 or more) for Oxygen XML Editor, you must set up an Oxygen XML Editor license server. A license server can be installed as one of the following:

- An HTTP server (*on page 57*). This is the recommended method.
- A TCP server (*on page 67*) (deprecated).

**Note:** Oxygen XML Editor version 17 or higher requires a license server version 17 or higher. License servers version 20.1 or higher can be used with any version of a floating or named-user license key.

Activating License Keys

To help you comply with the Oxygen XML Editor EULA (terms of licensing), all floating or named-user licenses require activation. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your license server deployment is sent to the Oxygen XML Editor servers, which in turn will sign the license key.

Split or Combine License Keys to Work with Your License Servers

A license server can only manage one license key. If you have multiple license keys for the same Oxygen XML Editor version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, contact the Oxygen support team and ask for a new license key.

Setting up an HTTP License Server (Floating or Named-User Licenses)

The HTTP License Server is available in several distributions, tailored for covering a variety of deployment configurations:

- **Windows installer (on page 58)** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution (on page 58)** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, Mac, and Linux.
• **Web Archive (WAR) distribution (on page 59)** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

**Installation Steps for the HTTP License Server Installer Distribution for Windows**

1. Download the HTTP license server installer from the [HTTP License Server website](http://www.httplicenser.com).
2. Run the installer and follow the on-screen instructions.
3. You need to configure two sets of credentials:
   a. **Administrator credentials** - Used for accessing the Oxygen XML Editor license server administrative interface.
   b. **Standard user credentials** - Used by an Oxygen XML Editor application to connect to the license server.
4. You can choose to change the default 8080 port the server will run on. If you need to change the port after the installation, you can do it by editing the following `vmoptions` file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.
5. Optionally, you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

**Tip:** In case you run into issues, the license server log file is located in: `[Installation_Directory]\temp\logs\oXygenLicenseServlet.log`.

**Installation Steps for the HTTP License Server All-Platform Distribution**

1. Download the HTTP license server all-platform archive from the [HTTP License Server website](http://www.httplicenser.com).
2. Unpack the archive.
3. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and Mac).

**Note:** To specify a different port (other than the default 8080), you can pass the new port number as an argument to the scripts (for example, `licenseServer.bat 8082`). You can also change the port by editing the following `vmoptions` file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.

4. On the first run, you will be prompted to set two sets of credentials:
   a. **Administrator credentials** - Used for accessing the Oxygen XML Editor license server administrative interface.
   b. **Standard user credentials** - Used by an Oxygen XML Editor application to connect to the license server.

**Tip:** If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:
• `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oxygenLicenseServer.vmoptions` file.
• `startWindowsService.bat [serviceName]` - Starts the Windows service.
• `stopWindowsService.bat [serviceName]` - Stops the Windows service.
• `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

If you do not provide the `serviceName` argument, the default name `oxygenLicenseServer` is used.

If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:
• `outLicenseServer.log` - Standard output stream of the server.
• `errLicenseServer.log` - Standard error stream of the server.

### Installation Steps for the HTTP License Server WAR Distribution

1. Make sure that you have Java Servlet Container installed on the machine you have selected to be the license server. Apache Tomcat 5.5 or higher is recommended (available at [http://tomcat.apache.org](http://tomcat.apache.org)).

   **Important:** By default, the license server stores the statistics database and other data in the Java Servlet Container’s temporary directory. If you are not using Apache Tomcat, this directory may be deleted when the server is stopped or restarted. However, you can set the `oxygen.license.server.work.dir` system property to specify a different path for the directory where the database is stored.

2. Download the HTTP license server **Web Archive (.war)** from the HTTP License Server website.

3. Configure three user roles in your installation of the Java Servlet Container (such as Apache Tomcat):
   a. One user with the role `user`, used by an Oxygen XML Editor application to connect to the license server. In the subsequent example, this user name is `John`.
   b. Another user with the role `admin`, used for accessing the HTTP License Server administrative interface and the management interface. In the subsequent example, this user name is `Mary`.
   c. Another user with the role `manager`, used for accessing the HTTP License Server main page and the statistics pages. In the subsequent example, this user name is `Henry`.

For example, in Apache Tomcat, a typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat `zip/tar.gz` distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the three users, the configuration file might look like this:

```xml
<tomcat-users xmlns="http://tomcat.apache.org/xml"
```
4. Deploy the WAR file.

For example, in Apache Tomcat, go to the Web Application Manager page and log in with the user you configured with the admin role (Mary in the example above). In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The `oXygenLicenseServlet` application is now up and running, but the license key is not yet registered.

5. Go to the HTTP License Server administration page. By default, the address of this page is `http://<server-address>/oXygenLicenseServlet`. In Apache Tomcat, you can also open this page by clicking the `oXygenLicenseServlet` link in the manager page.

You will need to authenticate with the user configured with the admin role (Mary in the example above).

6. **Activate the license key.** This process involves binding your license key to your license server deployment. The browser used in the activation process needs to have Internet access.

   ✋ **Note:** If you cannot access the internet during the deployment, you can [manually activate the license key](on page 61).

Once the process is completed you cannot activate the license on another license server. Follow these steps to activate the license:

   a. Paste your license key into the form and press **Register/Activate**.

      **Result:** You will be redirected to an online form hosted on the Oxygen XML Editor website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

   b. Press **Register/Activate**.

      If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Editor client applications.

7. The application's log file location is specified by the `log4j.appender.R2.File` property from the WEB-INF/lib/log4j.properties configuration file.
For example, in Apache Tomcat, the configuration file is located at `TomcatInstallDir/webapps/oXygenLicenseServlet/WEB-INF/lib/log4j.properties` and the default log file location is `TomcatInstallDir/logs/oxygenLicenseServlet.log`.

**Manual License Activation Procedure (For Users Whose License Server is Offline)**

If your license server is not connected to the internet, and hence the license cannot be activated automatically during the installation, you can manually activate the license by following these steps:

1. Access the HTTP license server management page in a web browser.
2. Copy the license server machine signature code.
4. Enter or paste the license server machine signature code and the license key, then click **Activate**.
   
   **Step Result:** The activated license key is displayed on-screen.
5. Copy the activated license key and paste it in the license registration page of the HTTP server.

**Preconfiguring License Server Details When Installing Oxygen XML Editor**

It is possible to install Oxygen XML Editor with the license server details preconfigured. For more information see:

- **Windows:** [Windows Installation: Command-Line Parameters for Preconfiguring License Server Details](on page 37)
- **Linux:** [Linux Installation: Command-Line Parameters for Preconfiguring License Server Details](on page 43)

**Backup License Server Information**

If you want to use a backup license server, the setup instructions are the same as the procedures for a main license server, but it will require its own separate license key. You do not need to purchase the separate license if it is to be used for a backup server, but you will need to request a separate license key by contacting the Oxygen support team.

**Related Information:**

- [Troubleshooting: Machine Signature Mismatch Errors](on page 71)
License Server Management and Statistics Pages

A system administrator can manage and access information about the license server at: http://hostName:port/oXygenLicenseServlet.

This page provides access to several statistics reports and management tasks. It also shows the current status of the server and provides additional instructions for using the license server with Oxygen XML Editor.

This page includes the following links for accessing statistics or managing tasks:

- **Current Allocated Licenses** - Opens the Allocated License Report page (on page 62).
- **Usage Statistics** - Available only for floating licenses. Opens the License Usage Statistics page (on page 63).
- **View License Key** - Use this link to view details about the license key.
- **Replace/Remove License Key** - Use this link if you need to replace or remove the current license key (on page 65).
- **Configuration** - Opens a page where you can configure notification settings and specify whether or not users are allowed to lock licenses. This page can be used for setting up the mail server used for sending emails whenever license requests from users are rejected.
- **Users management** - Available only for named-user licenses. Opens a page where you can manage the list of users who are entitled to use the license key.

Allocated License Report Page

This report page provides a system administrator the ability to revoke or unlock current running instances of licenses and includes the following information:

- **License load** - A graphical indicator that shows how many licenses are available.
- **License server status** - General information about the license server status, such as start time, license counts, rejected and acknowledged requests, average usage time, license refresh and timeout intervals, location of the license key, and the server version.
- **Current running instances** - Lists all currently acknowledged users, including user name, date and time when the license was granted, IP and MAC address of the computer where Oxygen XML Editor runs, and lock status.
  - **Revoke** - A system administrator can click on the  
    Revoke icon next to a user name to release that particular license and return it to the pool.
  - **Unlock** - If a user has locked their license, the system administrator can also unlock it from this page.

Note: This report is also available in XML format at: http://hostName:port/oXygenLicenseServlet/license-servlet/report-xml.
License Usage Statistics Page (Floating License Only)

This report page provides some usage statistics for the floating licenses. It is helpful for determining the number of licenses that are needed and monitoring times when licenses are consumed. It includes the following information:

- **Maximum number of concurrent licenses** - Shows the maximum number of floating licenses that can be consumed at any given time.

- **Concurrent license consumption per day** - A chart that shows the peak number of licenses that were consumed and the total number of users that were rejected, on a daily basis. This chart can be used to detect the amount of concurrent licenses that are needed to avoid having rejected users.

  **Tip:** You can click on any bar to see the license consumption per hour for that particular day.

  Figure 11. Concurrent License Consumption per Day Chart

- **Concurrent license consumption per hour** - A chart that shows the peak number of licenses that were consumed per hour throughout that particular month. This is useful for identifying the time of day when the most licenses were consumed.

  Figure 12. Concurrent License Consumption per Hour Chart
Users Management Page (Named-User License Only)

When using a named-user license key, the license server allocates available licenses on a *first come first served* basis until the maximum number is reached. Further users attempting to get a license key will be rejected.

This page provides access to the list of registered users and allows the server admin to:

- Revoke a user's right to use a license.
- Reactivate a previously deactivated user.

Figure 13. Users List Management Page
Replacing or Removing a License Key in an HTTP License Server

The following procedure assumes that your Oxygen XML Editor HTTP license server contains a previously activated license key (on page 60) and provides instructions for replacing it with another one or removing it completely.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users (on page 57).

Replacing a License Key

To replace a license key that is activated on your HTTP license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page using your admin credentials.
2. Click the Replace/Remove license key link. This will open a page that contains details about the license currently in use.
3. Click the Replace button to begin the replacement procedure.
4. Paste the new license key in the displayed form, then click Register/Activate. The browser used in the process needs to have Internet access.
You will be redirected to an online form hosted on the Oxygen XML Editor website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

**Note:** If you cannot access the online activation form, you can manually activate the license key (on page 61).

5. Press **Register/Activate**.

If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

### Removing a License Key

To remove a license key that is activated on your HTTP license server, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page using your admin credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Remove** button to begin the license deletion procedure.
4. Click the **Remove** button in the confirmation page.

**Important:** The removal process is irreversible. Once the process is complete, you cannot restore the license key.

### Upgrading Your HTTP License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the HTTP License Server to its latest version.

Follow this procedure:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the admin credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.
3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the admin role, and Undeploy the license server.
4. Download the Web Archive (WAR) distribution of HTTP license server.
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the admin user.
7. Paste the license key into the form and register it.

Setting up TCP Floating License Server (Deprecated) in 32-bit Windows

This section contains information about setting up the TCP floating license server as a Windows process.

Figure 14. TCP Floating License Server (Process in Windows)

Installation Steps

1. Download the license server installation kit for Windows from the Oxygen XML Editor website.

2. Run the downloaded installer and follow the on-screen instructions.

   By default, the installer installs the license server as a Windows service. Optionally, you have the ability to start the Windows service automatically at Windows startup or create shortcuts on the Start menu for starting and stopping the Windows service manually.

   Tip: If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

   • `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.vmoptions` file.
   • `startWindowsService.bat [serviceName]` - Starts the Windows service.
   • `stopWindowsService.bat [serviceName]` - Stops the Windows service.
   • `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

   If you do not provide the `serviceName` argument, the default name `oXygenLicenseServer` is used.

   If the license server is installed as a Windows service, the output and error messages are automatically redirected to the following log files that are created in the install folder:
3. Manually add the oXygenLicenseServer.exe file in the Windows Firewall list of exceptions. Go to Control Panel > System and Security > Windows Firewall > Allow a program or feature through Windows Firewall > Allow another program and browse for oXygenLicenseServer.exe from the Oxygen XML Editor License Server installation folder.

4. Floating licenses require activation prior to use. More details are available either on-screen (if the license server is started in a command-line interface) or in the outLicenseServer.log log file.

Note: A license server can only manage one license key. If you have multiple license keys for the same Oxygen XML Editor version and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, contact the Oxygen support team and ask for a new license key.

Replacing Floating License Key in TCP Floating License Server (Deprecated)

The following procedure assumes that your Oxygen XML Editor TCP floating license server contains a previously activated license key (on page 60) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users (on page 57).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the service that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named license and it is located in the installation directory of the license server).
3. Remove the license.txt file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start (on page 72).
4. Find the license activation procedure in the on-screen instructions (if the license server is started in a command-line interface) or in the outLicenseServer.log log file.
5. After you copy the activated license key in the license.txt file, restart the license server.

Upgrading Your TCP Floating License Server (Deprecated)

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor floating license server to its newest version.
Follow this procedure:

1. Go to the Oxygen XML Editor website and download the latest floating license server.
2. Run the installation kit.
3. Leave the default **Update the existing installation** option selected. This will ensure that some options set in the previous version (namely the installation folder, port number, and the floating license key in use) of the license server will be preserved.
4. Follow the on-screen instructions to complete the installation process.

**Setting up TCP Floating License Server (Deprecated) All-Platforms**

This installation method can be used for running the TCP license server on any platform where a Java virtual machine can run (OS X, Linux/Unix, Windows).

Figure 15. TCP Floating License Server (All-Platforms Distribution)

**Installation Steps**

1. Ensure that a Java runtime version 6 or later is installed on the server machine.
2. Download the license server installation kit for your platform from the Oxygen XML Editor website.
3. Unzip the installation kit into a new folder.
4. Start the server using the startup script from a command-line console. The startup script is called `licenseServer.sh` for OS X and Unix/Linux or `licenseServer.bat` for Windows. The following parameters are accepted:
   - `licenseDir` - The path of the directory where the license files will be placed. The default value is `license`.
   - `port` - The TCP port number used to communicate with Oxygen XML Editor instances. The default value is **12346**.
**Example:** The following is an example of the command line for starting the license server on Unix/Linux and OS X:

```bash
sh licenseServer.sh myLicenseDir 54321
```

5. Floating licenses require activation prior to use. Follow the on-screen instruction to complete the license activation process.

Replacing Floating License Key in TCP Floating License Server (Deprecated)

The following procedure assumes that your Oxygen XML Editor TCP floating license server contains a previously activated license key (on page 60) and provides instructions for replacing the activated license key with another one. The goal of the procedure is to minimize the HTTP license server downtime during the activation step of the new license key.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key that accommodates a different number of users (on page 57).

To replace a floating license key that is activated on your floating license server with a new one, follow these steps:

1. Stop the process that runs the floating license server.
2. Locate the folder that holds the previous activated license key (by default, it is named `license` and it is located in the installation directory of the license server).
3. Remove the `license.txt` file and try to restart the server. Since the file that stores the license key is missing, the server will fail to start.
4. Find the license activation procedure in the on-screen instructions.
5. After you copy the activated license key in the `license.txt` file, restart the license server.

Upgrading Your TCP Floating License Server (Deprecated)

The goal of the following procedure is to help you minimize the downtime generated when you upgrade the Oxygen XML Editor TCP floating license server to its newest version.

Follow this procedure:

1. Stop the current license server process.
2. Locate and open the floating server startup script. It should look like this:

```bash
sh licenseServer.sh pathToLicenseDir 54321
```
3. Make a note of the path to the license directory (in the example above, it is `pathToLicenseDir`) and the port number (in the example above, it is 54321).
4. Go to the license directory and copy the license key file (license.txt) for later use.
5. Go to the Oxygen XML Editor website and download the all-platforms floating license server installation kit.
6. Unzip the archive and overwrite the content of your current floating license server installation.
7. Copy the license key file (license.txt) saved in step 4 to license directory of the floating license server installation.
8. Edit the floating server startup script and configure with the info you made note of in step 3.
9. Start the floating license server process.

Common Problems: License Server Errors

This section includes some common problems that may appear when setting up a floating license server.

Machine Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server's Machine Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Machine Signature) is sent to the Oxygen XML Editor servers, which in turn will sign the license key. The Machine Signature is computed from the list of network interfaces of the machine where you deployed the license.

When starting the license server, if you receive an error stating that your server's Machine Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new machine that hosts your license server.

Solution

Revert to your previous configuration.
Possible Cause 2

A new network interface was changed, added, or activated in the machine that hosts your license server.

**Note:** A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

**Solution**

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

**Solution**

The server simply needs to always be restarted from the same location.

Windows Service Reports Incorrect Function Error When Starting (TCP Server)

**Problem**

My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

**Cause**

This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

**Solution**

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.
Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

**Problem**

My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

**Cause**

This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder).

**Solution**

Re-deploy your license key. For more information, see the Setting up a Floating License Server section (on page 67).

**Upgrading**

From time to time, upgrades and patch versions of Oxygen XML Editor are released to provide enhancements that fix problems and add new features.

By default, Oxygen XML Editor automatically checks for new versions at start up. If a newer version is detected, a dialog box will automatically be displayed that provides information about the type of upgrade or update that is available. If the newer version includes a critical bug fix, this dialog box will continue to be displayed every time Oxygen XML Editor is launched. To disable this check, open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and deselect Automatic Version Checking.

To check for new versions manually, go to Help > Check for New Versions. This opens a dialog box that displays information about whether or not a newer version is available.

**Upgrading Oxygen XML Editor on Windows/Linux**

**What is Preserved During an Upgrade?**

When you install a new version of Oxygen XML Editor, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Editor already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.
If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in framework (on page 3282) files, XSLT stylesheets, XML Catalogs (on page 3289), and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks (on page 3282) that were stored outside the installation directory (as configured in Document type associations > Locations (on page 94)) will be preserved and will be found by the new installation.

If you install in a new directory:

- All the files from the old install directory will be preserved, including any modification in framework (on page 3282) files, XSLT stylesheets, XML Catalogs (on page 3289), and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks (on page 3282) that were stored outside the installation directory (as configured in Document type associations > Locations (on page 94)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor on Windows or Linux

1. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select Help > Check for New Version. Note that the application needs an Internet connection to check the license compatibility.
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
4. Restart Oxygen XML Editor.
5. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.
Upgrading Oxygen XML Editor on OS X

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor, first you need to remove or rename the old installation directory. By renaming the directory, it can coexist with the new installation and the following data will be preserved:

- All the files from the old install directory will be preserved, including any modification in framework (on page 3282) files, XSLT stylesheets, XML Catalogs (on page 3289), and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom frameworks (on page 3282) that were stored outside the installation directory (as configured in Document type associations > Locations (on page 94)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor on OS X

1. Uninstall the current version of Oxygen XML Editor (on page 77) or rename the installation directory (for example, Oxygen XML Editor.old).
2. Upgrading to a new version might require a new license key. To check if your license key is compatible with the new version, select Help > Check for New Version. Note that the application needs an Internet connection to check the license compatibility.
3. Download and install the new version in an empty folder according to the instructions for your platform and the type of installer you selected.
4. If you installed from an archive (as opposed to an executable installer) you may have to update any shortcuts you have created or modify the system PATH to point to the new installation folder.
5. Restart Oxygen XML Editor.
6. If you require a new license for your upgrade, install it now according to the procedure for your platform and the type of installer you selected.

Installing and Updating Add-ons

Oxygen XML Editor provides an add-on (on page 3285) mechanism that can automatically discover and install frameworks (on page 2372) and plugins (on page 2612) from a remote location.

Note: Frameworks that you install through the add-ons system are read-only.
Installing Add-ons

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to Help > Install new add-ons.
2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the Show add-ons from field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml. If you want to see a list of all the default and sample add-ons that are available on the Oxygen remote update sites, choose ALL AVAILABLE SITES from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Editor version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.

   **Note:** To see all the versions of the add-ons, deselect Show only compatible add-ons and Show only the latest version of the add-ons. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.
3. Choose the add-ons you want to install, press the Next button, then follow the on-screen instructions.

   **Note:** Accepting the license agreement of the add-on is a mandatory step in the installation process.

   **Note:** All add-ons are installed in the extensions directory inside the Oxygen XML Editor preferences directory (on page 80).

Managing installed add-ons

To manage the installed add-ons, follow these steps:

1. Go to Help > Manage add-ons
2. The displayed dialog box presents a list of your installed add-ons along with various information (such as the installed version, the compatible Oxygen version, and more). The Status column will indicate if an update is available for a particular add-on. Also, you can click on the row for any particular add-on that has an update available to see details for the update (displayed in the preview pane below the list of add-ons).
3. To update an add-on, select the checkbox for the specific add-on, then press Update to update it (or Uninstall to remove it). If there is a newer version of the add-on available, Oxygen XML Editor will download the package and install it. Follow the on-screen instructions to complete the installation process.
Note: Accepting the license agreement of the add-on is a mandatory step in the installation process.

Checking for add-on updates

To check if there are available updates for the installed add-ons, go to Help > Check for add-ons updates. This action displays updates that are compatible with the current Oxygen XML Editor version.

- Packing and Deploying Plugins as Add-ons (on page 2612)

Uninstalling

How to Uninstall Oxygen XML Editor

⚠️ CAUTION: The following procedure will remove Oxygen XML Editor from your system. All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Make a backup of any data you want to keep before proceeding.

1. Back up any data you want to keep from the Oxygen XML Editor installation folder.
2. Remove the application according to your operating system:
   - Windows or Linux - Use the appropriate uninstaller shortcut provided with your OS.
   - OS X - Manually delete the installation folder and all its contents.
3. If you want to remove the user preferences:
   - Windows - Remove the directory: %APPDATA%\Roaming\com.oxygenxml (usually %APPDATA% has the value: [user-home-dir]\Application Data). Note that this directory is hidden.
   - OS X - Remove the directory: Library/Preferences/com.oxygenxml of the user home folder.
   - On Linux, remove the directory: .com.oxygenxml from the user home directory.

Unattended Uninstall

The unattended uninstall procedure is available only on Windows and Linux.
Run the uninstaller executable from command line with the -q parameter.

- **Windows** - The uninstaller executable is called `uninstall.exe` and is located in the *Oxygen* installation directory.
- **Linux** - The uninstaller executable is called `uninstall` and is located in the *Oxygen* installation directory.
4.

Configuring Oxygen XML Editor

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the editor variables (on page 276) that are available for customizing user-defined commands.

Preferences

You can configure Oxygen XML Editor options using the Preferences dialog box.

To open the preferences dialog box, go to Options > Preferences.

You can select the preference page you are interested in from the tree on the left of the Preferences dialog box. You can filter the tree by using the filter text box and the following buttons are available to the right of the text box:

- **Expand All** - Expands the structure of the tree to show all preference pages.
- **Collapse All** - Collapses the structure of the tree to show only the 1st level preference pages.
- **Project-Level Options Only** - If toggled on, it filters the tree to only show the preference pages that are saved at project level (on page 266).

Figure 16. Preferences Dialog Box
Press `?` or `F1` for help on any preferences page.

Some preference pages include an option to control how the options are stored, either as Global Options (on page 265) or Project Options (on page 266).

Figure 17. Controlling the Storage of the Preferences

You can restore options to their default values by pressing the Restore Defaults button, available in each preferences page.

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (`com.oxygenxml`) that is in the following locations:
Global Preferences

The global options cover a number of aspects of the overall operation of Oxygen XML Editor. To configure the Global options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Global.

The following options are available in the Global preferences page:

**Automatic Version Checking**

If this option is selected, Oxygen XML Editor will check for a new version on startup.

**Check for notifications**

If selected (default value), the application will check for various types of messages from the Oxygen XML Editor website and they will be displayed in the status bar. The types of messages include the addition of new videos on the website, the announcement of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.

**Language**

This option specifies the language used in the user interface. You can choose between English, French, German, Dutch, or Japanese. You must restart Oxygen XML Editor for the change to take effect.

**Other language**

This option sets the language used in the user interface using an interface localization file. For details about creating this file, see Localizing the User Interface (on page 289). You can use this option to set the language of the user interface to a language that is not shipped with Oxygen XML Editor.

**Note:** If some interface labels are not rendered correctly after restarting the application, (for example, Chinese or Korean characters are not displayed correctly), make sure that your operating system has the appropriate language pack installed (for example, the East-Asian language pack).

**Line separator**
This option specifies the type of line separator to be used when saving files. Use **System Default** to select the normal line separator for your OS. The other two possible selections are **Unix-like** and **Windows-like**.

**Notes:**

- This option is ignored if the Detect the line separator on file open option (on page 82) is selected AND a line separator is automatically detected.
- When changing the selection in this option, the change does not affect an opened file until you make a modification to the file and save it. At that point, all line separators in the file will change to the type of line separator you chose in this option.

**Detect the line separator on file open**

When this option is selected, the editor detects the line separator when a file is loaded and it uses it when the file is saved. If this option is not selected, you can use the Line separator option (on page 81) to choose the type of line separator to be used when saving files.

**Tip:** To see the line separator type for the current file, you can use the Properties view (Window > Show View > Properties).

**Default Internet browser**

This option sets the Web browser that Oxygen XML Editor will use to do the following:

- Open (X)HTML or PDF transformation results.
- Open a web page.

If you leave this setting blank, the system default browser will be used.

**Open last edited files from project**

When this option is selected, Oxygen XML Editor opens the files you had open the last time you used a project whenever you open the application or switch to that project.

**Check opened files for file system changes**

When this option is selected, Oxygen XML Editor checks the content of the all opened editors to see if they have been updated by another application. If the file has changed, Oxygen XML Editor will ask you if you want to reload the file.

**Auto update unmodified editors on file system changes**

If this option is selected, Oxygen XML Editor automatically updates unmodified editors if the edited file changes externally.
Beep on operation finished

When this option is selected, Oxygen XML Editor beeps when a validation or transform action ends. Different tones are used for success and failure. The tones used may depend on the sound settings in your operating system.

Show memory status

When this option is selected, the memory Oxygen XML Editor uses is displayed in the status bar. To free memory, click the Free unused memory button located at the right side of the status bar. The memory status bar turns yellow or red when Oxygen XML Editor uses too much memory. You can change the amount of memory available to Oxygen XML Editor by changing the parameters of the application launcher (on page 291).

Order of switching between editor tabs

This option specifies the order for switching between opened file tabs when using Ctrl + Tab (Command + Tab on OS X) or Ctrl + Shift + Tab (Command + Shift + Tab on OS X) (on page 701). You can choose between:

- Recently used order - Switches to the most recently used tab.
- Visual order - Switches to the next tab in visual order.

File Chooser Dialog section

Use platform file chooser (Windows and Mac OS X)

This option is selected by default and it specifies that the native file chooser is used. You can deselect this option if you want the Java Swing file chooser to be used instead. If Oxygen XML Editor encounters a problem while using the native file manager, it will avoid using it again in the current session, even if this option is selected.

Consider application bundles to be directories when browsing (Mac OS X only)

This option is available only on the Mac OS X platform. When selected, the file browser dialog box allows you to browse inside an application bundle, as in a regular folder. Otherwise, it is not allowed (the same as the Finder application on Mac OS X).

Note: The same effect can be obtained by setting the apple.awt.use-file-dialog-packages property to true or false in the Info.plist descriptor file of the Oxygen XML Editor application:
Show hidden files and directories

If this option is selected, Oxygen XML Editor shows system hidden files and folders in the file browser dialog box and the folder browser dialog box.

⚠️ Tip: On Mac OS X, you need to press `Command + Shift + Period` in the file browser to show hidden files.

File chooser opens

This options specifies the starting directory that the file browser dialog box (on page 689) will open. You can choose between:

- **Directory of the selected file** - The file browser opens the folder where the selected file is stored, depending on the current selection (for example, a file could be selected from the Project view, DITA Maps Manager, main editing pane, or another location within the application).
- **Last visited directory** - The file browser opens the last visited folder.

Appearance Preferences

This preferences page contains various options that allow you to change the appearance of the user interface of Oxygen XML Editor. To configure the Appearance options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Appearance.

The following options are available in the Appearance preferences page:

**Look and Feel**

This option allows you to change the graphic style (look and feel) of the user interface. Depending on the operating system, you can choose between various predefined style options.

**Theme**

This option allows you to choose predefined color themes that will be applied over the entire user interface. You can select between the following:

- **Light** (default theme in Windows)
- **Classic** (default theme in MAC OS)
**Note:** In Windows, if a high contrast theme is detected and the **Theme** option is set to **Classic** and the **Look and Feel option** *(on page 84)* is set to **Default** or **Windows**, Oxygen XML Editor inherits the high contrast theme colors that are set in the operating system.

- Graphite
- Ultramarine

You can also change various appearance-related options in other preference pages for the selected theme by clicking on the various links in this section.

**Custom Themes**

You can also create custom themes to share with others or use in other installations of Oxygen XML Editor. To create a custom theme, follow these steps:

1. Select a **Theme** to use as a base.
2. Configure the desired options in any of the option pages listed in this preferences page.
3. Click **Export** and specify a name for your custom theme. If you save the theme to the default file path, your custom theme will immediately appear in the **Theme** drop-down list. Otherwise, if you save it to another location, you can use the **Import button** *(on page 86)* to make it appear in the drop-down list.

**Note:** In OS X (starting with Yosemite), if you choose **Graphite** for the **Theme**, it is recommended that you select the **Use dark menu and Dock** option that is found in **System Preferences > General**.

**Theme preview area**

Displays a preview of the current **Theme selection** *(on page 84)* *(available for predefined color themes)*.

**Theme management section**

**Reset**

Resets the theme to its default values (this option is available when the theme is modified).

**Rename**

Changes the name of the theme (not available for default or predefined themes).
Delete
Removes the selected theme (not available for default or predefined themes).

Import
Allows you to import a color theme from an XML theme file. You can use this option to load an exported custom theme (on page 85).

Export
Allows you to export the current color theme into an XML theme file that can then be shared with others or imported into another installation of Oxygen XML Editor.

Configure icon saturation and brightness link
This link is available if you are using a dark theme (on page 84) (such as Graphite or Ultramarine). It opens a dialog box that allows you to configure the saturation and brightness for all the icons in Oxygen XML Editor.

Figure 18. Configure Icon Saturation and Brightness Dialog Box

Colors Preferences
Oxygen XML Editor allows you configure the colors for frames, dialog boxes, controls, and commands. To configure the Colors, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Appearance > Colors.

Clicking the color button for any of the options opens a Choose color dialog box. It includes several tabs that allow you to configure the color in numerous ways. This page allows you to select and configure the color for the following:

Background Colors
Background

Background color for various general user interface items.

Components background

Background color for various components (such as text fields, views, tables, and dialog boxes).

Components selection background

Background color for the current selections in certain components, such as some views and panes.

Components inactive selection background

Background color for a selection in a view that is not the current focus.

Menus, toolbars and frame background

Background color for specific components such as menus, toolbars, and the application frame.

Menus and toolbars selection background

(This option is not available for Mac OS) Background color for menu selections and toolbar buttons.

View titles background

Background color for the titles of view and tabs.

Status bar background

Background color of the status bar at the bottom of the editor.

Foreground Colors

Foreground

Foreground color for various general user interface items.

Component selection foreground

Foreground color for the current selection.

Disabled foreground

Foreground color for various components that are not the current focus (such as views other than the currently selected one).

Link foreground

Foreground color for links in views and dialog boxes.

View titles foreground

Foreground color for the title bar of views.
Status bar foreground

Foreground color for the text in the status bar at the bottom of the editor.

Other Colors

Borders and table grids

Color for certain borders and table grid lines.

Text component border

Color for the borders of text fields and drop-down lists.

View/Editor tabs border

Color for the borders of views and tabs.

Scroll bars, chevrons

Color for scroll bars (navigation bars) and chevrons (button to expand a non-visible area).

Separator

Color for the separators in toolbars, menus, and dialog boxes.

Note: You must restart the application for your changes to be applied.

Fonts Preferences

Oxygen XML Editor allows you to choose the fonts to be used in the Text, Design, and Grid editor modes, and fonts for the Author mode that are not specified in the associated CSS stylesheet. To configure the font options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Appearance > Fonts.

The following options are available:

Editor

Specifies the font family, size, and weight to be used in the Text mode editor. To change the current values, double-click the text field or click the Choose button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the Sample box to see a preview of how it will look in the application. If you select the Show only the fonts that can render the sample text option and paste content in the Sample box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

Note: On Mac OS X, the default font, Monaco, cannot be rendered in bold.

Author default font
Specifies the default font family, size, and weight to be used in Author mode. However, the default font will be overridden by the fonts specified in any CSS file associated with the opened document. To change the current values, double-click the text field or click the Choose button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the Sample box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the Sample box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

**Schema default font**

This option allows you to choose the font to be used in:

- The **Design** mode of the XML Schema editor ([on page 1249](#)).
- Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

To change the current values, double-click the text field or click the Choose button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the Sample box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the Sample box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

**Text anti-aliasing**

This option allows you to set the text anti-aliasing behavior:

- **Default** - Allows the application to use the setting of the operating system, if available.
- **On** - Sets the text anti-aliasing to pixel level.
- **Off** - Disables text anti-aliasing.
- Sub-pixel anti-aliasing modes, such as GASP, LCD_HRGB, LCD_HBGR, LCD_VRGB, and LCD_VBGR.

**Text components**

Specifies the font family, size, and weight to be used in text boxes within the interface. To change the current values, double-click the text field or click the Choose button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the Sample box to see a preview of how it will look in the application. If you select the **Show only the fonts that can render the sample text** option and paste content in the Sample box, the application
detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

GUI

Specifies the font family, size, and weight to be used for user interface labels. To change the current values, double-click the text field or click the Choose button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the Sample box to see a preview of how it will look in the application. If you select the Show only the fonts that can render the sample text option and paste content in the Sample box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

View titles font

Specifies the font family, size, and weight to be used in the titles of the various views within the interface. To change the current values, double-click the text field or click the Choose button. This opens a dialog box where you can choose the font family, font size, and whether or not to bold the text. You can enter or paste content in the Sample box to see a preview of how it will look in the application. If you select the Show only the fonts that can render the sample text option and paste content in the Sample box, the application detects fonts that can render the particular character set and filters the fonts that can be selected accordingly.

Note: You must restart the application for your changes to be applied.

Related Information:

- Changing the Font Size in the Editor (on page 832)

Application Layout Preferences

Oxygen XML Editor offers various perspectives (on page 3285) and views that you can arrange in a variety of layouts to suit your needs.

To configure the application layout options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Application Layout. The following options are available:

Select application layout

You can choose between the following three layouts:

Default
Uses the default layout for all perspectives (on page 3285). Any modification of this layout (such as closing views, displaying views, or a new view arrangement) is saved on exit and reloaded at start-up.

Predefined

Allows you to choose one of the predefined layouts:

- **Advanced** - All views are displayed.
- **Author** - An authoring-oriented layout that includes the following views: Project (on page 333), Archive Browser (on page 2191), DITA Maps Manager (on page 2990), Outline (on page 347), Attributes (on page 426), Model (on page 353), and Elements (on page 432).
- **Basic** - Only the Project view (on page 333) and Outline view (on page 347) are visible. Recommended when you edit XML content and you need maximum screen space.
- **Schema development** - The Project (on page 333), Component Dependencies (on page 1300), Resource Hierarchy/Dependencies (on page 1297), Outline (on page 625), Palette (on page 631), and Attributes (on page 628) views are displayed.
- **XQuery development** - The Project (on page 333), Outline (on page 1341), XSLT/XQuery Input (on page 1202), XPath/XQuery Builder (on page 1343), and Transformation Scenarios (on page 1768) views are displayed.
- **XSLT development** - The Project (on page 333), Component Dependencies (on page 1207), Resource Hierarchy/Dependencies (on page 1204), Outline (on page 1197), Attributes (on page 351), Model (on page 353), XSLT/XQuery Input (on page 1202), XPath/XQuery Builder (on page 1343), and Transformation Scenarios (on page 1768) views are displayed.

Custom

Allows you to specify a custom layout to be used. You can save your preferred layout using Window > Export Layout, then enter the location of the saved layout file in this setting.

Reset layout at startup

When this option is selected, Oxygen XML Editor forgets any changes made to the layout during a session and reloads the default layout the next time it is started. This is useful when you want to keep a fixed layout from one session to another.

Remember layout changes for each project
When this option is selected, Oxygen XML Editor saves layouts individually for each project. When you switch projects, the layout you last used for that project is loaded automatically.

**Allow detaching of editors from main window**

When this option is selected, you can drag and drop an editor window outside of the main screen. This is useful especially when you are using two monitors and you want to view files side by side.

**Note:** If the main screen is maximized, you cannot drag and drop an editor outside of it.

**View tab placement**

Specifies whether the View tabs are located at the top or bottom of the window.

**Editor tab placement**

Specifies whether the Editor tabs are located at the top or bottom of the window.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the preferences directory of Oxygen XML Editor.

For more information about configuring the user interface of Oxygen XML Editor, watch our video demonstration:

[https://www.youtube.com/embed/anwjepfAdEk](https://www.youtube.com/embed/anwjepfAdEk)

**Add-ons Preferences**

You can use add-ons (on page 3285) to enhance the functionality of Oxygen XML Editor. To configure the Add-ons options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Add-ons.

The following options are available in this preferences page:

**Enable automatic updates checking**

When this option is selected, Oxygen XML Editor will automatically search for available updates.

**Add-on Sites URLs**

This is a list of the URLs for the add-on sites. You can add, edit, and delete sites in this list by using the buttons below the list.
Document Type Association Preferences

Oxygen XML Editor uses document type associations (on page 3281) to associate a document type (on page 1537) with a set of functionality provided by a framework (on page 3282). To configure the Document Type Association options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for framework add-on update sites.

Document Type Table

This table presents the currently defined frameworks (on page 3282) (document type associations (on page 3281)), sorted by priority and alphabetically. Each edited document type has a set of association rules (on page 97) (used by the application to detect the proper document type association to use for an opened XML document).

New

Opens a Document type configuration dialog box (on page 95) that allows you to add a new framework.

Edit

Opens a Document type configuration dialog box (on page 95) that allows you to edit an existing framework.

⚠️ Note: If you try to edit an existing framework when you do not have write permissions to its storage location, a dialog box will be shown asking if you want to extend it.

Duplicate

Opens a Document type configuration dialog box (on page 95) that allows you to duplicate the configuration of an existing framework. This will create a snapshot of the framework in its current form. It is merely a copy of the document type and will not evolve along with the base document type like the Extend action does.

Extend

Opens a Document type configuration dialog box (on page 95) that allows you to extend an existing framework. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.
Delete

Deletes the selected framework (document type).

Enable DTD/XML Schema processing in document type detection

When this option is selected (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the DITAArchVersion attribute of the root element. This attribute is specified as default in the DTD and it is detected in the root element, helping Oxygen XML Editor to correctly match the DITA customization.

Only for local DTDs/XML Schemas

When this option is selected (default value), only the local DTDs / XML Schemas will be processed.

Enable DTD/XML Schema caching

When this option is selected (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Related Information:

• Sharing a Custom Framework (on page 2371)

Locations Preferences

Oxygen XML Editor allows you to change the location where frameworks (document types) are stored, and to specify additional framework directories. The Locations preferences page allows you to specify the main frameworks folder location. You can choose between the Default directory (\OXYGEN_INSTALL_DIR\frameworks) or a Custom specified directory. You can also change the current frameworks folder location value using the com.oxygenxml.editor.frameworks.url system property set in either the .vmoptions configuration files (on page 291) or in the startup scripts (on page 292).

A list of additional frameworks directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the Add, Edit and Delete buttons to manage the list of folders.

A document type configuration (framework) can be loaded from the following locations:
The configuration dialog box includes the following fields and sections:

**Name**
The name of the framework. This will be displayed as its name in the **Document Type** column in the **Document Type Association** preferences page (on page 92).

### Priority

Depending on the priority level, Oxygen XML Editor establishes the order in which the existing frameworks are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority for frameworks you want to be evaluated first.

**Note:** The built-in document types are set to Low priority by default. Frameworks that have the same priority are sorted alphabetically.

### Description

The document type description displayed as a tool tip in the **Document Type Association** preferences page (on page 92).

### Storage

The location where the document type is saved. If you select the **External** storage option, the document type is saved in the specified file with a mandatory framework extension, located in a subdirectory of the current frameworks directory. If you select the **Internal** storage option, the document type data is saved in the Oxygen XML Editor internal options file if **Global Options** (on page 265) is selected or in the current Oxygen XML Editor project file (.xpr) if **Project Options** (on page 266) is selected.

### Initial edit mode

Sets the default edit mode when you open a document for the first time: Editor specific, Text, Author, Grid and Design (available only for the W3C XML Schema editor). If the Editor specific option is selected, the initial editing mode is determined based upon the editor type. You can find the mapping between editors and edit modes in the **Edit modes preferences page**. (on page 126) You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the Author mode you can set it in the Initial edit mode combo box.

**Note:** You can also customize the initial mode for a document type in the Edit modes preferences page. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes.

### Configuration Tabs

The bottom section of the dialog box includes various tabs where you can configure numerous options for the framework.

---

**Related Information:**
Association Rules Tab

To open the Association Rules tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Association Rules tab.

In the Association rules tab, you can perform the following actions:

- **New**
  - Opens the Document type rule dialog box allowing you to create association rules.

- **Edit**
  - Opens the Document type rule dialog box allowing you to edit the properties of the currently selected association rule.

- **Delete**
  - Deletes the currently selected association rules from the list.

- **Move Up**
  - Moves the selected association rule up one spot in the list.

- **Move Down**
  - Moves the selected association rule down one spot in the list.

By combining multiple association rules you can instruct Oxygen XML Editor to identify the type of a document. Oxygen XML Editor identifies the type of a document when the document matches at least one of the association rules. This tab give you access to a Document type rule dialog box that you can use to create association rules that activate on any document matching all the criteria defined in the dialog box.

To create a new association rule, click the ✦ New button at the bottom of the Association Rules tab, or to edit an existing rule, click the ✏ Edit button.

Figure 20. Document Type Rule Dialog Box
The **Document type rule** dialog box includes the following fields and options:

**Namespace**

Specifies the namespace of the root element from the association rules set (* (any) by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY_VALUE** string).

**Root local name**

Specifies the local name of the root element (* (any) by default).

**File name**

Specifies the name of the file (* (any) by default).

**Public ID**

Represents the Public ID of the matched document.

**Attribute Local name**

Specifies the local name of the attributes for the root element (* (any) by default).

**Attribute Namespace**

Specifies the namespace of the attributes for the root element (* (any) by default).

**Attribute Value**

Specifies the value of the attributes for the root element (* (any) by default).

**Java class**

Presents the name of the Java class that is used to determine if a document matches the rule. This Java class should implement the

`ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.
Tip: You can use wildcards (? and *) or editor variables (on page 276) in the Document Type Rule dialog box, and you can enter multiple values by separating them with a comma.

Schema Tab

In the Schema tab, you can specify a default schema for Oxygen XML Editor to use if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

To open the Schema tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Schema tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

- **Schema type**
  Use this drop-down list to select the type of schema.

- **Schema URI**
  You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list.

  Tip: It is a good practice to store all resources in the framework directory and use the ${framework} editor variable (on page 282) to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

The Classpath tab displays a list of folders and JAR (on page 3283) libraries that hold implementations for API extensions, implementations for custom Author mode operations, various resources (such as stylesheets), and framework (on page 3282) translation files. Oxygen XML Editor loads the resources looking in the folders in the order they appear in the list.

To open the Classpath tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Classpath tab.

The Classpath tab includes the following actions:

- New
Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing actions in the **Browse** drop-down list.

**Tip:** The path can also contain wildcards (for example, ${framework}/lib/*.jar).

**Edit**

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing actions in the **Browse** drop-down list.

**Tip:** The path can also contain wildcards (for example, ${framework}/lib/*.jar).

**Delete**

Deletes the currently selected resource from the list.

**Move Up**

Moves the selected resource up one spot in the list.

**Move Down**

Moves the selected resource down one spot in the list.

**Use parent classloader from plugin with ID** *(on page 2611)*

Use this option to specify the ID of a **plugin** *(on page 3285)*. The current **framework** has access to the classes loaded for the **plugin**.

### Related Information:

- Extensions Tab *(on page 122)*
- Author Tab *(on page 100)*
- Localizing Frameworks *(on page 2333)*

**Author Tab**

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding **framework** *(on page 3282)-**specific actions, menus, contextual menus, toolbars, and content completion list of proposals.
To open the Author tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Author tab.

The options that you configure in the Author tab are grouped in subtabs.

CSS Subtab

The CSS subtab contains the CSS files that Oxygen XML Editor uses to render a document in the Author mode. In this subtab, you can set main and alternate CSS files. When you are editing a document in the Author mode, you can switch between these CSS files from the Styles drop-down menu on the Author Styles toolbar.

To open the CSS subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the CSS subtab.

The following actions are available in the CSS subtab:

- **New**
  Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list.

- **Edit**
  Opens a dialog box that allows you to edit the current selection.

- **Delete**
  Deletes the currently selected CSS file.

- **Move Up**
  Moves the selected CSS file up in the list.

- **Move Down**
  Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is selected by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:
• **Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.

• **Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

**Related Information:**

• [Associating a CSS with an XML Document](on page 2477)

• [Configuring and Managing Multiple CSS Styles for a Framework](on page 2348)

**Actions Subtab**

The **Actions** subtab contains a sortable table that includes all the framework (on page 3282)-specific actions. Each action has a unique ID, a name, a description, and a shortcut key.

To open the **Actions** subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the **Actions** subtab.

The following actions are available in this subtab:

- **New**
  
  Opens the Action dialog box (on page 102) that allows you to add an action.

- **Duplicate**
  
  Duplicates the currently selected action.

- **Edit**
  
  Opens the Action dialog box (on page 102) that allows you to edit the existing action.

- **Delete**
  
  Deletes the currently selected action.

**Author Action Dialog Box**

To edit an existing document type action or create a new one, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the **Actions** subtab. At the bottom of this subtab, click **New** to create a new action, or **Edit** to modify an existing one.

Figure 21. Action Dialog Box
The following options are available in the Action dialog box:

**ID**

Specifies a unique action identifier.

**Name**

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip: You can use the ${i18n('key')} editor variable (on page 282) to allow for multiple translations of the name.

**Menu access key**

In Windows, you can access menus by holding down Alt and pressing the keyboard key that corresponds to the Letter that is underlined in the name of the menu. Then, while still holding down Alt, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the Letter in the name of the action that can be used to access the action.

**Description**

A description of the action. This description is displayed as a tooltip when hovering over the action.

Tip: You can use the ${i18n('key')} editor variable (on page 282) to allow for multiple translations of the description.

**How to translate frameworks link**
Use this link to see more information about Localizing Frameworks (on page 2333).

**Large icon**

Allows you to select an image for the icon that Oxygen XML Editor uses for the toolbar action.

**Tip:** A good practice is to store the image files inside the framework directory and use the `${frameworks}` editor variable (on page 282) to make the image relative to the framework location. If the images are bundled in a jar archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the class-path.

**Small icon**

Allows you to select an image for the icon that Oxygen XML Editor uses for the contextual menu action.

**Note:** If you are using a Retina or HiDPI display, Oxygen XML Editor automatically searches for higher resolution icons in the path specified in both the Large icon and Small icon options. For more information, see Adding Retina/HiDPI Icons in a Framework (on page 2332).

**Shortcut key**

This field allows you to configure a shortcut key for the action that you are editing. The + character separates the keys.

**Enable platform-independent shortcut keys**

If this checkbox is selected, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- \(M_1\) represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
- \(M_2\) represents the **Shift** key.
- \(M_3\) represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
- \(M_4\) represents the **Ctrl** key on MacOS X, and is undefined on other platforms.

**Operations section**

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first selected operation mode is activated when you trigger the action. The scope of the XPath expression must consist
only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: 

*Activate Multiple Functions for Actions using XPath Expressions (on page 105).*

The following options are available in this section:

**Activation XPath**

An XPath 2.0 expression that applies to elements and attributes. For more details see: *Activate Multiple Functions for Actions using XPath Expressions (on page 105).*

**Operation**

Specifies the invoked operation.

**Arguments**

Specifies the arguments of the invoked operation. The *Edit* at the bottom of the table allows you to edit the arguments of the operation.

**Operation priority**

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

- ✕ Add - Adds an operation.
- ✕ Remove - Removes an operation.
- ✕ Duplicate - Duplicates an operation.

**Evaluate activation XPath expressions even in read-only contexts**

If this checkbox is selected, the action can be invoked even when the cursor is placed in a read-only location.

*Activate Multiple Functions for Actions using XPath Expressions*

An *Author* mode action can have multiple functions, each function invoking an *Author* mode operation with certain configured parameters. Each function of an action has an XPath 2.0 expression for activating it.

For each function of an action, the application will check if the XPath expression is fulfilled (when it returns a not empty nodes set or a *true* result). If it is fulfilled, the operation defined in the function will be executed.

The following special XPath extension functions are provided:
• **oxy:allows-child-element()** (on page 106) - Use this function to check whether or not an element is valid child element in the current context, according to the associated schema.

• **oxy:allows-global-element()** (on page 108) - Use this function to check whether or not an element is a valid global element for the current framework (on page 3282), according to the associated schema.

• **oxy:current-selected-element()** (on page 109) - Use this function to get the currently selected element.

• **oxy:selected-elements()** (on page 110) - Use this function to get the selected elements.

• **oxy:is-required-element()** (on page 110) - Use this function to check if the element returned by the given XPath expression is required (based on the rules declared in the schema).

• **oxy:platform()** (on page 110) - Use this function to get the current platform in cases where you want to enable or disable an action depending on the platform.

**oxy:allows-child-element() Function**

The **oxy:allows-child-element()** function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

oxy:allows-child-element($childName, ($attributeName, $defaultAttributeValue, $contains?)?)

The following parameters are supported:

**childName**

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.

  
  oxy:allows-child-element("para")

  The above example verifies if the **para** element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.

  oxy:allows-child-element("*:para")

  The above example verifies if the **para** element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.
oxy:allows-child-element("prefix:para")

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the `para` local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

oxy:allows-child-element("{namespaceURI}para")

The `namespaceURI` is the namespace of the element. The above example verifies if the `para` element (of the specified namespace) is allowed in the current context.

- Any element.

oxy:allows-child-element("*")

The above function verifies if any element is allowed in the current context.

**Note:** A common use case of `oxy:allows-child-element("*")` is in combination with the `attributeName` parameter.

attributeName

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

oxy:allows-child-element("", "class", " topic/topic ")

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

oxy:allows-child-element("", "*:localname", " topic/topic ")

- A qualified name of an attribute.

oxy:allows-child-element("", "prefix:localname", " topic/topic ")

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of `false`.

defaultAttributeValue
A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

contains

An optional boolean. The default value is true. For the true value, the default value of the attribute must contain the defaultAttributeValue parameter. If the value is false, the two values must be the same.

oxy:allows-global-element() Function

The oxy:allows-global-element() function allows you to check whether or not an element that matches the arguments of the function is valid for the current framework (on page 3282), according to the associated schema. It has the following signature:

oxy:allows-global-element($elementName, ($attributeName, $defaultAttributeValue, $contains?)?)

The following parameters are supported:

elementName

The name of the element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.
  
  oxy:allows-global-element("para")

  The above example verifies if the para element (of the default namespace) is allowed in the current framework.

- The element with the local name specified by any namespace.
  
  oxy:allows-global-element("*:para")

  The above example verifies if the para element (of any namespace) is allowed in the current framework.

- A prefix-qualified name of an element.
  
  oxy:allows-global-element("prefix:para")

  The prefix is resolved in the context of the framework. The function matches on the element with the para local name from the previous resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of false.

- A specified namespace-URI-qualified name of an element.
  
  oxy:allows-global-element("{namespaceURI}para")
The `namespaceURI` is the namespace of the element. The above example verifies if the `para` element (of the specified namespace) is allowed in the current framework.

- Any element.

```
oxy:allows-global-element("*")
```

The above function verifies if any element is allowed in the current framework.

**attributeName**

The attribute of an element that you want to check if it is valid in the current framework. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-global-element("*", "class", " topic/topic ")
```

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current framework.

- The attribute with the local name specified by any namespace.

```
oxy:allows-global-element("*", "*:localname", " topic/topic ")
```

- A qualified name of an attribute.

```
oxy:allows-global-element("*", "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the framework. If the prefix is not resolved to a namespace, the function returns a value of `false`.

**defaultAttributeValue**

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal with it.

**contains**

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

**oxy:current-selected-element() Function**

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.
Example: **oxy:current-selected-element Function**

```
oxy:current-selected-element()[self::p]/b
```

This example returns the `b` elements that are children of the currently selected `p` element.

**oxy:selected-elements() Function**

This function returns the selected elements from Author mode.

Example: **oxy:selected-elements Function**

```
oxy:selected-elements()[self::para][@audience="novice"]
```

This example would activate an action when at least one of the selected elements is a `<para>` element with the `@novice` attribute defined.

**oxy:is-required-element() Function**

This function checks if the element returned by the given XPath expression is required (based on the rules declared in the schema). It has only one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: **oxy:is-required-element Function**

```
oxy:is-required-element(.)
```

This example would check to see if the current element is required by the schema.

**oxy:is-editable-element() Function**

This function checks if the element returned by the given XPath expression is editable (content can be inserted in it), meaning both that the entire XML file is editable and that the current context where the element is placed is editable. For example, if the element is inside an `xi:included` section, it is not editable.

It only has one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: **oxy:is-editable-element Function**

```
oxy:is-editable-element(ancestor-or-self::table)
```

This example would return *true* if the cursor is placed inside a table and it is editable or *false* if it is not editable.
oxy:platform() Function

This function returns the current platform. You can use this if you want to enable or disable an action depending on the platform. The possible values are: standalone, eclipse, or webapp.

Example: oxy:platform Function

```xml
oxy:platform() = "standalone"
```

This example would keep the action activated for the standalone distribution of Oxygen XML Editor, but disable it for the Eclipse and Web Author distributions.

Localizing Frameworks

Oxygen XML Editor supports framework (on page 3282) localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework. Changing the language used in Oxygen XML Editor in the Global preferences page is enough to set the right language for each framework.

To localize the content of a framework, create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list">
    <comment>List menu item name.</comment>
    <val lang="en_US">List</val>
    <val lang="de_DE">Liste</val>
    <val lang="fr_FR">Liste</val>
  </key>
</translation>
```

Oxygen XML Editor matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the languagelist tag for the corresponding framework is used.
Add the directory where this file is located to the **Classpath** list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the **Preferences** dialog box (*Options > Preferences*) and go to **Document Type Association**. Use the **New** or **Edit** button to open the **Document type configuration dialog box** (*on page 95*), go to **Author > Actions**, and rename the bold action to **${i18n(translation_key)}**. Actions with a name format other than **${i18n(translation_key)}** are not localized. **Translation_key** corresponds to the key from the translation.xml file.

Now open the **translation.xml** file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:

```
<key value="translation_key">
  <comment>Bold action name.</comment>
  <val lang="en_US">Bold</val>
  <val lang="de_DE">Bold</val>
  <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the **translation.xml** file in the Java code used by your custom framework, use the new **ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()** API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```
title:before{
  content:"${i18n(title.key)} : ";
}
```

**Note:** You can enter any language you want in the **languagelist** tag and any number of keys.
The translation.xml file for the DocBook framework is located here: \[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml. In the Classpath list corresponding to the DocBook document type the following entry was added: \${framework}/i18n/.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association > Author > Actions. If you look in the Java class ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog available in the oxygen-sample-framework module of the Oxygen SDK Maven archetype, you can see how the new ro.sync.ecss.extensions.api.AuthorResourceBundle API is used to retrieve localized descriptions for various keys.

Menu Subtab

In the Menu subtab, you can configure which actions will appear in the framework (on page 3282)-specific menu. The subtab is divided in two sections: Available actions and Current actions.

To open the Menu subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the Menu subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that are displayed in the Oxygen XML Editor menu. To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an image in this section as a child of the currently selected action use the Add as child button.

The following actions are available in the Current actions section:

- **Edit**
  - Edits an item.
- **Remove**
  - Removes an item.
- **Move Up**
  - Moves an item up.
- **Move Down**
  - Moves an item down.
Contextual Menu Subtab

In the Contextual menu subtab you configure what framework (on page 3282)-specific action the Content Completion Assistant (on page 3280) proposes. The subtab is divided in two sections: Available actions and Current actions.

To open the Contextual Menu subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the Contextual Menu subtab.

Figure 22. Contextual Menu Subtab

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section contains the actions that are displayed in the contextual menu for documents that belong to the edited framework.

The following actions are available in this subtab:

- **Add as sibling**
  
  Adds the selected action or submenu from the Available actions section to the Current actions section as a sibling of the selected action.

- **Add as child**
  
  Adds the selected action or submenu from the Available actions section to the Current actions section as a child of the selected action.

- **Edit**
This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

**Figure 23. Menu Action Configuration Dialog Box**

The following options are available in this dialog box:

**Name**

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

*Tip:* You can use the `$\{i18n('key')\}$` editor variable (on page 282) to allow for multiple translations of the name.

**Menu access key**

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the **Letter** that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the **Letter** in the name of the action that can be used to access the action.

**Menu icon**

Allows you to select an image for the icon that Oxygen XML Editor uses for the container (submenu).

**Promote items when in a table context**

If this option is selected, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the **Other actions** submenu when invoking the contextual menu within a table.

**Remove**

Removes the selected action or submenu from the **Current actions** section.
Move Up

Moves the selected item up in the list.

Move Down

Moves the selected item down in the list.

Toolbar Subtab

In the Toolbar subtab you configure what framework (on page 3282)-specific action the Oxygen XML Editor toolbar holds. The subtab is divided in two sections: Available actions and Current actions.

To open the Toolbar subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the Toolbar subtab.

The Available actions section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The Current actions section holds the actions that are displayed in the Oxygen XML Editor toolbar when you work with a document belonging to the edited framework.

To add an action in this section as a sibling of the currently selected action, use the Add as sibling button. To add an action in this section as a child of the currently selected action use the Add as child button.

The following actions are available in the Current actions section:

- Edit
  Edits an item.

- Remove
  Removes an item.

- Move Up
  Moves an item up.

- Move Down
  Moves an item down.

Content Completion Subtab

In the Content Completion subtab you configure what framework (on page 3282)-specific the Content Completion Assistant (on page 3280) proposes. The subtab is divided in two sections: Available actions and Current actions.
To open the **Content Completion** subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the **Content Completion** subtab.

### Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the Actions subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the Content Completion Assistant proposes when you work with a document belonging to the edited framework.

To add an action in this section as a sibling of the currently selected action, use the $\text{Add as sibling}$ button. To add an action in this section as a child of the currently selected action use the $\text{Add as child}$ button.

The following actions are available in the **Current actions** section:

- **Edit**
  Edits an item.

- **Remove**
  Removes an item.

- **Move Up**
  Moves an item up.

- **Move Down**
  Moves an item down.

### Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the Content Completion Assistant or from some specific helper views or menus. Use the $\text{Add}$ button to add more filters to the table, the $\text{Edit}$ button to modify an existing item in the table, or the $\text{Remove}$ button to remove a filtered item. The $\text{Add}$ and $\text{Edit}$ buttons open a Remove item dialog box.

Figure 24. Remove Item Dialog Box
Use this dialog box to add or configure the elements that will be filtered:

**Item name**

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered (\texttt{<SPLIT>} and \texttt{<ENTER>}).

**Remove item from**

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the Content Completion Assistant (on page 3280).
- **Elements View** - The element will not appear in the Elements view (on page 355).
- **Element Insert Menus** - The element will not appear in the Append Child, Insert Before, or Insert After menus that are available in certain contextual menus (for example, the contextual menu of the Outline view (on page 347)).
- **Entities View** - The element will not appear in the Entities view (on page 356).

**Related Information:**

- Customizing the Content Completion Assistant (on page 2352)

**Templates Tab**

The Templates tab specifies a list of directories where new document templates are located for this particular framework. These directories, along with the document templates that are saved inside them, will appear in the New Document wizard (on page 676) inside the Framework templates category according to your framework and the directory path you specify in this tab.
To open the **Templates** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box ([Options > Preferences] (on page 79)), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 92), and click on the **Templates** tab.

The **Templates** tab includes the following actions:

**New**

Opens a dialog box that allows you to specify the path to a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the **发挥了 Editor Variables** (on page 276) button, or the browsing actions in the **发挥了 Browse** drop-down list.

**Tip:** The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

**Edit**

Opens a dialog box that allows you to edit the path of a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the **发挥了 Editor Variables** (on page 276) button, or the browsing actions in the **发挥了 Browse** drop-down list.

**Tip:** The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

**Delete**

Deletes the currently selected template directory from the list.

**Move Up**

Moves the selected template directory up one spot in the list.

**Move Down**

Moves the selected template directory down one spot in the list.

**Related Information:**

- **Creating New Document Templates** (on page 683)
- **Customizing Document Templates** (on page 685)
- **Sharing Custom Document Templates** (on page 688)
Catalogs Tab

The Catalogs tab specifies a list of XML Catalogs (on page 1123), specifically for the edited framework (on page 3282), that are added to list of catalogs that Oxygen XML Editor uses to resolve resources.

To open the Catalogs tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Catalogs tab.

You can perform the following actions:

**Add**

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list.

**Edit**

Opens a dialog box that allows you to edit the path of an existing catalog.

**Delete**

Deletes the currently selected catalog from the list.

**Move Up**

Moves the selected catalog up one spot in the list.

**Move Down**

Moves the selected catalog down one spot in the list.

Transformation Tab

In the Transformation tab, you can configure the transformation scenarios associated with the particular framework (on page 3282) you are editing. These transformation scenarios are presented in the Configure Transformation Scenarios dialog box (on page 1762) when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the Transformation tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Transformation tab.

The Transformation tab offers the following options:

**Default checkbox**
You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the Configure Transformation Scenarios dialog box (on page 1762).

**New**

Opens the **New scenario** dialog box allowing you to create a new transformation scenario for the particular document type (on page 1674).

**Duplicate**

Allows you to duplicate the configuration of an existing transformation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario (on page 1760).

**Edit**

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected transformation scenario (on page 1758).

**Delete**

Deletes the currently selected transformation scenario.

**Import scenarios**

Imports transformation scenarios.

**Export selected scenarios**

Export transformation scenarios.

**Move Up**

Moves the selection to the previous scenario.

**Move Down**

Moves the selection to the next scenario.

**Validation Tab**

In the **Validation** tab, you can configure the validation scenarios associated with the particular framework (on page 3282) you are editing. These validation scenarios are presented in the Configure Validation Scenarios dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

**Note:** If a **master file** is associated with the current file, the validation scenarios defined in the master file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units.
defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support (on page 726) or Working with Modular XML Files in the Master Files Context (on page 1126).

To open the Validation tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Validation tab.

The Validation tab offers the following options:

**Default checkbox**
You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the Configure Validation Scenarios dialog box.

**New**
Opens the New scenario dialog box allowing you to create a new validation scenario (on page 1094).

**Duplicate**
Allows you to duplicate the configuration of an existing validation scenario. It opens the Edit scenario dialog box where you can configure the properties of the duplicated scenario (on page 1100).

**Edit**
Opens the Edit scenario dialog box allowing you to edit the properties of the currently selected validation scenario (on page 1100).

**Delete**
Deletes the currently selected validation scenario.

**Import scenarios**
Imports validation scenarios.

**Export selected scenarios**
Exports validation scenarios.

**Move Up**
Moves the selected scenario up one spot in the list.

**Move Down**
Moves the selected scenario down one spot in the list.
Extensions Tab

The Extensions tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the Extensions tab of the Document type configuration dialog box, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), and click on the Extensions tab.

Libraries containing the implementations must be present in the classpath (on page 99) of your document type. The Javadoc available at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ contains details about how each API implementation functions.

Document Templates Preferences

Oxygen XML Editor provides a variety of built-in document templates that make it easier to create new documents in various formats. The list of available templates is presented in the New Document wizard (on page 676) when you create a new document (New toolbar button or File > New).

You can also create your own templates (on page 683) and share them with others. You can store your custom document templates in the existing templates folder in the Oxygen XML Editor installation directory or store them in a custom directory. If you store them in a custom directory, you need to use this Document Templates preferences page to add that directory to the list of template directories that Oxygen XML Editor makes available in the New Document wizard.

To add a template directory, follow these steps:

1. open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Document Templates.
2. Use the New button to select a location of the new document template folder.
3. You can also use the Edit or Delete buttons to manage folders in the list, and you can alter the order in which Oxygen XML Editor looks in these directories by using the Up and Down buttons.

Result: This will add the folder to the list in this preferences page and it will now appear in the New Document wizard (on page 676) in a category based upon the folder path you specified.

Note: For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you customize the template (on page 685), you need to set the type property to dita in the corresponding properties file.
Encoding Preferences

Oxygen XML Editor lets you configure how character encodings are recognized when opening files and which encodings are used when saving files. To configure encoding options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Encoding.

The following encoding options are available:

**Fallback character encoding**

Specifies the default character encoding of non-XML documents if their character encoding cannot be determined from other sources (for example, it is not specified in the document or determined by the file type).

*Note:* For certain document types, the following encoding detection rules are used:

- For XML, DTD, and CSS documents, Oxygen XML Editor tries to collect the character encoding from the document. If no such encoding is found, then **UTF-8** is used.
- For JavaScript, JSON, SQL, XQuery, and RNC, the **UTF-8** encoding is used.

**UTF-8 BOM handling**

This setting specifies how to handle the *Byte Order Mark* (BOM) when Oxygen XML Editor saves a UTF-8 XML document:

- **Keep** (default) - Do not alter the BOM declaration of the currently open file.
- **Write** - Save the BOM bytes.
- **Don't Write** - Do not save the BOM bytes. Loaded BOM bytes are ignored.

*Note:* The UTF-16 BOM is always preserved. UTF-32 documents have a *big-endian* byte order.

**Encoding errors handling**

This setting specifies how to handle characters that cannot be represented in the character encoding that is used when the document is opened. The available options are:

- **REPORT** (default) - Displays an error identifying the character that cannot be represented in the specified encoding. Unrecognized characters are rendered as an empty box.
- **REPLACE** - The character is replaced with a standard replacement character. For example, if the encoding is UTF-8, the replacement character has the Unicode code `FFFD`, and if the encoding is ASCII, the replacement character code is 63.
- **IGNORE** - The error is ignored and the character is not included in the document displayed in the editor.
Attention: If you edit and save the document, the characters that cannot be represented in the specified encoding are dropped.

Encoding for Base64, Base32, Hex conversions

Specifies the encoding to be used when invoking the Encode Selection or Decode Selection actions for Base64 (on page 876), Base32 (on page 877), or Hex conversions (on page 878). The default setting is UTF8.

Editor Preferences

Oxygen XML Editor lets you configure the appearance of various components and features of the main editor. To access these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor.

The following options are available:

Selection background color

Allows you to set the background color of selected text.

Selection foreground color

Allows you to set the color of selected text.

Completion proposal background

Allows you to set the background color of the Content Completion Assistant (on page 3280).

Completion proposal foreground

Allows you to set the color of the text in the Content Completion Assistant (on page 3280).

Documentation window background

Allows you to set the background color of the documentation of elements suggested by the Content Completion Assistant (on page 3280).

Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the Content Completion Assistant (on page 3280).

Find highlight color

Allows you to set the color of the highlights generated by the Find and Find all actions.

XPath highlight color
Allows you to set the color of the highlights generated when you run an XPath expression.

**Declaration highlight color**

Allows you to set the color of the highlights generated by the **Find declaration** action.

**Reference highlight color**

Allows you to set the color of the highlights generated by the **Find reference** action.

**Maximum number of highlights**

Allows you to set the maximum number of highlights that Oxygen XML Editor displays.

**Show TAB/NBSP/EOL/EOF marks**

Makes the TAB/NBSP/EOL/EOF characters visible in the editor. You can use the color picker to choose the color of the marks.

**Show SPACE marks**

Makes the space character visible in the editor.

**Can edit read-only files**

If this option is selected, Oxygen XML Editor will let you edit read-only files. When you try to save them, a **Save As** dialog box will be displayed to avoid overwriting the initial resource. If the option is not selected, a warning message is displayed when you try to edit a read-only file.

**Display quick-assist and quick-fix side hints**

Displays the **Quick Assist** (on page 3286) icon (🪤) and **Quick Fix** (on page 3287) icon (🪤) in the line number stripe on the left side of the editor.

**Undo history size**

Allows you to set the maximum amount of undo operations you can perform in any of the editor modes (Text, Author, Design, Grid).

**Enable mouse-wheel zooming**

If selected, you can use **Ctrl + MouseWheelForward** (**Command + MouseWheelForward on OS X**) to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards** (**Command + MouseWheelBackwards on OS X**) to decrease the editor font (zoom out). It is enabled by default on Windows and Linux, while it is disabled by default on Mac OS X, due to the way inertia affects the mouse wheel on this operating system.

**Edit Modes Preferences**

Oxygen XML Editor lets you configure which **edit mode** (on page 303) a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode
of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit Modes.

**Allow Document Type specific edit mode setting to override the general mode setting**

If selected, the initial edit mode setting set in the Document Type configuration dialog box (on page 95) overrides the general edit mode setting from the table below.

**Select the initial edit mode (page) for each editor**

This table specifies the default editing mode that will be opened for each type of document when the Allow Document Type specific edit mode setting to override the general mode setting option is not selected. Use the Edit button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- Text (on page 303)
- Author (on page 402)
- Grid (on page 392)
- Design (available only for the XSD editor).

Figure 25. Edit Modes Preferences Page

Text Preferences

Oxygen XML Editor lets you configure how the Text mode editor (on page 303) appears. To configure these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Text.
The following options are available:

**Editor background color**

Sets the background color for the **Text** editing mode, **Outline view (on page 347)**, and some external tool editors (**Large File Viewer (on page 2764)**, **Compare Files (on page 2770)**, **Compare Directories (on page 808)**).

**Editor cursor color**

Sets the color for the cursor in **Text** mode.

**Highlight current line**

If selected, the current line is highlighted with the foreground color specified with the color chooser.

**Show line numbers**

If selected (default value), line numbers are shown in the editor panels and in the **Output view (on page 2291)** of the debugger **perspectives (on page 3285)**. You can also specify the color for the line numbers using the color chooser. Printed output will also include the line numbers.

**Show print margin**

If selected, it allows you to set a safe print limit in the form of a vertical line displayed in the right side of the editor pane. You can also customize the print margin line color.

- **Print margin column**
  
  Allows you to specify a limit for the print width, measured in the number of characters.

**Line wrap**

If selected, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use **new-line** characters to break long lines.

**Cut / Copy whole line when nothing is selected**

If selected, **Cut** and **Copy** actions operate on the entire current line when nothing is selected in the editor.

**Enable folding**

If selected (default value), the vertical stripe that holds the **folding markers (on page 840)** is displayed in **Text** mode.

**Highlight matching tag**
If selected, when you place the cursor on a start or end tag, Oxygen XML Editor highlights the corresponding member of the pair. You can also customize the highlight color.

**Lock the XML tags**

If selected, XML are locked and cannot be edited in Text mode.

**Diagram Preferences**

For certain XML languages, Oxygen XML Editor provides a diagram view as part of the text mode editor. To configure the Diagram preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Text > Diagram.

The following options are available in this preference page:

**Show Full Model XML Schema diagram**

When this option is selected, the Text mode editor for XML Schemas includes a split screen view that shows a diagram of the schema structure. This is useful for seeing the effects of schema changes you make. For editing a schema using a diagram instead of text, use the schema Design view (on page 623).

**Note:** When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

**Enable Relax NG diagram and related views**

Enables the Relax NG schema diagram and synchronization with the related views (Attributes (on page 351), Model (on page 353), Elements (on page 355), Outline (on page 1397)).

**Show Relax NG diagram**

Displays the Relax NG schema diagram in the split screen views (Full Model View (on page 1390) and Logical Model View (on page 1391)).

**Enable NVDL diagram and related views**

Enables the NVDL schema diagram and synchronization with the related views (Attributes (on page 351), Model (on page 353), Elements (on page 355), Outline (on page 1414)).

**Show NVDL diagram**

Displays the NVDL schema diagram in the split screen views (Full Model View (on page 1409) and Logical Model View (on page 1410)).
Allows you to specify the location of the schema diagram panel relative to the diagram Text editor.

Show/Hide Annotations link

Use this link to navigate to the Schema Design preferences page (on page 153) where you can choose to show or hide annotations in schema diagrams.

Zoom link

Use this link to navigate to the Schema Design preferences page (on page 153) where you can adjust the default zoom level of schema diagrams.

Grid Preferences

Oxygen XML Editor provides a Grid view (on page 392) of an XML document. To configure the Grid options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Grid.

The following options are available:

Compact representation

If selected, the compact representation of the grid is used: a child element is displayed beside the parent element. In the non-compact representation, a child element is nested below the parent.

Format and indent when passing from grid to text or on save

If selected, the content of the document is formatted and indented (on page 863) each time you switch from the Grid view to the Text view.

Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

Active cell color

Allows you to set the background color for the active cell (on page 3279) of the grid. The keyboard input always goes to the active cell and the selection always contains it.
Selection color

Allows you to set the background color for the selected cells of the grid except the active cell (on page 3279).

Border color

Allows you to set the color used for the lines that separate the grid cells.

Background color

Allows you to set the background color of grid cells that are not selected.

Foreground color

Allows you to set the text color of the information displayed in the grid cells.

Row header colors

Background color

Allows you to set the background color of row headers that are not selected.

Active cell color

Allows you to set the background color of the row header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected rows.

Column header colors

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

Background color

Allows you to set the background color of column headers that are not selected.

Active cell color

Allows you to set the background color of the column header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.
Author Preferences

Oxygen XML Editor provides an **Author editing mode (on page 402)** that provides a configurable graphical interface for editing XML documents. To configure the options for the **Author** mode, open the **Preferences** dialog box (**Options > Preferences**) (on page 79) and go to **Editor > Edit modes > Author**.

The following options are available:

- **Author default background color**
  - Sets the default background color of the **Author** editing mode. The `background-color` property set in the CSS file associated with the currently edited document overwrites this option.

- **Author default foreground color**
  - Sets the default foreground color of the **Author** editing mode. The `color` property set in the CSS file associated with the current edited document overwrites this option.

- **Show XML comments**
  - When this option is selected, XML comments are displayed in **Author** mode. Otherwise, they are hidden.

- **Show placeholders for empty elements**
  - When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

- **Show processing instructions**
  - When this option is selected, XML processing instructions are displayed in **Author** mode. Otherwise they are hidden.

- **Show Author layout messages**
  - When this option is selected, all errors reported while rendering the document in **Author** mode are presented in the **Results panel (on page 357)** at the bottom of the editor.

- **Show doctype**
  - When this option is selected, the **doctype** declaration is displayed in **Author** mode. Otherwise it is hidden.

- **Show block range**
  - When this option is selected, a **block range indicator** is displayed in a stripe located in the left side of the editor. It is displayed as a heavy line that spans from the first line to the last line of the block.

- **Display referenced content (entities, XInclude, DITA conref, etc.)**
When selected, the references (such as entities, XInclude, DITA conrefs) also display the content of the resources they reference. If you toggle this option while editing, you need to reload the file for the modification to take effect.

Fast text layout

In certain cases (combinations of fonts and characters), the widths computed in the **Author** visual editing mode for lines of text may be larger than expected, leading to an incorrect visual layout. Deactivating this option will improve the computation quality for character widths in the visual editing mode, but it may hinder overall performance for very large documents.

Images Section

The following options regarding images in **Author** mode are available in this section:

**Auto-scale images wider than (pixels)**

Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

**Show very large images**

When this option is selected, images larger than 6 megapixels are displayed in **Author** mode. Otherwise, they are not displayed.

⚠️ **Important:** If you select this option and your document contains many such images, Oxygen XML Editor may consume all available memory, throwing an OutOfMemory error. To resolve this, increase the available memory limit. *(on page 290)* and restart the application.

Tags Section

In this section you can configure the following options regarding tags that are displayed in **Author** mode:

**Tags display mode**

Sets the default display mode for element tags presented in **Author** mode. You can choose between the following:

- **Full Tags with Attributes** - All XML tags are displayed, with attribute names and values, making it easier to transition from a Text-based editing to **Author** mode editing.
- **Full Tags** - All XML tags are displayed, but without attributes.
- **Block Tags** - The XML tags that enclose block elements *(on page 3280)* are displayed in full. Compact tags (no element names) are displayed for *inline elements.*
• **Inline Tags** - The XML tags that enclose *inline elements* (on page 3283) are displayed in full. *Block* (on page 3280) tags are not displayed.

• **Partial Tags** - Partial tags (no names) are displayed for all elements.

• **No Tags** - No tags are displayed. This representation is as close as possible to a word-processor view.

**Sort attributes alphabetically for "Full Tags with Attributes"**

When selected, if you choose Full Tags with Attributes for the Tags Display Mode (on page 441), the attributes will be displayed in alphabetical order. Otherwise, they are displayed in the order that they appear in the XML source code.

**Tags background color**

Sets the Author mode tags background color.

**Tags foreground color**

Sets the Author mode tags foreground color.

**Tags font**

Allows you to change the font used to display tags text in the Author visual editing mode. The *default* font is computed based on the setting of the Author default font option in the Fonts preferences page (on page 88).

**Compact tag layout**

If this option is not selected, the Author mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

**Serialization Section**

In this section you can configure options regarding the formatting and indenting that is applied when a document is saved in Author mode, or when switching the editing mode from Author to Text. The following options are available:

**Format and indent**

Use this option to specify what should be formatted and indented when you save a document (or switch from Author to Text mode). You can choose between the following two options:

**Only the modified content**

The Save operation only formats the nodes that were modified in the Author mode. The rest of the document preserves its original formatting.
**Note:** This option also applies to the DITA maps opened in the DITA Maps Manager (on page 2990).

### The entire document

The **Save** operation applies the formatting to the entire document regardless of the nodes that were modified in **Author** mode.

**Also apply the format and indent options that are set for Text mode**

If this option is selected, the result of the **Format and indent** operation will be the same as when it is applied in Text editing mode. Thus, the content of the document is formatted by applying the **Format and Indent** rules from the Editor/Format (on page 157) and Editor/Format/XML (on page 160) preference pages. You can use the **Format and indent options** link to navigate to those options.

### Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:

- **None** - Choose this option if compatibility with other tools can be ignored.
- **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

**Note:** New lines that are added by the user in elements where the `xml:space` attribute is set to `preserve` (such as `pre` elements in HTML, or `codeblock` elements in DITA) are still inserted. Also, selecting this option automatically disables the **Also apply the format and indent options that are set for Text mode** option (on page 135), since the formatting from Text mode does not take the CSS styles into account.

- **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Editor to insert new lines only after elements that have a CSS display property set to anything other than `inline` or `none` (for example, `block`, `list-item`, `table`,...
etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

Note: New lines that are added by the user in elements where the xml:space attribute is set to preserve (such as pre elements in HTML, or codeblock elements in DITA) are still inserted. Also, selecting this option automatically disables the Also apply the format and indent options that are set for Text mode option (on page 135), since the formatting from Text mode does not take the CSS styles into account.

For advanced Author configuration see the Document Type Association settings

Click this link to open the Document Type Association preferences page (on page 92).

Cursor Navigation Preferences

Oxygen XML Editor allows you to configure the appearance and behavior of the cursor in the Author mode editor (on page 402). To set cursor navigation preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Author > Cursor Navigation.

The following options are available:

Highlight elements near cursor

When this option is selected, the element containing the cursor is highlighted. You can use the color picker to choose the color of the highlight.

Show cursor position tooltip

Oxygen XML Editor uses tool tips in Author mode to indicate the position of the cursor in the element structure (on page 901) of the underlying document. Depending on context, the tool tips may show the current element name or the names of the elements before and after the current cursor position.

Show location tooltip on mouse move

When this option is selected, Oxygen XML Editor displays Location Tooltips (on page 902) when you are editing the document in certain tags display modes (Inline Tags, Partial Tags, No Tags) or when the mouse pointer is moved between block elements (on page 3280).

Quick up/down navigation

This option is deselected by default and this means that when you navigate using the up and down arrow keys in Author mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when
it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is selected, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

**Quick navigation in tables**

This option is selected by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is not selected, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

**Arrow keys move the cursor in the writing direction**

This setting determines how the left and right arrow keys behave in Author mode for bidirectional (BIDI) text. When this option is selected (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

**Schema Aware Preferences**

Oxygen XML Editor can use the schema of your XML language to improve the way the Author (on page 402) mode editor handles your content. To configure the Schema Aware options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Schema Aware.

The following options are available:

**Schema aware normalization, format, and indent**

When you open or save a document in Author mode, white space is normalized using the display property of the current CSS stylesheet and the values of the settings (on page 160) for Preserve space elements, Default space elements, and Mixed content elements. When this option is selected, the schema will also be used to normalize white space, based on the content model (element-only, simple-content, or mixed). Note that the schema information takes precedence.

**Indent blocks-only content**

To avoid accidentally introducing inappropriate white space around inline elements (on page 3283), Oxygen XML Editor does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Editor will apply indenting to the source of mixed content elements that only contain block elements (on page 3280).
Schema Aware Editing

The options in this section determine how Oxygen XML Editor will use the schema of a document to control the behavior of the Author mode.

- **On** - Enables all schema-aware editing options.
- **Off** - Disables all schema-aware editing options.
- **Custom** - Allows you to select custom schema-aware editing options from the following:

Schema Aware Actions section

Delete element tags with backspace and delete

Controls what happens when you attempt to delete an element tag. The two options are:

- **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Editor will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list items.
- **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:

- **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Editor tries to find an appropriate insert position. The possibilities include:
  ◦ Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
  ◦ Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below and existing list).
Inserting the content into an ancestor element where it would be valid.

- **Reject action when its result is invalid** - If selected, Oxygen XML Editor will not let you paste content into a position where it would be invalid.

**Typing**

Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.
- **Reject action when its result is invalid** - If selected, and the result of the typing action is invalid, the action will not be performed.

**Content Completion**

Controls the behavior that takes place when inserting elements using the `Content Completion Assistant in Author mode (on page 921)`. Available options are:

- **Press ENTER to show available content completion proposals** - If selected, pressing Enter will open the `Content Completion Assistant`. If deselected, there are three possibilities:
  - The current element will be split (if possible).
  - A new element with the same name will be inserted (if possible).
  - Otherwise, a new paragraph will be inserted.
- **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Editor will attempt to find a valid location to insert it and may present you with several options.
- **Allow only insertion of valid elements and attributes** - If selected, you can only select elements in the content completion list that are valid (according to the schema) at the current position.
- **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the `Attributes view (on page 426)` or `In-place Attributes Editor (on page 915)`. If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.
Warn on invalid content when performing action

A warning message will be displayed when performing an action that will result in invalid content. Available options are:

• **Delete Element Tags** - If selected, a warning message will be displayed if the Delete Element Tags (on page 1065) action will result in an invalid document. You will be asked to confirm the deletion.

• **Join Elements** - If selected, a warning message will be displayed if the Join Elements (on page 1065) action will result in an invalid document. You will be asked to confirm the join.

Automatically apply the best schema-aware insertion operation

If selected, Oxygen XML Editor automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If not selected, Oxygen XML Editor will ask the user to choose from a list of proposed solutions.

Convert external content on paste

If selected, the Smart Paste feature (on page 918) is enabled when external content is pasted in Author mode.

Convert even when pasting inside space-preserve elements

If selected, the Smart Paste feature (on page 918) will be used even when external content is pasted inside a space-preserve element (such as a codeblock).

Convert pasted URLs to links

If selected, when a URL is pasted into Author mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an \texttt{xref} is inserted.

• [Smart Paste Mechanism (on page 918)]

• [Customizing Smart Paste Support (on page 2343)]
Review Preferences

Oxygen XML Editor allows you to add review comments and track changes (on page 941) in your documents. The Review preferences page allows you to control how the Oxygen XML Editor review features work. To configure these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Review.

The available options are as follows:

**Author**

Specifies the name to be attached to all comments and to changes made while Track Changes is active. By default, Oxygen XML Editor uses the system user name.

**Track Changes section (applies for all authors)**

**Initial State**

Specifies whether or not the Track Changes feature (on page 3288) is enabled when you open a document. You may have the Track Changes feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of the Track Changes feature is stored in the document itself, meaning that it is on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it will make it obvious to other authors that changes have been made in the document.

- **Always On** - The Track Changes feature is always on when you open a document. You can turn it off for an opened document, but it will be turned on for the next document you open.

- **Always Off** - The Track Changes feature is always off when you open a document. You can turn it on for an opened document, but it will be turned off for the next document you open.

**Display changed lines marker**

A changed line maker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, deselect this option.

**Inserted content color**

When the Track Changes feature (on page 3288) is on, the newly inserted content is highlighted with an insertion marker that uses a color to adjust
the following display properties of the inserted content: **foreground**, **background**, and **underline**. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who inserted content in the current document. The colors are picked from the Colors for automatic assignment list (on page 143), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Editor uses the color defined above (Automatic or Fixed) to render the foreground of the inserted content.
- **Use same color for background** - If selected, Oxygen XML Editor uses the color defined above (Automatic or Fixed) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

**Deleted content color**

When the Track Changes feature (on page 3288) is on, the deleted content is highlighted with a deletion marker that uses a color to adjust the following display properties of the deleted content: **foreground**, **background**, and **strikethrough**. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a color to each user who deleted content in the current document. The colors are picked from the Colors for automatic assignment list (on page 143), the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for all deletion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Editor uses the color defined above (Automatic or Fixed) to render the foreground of the deleted content.
- **Use same color for background** - If selected, Oxygen XML Editor uses the color defined above (Automatic or Fixed) to render the
background of the deleted content. A slider control allows you to set
the transparency level of the background.

Comments color section (applies for all authors)

Sets the background color of the text that is commented on. The options are:

- **Automatic** - If this option is selected, Oxygen XML Editor automatically assigns a
color to each user who adds a comment in the current document. The colors are
picked from the Colors for automatic assignment list (on page 143), the priority
being established by the type of change (deletion, insertion, or comment) and in the
order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor uses the specified color for
all changes, regardless of who the author is. A slider control allows you to set the
transparency level of the background.

Colors for automatic assignment list

These are the colors that will be automatically assigned for tracked insertion changes,
tracked deletion changes, and comments if the Automatic option is selected in any of
the sections in this preferences page. The colors are assigned in the order that you see
in this list. You can use the Add, Edit, or Remove buttons to modify the list of colors.

Related Information:

- Reviewing Documents (on page 941)

Callouts Preferences

Oxygen XML Editor can display callouts (on page 3280) for review items such as comments and
tracked changes (on page 941). To customize options for review callouts, open the Preferences
dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Review
> Callouts.

The available options are as follows:

Show Review Callouts section

Comments

If selected, callouts are displayed for comments, including comments that
are added to tracked changes (on page 3288). This option is selected by
default.
Track Changes deletions

If selected, callouts are displayed for *tracked change* (on page 3288) deletions and the following additional option becomes available:

**Show deleted content in callout**

If selected, the deleted content is also displayed in the callout.

Track Changes insertions

If selected, callouts are displayed for *tracked change* (on page 3288) insertions and the following additional option becomes available:

**Show inserted content in callout**

If selected, the inserted content is also displayed in the callout.

Rendering section

**Show review time**

When selected, timestamp information is displayed in callouts.

**Show all connecting lines**

When selected, lines are shown that connect the callout to the location of the change.

**Initial width (px)**

Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.

**Text lines count limit**

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select **Edit Comment** or **Show Comment**.

Profiling/Conditional Text Preferences

Oxygen XML Editor lets you configure how *profiling and conditional text* (on page 969) is displayed in **Author** mode. It has built-in support for the standard conditional text features of DITA and DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.
To configure **Profiling/Conditional Text** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 79) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**.

**Note:** Note the following when configuring these settings:

- This preferences page is used to define how profiled elements are treated in **Author** mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.
- This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.
- If you are using the DITA XML vocabulary and a DITA **subject scheme map** (on page 3288) is defined in the **root map** (on page 3287) of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

**Import from DITAVAL**

This button allows you to import profiling attributes from **DITAVAL files** (on page 3248). You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Editor displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

**Note:** When importing profiling attributes from DITAVAL files, Oxygen XML Editor automatically creates condition sets based on these files.

**Profiling Attributes section**

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the **New** button at the bottom of the table to add profiling attributes (on page 970), the **Edit** button to edit existing ones, or the **Delete** button to delete entries from the table. Use the **Up** and **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

**Report invalid profiling attribute values (DITA only)**

If selected, it means the following:

- In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.
- In the DITA **_validate and Check for Completeness** dialog box, the **Report attributes and values that conflict with profiling preferences**
option (on page 3040) is not displayed. This means that the validation will behave the same as if that option was selected and it will always report such values.

Allow contributing extra profiling attribute values

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the Edit Profiling Attributes action from the contextual menu in Author mode (or for DITA topics, the Edit Properties action in the DITA Maps Manager (on page 2990)), the Profiling Values Conflict dialog box (on page 972) will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Editor behaves as if the Preserve the configuration option has been chose in the Profiling Values Conflict dialog box (on page 972) and that dialog box will never appear.

Configure profiling colors and styles link

Use this link to open the profiling Colors and Styles preference page (on page 146).

Profiling Condition Sets section

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the New button at the bottom of the table to add condition sets (on page 975), the Edit button to edit existing ones, or the Delete button to delete entries from the table. Use the Up and Down buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor uses the one that is positioned highest in the table.

Show excluded content

Toggles whether or not the Show Excluded Content option (on page 981) in the Profiling / Conditional Text drop-down menu is enabled by default.

Colors and Styles Preferences

Oxygen XML Editor lets you set the colors and styles used to display profiling / conditional text (on page 144) in the Author mode editor (on page 402). To set Colors and Styles preferences, open
the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

The preference page includes the following options and sections:

- **Show profiling colors and styles**
  
  Toggles whether or not the Show Profiling Colors and Styles option (on page 980) in the Preferences > Profiling / Conditional Text drop-down menu is enabled by default.

- **Import from DITAVAL**
  
  Allows you to import profiling styles from .ditaval files. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Editor displays a dialog box containing two tables: the first one previews the imported styles and the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones.

- **Profiling Colors and Styles Table**
  
  You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

  - **Defined attributes values** - Contains the styles for profiling attribute values defined in the Profiling / Conditional Text (on page 144) preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the Defined attributes values category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name and value). This is the reason why a style from this category can only be reset (on page 148), not deleted.

  - **Other** - This category contains styles for attribute values that are not marked as profiling values, in the Profiling / Conditional Text (on page 144) preferences page. In this category are listed:
    ◦ All the styles that were defined in other projects (with other profiling attribute value sets).
    ◦ All the styles set for the profiling attributes defined in a subject scheme map (on page 3243).

- **Automatic styling button**
  
  If you click this button, Oxygen XML Editor will apply automatic styling to the profiling attribute values that do not have a style defined.

- **New button**
Opens the Add Profiling Style dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

**Note:** You can define a default style for a specific attribute by setting the Attribute value field to `<ANY>`. This style is applied for attribute values that do not have a specific style associated with it.

**Edit button**

Open the Edit Profiling Style dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

**Clear style button**

 Resets the style for the selected value to its default setting (no color or decoration).

**Delete button**

Delete the selected style from the Other category.

Related Information:

- Filtering Profiling Values with a DITAVAL File *(on page 3248)*
- Styling the Rendering of Profiled Content Using a DITAVAL File *(on page 3250)*

Attributes Rendering Preferences

Oxygen XML Editor lets you display the profiling attributes applied to your content *(on page 980)* in the Author mode editor. To configure how the profiling attributes appear, open the Preferences dialog box *(Options > Preferences)* *(on page 79)* and go to Editor > Edit modes > Author > Profiling/Conditional Text > Attributes Rendering. When the Show Profiling Attributes option *(on page 981)* is selected, the Author mode displays conditional text markers at the end of conditional text blocks. Use the options in this page to customize the rendering of these text markers.

The following options are available:

**Show profiling attributes**

Toggles whether or not the Show Profiling Attributes option *(on page 981)* in the Profiling / Conditional Text drop-down menu is enabled by default.

**Show profiling attribute name**

If selected, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.
Background color

Sets the background color used to display the profiling attributes.

Attribute name foreground color

Sets the foreground color used to display the names of the profiling attributes.

Attribute values foreground color

Sets the foreground color used to display values of the profiling attributes.

Border color

Sets the color of the border of the block that displays the profiling attributes.

MathML Preferences

Oxygen XML Editor allows you to edit MathML (on page 1057) equations and displays the results in a preview window. For a more specialized MathML editor, you can install Design Science MathFlow (on page 1058), which is a commercial product that requires a separate license.

To configure the MathML editor or to enter your MathFlow license information, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > MathML.

You can configure the following options:

Equation minimum font size

The minimum size of the font used for rendering mathematical symbols when editing in the Author mode.

MathFlow installation directory

The installation folder for the MathFlow components product (MathFlow SDK).

MathFlow license file

The license file for the MathFlow components product (MathFlow SDK).

MathFlow preferred editor

A MathML formula can be edited in one of three editors of MathFlow components product (MathFlow SDK).

- Structure Editor (default selection) - Targets professional XML workflow users.
- Style Editor - Tailored to the needs of content authors.
- Simple Editor - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

Save special characters
Specifies how special characters are saved in the XML file.

- **As entity names** - Saves the characters in \&name; format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek Omega character is saved as \&Omega;.

- **As character entities** (default selection) - Saves the characters in a hexadecimal value, using the \&#xNNN format. For example, the Greek Omega character is saved as \&#x3a9;.

- **As character values** - Saves the characters as the actual symbol. For example, the Greek Omega character is saved as Ω.

More documentation is available on the Design Science MathFlow website.

AutoCorrect Preferences

Oxygen XML Editor includes an option to automatically correct misspelled words as you type in Author mode. To enable and configure this AutoCorrect feature (on page 767), open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit Modes > Author > AutoCorrect.

The following options are available:

**Enable AutoCorrect**

When selected (default state), while editing in Author mode, if you type anything that is listed in the Replace column of the Replacements table displayed in this preferences page, Oxygen XML Editor will automatically replace it with the value listed in the With column.

**Use additional suggestions from the spell checker**

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Editor will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

**Note:** The AutoCorrect feature shares the same options configured in the Language options (on page 184) and Ignore elements (on page 186) sections in the Spell Check preferences page.

Spell Check options link

Use this link to navigate to the Spell Check Preferences page (on page 183).

Replacements Table section
The AutoCorrect feature uses the Replacements table to automatically replace anything that is listed in the Replace column with the value listed in the With column for each language.

**Replacements for language drop-down menu**

You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the AutoCorrect feature. It is simply the language for the Replacements table.

**Replacements Table**

You can double-click on cells in either column to edit the listed items. Use the Add button to insert new items and the Remove button to delete rows from the table.

![Note: Any changes, additions, or deletions you make to this table are saved to a path that is specified in the AutoCorrect Dictionaries preferences page (on page 153).]

**Smart quotes section**

You can also choose to automatically convert double and single quotes to a quotation characters of your choice by using the following options in the Smart quotes section:

- **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the Start quote and End quote buttons.
- **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the Start quote and End quote buttons.

![Note: These Smart quotes options are ignored for content inside any element listed in the Ignore elements section of the Spell Check preferences page (on page 186).]

**Global Options (on page 3283)**

If this option is selected, the options are stored on your local computer, in a folder that is not accessible to other users.

**Project Options (on page 3286)**

If this option is selected, the options are stored in the project file and can be shared with other users. Selecting Project Options (on page 3286) will only save your selections in Enable AutoCorrect (on page 150), Use additional suggestions from the spell checker (on page 150), and the options in the Smart quotes section (on page 151). Changes to the Replacements table are not saved in this page. To save changes to the Replacements table at project level you need to specify a custom location in the User-
defined replacements section of the AutoCorrect Dictionaries preferences page (on page 153) and select Project Options from that preferences page instead.

Restores the options in this preferences page to their default values and also deletes any changes you have made to the Replacements table (on page 150).

AutoCorrect Dictionaries Preferences

To set the Dictionaries preferences for the AutoCorrect feature (on page 767), open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit Modes > Author > AutoCorrect > Dictionaries. This page allows you to specify the location of the dictionaries that Oxygen XML Editor uses for the AutoCorrect feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

Dictionaries default folder

Displays the default location where the dictionaries that Oxygen XML Editor uses for the AutoCorrect feature are stored.

Include dictionaries from

Selecting this option allows you to specify a location where you have stored AutoCorrect dictionaries that you want to include, along with the default ones.

⚠️ Important: Consider the following notes regarding this option:

• The AutoCorrect mechanism takes into account AutoCorrect dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged (for example, en_UK.dat from the default location is merged with en_US.dat from a custom location).

• If you have a generic AutoCorrect dictionary file (one that just has a two letter language code for its file name, such as en.dat) saved in either the default or custom location, the other more specific dictionaries (for example, en_UK.dat and en_US.dat) will not be merged and the existing generic dictionary will simply be used instead.

• If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to add dictionaries for the AutoCorrect feature (on page 769).
Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Tip: To save changes to the Replacement table (in the AutoCorrect preferences page (on page 150) at project level (on page 3286), select a custom location for the User-defined replacements and select Project Options (on page 3286) at the bottom of the page.

Related Information:

• Add Dictionaries for the AutoCorrect Feature (on page 769)

Schema Design Preferences

Oxygen XML Editor provides a graphical schema design editor (on page 623) to make editing XML Schema easier. To configure the Schema Design options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Schema Design.

The following options are available in the Schema Design preferences page:

Show annotation in the diagram

When selected, Oxygen XML Editor displays the content of xs:documentation elements in schema diagrams.

When trying to edit components from another schema

The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:

• Always go to its definition - Oxygen XML Editor opens the imported schema file so that you can edit it.
• Never go to its definition - The imported schema file is not opened and the component cannot be edited in place.
• Always ask - Oxygen XML Editor asks if you want to open the imported schema file.

Zoom

Allows you to set the default zoom level of the schema diagram.
Properties Preferences

Oxygen XML Editor lets you control which properties to display for XML Schema components in the XML Schema Design view (on page 623). To configure the schema design properties displayed, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Schema Design > Properties.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the XML Schema Design mode. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the XML Schema Design mode.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

Open Preferences

Oxygen XML Editor lets you control how files are opened. To configure the options for opening documents, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Open.

The following options are available:

Open each document in a tab next to the current one

When selected (default), each new document is opened in a tab next to the currently opened tab. If not selected, each new document is opened in a tab at the end of the current tab stack.

Restore cursor position

Selected by default, it ensures that the last position of the cursor will be remembered when a document is re-opened. If this option is not selected, the cursor will always be positioned at the beginning of the document.

Lock local resources

When this option is selected and you open a file from the local file system or a shared network drive, Oxygen XML Editor locks the file for the current user and the file becomes
read-only for other users while the lock exists. Locked and read-only files have a lock icon (🔒) displayed on their editor tabs. Newly created files are locked when you first save them. If you select this option with files already opened in Oxygen XML Editor, it will lock all the currently opened files. If you deselect this option with files already opened, it will unlock them by deleting the corresponding .lock files. When you try to save locked (read-only) files, a Save As dialog box will be displayed to avoid overwriting the initial resource.

**Support for Special Characters section**

**Note:** The options in this section only affect the Text editing mode.

**When bidirectional text, Asian languages, or other special characters are detected**

You can choose how you want Oxygen XML Editor to handle bidirectional text, Asian languages, or other special characters when they are detected in Text mode. You can choose one of the following:

- **Enable support for special characters** - The support for special characters will always be enabled. For details about what this means, see [Bidirectional Text Support in Text Mode - Enabled](on page 366).

- **Disable support for special characters** - The support for special characters will always be disabled. For details about what this means, see [Bidirectional Text Support in Text Mode - Disabled](on page 367).

- **Prompt for each document** (default setting) - You will be prompted to choose whether or not to enable the support for special characters whenever they are detected in a newly opened document. For details about which setting to choose, see [Special Character Support in Text Mode](on page 366).

**Disable special characters support for documents larger than (characters)**

Enabling bidirectional text editing support can affect performance on large files. When this option is selected, bidirectional editing is disabled for files exceeding the specified size (even if the **Enable support for special characters** option (on page 155) is selected). The default limit is 300 MB. You can change it to 500 MB or 800 MB, but it is recommended that you always leave this option selected regardless of the limit that is set.

**Performance section**

**Optimize loading in the Text edit mode for files over (MB)**
File loading is optimized for reduced memory usage for any file whose size is larger than the value specified in this drop-down list. This is useful for editing large files, but there are several restrictions (on page 781) for memory-intensive operations.

**Show warning when loading large documents**

Oxygen XML Editor will warn you if you open a file that is bigger than the specified size.

**Optimize loading for documents with lines longer than (Characters)**

*Line wrap* is automatically performed for documents that contain lines that exceed the length specified in this text field. For a list of the restrictions applied to a document with long lines, see Editing Documents with Long Lines (on page 784).

**Show warning when loading documents with long lines**

When selected, Oxygen XML Editor will warn you when you open a file with lines longer than the specified length. To reduce the length of lines in a file, format and indent the document (on page 863) after it is opened in the editor panel. For a list of the restrictions applied to a document with long lines, see Documents with Long Lines (on page 784).

**Save Preferences**

Oxygen XML Editor lets you control how files are saved. To configure the options for saving documents, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Save.

The following options are available:

**Show "Save as" option to save newly created documents in the "New" document wizard**

It is selected by default, but if you deselect this option, the Save as option (on page 678) will not be available in the New Document wizard (on page 678), so you will not have the ability to change the default name and path of the new file.

**Safe save (only for local files)**

In the unlikely event of a failure when attempting a Save action, this option provides increased protection from corruption of the original file. When this option is selected, it saves the content to a temporary file and if the save is unsuccessful, the editor preserves its unsaved state status.

**Automatically save the document every**
If selected, your documents are automatically saved after a preset time interval that is specified in the drop-down list.

**On Save, make backup copy with extension (only for local files)**

If selected, a backup copy is made when saving the edited document. This option is available only for local files (files that are stored on the local file system). The default backup file extension is .bak, but that can be changed in the text field.

**Save auto-recover information every**

If selected, your documents are automatically saved to a backup file after the time interval specified in the drop-down list.

**Auto-recover file location**

Specifies the location of the backup file for auto-recovery.

**Validate document before saving**

If selected, Oxygen XML Editor runs a validation that checks your document for errors before saving it.

**Save all files before transformation or validation**

Saves all opened files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

**Save all files before calling external tools**

If selected, all files are saved before executing an external tool (on page 2942).

**Automatically compile LESS to CSS when saving**

If selected, when you save a LESS file it will automatically be compiled to CSS (deselected by default).

⚠️ **Important**: If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

**Performance section**

**Clear undo buffer on save**

If selected, Oxygen XML Editor clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter out of memory errors when editing large documents.
Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the Text (on page 303) and Author (on page 402) editing modes. To control additional options specifically for the Author mode editor, see Whitespace Handling in Author Mode (on page 902).

Note: These settings apply to the formatting of source documents. The formatting of output documents is determined by the transformation scenarios that create them (on page 1640).

To configure the Format options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format.

The following options are available:

Detect indent on open

If selected, Oxygen XML Editor detects how a document is indented when it is opened. Oxygen XML Editor uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Editor detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

Tip: If you want to minimize the formatting differences created by the Format and Indent operation in a document edited in the Text edited mode, make sure that both the Detect indent on open and Detect line width on open (on page 159) options are selected.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all of your documents have no indentation and you want to keep them that way.

Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the Detect indent on open (on page 158) option.

Indent size
The meaning of this setting depends on the following:

- If the **Detect indent on open** option (on page 158) is selected and TAB characters are detected at the beginning of the line, the *indent size* is the width of a TAB character. Otherwise, the *indent size* value is ignored and Oxygen XML Editor uses the number of detected SPACE characters.
- If the **Indent with tabs** option (on page 158) is selected, the *indent size* is the width of a TAB character.
- If neither of these options are selected, the *indent size* is the number of SPACE characters used for indenting the text lines.

For additional information about changing the *indent size*, see **Setting an Indent Size to Zero** (on page 869).

For information about when this setting is used, see **Where Indent Size and Line Width Settings are Used in Oxygen XML Editor** (on page 160).

**Indent on enter**

If selected, when you press **Enter** to insert a line break in the **Text** editing mode, an indentation will be added to the new line.

**Enable smart enter**

If selected, when you press the **Enter** key between a start and an end XML tag in the **Text** editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

**Format and indent the document on open**

If selected, an XML document is formatted and indented before opening it in Oxygen XML Editor.

**Note:** Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

**Detect line width on open**

If selected, Oxygen XML Editor automatically detects the line width when the document is opened.

**Hard line wrap (Limit to "Line width - Format and Indent")**

If selected, when typing content in the **Text** editing mode and the maximum line width is reached, a line break is automatically inserted.

**Line width - Format and Indent**
Defines the number of characters after which the **Format and Indent** (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the longest line will have a maximum of 100 characters. This setting is also used when saving XML content edited in the **Author** editing mode.

**Note:** To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width - Format and Indent** setting. The remaining space is reserved for text.

For information about when this setting is used, see Where Indent Size and Line Width Settings are Used in Oxygen XML Editor *(on page 160).*

**Clear undo buffer before Format and Indent**

The **Format and Indent** operation can be *undone*, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Editor will be used for storing the undo states. If this option is selected, Oxygen XML Editor empties the undo buffer before doing a **Format and Indent** operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (*OutOfMemoryError*) when performing the **Format and Indent** operation.

**Where Indent Size and Line Width Settings are Used in Oxygen XML Editor**

The values set in the **Indent Size** and **Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press **Enter** to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is selected and the maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

For more information about the formatting options offered by Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/1plmdN0Cfso

**XML Preferences**

To configure the **XML** Formatting options, open the **Preferences** dialog box (**Options > Preferences**) *(on page 79)* and go to **Editor > Format > XML**.
The following options are available:

**Format Section**

This section includes the following drop-down boxes:

- **Preserve empty lines**
  
  The **Format and Indent** operation preserves all empty lines found in the document.

- **Preserve text as it is**
  
  The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

- **Preserve line breaks in attributes**
  
  Line breaks found in attribute values are preserved.

  **Note:** When this option is selected, the **Break long attributes** option *(on page 161)* is automatically disabled.

- **Break long attributes**
  
  The **Format and Indent** operation breaks long attribute values.

- **Indent inline elements**
  
  The **inline elements** are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

  **Original XML:**

  ```xml
  <root>
  text <parent> <child/></child> </parent>
  </root>
  ```

  **Indent inline elements** selected:

  ```xml
  <root>
  text <parent>
  <child/>
  </parent>
  </root>
  ```

  **Indent inline elements** not selected:

  ```xml
  <root>
  text <parent> <child/> </parent> </root>
  ```

- **Expand empty elements**
If not selected (default), the **Format and Indent** operation results in an empty XML element being serialized in a compact form ( `<a atr1="v1"/>
`). If selected, the same operation results in empty XML elements being serialized in expanded form (for example, `<a atr1="v1"></a>`).

**Notes:**

- When using the **Format and Indent** operation in **Text** mode, if the **Schema aware format and indent** option (on page 163) is enabled, Oxygen XML Editor will use information from the associated schema and avoid expanding tags for elements that are defined as *empty* in the schema.
- When saving a document in **Author** mode, if the **Schema aware normalization, format, and indent** option in the **Schema-Aware** preferences page (on page 137) is enabled, Oxygen XML Editor will use information from the associated schema and avoid expanding tags for elements that are defined as *empty* in the schema (therefore, text or other elements are not allowed inside them).

**Sort attributes**

The **Format and Indent** operation sorts the attributes of an element lexicographically.

**Add space before slash in empty elements**

Inserts a space character before the trailing `/` and `>` of empty elements.

**Break line before an attribute name**

The **Format and Indent** operation breaks the line before the attribute name.

**Element Spacing Section**

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use **AND/OR** boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`  
  Note: The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.
- `//xs:documentation[@lang="en"]`

The tabs are as follows:

**Preserve space**

List of elements for which the Format and Indent operation preserves the whitespaces (such as blanks, tabs, and newlines).

**Default space**

List of elements for which the content is normalized (multiple contiguous whitespaces are replaced by a single space), before applying the Format and Indent operation.

**Mixed content**

The elements from this list are treated as mixed content when applying the Format and Indent operation. The lines are split only when whitespaces are encountered.

**Line break**

List of elements for which line breaks will be inserted, regardless of their content. You can choose to break the line before the element, after, or both.

**Schema aware format and indent**
The **Format and Indent** operation takes the schema information into account with regard to the *space preserve, mixed, or element only* properties of an element.

**Indent Section**

Includes the following options:

**Indent (when typing) in preserve space elements**

Normally, the *Preserve space* elements (identified by the `xml:space` attribute set to `preserve` or by their presence in the *Preserve space* tab of the *Element Spacing* list ([on page 162](#))) are ignored by the *Format and Indent* operation. When this option is selected and you edit one of these elements, its content is formatted.

**Indent on paste - sections with number of lines less than 300**

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, deselect this option.

**Whitespaces Preferences**

When Oxygen XML Editor formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Editor allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the *Whitespace* preferences, open the Preferences dialog box ([Options > Preferences](#)) ([on page 79](#)) and go to Editor > Format > XML > Whitespace.

This table lists the Unicode whitespace characters. Select any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The **Format and Indent** action is applied on an XML document.
- You switch from Text mode to Author mode.
- You switch from Author mode to Text mode.

**Note:** The whitespace normalization process replaces any sequence of characters declared as whitespaces in the *Whitespaces* table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the *Whitespaces* table.

**Important:** The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.
**XQuery Preferences**

To configure the XQuery Formatting options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format > XQuery.

The following options are available:

- **Preserve line breaks** - All initial line breaks are preserved.
- **Break line before an attribute name** - Each attribute of an XML element is written on a new line and properly indented.

**XPath Preferences**

To configure the XPath Formatting options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format > XPath.

The following option is available:

**Format XPath code embedded in XSLT, XSD and Schematron files**

If selected, the Format and Indent action applied on an XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the attributes that accept XPath expressions.

**Note:** For XSLT documents, the formatting is not applied to attribute value templates.

**CSS Preferences**

Oxygen XML Editor can format and indent your CSS files. To configure the CSS formatting options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format > CSS.

The following options control how your CSS files are formatted and indented:

- **Class body on new line**
  
  If selected, the class body (including the curly brackets) is placed on a new line. This option is not selected by default.

- **Indent class content**
  
  When selected (default state), the class content is indented.

- **Add space before the value of a CSS property**
When selected (default state), whitespaces are added between the `:` (colon) and the value of a style property.

**Add new line between classes**

If selected, an empty line is added between two classes. This option is not selected by default.

**Preserve empty lines**

When selected (default state), the empty lines from the CSS content are preserved.

**Allow formatting embedded CSS**

When selected (default state), CSS content that is embedded in XML is also formatted when the XML content is formatted.

---

**JavaScript Preferences**

To configure the JavaScript format options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format > JavaScript.

The following options control the behavior of the Format and Indent action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is selected by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Editor to format embedded JavaScript code, taking precedence over the Schema aware format and indent (on page 163) option. This option is selected by default.

---

**Content Completion Preferences**

Oxygen XML Editor provides a Content Completion Assistant (on page 3280) that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the Content Completion preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Content Completion. These options control how the Content Completion Assistant works.

The following options are available:

- **Auto close the last opened tag**
  When selected, Oxygen XML Editor automatically closes the last open tag when you type `</`.

- **Automatically rename/delete/comment matching tags**
If you rename, delete, or comment out a start tag, Oxygen XML Editor automatically renames, deletes, or comments out the matching end tag.

**Note:** If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

**Enable content completion**

Toggles the content completion feature on or off.

**Close the inserted element**

When you choose an entry from the **Content Completion Assistant** list of proposals, Oxygen XML Editor inserts both start and end tags. The following additional options are available with regard to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Editor inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document (on page 1112).
  - **Add optional content** - If selected, Oxygen XML Editor inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
  - **Add first Choice particle** - If selected, Oxygen XML Editor inserts the first choice particle specified in the DTD, XML Schema, or RELAX NG schema.

**Case sensitive search**

When selected, the search in the **Content Completion Assistant** is case-sensitive when you type a character ('a' and 'A' are different characters).

**Note:** This option is ignored when the current language itself is not case-sensitive. For example, the case is ignored in the CSS language.

**Position cursor between tags**

When selected, Oxygen XML Editor automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the **Insert the required attributes option** (on page 168) is not selected.

**Show all entities**
Oxygen XML Editor displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, `&`).

**Insert the required attributes**

Oxygen XML Editor inserts automatically the required attributes taken from the DTD or XML Schema.

**Insert the fixed attributes**

If selected, Oxygen XML Editor automatically inserts any \texttt{FIXED} attributes from the DTD or XML Schema for an element inserted with the help of the Content Completion Assistant.

**Show recently used items**

When selected, Oxygen XML Editor remembers the last inserted items from the Content Completion Assistant window. The number of items to be remembered is limited by the Maximum number of recent items shown list box. These most frequently used items are displayed on the top of the content completion window and are separated from the rest of the suggestions by a thin gray line.

- **Maximum number of recent items shown**
  Specifies the limit for the number of recently used items presented at the top of the Content Completion Assistant window.

**Learn attributes values**

When selected, Oxygen XML Editor learns the attribute values used in a document.

**Learn on open document**

Oxygen XML Editor automatically learns the document structure when the document is opened.

**Learn words (Dynamic Abbreviations, available on Ctrl+Space (Command+Space on OS X))**

When selected, Oxygen XML Editor learns the typed words and makes them available in a content completion fashion by pressing Ctrl + Space (Command + Space on OS X) on your keyboard;

\textbf{Note:} For the words to be learned, they need to be separated by space characters.

**Activation delay of the proposals window (ms)**

Delay in milliseconds from last key press until the Content Completion Assistant is displayed.

**Related Information:**
XSLT Preferences

XSLT stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Editor can suggest elements from these vocabularies. To configure the XSLT content completion options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Content Completion > XSLT.

The following options are available:

Include elements declared in the schema section

This section includes options with regard to detecting elements from the declared schema.

Automatically detect HTML or Formatting Objects

Detects if the output being generated is HTML or FO and provides content completion for those vocabularies. Oxygen XML Editor analyzes the namespaces declared in the root element to find an appropriate schema.

If the detection fails, Oxygen XML Editor uses one of the following options:

- **None** - The Content Completion Assistant (on page 3280) suggests only XSLT elements.
- **HTML** - The Content Completion Assistant (on page 3280) includes HTML elements, including HTML5 elements (such as video, canvas, etc.).
- **Formatting objects** - The Content Completion Assistant (on page 3280) includes Formatting Objects (XSL-FO) elements as substitutes for xsi:element.
- **Custom schema** - If you want content completion hints for another output vocabulary, you can use this option to specify the path to the schema for that vocabulary. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.

Documentation schema section

This section specifies an additional schema that will be used for documenting XSL stylesheets. You can choose between the following:

- **Built-in schema** - Uses the built-in schema for documentation.
- **Custom schema** - Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.
XPath Preferences

Oxygen XML Editor provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Content Completion > XPath.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the Content Completion Assistant in XPath expressions (on page 1192) that you enter in the match, select, and test XSL attributes and also in the XPath toolbar (on page 2182).
  - Include XPath functions - When this option is selected, XPath functions are included in the content completion suggestions.
  - Include XSLT functions - When this option is selected, XSLT functions are included in the content completion suggestions.
  - Include axes - When this option is selected, XSLT axes are included in the content completion suggestions.
- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the XPath Tooltip Helper (on page 1195) section for more information.
- **Function signature window background** - Specifies the background color of the tooltip window.
- **Function signature window foreground** - Specifies the foreground color of the tooltip window.

XSD Preferences

Oxygen XML Editor provides content completion assistance when you are writing XML Schema (XSD). To configure XSD preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Content Completion > XSD. The option in this preferences page allows you to define additional elements to be suggested by the Content Completion Assistant (on page 3280) in xs:appinfo elements (in addition to the elements defined in the XML Schema).

The following option is available:

**When in "xs:appinfo" context, also include elements declared in the schema**

You can choose between the following:

- **None** - The Content Completion Assistant offers only the XML Schema schema information.
- **ISO Schematron** - The Content Completion Assistant also includes ISO Schematron elements in xs:appinfo.
- **Schematron 1.5** - The Content Completion Assistant also includes Schematron 1.5 elements in xs:appinfo.
• **Other** - The Content Completion Assistant also includes elements from an XML Schema identified by a URL in `xs:appinfo` elements.

**JavaScript Preferences**

Oxygen XML Editor can provide content completion suggestions when you are writing JavaScript files. To configure content completion support for JavaScript, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Content Completion > JavaScript. You can configure the following options:

**Enable content completion**

Enables the content completion support for JavaScript files.

**Use built-in libraries**

Allows Oxygen XML Editor to include components (object names, properties, functions, and variables) collected from the built-in JavaScript library files when making suggestions.

**Use defined libraries**

Oxygen XML Editor can also use JavaScript libraries to when making suggestions. List the paths (URIs) of any JavaScript files you want Oxygen XML Editor to use when making suggestions.

**Note:** The paths can contain editor variables (on page 276) such as `${pdu}`, or `${oxygenHome}`. You can make these paths relative to the project directory or installation directory.

**Annotations Preferences**

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Editor can display these annotations when offering content completion suggestions. To configure the Annotations preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Content Completion > Annotations.

The following options are available:

**Show annotations in Content Completion Assistant**

If selected, Oxygen XML Editor displays the schema annotations of an element, attribute, or attribute value currently selected in the Content Completion Assistant (on page 3280) proposals list.

**Show annotations in tooltip**
If selected, Oxygen XML Editor displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the Elements view (on page 355). If not selected, tooltips are disabled in all modes.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. If this option is not selected, the annotations are converted and displayed as plain text.

Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Editor recommends prefixing with the doc: particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

If this option is selected, Oxygen XML Editor uses the following mechanism to collect annotations:

- If at least one doc: comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no doc: comment is found in the entire DTD, all comments are considered annotations and displayed as such.

If not selected, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

If selected, any element outside the Relax NG namespace, that is http://relaxng.org/ns/structure/1.0, is considered annotation and is displayed in the annotation window next to the Content Completion Assistant (on page 3280) window and in the Model view (on page 353). When this option is not selected, only elements from the Relax NG annotations namespace, that is http://relaxng.org/ns/compatibility/annotations/1.0 are considered annotations.

Related Information:

- Schema Annotations in Text Mode (on page 847)

Code Templates Preferences

Code templates (on page 855) are code fragments that can be inserted at the current editing position. Oxygen XML Editor includes a set of built-in templates for CSS, LESS, Schematron, XSL,
XQuery, and XML Schema document types. You can also define your own code templates (on page 855) for any type of file and share them with your colleagues (on page 857) using the template export and import functions.

To configure Code Templates, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

**New**

Opens the Code template dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (on page 3280). HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  - M1 represents the Command key on MacOS X, and the Ctrl key on other platforms.
  - M2 represents the Shift key.
  - M3 represents the Option key on MacOS X, and the Alt key on other platforms.
  - M4 represents the Ctrl key on MacOS X, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 276) can be inserted in the text box using the Insert Editor Variables button.

**Edit**

Opens the Code template dialog box and allows you to edit an existing code template. You can edit the following fields:
• **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the [Content Completion Assistant](on page 3280). HTML markup can be used for better rendering.

• **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
  ◦ $M1$ represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
  ◦ $M2$ represents the **Shift** key.
  ◦ $M3$ represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
  ◦ $M4$ represents the **Ctrl** key on MacOS X, and is undefined on other platforms.

• **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 276) can be inserted in the text box using the **Insert Editor Variables** button.

Duplicate

Creates a duplicate of the currently selected code template.

Delete

Deletes the currently selected code template. This action is not available for the built-in code templates.

Export

Exports a file with code templates.

Import

Imports a file with code templates that was created by the Export action.

You can use the following editor variables (on page 276) when you define a code template in the Content text box:

• **$\{caret\}** - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

  ![Note](on page 276)  

  **Note:** The $\{caret\}$ editor variable is available only for parameters that take XML content as values. It is replaced with the $\{UNIQUE_CARET_MARKER_FOR_AUTHOR\}$ macro. The default Author operations process this macro and position the cursor at the designated offset.

• **$\{selection\}** - The current selected text content in the current edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.
To prompt for values at runtime, use the `ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value', @id)` editor variable. You can set the following parameters:

- **message** - The displayed message. Note the quotes that enclose the message.
- **default-value** - Optional parameter. Provides a default value.
- **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the `${answer(@id)}` editor variable.
- **type** - Optional parameter, with one of the following values:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format:</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td><code>${ask('message', url, 'default_value')}</code></td>
<td>Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.</td>
<td></td>
</tr>
<tr>
<td>password</td>
<td><code>${ask('message', password, 'default')}</code></td>
<td>The input is hidden with bullet characters.</td>
<td></td>
</tr>
<tr>
<td>generic</td>
<td><code>${ask('message', generic, 'default')}</code></td>
<td>The input is considered to be generic text that requires no special handling.</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
<td></td>
<td></td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>${ask('Hello world!')</strong>}</td>
<td>The dialog box has a <em>Hello world!</em> message displayed.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>${ask('Hello world!', generic, 'Hello again!')</strong>}</td>
<td>The dialog box has a <em>Hello world!</em> message displayed and the value displayed in the input box is <em>Hello again!</em>.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**relative_url**

**Format**: `${ask('message', relative_url, 'default')}

**Description**: Input is considered a URL. Oxygen XML Editor tries to make the URL relative to that of the document you are editing.

- **Note**: If the $ask editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL.

**Example**:

`$\{ask('File location', relative_url, 'C:\example.txt')\}' - The dialog box has the name *File location*. The URL inserted in the input box is made relative to the current edited document location.

**combobox**

**Format**: `${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}

**Description**: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).

- **Note**: The *default* parameter specifies the default selected value and can match either a key or a value.

**Example**:

- `\{ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')\}' - The dialog box has the name *Operating System*. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.

- **Note**: In this example, the default value is indicated by the *osx* key. However, the same result could be obtained if the default value is indicated by *Mac OS X*, as in the following example: `\{ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')\}

- `\{ask('Mobile OS', combobox, ('win':Mobile';'ios':iOS';'and':Android'), 'Android')\}`
**editable_combobox**

Format: 

```xml
${ask('message', editable_combobox,
   ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'),
   'default'))
```

**Description:** Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.

**Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.

**Example:**

```xml
${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}
```

- The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.

---

**radio**

Format: 

```xml
${ask('message', radio,
   ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'),
   'default'))
```

**Description:** Displays a dialog box that offers a series of radio buttons. Each radio button displays a rendered_value and will return an associated real_value.

**Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.

**Example:**

```xml
${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}
```

- The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.

**Note:** In this example, Mac OS X is the default selected value and if selected, it would return osx for the output.

---

- **${timeStamp}** - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

- **${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
• ${id} - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.

• ${cfn} - Current file name without extension and without parent folder. The current file is the one currently opened and selected.

• ${cfne} - Current file name with extension. The current file is the one currently opened and selected.

• ${cf} - Current file as file path, that is the absolute file path of the current edited document.

• ${cfd} - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.

• ${frameworksDir} - The path (as file path) of the frameworks directory.

• ${pd} - The file path to the folder that contains the current project file (.xpr).

• ${oxygenInstallDir} - Oxygen XML Editor installation folder as file path.

• ${homeDir} - The path (as file path) of the user home folder.

• ${pn} - Current project name.

• ${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the ${system(var.name)} editor variable.

• ${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the ${env(VAR_NAME)} editor variable instead.

• ${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd,

  Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

Syntax Highlight Preferences

Oxygen XML Editor supports syntax highlighting in the Text mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, CSS, LESS, Markdown, Text, DTD, RNC, Java, JSON, Ant, and more.

To configure syntax highlighting, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Syntax Highlight.
To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the Preview panel. If you do not know the name of the syntax token that you want to configure, click that token in the Preview area to select it.

**Note:** All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the Preview area has a separate tab for each of them when XML is selected in the top pane.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

**Elements/Attributes by Prefix Preferences**

Oxygen XML Editor allows you to specify syntax highlighting colors for XML elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

**Note:** Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix (and not the whole element or attribute name) to be styled with a particular color, select the **Draw only the prefix with a separate color** option.

**Mark Occurrences Preferences**

This preferences page specifies which types of files will have the **Highlight IDs Occurrences** (on page 873) feature activated. To configure these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to **Editor > Mark Occurrences**:

The following options are available in this preferences page:

- **Highlight component occurrences in the current file for:**
• **XML files** - Activates the Highlight IDs Occurrences *(on page 873)* feature in XML files.

• **XSLT files** - Activates the Highlight Component Occurrences *(on page 1209)* feature in XSLT files.

• **XML Schema files** - Activates the Highlight Component Occurrences *(on page 1302)* feature in XSD files.

• **WSDL files** - Activates the Highlight Component Occurrences *(on page 1302)* feature in WSDL files.

• **RNG files** - Activates the highlight component occurrences feature in RNG files.

• **Schematron files** - Activates the Highlight Component Occurrences *(on page 1475)* feature in Schematron files.

• **Ant files** - Activates the Highlight Component Occurrences *(on page 1246)* feature in Ant files.

**Declaration highlight color**

Allows you to choose the color to be used for highlighting component declarations.

**Reference highlight color**

Allows you to choose the color to be used for highlighting component references.

**Document Validation Preferences**

To configure document validation options, open the Preferences dialog box *(Options > Preferences)* *(on page 79)* and go to Editor > Document Validation. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

**Maximum number of validation highlights**

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both automatic validation *(on page 1082)* and manual validation *(on page 1082)*.

**Validation error highlight color**

The color used to highlight validation errors in the document.

**Validation warning highlight color**

The color used to highlight validation warnings in the document.

**Validation info highlight color**

The color used to highlight validation info messages in the document.
Validation success color

The color used to highlight the success indicator of the validation operation in the vertical ruler bar.

Always show validation status

If this option is selected, the current validation error or warning is always visible in the message line at the bottom of the editor panel. This is useful when the Enable automatic validation option is selected and the vertical scroll bar changes position due to an error message being displayed.

Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Editor.

Delay after the last key event (s)

The period of keyboard inactivity before starting a new validation (in seconds).

At the bottom of the preferences page you can choose whether or not the saved options will be shared with other users by selecting Global or Project storage options (on page 265).

Custom Validation Engines Preferences

As the name implies, the Custom Validation Engines preferences page displays the list of custom validation engines that can be associated to a particular editor and used for validating documents. To access this page, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Document Validation > Custom Validation Engines.

If you want to add a new custom validation tool or edit the properties of an existing one, you can use the Custom Validator dialog box displayed by pressing the New or Edit button.

Figure 26. Custom Validator Dialog Box
The Custom Validator dialog box allows you to configure the following parameters:

**Name**

Name of the custom validation engine that will be displayed in the Validation toolbar drop-down menu.

**Executable path**

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button.

**Working directory**

The working directory of the custom validation tool. You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button.

**Associated editors**

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

**Command-line arguments for detected schemas**

Command-line arguments used in the commands that validate the currently edited file against various types of schema (XML Schema, Relax NG full syntax, Relax NG compact
syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as -rng) and the following editor variables (on page 276):

- \${cf} - Current file as file path, that is the absolute file path of the current edited document.
- \${currentFileURL} - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- \${ds} - The path of the detected schema as a local file path for the current validated XML document.
- \${dsu} - The path of the detected schema as a URL for the current validated XML document.

- Editor Variables (on page 276)

Increasing the Stack Size for Validation Engines

To prevent the appearance of a StackOverflowException error, use one of the following methods:

- Use the com.oxygenxml.stack.size.validation.threads property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify 1x1024x1024=1048576.
- Increase the value of the -Xss parameter.

Note: Increasing the value of the -Xss parameter affects all the threads of the application.

Related Information:
- Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor (on page 290)

Spell Check Preferences

Oxygen XML Editor provides support for spell checking in the Text (on page 303) and Author (on page 402) editing modes. To configure the Spell Check options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Spell Check.

The following options are available:
Automatic spell check

This option is not selected by default. When selected, Oxygen XML Editor automatically checks the spelling as you type and highlights misspelled words in the document.

Select editors

You can select which editors (and therefore which file types) will automatically be spell checked. File types (such as CSS and DTD), in which automatic spell checking is not usually helpful, are excluded by default.

Spell check highlight color

Use this option to set the color used by the spell check engine to highlight spelling errors.

Language options section

This section includes the following language options:

Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file.

You can add additional dictionaries to the spell check engines (on page 754).

Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the lang or xml:lang attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the lang and xml:lang attributes are missing, the selection in the Default language list (on page 184) is used.
- **Do not check** - If the lang and xml:lang attributes are missing, the element is not checked.

XML spell checking in section

You can choose to check the spelling inside the following XML items:

- Comments
- Attribute values
- Text
- CDATA
Options section

This section includes the following other options:

Check capitalization

When selected, the spell checker reports detected capitalization errors.

Note: This option will not have any effect on words stored in dictionaries, term lists, and the list of learned words because they are not handled as case-sensitive.

Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, SpellChecker).

Ignore acronyms

Available only for the Hunspell Spell Checker. When selected, acronyms are not reported as errors.

Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, b2b).

Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL

When selected, the spell checker ignores words recognized as URLs or file names (for example, www.oxygenxml.com or c:\boot.ini).

Allow compounds words

When selected, all words formed by concatenating two legal words with a hyphen (hyphenated compounds) are accepted. If recognized by the language, two words concatenated without hyphen (closed compounds) are also accepted.

Allow file extensions
When selected, the spell checker accepts any word ending with recognized file extensions (for example, `myfile.txt` or `index.html`).

**Ignore elements section**

You can use the Add and Remove buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- `/` and `//` separators
- `*` wildcard

An example of an allowed XPath expression is: `/a/*/b`.

**AutoCorrect options link**

Use this link to navigate to the AutoCorrect preferences page (on page 150).

**Spell Check Dictionaries Preferences**

To set the Dictionaries preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Spell Check > Dictionaries. This page allows you to configure the dictionaries (.dic files) and term lists (.tdi files) that Oxygen XML Editor uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Editor uses the Hunspell spell checking engine:

**Dictionaries and term lists default folder**

Displays the default location where the dictionaries and term lists that Oxygen XML Editor uses are stored.

**Include dictionaries and term list from**

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

⚠️ **Important:** Consider the following notes regarding this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, `en_UK.dic` from the default location is merged with `en_US.dic` from a custom location).
- If you have a generic dictionary file (one that just has a two letter language code for its file name, such as `en.dic`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dic` and `en_US.dic`) will not be merged and the existing generic dictionary will simply be used instead.
• If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

**How to add more dictionaries and term lists link**

Use this link to open a topic in the Oxygen XML Editor User Guide that explains how to add more dictionaries and term lists *(on page 758).*

**Save learned words in the following location**

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

**Delete learned words**

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

**Note:** Words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

**Related Information:**

- Adding Custom Spell Check Dictionaries *(on page 758)*
- Adding Custom Spell Check Term Lists *(on page 760)*

**Print Preferences**

Oxygen XML Editor lets you configure how files are printed out of the editor. Note that these settings cover how files are printed directly from Oxygen XML Editor itself, not how they are printed after the XML source has been transformed by a publishing stylesheet. To configure the Print options, open the Preferences dialog box *(Options > Preferences)* *(on page 79)* and go to Editor > Print.

This page allows you to customize the headers and footers added to a printed page when you print from the Text mode *(on page 303)* or Author mode *(on page 402)* editors. These settings do not apply to the Grid *(on page 392)* and schema Design *(on page 623)* mode.

You can specify what is printed on the Left, Middle, and Right of the header and footer using plain text of any of the following variables:
• \${currentFileURL} - Current file as URL, that is the absolute file path of the current edited document represented as URL.
• \${cfne} - Current file name with extension. The current file is the one currently opened and selected.
• \${cp} - Current page number. Used to display the current page number on each printed page in the Editor / Print Preferences page.
• \${tp} - Total number of pages in the document. Used to display the total number of pages on each printed page in the Editor / Print Preferences page.
• \${env(VAR_NAME)} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \${system(var.name)} editor variable.
• \${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the \${env(VAR_NAME)} editor variable instead.
• \${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd,

| Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime. |

For example, to show the current page number and the total number of pages in the top right corner of the page, write the following pattern in the Right text area of the Header section: \${cp} of \${tp}.

You can also set the Color and Font used in the header and footer. Default font is SansSerif.

You can place a line below the header or above the footer by selecting Underline/Overline.

CSS Validator Preferences

To configure the CSS Validator preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to CSS Validator.

You can configure the following options for the built-in CSS Validator of Oxygen XML Editor:

• Profile - Selects one of the available validation profiles: CSS 1, CSS 2, CSS 2.1, CSS 3, CSS 3 with Oxygen extensions, SVG, SVG Basic, SVG Tiny, Mobile, TV Profile, ATSC TV Profile. The CSS 3 with Oxygen extensions profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen (on page 2501) that can be used in Author mode (on page 402). That means all Oxygen-specific extensions are accepted in a CSS stylesheet by the built-in CSS validator (on page 1381) when this profile is selected.
• Media type - Selects one of the available mediums: all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen.

• Warning level - Sets the minimum severity level for reported validation warnings. Can be one of: All, Normal, Most Important, No Warnings.

• Ignore properties - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. The following vendor extensions are specified as ignored by default: -ro-* (PDFreactor), -ah-* (Antenna House), prince-* (Prince). As wildcards you can use:
  ◦ * to match any string.
  ◦ ? to match any character.

• Recognize browser CSS extensions (also applies to content completion) - If selected, Oxygen XML Editor recognizes browser-specific CSS properties (no validation is performed). The Content Completion Assistant (on page 3280) lists these properties at the end of its list, prefixed with the following particles:
  ◦ -moz- for Mozilla.
  ◦ -ms- for Internet Explorer or Edge.
  ◦ -o- for Opera.
  ◦ -webkit- for Safari/Webkit.

XML Preferences

This section describes the panels that contain the user preferences related with XML.

XML Catalog Preferences

To configure options that pertain to XML Catalogs (on page 3289), open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Catalog.

The following options are available:

  Prefer

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document for which both a public identifier and a system identifier has been specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

  • system - If selected, the system identifier in the document is used.
  • public - If selected, the URI supplied in the matching public catalog entry is used.

Generally, the purpose of catalogs is to override the system identifiers in XML documents, so public should usually be used for your catalogs.
Note: If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

Verbosity

When using catalogs, it is sometimes useful to see what catalog files are parsed, if they are valid, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the XML catalog resolver that will be displayed in the Catalogs table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the XML catalogs specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

Resolve schema locations also through system mappings

If selected, Oxygen XML Editor analyzes both uri and system mappings to resolve the location of schema.

Note: This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

Process "schemaLocation" namespaces through URI mappings for XML Schema

If selected, the target namespace of the imported XML Schema is resolved through the uri mappings. The namespace is taken into account only when the schema specified in the schemaLocation attribute was not resolved successfully. If not selected, the system IDs are used to resolve the schema location.

Use default catalog

If this option is selected and Oxygen XML Editor cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used.

For more information, see How Oxygen XML Editor Determines which Catalog to Use (on page 1125).

Catalogs table

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

Add
Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list.

**Edit**

Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list.

**Delete**

Deletes the currently selected catalog from the list.

**Up**

Moves the selection to the previous resource.

**Down**

Moves the selection to the following resource.

**Note:** When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a manual Validate action (on page 1082) so that the changes take full effect.

You can also add or configure catalogs at framework level from the Catalogs tab (on page 119) in the Document Type configuration dialog box (on page 95).

### Related Information:

- Controlling the Catalog Resolver
- Working with XML Catalogs (on page 1123)

### XML Parser Preferences

To configure the XML Parser options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Parser.

The configurable options of the built-in XML parser are as follows:

**Enable parser caching (validation and content completion)**
Enables re-use of internal models when validating and provides content completion in opened XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

**Ignore the DTD for validation if a schema is specified**

Forces validation against a referenced schema (XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against an XML Schema or a Relax NG schema.

- **Note:** Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

**Enable XInclude processing**

Enables XInclude processing. If selected, the XInclude support in Oxygen XML Editor is turned on for validation, rendering in **Author** mode and transformation of XML documents.

**Base URI fix-up**

According to the specification for XInclude, processors must add an `xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `xml:base` and/or `xml:lang` is not desired by your application, you can deselect this option.

**Language fix-up**

The processor will preserve language information on a top-level included element by adding an `xml:lang` attribute if its included parent has a different [language] property. If the addition of `xml:lang` is not allowed by your application, you can deselect this option.

**DTD post-validation**

Select this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using XInclude was resolved. If you deselect this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using XInclude is resolved.
XML Schema Preferences

To configure options regarding XML Schema, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Parser > XML Schema.

This preferences page allows you to configure the following options:

**Default XML Schema version**

Allows you to select the version of XML Schema to be used as the default. You can choose XML Schema 1.0 or XML Schema 1.1.

⚠️ Note: You are also able to set the XML Schema version using the Customize option in the New document wizard (on page 676).

**Default XML Schema validation engine**

Allows you to select the default validation engine to be used for XML Schema. You can choose Xerces or Saxon EE.

**Xerces validation features section**

- **Enable full schema constraint checking**
  
  Sets the schema-full-checking feature to true. This enables a validation of the parsed XML document against a schema (XML Schema or DTD) while the document is parsed.

- **Enable honour all schema location feature**

  Sets the honour-all-schema-location feature to true. All the files that declare XML Schema components from the same namespace are used to compose the validation model. If this option is not selected, only the first XML Schema file that is encountered in the XML Schema import tree is taken into account.

- **Enable full XPath 2.0 for alternative types**

  When selected (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

- **Assertions can see comments and processing instructions**

  Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

**Saxon EE validation features section**

- **Multiple schema imports**
Forces `xs:import` to fetch the referenced schema document. By default, the `xs:import` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

**Assertions can see comments and processing instructions**

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

**Relax NG Preferences**

To configure options regarding Relax NG, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Parser > Relax NG.

The following options are available in this page:

**Check feasibly valid**

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

**Note:** Selecting this option disables the Check ID/IDREF option.

**Check ID/IDREF**

Checks the ID/IDREF matches when a Relax NG document is validated.

**Add default attribute values**

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

**Ignore "data-" attributes in XHTML**

This option is selected by default, which means that when XHTML documents are validated with an RNG schema, any `data-` attributes detected in the document will not be taken into account by the validation engine.

**Schematron Preferences**

To configure options regarding Schematron, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Parser > Schematron.

The following options are available in this preferences page:

**ISO Schematron Section**
Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should select this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for allow-foreign on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use associated XML Schema to expand default attribute values

When selected (default value), if the validated XML document has an XML Schema associated that contains default values for attributes defined in the XML content, the Schematron will be able to match on those default attributes.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When selected, Saxon EE is used for xslt2 / xslt3 query binding. If this option is not selected, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for Quick Fixes (on page 3287) in Schematron files. This option is selected by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: xslt1, xslt2, or xslt3.

Note: To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a queryBinding attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- Use the language defined in the application - The language that is specified in the Global Preferences page (on page 81) will be used and only the validation messages that match that language will be presented. You can use the Change application language link to navigate to the preferences page where you can specify the language to be used in the application.

- Use the "xml:lang" attribute set on the Schematron root - The language specified in the xml:lang attribute from the Schematron
root will be used and only the validation message that match that language will be presented.

- **Ignore the language and show all message** - All messages are displayed in whatever language is defined within the Schematron schema.

- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

**Note:** In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language is defined within the Schematron schema.

**Schematron 1.5 Section**

**XPath Version**

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: 1.0, 2.0, or 3.0. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

**Sample XML Files Generator Preferences**

The [Generate Sample XML Files tool](on page 1306) (available on the **Tools** menu) allows you to generate XML instance documents based on an XML Schema. There are various options that can be configured within the tool and these options are also available in the Sample XML Files Generator preferences page. This allows you to set default values for these options. To configure the options for generating the XML files, open the Preferences dialog box (Options > Preferences) (on page 79) and go to **XML > Sample XML Files Generator**.

The following options are available:

**Generate optional elements**

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

**Generate optional attributes**

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

**Values of elements and attributes**

Controls the content of generated attribute and element values. The following choices are available:
• None - No content is inserted.
• Default - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
• Random - Inserts a random value depending on the data type descriptor of the particular element or attribute.

⚠️ Important: If all of the following are true, the Generate Sample XML Files tool outputs invalid values:
- At least one of the restrictions is a `regexp`.
- The value generated after applying the `regexp` does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

• If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
• If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
• If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

• First - The first valid alternative type is always used.
• Random - A random alternative type is used.

Choice strategy

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

• First - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
• Random - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

**Generate the other options as comments**

If selected, generates the other possible choices or substitutions (for `xs:choice` and `substitutionGroup`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `a` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Related Information:**

- [Generating Sample XML Files](on page 1306)

**XProc Preferences**

Oxygen XML Editor includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you also have several ways to integrate other external XProc engines.

If the external engine is Java-based, or it has validation support, or it has the ability to receive parameters or ports passed from the transformation, you need to integrate the external XProc engine using a plugin extension procedure (on page 1747).

If you do not need the engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can add an external XProc engine by using the XProc preferences page. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XProc.
To add an external engine, click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

**Figure 27. Creating an XProc external engine**

![Custom Engine Dialog Box](image)

The following options can be configured in this custom engine configuration dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the **Insert Editor Variables** (on page 276) button, or the **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the **Insert Editor Variables** (on page 276) button, or the **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

**Note:** You can configure the built-in Calabash processor by using the `calabash.config` file. This file is located in `{OXYGEN_INSTALL_DIR}/lib/xproc/calabash/lib`. If that file does not exist, you have to create it.
The **Show XProc messages** option at the bottom of the **XProc** preferences page can be selected if you want all messages emitted by the XProc processor during a transformation to be presented in dedicated XProc **Results** view (on page 357).

**XSLT-XQuery Preferences**

To configure options regarding XSLT and XQuery processors, open the **Preferences** dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery. This panel contains only the most generic options for working with XSLT or XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

**Create transformation temporary files in system temporary directory**

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

**XSLT Preferences**

To configure the **XSLT** options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XSLT.

Oxygen XML Editor offers the possibility of using an XSLT transformer implemented in Java (other than the XSLT transformers that come bundled with Oxygen XML Editor). To use another XSLT transformer, specify the name of the transformer factory class. Oxygen XML Editor sets this transformer factory class as the value of the Java property: javax.xml.transform.TransformerFactory.

The XSLT preferences page allows you to customize the following options:

**JAXP XSLT Transformer - Value**

Allows you to set the value of the TransformerFactory Java class.

**Validation engine - XSLT 1.0**

Allows you to select the XSLT engine to be used for validation of XSLT 1.0 documents.

**Validation engine - XSLT 2.0**

Allows you to select the XSLT engine to be used for validation of XSLT 2.0 documents.

**Validation engine - XSLT 3.0**

Allows you to select the XSLT engine to be used for validation of XSLT 3.0 documents.
**Note:** Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.1) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to http://www.saxonica.com/documentation/index.html#!conformance/xslt30.

**XSLT Editor Content Completion Options link**

Use this link to switch to the XSLT Content Completion preferences page (on page 169), where you can configure the XSLT content completion options.

**Saxon6 Preferences**

To configure the Saxon 6 options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon6.

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.
- **Disable calls on extension functions** - If selected, external function calls are not allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
  - **recover silently** - Continue processing without reporting the error.
  - **recover with warnings** - Issue a warning but continue processing.
  - **signal the error and do not attempt recovery** - Issue an error and stop processing.

**Saxon-HE/PE/EE Preferences**

To configure global options for XSLT transformation and validation scenarios that use the Saxon HE/PE/EE engine, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE.

**Saxon-HE/PE/EE Options**

Oxygen XML Editor allows you to configure the following XSLT options for the Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

- **Use a configuration file ("-config")**
Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the \( \text{Insert Editor Variables} \) button, or using the browsing actions in the \( \text{Browse} \) drop-down list.

**Debugger trace into XPath expressions (applies to debugging sessions)**

Instructs the XSLT Debugger [on page 2309] to step into XPath expressions.

**Enable Optimizations ("-opt")**

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Line numbering ("-l")**

Line numbers where errors occur are included in the output messages.

**Expand attributes defaults ("-expand")**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

**DTD validation of the source ("-dtd")**

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

[Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.]

**Recoverable errors ("-warnings")**

Specifies how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

**Strip whitespaces ("-strip")**
Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

**Saxon-PE/EE Options**

The following options are available for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

**Allow calls on extension functions ("-ext")**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `xsl:assert` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

**Saxon-EE Options**

The options available specifically for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**Validation of the source file ("-val")**
Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings ("-outval")**

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Saxon-HE/PE/EE Advanced Preferences**

To configure the Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced.

- **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 9.8.0.12 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XSLT extension (on page 1678) for the particular transformation scenario.
- **Collection URI Resolver class name ("-cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 9.8.0.12 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding jar or class extension must be configured from the dialog box for configuring the XSLT extension (on page 1678) for the particular transformation scenario.
XSLTProc Preferences

To configure XSLTProc options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XSLT > XSLTProc.

The following options are available in this preferences page:

- **Enable XInclude processing** - If selected, XInclude references will be resolved when XSLTProc is used as transformer in XSLT transformation scenarios (on page 1640).
- **Skip loading the document's DTD** - If selected, the DTD specified in the DOCTYPE declaration will not be loaded.
- **Do not apply default attributes from document's DTD** - If selected, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If selected, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If selected, the transformation will output detailed status messages about the transformation process in the Warnings view.
- **Show version of libxml and libxslt used** - If selected, Oxygen XML Editor will display in the Warnings view the version of the libxml and libxslt libraries invoked by XSLTProc.
- **Show time information** - If selected, the Warnings view will display the time necessary for running the transformation.
- **Show debug information** - If selected, the Warnings view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If selected, Oxygen XML Editor will display in the Warnings view the URL of all the files loaded during transformation.
- **Show profile information** - If selected, Oxygen XML Editor will display in the Warnings view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- **Show the list of registered extensions** - If selected, Oxygen XML Editor will display in the Warnings view a list with all the registered extension functions, extension elements and extension modules.
- **Refuses to write to any file or resource** - If selected, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
- **Refuses to create directories** - If selected, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
MSXML Preferences

To configure the MSXML options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XSLT > MSXML.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

**Validate documents during parse phase**
If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

**Do not resolve external definitions during parse phase**
By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

**Strip non-significant whitespaces**
If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

**Show time information**
If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

**Start transformation in this mode**
Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

MSXML.NET Preferences

To configure the MSXML.NET options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XSLT > MSXML.NET.

The options in this preferences page for the MSXML.NET processor are as follows:

**Enable XInclude processing**
If selected, XInclude references will be resolved when MSXML.NET is used as the transformer in the XSLT transformation scenario (on page 1640).

Validate documents during parse phase
If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase
By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces
If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information
If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Forces ASCII output encoding
There is a known problem with the .NET 1.X XSLT processor (System.Xml.Xsl.XslTransform class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as `?`. Usually this happens when output encoding is set to ASCII. If this option is selected, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (`&#nnnn;` form).

Allow multiple output documents
This option allows you to create multiple result documents using the exsl:document extension element.

Use named URI resolver class
This option allows you to specify a custom URI resolver class to resolve URI references in xsl:import and xsl:include instructions (during XSLT stylesheet loading phase) and in document() functions (during XSL transformation phase).

Assembly file name for URI resolver class
This option specifies a file name of the assembly where the specified resolver class can be found. The **Use named URI resolver class** option (on page 207) specifies a partially or fully qualified URI resolver class name (for example, `Acme.Resolvers.CacheResolver`). Such a name requires additional assembly specification using this option or the **Assembly GAC name for URI resolver class** option (on page 208), but fully qualified class name (which always includes an assembly specifier) is all-sufficient. See MSDN for more info about fully qualified class names.

**Assembly GAC name for URI resolver class**

This option specifies partially or fully qualified name of the assembly in the **global assembly cache** (GAC) where the specified resolver class can be found. See MSDN for more info about partial assembly names.

**List of extension object class names**

This option allows to specify extension object classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

**Use specified EXSLT assembly**

MSXML.NET supports a rich library of the [EXSLT](https://www.exslt.org) and EXSLT.NET extension functions embedded or in a plugin EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

**Credential loading source xml**

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

**Credential loading stylesheet**

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

**XQuery Preferences**

To configure the **XQuery** options, open the **Preferences** dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XQuery.

The following generic XQuery preferences are available:

**Validation engine**
Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Editor uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

**Size limit of Sequence view (MB)**

When the result of an XQuery transformation is set as a sequence ([Present as a sequence option (on page 1697)](on page 1697)) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceeded, go to the Sequence view (on page 1350) and click More results available to extract more data from the database.

**Format transformer output**

Specifies whether or not the output of the transformer is formatted and indented ([pretty-print (on page 3286)](on page 3286)).

*Note:* This option is ignored if you choose [Present as a sequence (on page 1697)](on page 1697) (lazy extract data from a database) from the associated transformation scenario.

**Create structure indicating the type nodes**

If selected, Oxygen XML Editor takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.

*Note:* This option is ignored if you choose [Present as a sequence (on page 1697)](on page 1697) (lazy extract data from a database) from the associated transformation scenario.

**Saxon-HE/PE/EE Preferences**

To configure global options for XQuery transformation and validation scenarios that use the Saxon HE/PE/EE engine, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE.

Oxygen XML Editor allows you to configure the following XQuery options for the Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

**Use a configuration file ("-config")**

Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

**Enable Optimizations ("-opt")**
This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Use linked tree model ("-tree:linked")**

This option activates the linked tree model.

**Recoverable errors ("-warnings")**

Specifies how dynamic errors are handled. The following options can be selected:

- Recover silently ("silent") - Continues processing without reporting the error.
- Recover with warnings ("recover") - Issues a warning but continues processing.
- Signal the error and do not attempt recovery ("fatal") - Issues an error and stops processing.

**Strip whitespaces ("-strip")**

Specifies how the `strip whitespaces` operation is handled. You can choose one of the following values:

- All ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- Ignore ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- None ("none") - Strips no whitespace before further processing.

The following option is available for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions ("-ext")**

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

**Validation of the source file ("-val")**

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:
• **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

• **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

• **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings** ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update** ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery** ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

**Saxon HE/PE/EE Advanced Preferences**

To configure Saxon HE/PE/EE Advanced preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE > Advanced.

The advanced XQuery options that can be configured for the Saxon 9.8.0.12 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

• **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 9.8.0.12 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding JAR or class extension must be configured from the dialog box for configuring the XQuery extension (on page 1678) for the particular transformation scenario.
Note: If your URIResolver implementation does not recognize the given resource, the resolve(String href, String base) method should return a null value. Otherwise, the given resource will not be resolved through the XML Catalog (on page 1123).

**Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 9.8.0.12 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding JAR or class extension must be configured from the dialog box for configuring the XQuery extension (on page 1678) for the particular transformation scenario.

Debugger Preferences

To configure the Debugger preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > Debugger.

The following options are available:

**Show xsl:result-document output**

If selected, the debugger presents the output of xsl:result-document instructions into the debugger output view.

**Infinite loop detection**

Select this option to receive notifications when an infinite loop occurs during transformation.

**Enable Saxon optimizations**

This option is not selected by default and this means that the optimization for the debugging process is suppressed. This is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Maximum depth in templates stack**

Allows you to set how many xsl:template instructions can appear on the current stack. This setting is used by the infinite loop detection.

**Debugger layout**

If you select the Horizontal layout, the stack of XML editors is presented on the left half of the editing area while the stack of XSL editors is on the right half. If you select the Vertical layout, the stack of XML editors is presented on the upper half of the editing area while the stack of XSL editors is on the lower half.

**Debugger current instruction pointer**

Allows you to set the background color of the current execution node, both in the document (XML) and XSLT/XQuery views.
XWatch evaluation timeout (seconds)

Allows you to specify the maximum time that Oxygen XML Editor allocates to the evaluation of XPath expressions while debugging.

Messages

Allows you to specify how to handle the debugging process when the source document involved in a debugging session is edited. You can choose one of the following:

- Ask me what to do
- Always stop the debugging session
- Never stop the debugging session

Profiler Preferences

This section explains the settings available for the XSLT/XQuery Profiler. To access and modify these settings, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > Profiler (see Debugger Preferences (on page 212)).

The following profiler settings are available:

Show time

Shows the total time that was spent in the call.

Show inherent time

Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.

Show invocation count

Shows how many times the call was called in this particular call sequence.

Time scale

Determines the unit of time measurement. You can choose between milliseconds or microseconds.

Hotspot threshold

Hotspots are ignored below this specified amount (in milliseconds). For more information, see Hotspots View (on page 2318).

Ignore invocation less than

Invocations are ignored below this specified amount (in microseconds). For more information, see Invocation Tree View (on page 2316).

Percentage calculation
The percentage base that determines what time span percentages are calculated against. You can choose between the following:

- **Absolute** - Percentage values show the contribution to the total time.
- **Relative** - Percentage values show the contribution to the calling call.

### XPath Preferences

To configure XPath options, open the **Preferences** dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > XPath.

Oxygen XML Editor allows you to customize the following options:

#### Unescape XPath expression

If selected, the entities of an XPath expression that you type in the **XPath/XQuery Builder** (on page 2185) and the **XPath toolbar** (on page 2182) are unescaped during their execution. For example, the expression:

```
//varlistentry[starts-with(@os,'##x73;')]
```

is equivalent to:

```
//varlistentry[starts-with(@os,'s')]"
```

#### Multiple XPath results

Select this option to display the results of an XPath expression in separate tabs in the **Results view** (on page 357).

#### XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Editor considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.
Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the New button to add mappings to the list and the Delete button to remove mappings.

Custom Engines Preferences

Oxygen XML Editor allows you to configure custom processors to be used for running XSLT and XQuery transformations.

**Note:** You can not use these custom engines in the Debugger perspective (on page 2290).

To configure the Custom Engines preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XSLT-XQuery > Custom Engines.

The table in this preferences page displays the custom engines that have been defined. Use the New or Edit button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

Figure 28. Parameters of a Custom Engine

The following parameters can be configured for a custom engine:

**Engine type**

Specifies the transformer type. You can choose between XSLT and XQuery engines.

**Name**

The name of the transformer displayed in the dialog box for editing transformation scenarios.
Description

A textual description of the transformer.

Working directory

The start directory of the executable program for the transformer. The following editor variables (on page 276) are available for making the path to the working directory independent of the location of the input files:

- $(homeDir) - The user home directory in the operating system.
- $(cfd) - The path to the directory of the current file.
- $(pd) - The path to the directory of the current project.
- $(oxygenInstallDir) - The Oxygen XML Editor install directory.

Command line

The command line that must be executed by Oxygen XML Editor to perform a transformation with the engine. The following editor variables (on page 276) are available for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- $(xml) - The XML input document as a file path.
- $(xmlu) - The XML input document as a URL.
- $(xsl) - The XSL / XQuery input document as a file path.
- $(xslu) - The XSL / XQuery input document as a URL.
- $(out) - The output document as a file path.
- $(outu) - The output document as a URL.
- $(ps) - The platform separator that is used between library file names specified in the class path.

Output Encoding

The encoding of the transformer output stream.

Error Encoding

The encoding of the transformer error stream.

PDF Output Preferences

The PDF Output preferences page simply includes links to sub-pages for configuring PDF output options.
FO Processors Preferences

Oxygen XML Editor includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Editor provides an easy way to add two of the most commonly used commercial FO processors: RenderX XEP and Antenna House Formatter. You can easily add RenderX XEP as an external FO processor if you have the XEP installed. Also, if you have the Antenna House Formatter, Oxygen XML Editor uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for DITA OT transformations scenarios (on page 1702) and XML with XSLT transformation scenarios (on page 1674).

To configure the options for the FO Processors, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > PDF Output > FO Processors. This preferences page includes the following options:

Apache FOP Section

In this section you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Editor to use the built-in Apache FO processor. To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

Use other Apache FOP

Instructs Oxygen XML Editor to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Editor window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the built-in FOP

If your Apache FOP transformations fail with an Out of Memory error (OutOfMemoryError), use this combo box to select a bigger value for the amount of memory reserved for FOP transformations.
Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special true type font).
You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button.

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Note: All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in Add a font to the built-in FOP (on page 1740).

Note: You cannot use the <filterList> key in the configuration file since the FOP would generate the following error: The Filter key is prohibited when PDF/A-1 is active.

External FO Processors Section

In this section you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the RenderX XEP or Antenna House Formatter commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If RenderX XEP is already installed on your computer, you can use this button to choose the XEP executable script (xep.bat for Windows, xep for Linux).

Add 'Antenna House' FO processor (executable file is needed)

If Antenna House Formatter is already installed on your computer, you can use this button to choose the Antenna House executable script (AHFCmd.exe or XSLCmd.exe for Windows, and run.sh for Linux/Mac OS).

Note: The built-in Antenna House Formatter GUI transformation scenario requires that you configure an external FO processor that runs AHFormatter.exe (Windows only). In the external FO Processor configuration dialog box (on page 219), you could use "$env(AHF63_64_HOME)\AHFormatter.exe" -d $@ -s for the value in the Command line field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see https://github.com/AntennaHouse/focheck/wiki/focheck.

You can also add external processors or configure existing ones. Press the New button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (Edit, Duplicate, Delete, Up, Down) to configure existing external processors.
Figure 29. External FO Processor Configuration Dialog Box

The external FO Processor configuration dialog box includes the following options:

**Name**

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

**Description**

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

**Working directory**

The directory where the intermediate and final results of the processing is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button. You can use one of the following editor variables (on page 276):

- \$\{homeDir\} - The path to the user home directory.
- \$\{cfd\} - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- \$\{pd\} - The project directory.
- \$\{oxygenInstallDir\} - The Oxygen XML Editor installation directory.

**Command line**

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button. You can use one of the following editor variables (on page 276):
• \$\{method\} - The FOP transformation method: pdf, ps, or txt.
• \$\{fo\} - The input FO file.
• \$\{out\} - The output file.
• \$\{pd\} - The project directory.
• \$\{frameworksDir\} - The path of the frameworks subdirectory of the Oxygen XML Editor installation directory.
• \$\{oxygenInstallDir\} - The Oxygen XML Editor installation directory.
• \$\{ps\} - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

**Output Encoding**

The encoding of the FO processor output stream that is displayed in a Results panel (on page 357) at the bottom of the Oxygen XML Editor window.

**Error Encoding**

The encoding of the FO processor error stream that is displayed in a Results panel (on page 357) at the bottom of the Oxygen XML Editor window.

**CSS-based Processors Preferences**

Oxygen XML Editor includes a built-in XML to PDF transformation with CSS scenario type for generating PDF output using a CSS-based processor.

To configure the options for the CSS-based processors, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > PDF Output > CSS-based Processors. This preferences page includes the following options:

**Oxygen PDF Chemistry Section**

**Auto-detect**

If selected, the directory of the Chemistry processor will be automatically detected. This is based on the system's PATH environmental variable. If none is detected, it will use the path of the built-in distribution.

**Custom installation directory**

Use this option to select an external directory of a custom installation of the Chemistry processor.

**Memory available to the processor (MB)**
Specifies the maximum amount of memory that is available for the transformation. If your transformations fail with an Out of Memory error (OutOfMemoryError), you can use this option to select a bigger value for the amount of memory reserved for the process.

**Generates PDF/UA-1 output**

Use this option to produce output that conforms with the PDF/UA-1 accessibility standards.

**Note:** This mode has some special requirements. For example, all fonts have to be embedded and the title of documents must be marked using the metadata. For more information, see Oxygen PDF Chemistry User Guide: Fully Accessible PDF (PDF/UA1).

**Show console output**

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

**Ant Preferences**

To set Ant preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > Ant. This panel allows you to choose the directory containing the Apache Ant (on page 3279) libraries (the so-called Ant Home) that Oxygen XML Editor uses to handle Ant build files.

There are two options available:

- **Built-in** - the path to the Ant distribution that comes bundled with Oxygen XML Editor installation kit.
- **Custom** - the path to an Ant distribution of your choice.

**Import Preferences**

To configure importing options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > Import. This page allows you to configure how empty values and null values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

- **Create empty elements for empty values**
If selected, an empty value from a database column or from a text file is imported as an empty element.

**Create empty elements for null values**

If selected, null values from a database column are imported as empty elements.

**Escape XML content**

Selected by default, this option instructs Oxygen XML Editor to escape the imported content to an XML-safe form.

**Add annotations for generated XML Schema**

If selected, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

**Date / Time Format section**

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.

- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (`yyyy-MM-dd'T'HH:mm:ss` for `datetime`, `yyyy-MM-dd` for `date` and `HH:mm:ss` for `time`). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.

- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

### Table 2. Pattern Letters

<td>RFC 822 time zone</td>
<td>-0800</td>
</tr>
</tbody>
</table>

Pattern letters are usually repeated, as their number determines the exact presentation:

- **Text** - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- **Number** - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.
- **Year** - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- **Month** - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- **General time zone** - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
  - **GMTOffsetTimeZone** - GMT Sign Hours: Minutes
    - **Sign** - one of + or -
    - **Hours** - one or two digits
    - **Minutes** - two digits
    - **Digit** - one of 0 1 2 3 4 5 6 7 8 9
  - **RFC822TimeZone**
  - **TwoDigitHours** (must be between 00 and 23)

Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

- **RFC 822 time zone**: The RFC 822 4-digit time zone format is used:
  - **RFC822TimeZone**
  - **TwoDigitHours** (must be between 00 and 23)
XML Signing Certificates Preferences

Oxygen XML Editor provides two types of keystores (on page 3283) for certificates that are used for digital signatures of XML documents: Java Keystore (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A keystore file is protected by a password. To configure a certificate keystore, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Signing Certificates. You can customize the following parameters of a keystore:

- **Keystore type** - The type of keystore (on page 3283) that Oxygen XML Editor uses (JKS or PKCS-12).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the keystore (on page 3283).
- **Private key password** - The private key password of the certificate (required only for JKS keystores (on page 3283)).
- **Validate** - Press this button to verify the configured keystore (on page 3283) and the validity of the certificate.

XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Refactoring. The following option is available in this preferences page:

**Load additional refactoring operations from**

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the ![Insert Editor Variables](on page 276) button, or the ![Browse](button. Oxygen XML Editor looks for XML refactoring operations recursively in the specified folder, so they can be stored in descendant folders.
DITA Preferences

To access the DITA Preferences page, open the Preferences dialog box (Options > Preferences) (on page 79) and go to DITA. This preferences page includes the following sections and options:

**DITA Open Toolkit section**

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Editor installation) to be used for validating and publishing DITA content. You can select from the following:

- **Built-in DITA-OT 3.x**
  
  Oxygen XML Editor comes bundled with DITA-OT 3.3.1. By default, all defined DITA transformation/validation scenarios will run with this version. This also provides access to DITA 1.3 features (including document templates). The default DITA OT 3.3.1 directory is: 
  
  `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x`. 

- **Custom**
  
  Allows you to specify a custom directory for your DITA-OT distribution.

  **Location**
  
  You can either provide a new file path for the specific DITA OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button.

**DITA Maps file patterns**

Allows you to specify the extension types that will be handled as DITA maps when opened in Oxygen XML Editor.

**When opening a map**

Oxygen XML Editor can open a DITA map in the regular editor view or in the DITA Maps Manager (on page 2990). This option allows you to specify how a map will be opened. You can choose one of the following options:

- **Always open in the DITA Maps Manager** - A DITA map file is always opened in the DITA Maps Manager view.
- **Always open as XML** - A DITA map file is always opened in the XML editor.
- **Always ask** - When opening a DITA map, you are prompted to choose between opening it in the XML editor panel or in the DITA Maps Manager view.
When the last/first item is reached while navigating reviews

This option allows you to specify what should happen when you are navigating review items in the Review view (on page 964) and you reach the last or first review item. You can choose one of the following options:

- **Open the next/previous document (in the current DITA map hierarchy) that contains review items** - If you reach the last/first review item in the document, clicking the ↓ Next or ↑ Previous navigation buttons will open the next/previous document (from the current DITA map hierarchy) that contains review items.
- **Do nothing** - If you reach the last/first review item in the document, clicking the ↓ Next or ↑ Previous navigation buttons will do nothing.
- **Always ask** - If you reach the last/first review item in the document, clicking the ↓ Next or ↑ Previous navigation buttons will open a dialog box asking if you want to open the next/previous document (from the current DITA map hierarchy) that contains review items.

Prefer navigation title for topicref rendering

If selected and there is a navtitle attribute set on a topicref, then the navtitle is used to render the title of the topic in the DITA Maps Manager (on page 2990).

Insert topic reference section

Allows you to specify that when inserting a topic reference (using the Insert Reference dialog box (on page 3017) and Edit Properties dialog box (on page 3027)), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the format attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the scope attribute will always be automatically populated with a detected value.
- **Type** - If selected, the type attribute will always be automatically populated with a detected value.
- **Navigation title** - If selected, the navtitle attribute will always be automatically populated with a detected value.

Insert link section

Allows you to specify that when a link reference is inserted (using actions in the Link drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same
as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `scope` attribute will always be automatically populated with a detected value.
- **Type** - If selected, the `type` attribute will always be automatically populated with a detected value.

### Use `.` instead of the ID of the parent topic (DITA 1.3)

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with `.` (`.//elementId`). For more information, see [https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html](https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html).

### Profiling Attributes link

Opens the Profiling/Conditional Text preferences page (on page 144) where you can configure profiling attributes and condition sets.

### DITA New Topics Preferences

To access the DITA New Topics preferences page, open the Preferences dialog box (Options > Preferences) (on page 79) and go to DITA > New topics. This preferences page includes the following options:

#### Use the title to generate the file name

This option (and its sub-options) pertain to the rules that will be used to generate file names in the New DITA File dialog box (on page 3050). Select this option to use the text entered in the **Title** field to automatically generate a file name (the generated name can be seen in the **Save as** field). By default, the generated name will replace spaces with underscores (`_`), all illegal characters will be removed, and all upper case characters changed to lower case, but you can use the sub-options to change this.

**Replace spaces with**

If selected, the file name generation mechanism will replace spaces in the title with the character entered in this option.

**Lower case only**
If selected, the file name generation mechanism will only use lower case letters.

**Use camel case**

If selected, the file name generation mechanism will convert the title to a file name using the *camel case* convention where the first word starts with a lower case letter and all subsequent words begin with upper case (for example, `myFileName`).

**Upper case first letter**

Select this option if you want the file name generation mechanism to convert the title to a file name using the *camel case* convention but with an upper case letter for the first word (for example, `MyFileName`).

**Use the file name as the value of the root ID attribute**

Select this option to use the file name (as seen in the *Save as* field but without the file extension) as the value of the root `id` attribute for the new topic.

DITA Publishing Preferences

To access the DITA Publishing preferences page, open the *Preferences* dialog box ([Options > Preferences](on page 79)) and go to DITA > Publishing. You can also open this page by clicking the *Configure Publishing Templates Gallery* link in the Templates tab of the transformation scenario dialog box for WebHelp Responsive transformations.

You can use this preferences page to specify additional directories where custom publishing templates are stored. The templates stored in these directories will appear in the preview pane in the Templates tab of the transformation scenario dialog box, along with all the built-in templates.

DITA Logging Preferences

To access the DITA Logging preferences page, open the *Preferences* dialog box ([Options > Preferences](on page 79)) and go to DITA > Logging. This preferences page includes the following sections and options:

**Show console output**

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
• **Always** - Displays the console output log, regardless of whether or not the build fails.

**Show the following types of messages in a new tab**

This section allows you to specify which types of messages will be displayed in separate tabs in the message panel at the bottom of the editor if a DITA transformation results in errors or warnings. You can choose whether or not to display the following types of messages:

- DITA-OT errors
- DITA-OT warnings
- DITA-OT info
- FOP errors
- FOP warnings
- FOP info
- XSLT problems

**Data Sources Preferences**

To configure the **Data Sources** preferences, open the **Preferences** dialog box (**Options > Preferences**) and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see **Download Links for Database Drivers** (on page 234).

**Connection Wizards Section**

**Create eXist-db XML connection**

Click this link to open the dedicated **Create eXist-db XML connection** dialog box (**on page 2230**) that provides a quick way to create an eXist connection.

**Data Sources Section**

This section allows you to add and configure data sources.

Figure 31. Data Sources Preferences Panel
The following buttons are available at the bottom of the **Data Sources** panel:

**New**

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

Figure 32. Data Sources Drivers Dialog Box

The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.
• ✉ Help button - Opens the User Manual at the list of the sections (on page 234) where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.

• Driver files (JAR, ZIP) - Lists download links for database drivers (on page 234) that are necessary for accessing databases in Oxygen XML Editor.

• Add Files - Adds the driver class library.

• Add Recursively - Adds driver files recursively.

• Remove - Removes the selected driver class library from the list.

• Detect - Detects driver file candidates.

• Stop - Stops the detection of the driver candidates.

• Driver class - Specifies the driver class for the data source driver.

Edit

Opens the Data Sources Drivers dialog box for editing the selected driver. See above the specifications for the Data Sources Drivers dialog box. To edit a data source, there must be no connections using that data source driver.

Duplicate

Creates a copy of the selected data source.

Delete

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

Connections Section

This section allows you to add and configure data source connections.

Figure 33. Connections Preferences Panel

The following buttons and options are available at the bottom of the Connections panel:

• New
Opens the **Connection** dialog box that allows you to configure a new database connection.

**Figure 34. Connection Dialog Box**

The following options are available in the **Connection** dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the **Data Source Drivers** dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Environment home directory** - Specifies the home directory (only for a Berkeley database).
- **Verbosity** - Sets the verbosity level for output messages (only for a Berkeley database).
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

**Edit**

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

**Duplicate**

Creates a copy of the selected connection.

**Delete**

Deletes the selected connection.

**Move Up**

Moves the selected connection up one row in the list.

**Move Down**

Moves the selected connection down one row in the list.

**Limit the number of cells**

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer view** (on page 2200) for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer view** (on page 2200), a warning dialog box will inform you that the table is only partially shown.

**Maximum number of children for container nodes**

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer view** (on page 2198) would display all the contained resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. You can navigate to other contained resources from the same container by using the **Up** and **Down** buttons in the **Data Source Explorer view** (on page 2198). This limited number is set in the field. The default value is 200 nodes.

**Table Filters Preferences**

The **Table Filters** preferences page allows you to choose the types of tables to be shown in the **Data Source Explorer view** (on page 2198). To open this preferences page, open the **Preferences** dialog box (Options > Preferences) (on page 79) and go to **Data Sources > Table Filters**.
You can choose to display the following types of tables:

- Alias
- Global Temporary
- Local Temporary
- Synonym
- System Table
- Table
- View

Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see https://www.oxygenxml.com/database_drivers.html.

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Editor:

- **Berkeley DB XML database** - Copy the `jar` files from the Berkeley database install directory into the Oxygen XML Editor install directory as described in the procedure for configuring a Berkeley DB data source (on page 2223).

- **IBM DB2 Pure XML database** - Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor for configuring a DB2 data source (on page 2205).

- **eXist database** - Copy the `jar` files from the eXist database install directory to the Oxygen XML Editor install directory as described in the procedure for configuring an eXist data source (on page 2230).

- **MarkLogic database** - Download the MarkLogic driver from MarkLogic Community site.

- **Microsoft SQL Server 2005 / 2008 database** - Download the appropriate MS SQL JDBC driver from the Microsoft website.

- **Oracle 11g database** - Go to http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html and download the Oracle 11g JDBC driver called `ojdbc6.jar`.

- **PostgreSQL 8.3 database** - Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.

SVN Preferences

To configure the options for the SVN client tool, open the Preferences dialog box (Options > Preferences) (on page 79) and go to SVN. Some other preferences for the embedded SVN client
tool can be set in the global files called **config** and **servers**. These files contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their computer login account. To open these files for editing, launch the embedded SVN client tool (Tools > SVN Client) and select Global Runtime Configuration > Edit ‘config’ file or Global Runtime Configuration > Edit ‘servers’ file from the SVN client Options menu.

Figure 35. SVN Preferences Panel

The following SVN options can be configured in this preferences page:

**Enable symbolic link support (available only on Mac OS X and Linux)**

Apache Subversion™ has the ability to put a symbolic link under version control, via the usual SVN add command. The Subversion repository has no internal concept of a symbolic link. It stores a versioned symbolic link as an ordinary file with a svn:special property attached. On Unix/Linux, the SVN client sees the property and translates the file into a symbolic link in the working copy. If the symbolic link support is disabled, the versioned symbolic links appear as a text file instead of symbolic link.

**Note:** Windows file systems have no symbolic links, so a Windows client will not do any such translation and the object appears as a normal file.

**Important:** It is recommended to disable symbolic links support if you do not have versioned symbolic links in your repository, since the SVN operations will work faster. However, you should not disable this option when you do have versioned symbolic links in repository. In that case a workaround would be to reference the working copy by its real path, instead of a path that includes a symbolic link.

**Allow unversioned obstructions**

Controls how to handle a situation where working copy resources are ignored/unversioned when performing an update operation and incoming files (from the repository) with the same name and location intersect with those being ignored/unversioned. If the option is selected, the incoming items will become BASE revisions of
the ones already present in the working copy, and those present will be made versioned resources and will be marked as modified (exactly as if the user first made the update operation and then modified the files). If the option is not selected, the update operation will fail when encountering files in this situation, possibly leaving other files not updated. By default, this option is selected.

**Use unsafe copy operations**

Sometimes when the working copy is accessed through Samba and the SVN client cannot make a safe copy of the committed file due to a delay in getting a write permission, the result is that the committed file will be saved with zero length (the content is removed) and an error will be reported. In this case, this option should be selected so that the SVN client does not try to make the safe copy.

**Results Console**

Specifies the maximum number of lines displayed in the **Console** view. The default value is 1000.

**Annotations View**

Sets the color used in the editor panel for highlighting all the changes contributed to a resource by the revision selected in the **Annotations view** (on page 2924).

**Revision Graph**

Enables caching for the action of computing a revision graph. When a new revision graph is requested, one of the caches from the previous actions may be used that will avoid running the whole query again on the SVN server. If a cache is used, it will finish the action much faster.

**Working Copy Preferences**

To configure the **Working Copy** preferences, open the **Preferences** dialog box (Options > Preferences) (on page 79) and go to SVN > **Working Copy**. The options in this preferences page are specific to SVN working copies and they include the following:

**Working copies location**

Allows you to define a location where you keep your working copies. This location is automatically suggested when you checkout a new working copy.

**Working copy administrative directory**

Allows you to customize the directory name where the SVN entries are kept for each directory in the working copy.

**When loading an old format working copy**

You can instruct the SVN client to do one of the following:
- **Always ask** - You are notified when such a working copy is used and you are allowed to choose what action to be taken (whether or not to upgrade the format of the current working copy).
- **Never upgrade** - Older format working copies are left untouched. No attempt to upgrade the format is made.

Note: SVN 1.6 and older working copies still need to be upgraded before loading them.

**Enable working copy caching**

If selected, the content of the working copies is cached for refresh operations.

**Automatically refresh the working copy**

If selected, the working copy is refreshed from cache. Only the new changes (modifications with a date/time that follows the last refresh operation) are refreshed from disk. This option is not selected by default.

**Allow moving/renaming mixed revision directories**

If selected, Oxygen XML Editor will allow you to move or rename a directory even if its child items have a different revision. Otherwise, an error message is displayed when there are multiple revisions to avoid unnecessary conflicts. It is recommended to leave this option deselected and to Update the subtree to a single revision before moving or renaming it.

**When synchronizing with repository**

The action that will be executed automatically after the Synchronize action. The possible actions are:

- **Always switch to 'Modified' mode** - The Synchronize action is followed automatically by a switch to Modified mode of Working Copy view, if All Files mode is currently selected.
- **Never switch to 'Modified' mode** - Keeps the currently selected view mode unchanged.
- **Always ask** - The user is always asked if they want to switch to Modified mode.

**Application global ignores**

Allows you to set file patterns that may include the * and ? wildcards for unversioned files and folders that must be ignored when displaying the working copy resources in the Working Copy view (on page 2902). These patterns are case-sensitive. For example, *.txt matches file.txt, but does not match file.TXT.
Diff Preferences

To configure the SVN Diff options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Diff.

The following option is available:

**Compare With External Application**

Specifies an external application to be launched for compare operations in the following cases:

- When two history revisions are compared.
- When the working copy file is compared with a history revision.
- When a conflict is edited.

The parameters \$\text{firstFile} and \$\text{secondFile} specify the positions of the two compared files in the command line for the external diff application. The parameter \$\text{ancestorFile} specifies the common ancestor (that is, the BASE revision of a file) in a three-way comparison. The working copy version of a file is compared with the repository version, with the BASE revision (the latest revision read from the repository by an Update or Synchronize operation) being the common ancestor of these two compared versions.

⚠️ **Important:** If the path to the external compare application includes spaces (or any of the subsequent options or arguments), then each of these paths or tokens must be double-quoted for the Oxygen XML Editor to correctly parse and identify them. For example, `C:\Program Files\compareDir\app name.exe` must be written as "C:\Program Files\compareDir\app name.exe".

Messages Preferences

The Messages preferences page allows you to disable certain warning messages that may appear in the application. To configure these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to SVN > Messages.

This preferences page allows you to disable the following warning messages:

- **Show confirmation dialog when using the "Update All" action**
  
  Allows you to avoid performing accidental update operations by requesting you to confirm them before execution.

- **Show confirmation dialog for drag and drop actions in Working Copy**
  
  This option avoids doing a drag and drop when you just want to select multiple files in the Working Copy view.
Show warning dialog when editing conflicts

When the Edit Conflicts action is executed, a warning dialog box notifies you that the action overwrites the conflicted version of the file created by an update operation. The conflicted file is overwritten with the version of the same file that existed in the working copy before the update operation and then proceeds with the visual editing of the conflicting file (on page 2845).

Show warning dialog when "svn:externals" definitions are ignored

A warning dialog box is displayed when "svn:externals" definitions are ignored before performing any operation that updates resources of the working copy (such as Update and Override and Update).

Diff Preferences

The Diff Preferences Page has sub-pages for configuring File Comparisons and Directory Comparisons.

Files Comparison Preferences

To configure the Files Comparison options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Diff > Files Comparison.

This preferences page allows you to configure the following options:

Enable file comparison in Author mode

When selected, a visual Author mode is available in the file comparison tool. It displays the files in a visual mode similar to the Author editing mode in Oxygen XML Editor/Author. This visual mode is available when both compared files are detected as being XML and from a recognized document type.

Ignore Whitespaces (Not applicable for the visual Author comparison mode)

If selected, before performing the comparison, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces.

Note: If the Ignore Whitespaces checkbox is selected, comparing the a b sequence with a b , Oxygen XML Editor finds no differences, because after normalization, all whitespaces from the first sequence are collapsed into a single space character. However, when comparing a b with ab (no whitespace between a and b ), Oxygen XML Editor signals a difference.

Two-Way Diff section
Default algorithm

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in Author mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in Author mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in Author mode.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in Author mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than XML Accurate.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Three-Way Diff section

Default algorithm

The default algorithm used for performing a three-way comparison. The following options are available:
• **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Algorithm strength**

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

**Show pseudo conflicts**

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

**XML Diff section**

**Ignore (Some of these options are not applicable for the visual Author comparison mode)**

Allows you to specify the types of XML nodes that will be ignored in the file comparison for the **XML Fast** and **XML Accurate** algorithms.

**Ignore nodes by XPath (Not applicable for the visual Author comparison mode)**

If selected, you can enter an XPath expression (on page 2182) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. The XPath expression specified in this option is used as the default ignore instructions only when the application is started. If you enter an XPath expression in the similar option on the **Diff Files** toolbar, that expression will be used instead.

**Merge adjacent differences (Not applicable for the visual Author comparison mode)**
If selected, the application considers two adjacent differences as one when the differences are painted in the side-by-side editors. If not selected, every difference is represented separately.

**Mark end tags as different for modified elements (Not applicable for the visual Author comparison mode)**

If selected, end tags of modified elements are also presented as differences. Otherwise, only the start tags are presented as differences.

**Ignore expansion state for empty elements (Not applicable for the visual Author comparison mode)**

If selected, empty elements in both expansion states are considered matched (that is `<element/>` and `<element></element>` are considered equal).

### Appearance Preferences

To configure the appearance options for the Files Comparison tool, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Diff > Files Comparison > Appearance. This preferences page offers the following options:

#### Figure 36. Files Comparison Appearance Preferences Panel

![Appearance Preferences Panel](image)

**Line wrap**

Wraps the lines presented in the two diff panels at the right margin of each panel, so no horizontal scrollbar is necessary.

**Incoming color**

Specifies the color used on the vertical bar for incoming changes.

**Outgoing color**

Specifies the color used on the vertical bar for outgoing changes.

**Conflict color**

Specifies the color used on the vertical bar for conflicts between the compared files.
Directories Comparison Preferences

To configure the *Directories Comparison* preferences, open the Preferences dialog box *(Options > Preferences)* *(on page 79)* and go to Diff > Directories Comparison.

Figure 37. Diff Preferences Page

You can specify the following options for the directories comparison tool:

**Compare files by**

Controls the method used for comparing two files:

- **Content** - The file content is compared using the current diff algorithm *(on page 240)*. This option is applied for a pair of files only if that file type is associated with a built-in editor type (either associated by default or associated by the user when prompted to do so on opening a file of that type for the first time).

You can use the **Configure content comparison** link to open the Files Comparison preferences page *(on page 239)* where you can configure options for comparing files. However, the Ignore nodes by XPath option is ignored when using the Compare Directories tool.

- **Binary Compare** - The files are compared at byte level.
- **Timestamp (last modified date / time)** - The files are compared only by their last modified timestamp.

**Look in archives**

If selected, known archive types *(on page 245)* are considered directories and their content is compared just like regular files.

**Navigation**
This options control the behavior of the differences traversal actions (Go to previous modification, Go to next modification) when the first or last difference in a file is reached:

- **Ask what to do next** - A dialog box is displayed asking you to confirm that you want the application to display modifications from the previous or next file.
- **Go to the next/previous file** - The application opens the next or previous file without waiting for your confirmation.
- **Do nothing** - No further action is taken.

### Appearance Preferences

To configure the appearance options for the Directories Comparison tool, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Diff > Directories Comparison > Appearance.

![Diff Appearance Preferences Panel](image)

- **Added/Deleted** - Color used for marking added or deleted files and folders.
- **Modified** - Color used for marking modified files.

### Archive Preferences

To configure Archive options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Archive.

The following options are available in the Archive preferences page:

**Archive backup options**

Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.
Note: Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

### Archive types

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Editor. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

![Edit Archive Extension Mappings](image)

**Important:** You have to restart Oxygen XML Editor after removing an extension from the table for that extension to not be recognized as an archive extension.

### Store Unicode file names in Zip archives

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

### Plugins Preferences

You can add plugins (on page 3285) that extend the functionality of Oxygen XML Editor. The plugins are shipped as separate packages. To check for new plugins, go to [http://www.oxygenxml.com/oxygen_sdk.html](http://www.oxygenxml.com/oxygen_sdk.html).

A **plugin** consists of a separate sub-folder in the Plugins folder of the Oxygen XML Editor installation folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`). This sub-folder must contain a valid `plugin.xml` file in accordance with the `plugin.dtd` file located in the Plugins folder.

Oxygen XML Editor automatically detects and loads plugins installed correctly in the Plugins folder and displays them in the Plugins preferences page. To configure plugins, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Plugins.
You can use the checkboxes in front of each plugin to enable or disable them. To display the properties of a plugin in the second section of the Plugins preferences page, click the name of the plugin.

Also, you can install a plugin as an add-on. For further details about this, go to Deploying Add-ons (on page 2612)

External Tools Preferences

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. The External Tools preferences page allows you to add and configure these external tools that could be used while working with Oxygen XML Editor. To access this preferences page, open the Preferences dialog box (Options > Preferences) (on page 79) and go to External Tools (or select Configure from the Tools > External Tools menu).

This preferences page presents a list of the external tools that have been configured. You can use the buttons at the bottom of the page to configure the items in the list. Once a tool has been configured, you can open it by selecting it from the Tools > External Tools menu or from the External Tools drop-down menu on the toolbar (the Tools toolbar needs to be selected in the Configure Toolbars dialog box (on page 273)).

How to Configure an External Tool

To configure an external tool in the External Tools preferences page, use any of the following buttons at the bottom of the page:

- **New** - Adds a new external tool to the list.
- **Edit** - Allows you to configure an existing external tool, selected from the list.
- **Duplicate** - Duplicates an existing external tool, selected from the list, to use as a template for configuring a similar tool.

Any of those three buttons opens the External Tools configuration dialog box.

Figure 40. External Tools Configuration Dialog Box
This configuration dialog box includes the following options:

**Name**

The name of tool that will be displayed in the Tools > External Tools menu and in the External Tools drop-down menu on toolbar.

**Description**

A description of the tool displayed as a tooltip where the tool name is used.

**Working directory**

The directory that the external tool will use to store intermediate and final results. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button. You can use one of the following editor variables: 
- `$(cfd)` (on page 281), `$(pd)` (on page 282), `$(oxygenInstallDir)` (on page 282), `$(homeDir)` (on page 282), `$(system(var.name))` (on page 283), `$(date(pattern))` (on page 281), `$(xpath_eval(expression))` (on page 283).

**Command line**

The command line that will start the external tool. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button. You can use one of the following editor variables: 
- `$(homeDir)` (on page 282), `$(home)` (on page 282), `$(cf)` (on page 281), `$(cfne)` (on page 281), `$(cfn)` (on page 281), `$(currentFileURL)` (on page 281), `$(cfd)` (on page 281), `$(cfdu)` (on page 281), `$(tsf)` (on page 283), `$(pd)` (on page 282), `$(pdu)` (on page 282), `$(oxygenInstallDir)` (on page 282), `$(oxygenHome)` (on page 282), `$(frameworksDir)`
Show output messages

When this option is selected, all the messages emitted by the external tool are displayed in the Results view (on page 357). When this option is not selected, only the error messages are displayed. You can also choose the output encoding and content type:

- **Output encoding** - The encoding of the output stream of the external tool that will be used by Oxygen XML Editor to read the output of the tool.
- **Output content type** - A list of predefined content type formats that instruct Oxygen XML Editor how to display the generated output. For example, setting the Output content type to text/xml enables the syntax coloring of XML output.

Error Encoding

The encoding of the error stream of the external tool that will be used by Oxygen XML Editor to read the error stream.

Shortcut key

You can choose a keyboard shortcut that can be used to launch the external tool.

Menu Shortcut Keys Preferences

You can use the Menu Shortcut Keys preferences page to configure shortcut keys for the actions available in Oxygen XML Editor. The shortcuts assigned to actions are displayed in a table in this preference page. To access the full list of shortcut keys, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Menu Shortcut Keys (or simply go to Options > Menu Shortcut Keys).

For a list of the most commonly used shortcuts, see Frequently Used Shortcut Keys (on page 27).

Figure 41. Menu Shortcut Keys Preferences Page
The **Menu Shortcut Keys** preferences page also contains the shortcuts that you define at document type level (on page 104).

**Note:** A shortcut defined at document type level overwrites a default shortcut.

To find a specific action, you can use the filter text field to search through any of the columns in the table. You can also press shortcut key combinations on your keyboard to filter the list and click on a column header to sort that column.

The table includes the following columns or options:

- **Description** - A short description of the action.
- **Category** - A classification of the actions in categories for easier management and more flexibility in assigning multiple keys for the same action.
- **Shortcut key** - The combination of keyboard keys that can be used to launch the action. To add or change a shortcut key, you can either double-click a row or select the row and press the **Edit** button.
- **'Home' and 'End' keys are applied at line level** (available on Mac OS X only) - Controls the way the HOME and END keys are interpreted. If selected, the default behavior of these keys is overridden and the cursor only moves on the current line.

### How to Assign a Shortcut Key or Edit an Existing Shortcut

To assign a shortcut key to an action or edit an existing shortcut configuration, follow these steps:
1. Select the action in the table.
2. Click the **Edit** button.

**Step Result:** The **Shortcut key** configuration dialog box is displayed.

![Shortcut Key Configuration Dialog Box](image)

3. Press the desired shortcut keys on your keyboard.
4. If you need the shortcut to work on multiple platforms, select the **Enable platform-independent shortcut keys** option. In this case, the following modifiers are used:
   - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
   - M2 represents the **Shift** key.
   - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
   - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
5. Click **OK** to save your configuration.

**Troubleshooting:** If you encounter problems with keyboard shortcuts not working as expected, see *Keyboard Shortcuts Result in Unexpected Behavior (on page 2970)* or *Keyboard Shortcuts Do Not Work At All (on page 2969).*

**Related Information:**

- **Frequently Used Shortcut Keys (on page 27)**

### File Types Preferences

Oxygen XML Editor offers built-in editing support for a wide variety of file types, but you can also add new file extensions and associate them with whatever editor type fits your needs. The associations set here between a file extension and the type of editor will determine which editor will be opened for editing purposes when that type of file is created or opened.

To configure the **File Types** options, open the **Preferences** dialog box (**Options > Preferences**) (on page 79) and go to **File Types**.

![File Types Preferences Page](image)
The table contains the following columns:

- **Extension** - The extensions of the files that will be associated with an editor type.
- **Editor** - The type of editor which the extensions will be associated with. Some editors provide easy access to frequent operations via toolbars (XML editor, XSL editor, DTD editor) while others provide just a syntax highlight scheme (Java editor, SQL editor, Shell editor, etc.).

If the editor set here is not one of the XML editors (XML editor, XSL editor, XSD editor, RNG editor, WSDL editor) then the encoding set in the Encoding for non XML files option (on page 123) is used for opening and saving a file of this type.

The files that match the **Ant build patterns** will be associated with the Ant editor.

The files that match the **Binary file patterns** patterns are handled as binary and opened in the associated system application. Also, they are excluded from the following actions available in the Project view (on page 333): File/Replace in Files, Check Spelling in Files, Validate.

### Open/Find Resource Preferences Page

You can configure various options that pertain to the Open/Find Resource dialog box (on page 733) and Open/Find Resource view (on page 344). To access these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Open/Find Resource.

The following options are available in this Open/Find Resource preferences page:

- **Refresh index when opening a map in DITA Maps Manager**
If selected, DITA maps that are opened in the DITA Maps Manager will automatically be re-indexed.

**Limit search results to**

Specifies the maximum number of results that are displayed in the Open/Find Resource dialog box/view (on page 733).

**Enable searching in content**

This option is selected by default and it allows you to use the Open/Find Resource dialog box/view (on page 733) to search in content or reviews, as well as in file paths. If this option is not selected, you can only use the Open/Find Resource feature to search in file paths.

**Content search scope section**

**Ignore content of these files**

Allows you to select specific directories, files, or file types that are ignored when you perform a search. For example, *.txt ignores all the .txt files, */topics/* ignores all the files from the topics directory, regardless of their depth, and file:/C:/tmp/* ignores everything from the tmp directory.

**Index the content of remote resources**

Controls the indexing of resources that are not local. For example, the resources referenced in a DITA map (on page 3281) opened from a remote server (from a CMS or from a WebDAV location) are not indexed by default. To index the content of these resources, select this option.

> **Note:** Selecting this option may lead to delays when the indexing is computed.

**Content search options section**

**Content language**

Use this option to specify a language for the search engine to use for the current document. This is helpful if you have multiple languages within the content of a document. The search engine will use a set of stop words and analyzers tuned specifically for that specific language. By default, it is mapped to the UI language specified in the Global preferences page (on page 81). Therefore, you need to change this option only if the language of the text you want to perform the search in differs from the UI language.

> **Tip:** If you select <Generic language (no stemming)> from the drop-down list, no word stemming is performed when creating the index. This
might be useful if your content has many technical terms that should be indexed as they are.

**Stop words**

A list of *stop words* that will be filtered out of the search processing. The list is automatically populated based upon the specified Content language, but you can add or remove words from the list.

**When searching in content, return**

This option specifies how matches are returned when doing searches in content. You can choose between two options:

- **Exact matches** - The search results match the exact whole words that you enter in the search field of the Open/Find Resource dialog box/view.
- **Prefix matches** (default) - The search results match documents that contain words starting with the search terms. For instance, searching for “pref page” will also find documents containing “preference page”.

**Automatically join search terms using:**

Allows you to select the default boolean operator that Oxygen XML Editor applies when you perform a search. For example, if the AND operator is selected and you search for "car assembly", the matches must contain both of the words. If you choose OR, the matches must contain one of the selected search terms and results that contain both words are promoted to the top of the list.

**Enable XML-aware searching**

When selected, you can perform XML-specific searches (on page 736) for XML elements and attributes.

**Note:** Selecting this option may slow down the indexing of your documents and increase the index size on the disk.

**Index files with size less than (KB)**

Since indexing can be slowed down when the Enable XML-aware searching option (on page 253) is active, you can use this option to set a maximum file size to be indexed.

**Stop Words**

A list of comma separated *stop words*, meaning that the words added in this list are filtered out prior to processing a search query.
Related Information:

- Open/Find Resource View (on page 344)
- Open/Find Resource Dialog Box (on page 733)

Custom Editor Variables Preferences

An editor variable (on page 276) is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the built-in editor variables (on page 276).

Custom editor variables are created and configured in the Custom Editor Variables preferences page. To access this page, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Custom Editor Variables.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable Name, its Value, and its Description. The create a new variable, click the New button at the bottom of the table and define your custom editor variable in the subsequent dialog box. To edit an existing custom editor variable, click the Edit button and configure the variable in the subsequent dialog box. You can also use the Delete button to remove custom editor variables that are no longer needed.

Figure 44. Custom Editor Variables Table
Network Connection Settings Preferences

This section presents the options available in the Network Connection Settings preferences pages.

Proxy Preferences

Some networks use proxy servers to provide internet services to LAN clients. Therefore, clients behind the proxy may only connect to the Internet via the proxy service. If you are not sure if your computer is required to use a proxy server to connect to the Internet or you do not know the proxy parameters, consult your network administrator.

To configure the Proxy options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Network Connection Settings > Proxy. The following options are available:

- **Proxy section**
  Specifies how HTTP(S) connections go through the proxy server. You can choose between the following three options:

  - **Direct connection** - HTTP(S) connections will go directly to the target host without going through a proxy server.
  - **Use system settings** (default setting) - HTTP(S) connections will go through the proxy server set in the operating system.
  - **Manual proxy configuration** - HTTP(S) connections will go through the proxy server specified in the Web Proxy (HTTP/HTTPS) section.

  **Attention:** The system settings for the proxy cannot be read correctly from the operating system on some Linux systems. The system settings option should work properly on Gnome-based Linux systems, but it does not work on KDE-based ones as the Java virtual machine does not offer the necessary support yet.

- **Web Proxy (HTTP/HTTPS) section**
  - **Address**
    The address of the proxy server used for manual configurations.
  - **Port**
    The port of the proxy server used for manual configurations.
  - **No proxy for**
    Specifies the hosts that the connections must not go through a proxy server. A host needs to be written as a fully qualified domain name (for example, myhost.example.com) or as a domain name (for example, example.com). Use a comma to separate multiple hosts.
User
The user name for authentication with the proxy server.

Password
The password for authentication with the proxy server.

SOCKS Proxy section

Address
The address of a SOCKS proxy that all connections will pass through. If this field is empty, the connections do not use a SOCKS proxy.

Port
The port of a SOCKS proxy that all connections will pass through.

Using a Proxy Auto-Configuration Script (PAC)

If you have set up the path to a Proxy auto-configuration script in your system, Oxygen XML Editor cannot detect this setting out of the box.

You can create a new folder (`{OXYGEN_INSTALL_DIR}/lib/endorsed`) in which you should copy two additional Java libraries: `deploy.jar` and `plugin.jar`. These libraries can be found in the `{OXYGEN_INSTALL_DIR}/jre/lib` folder if the application came with a bundled Java VM (otherwise, in the Java VM installation used to run the application).

HTTP(S)/WebDAV Preferences

To set the HTTP(S)/WebDAV preferences, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Network Connection Settings > HTTP(S)/WebDAV. The following options are available:

Maximum number of simultaneous connections per host

Defines the maximum number of simultaneous connections established by the application with a distinct host. Servers might consider multiple connections opened from the same source to be a Denial of Service attack. You can avoid that by lowering the value of this option.

Note: The minimum value that can be set in this option is 5.

Read Timeout (seconds)

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

Enable HTTP 'Expect: 100-continue ' handshake (for HTTP/1.1 protocol)
Activates *Expect: 100-Continue* handshake. The purpose of the *Expect: 100-Continue* handshake is to allow a client that is sending a request message with a request body to determine if the origin server is willing to accept the request (based on the request headers) before the client sends the request body. The use of the *Expect: 100-continue* handshake can result in noticeable performance improvement when working with databases. The *Expect: 100-continue* handshake should be used with caution, as it may cause problems with HTTP servers and proxies that do not support the HTTP/1.1 protocol.

**Use the 'Content-Type' header field to determine the content type**

When selected, Oxygen XML Editor tries to determine a resource type using the **Content-Type** header field. This header indicates the *Internet media type* of the message content, consisting of a type and subtype. For example:

```
Content-Type: text/xml
```

When unchecked, the resource type is determined by analyzing its extension. For example, a file ending in `.xml` is considered to be an XML file.

**Automatic retry on recoverable error**

When selected, if an HTTP error occurs when Oxygen XML Editor communicates with a server via HTTP (for example, sending or receiving a SOAP request to or from a Web services server) and the error is recoverable, Oxygen XML Editor tries to re-send the request to the server.

**Automatically accept a security certificate, even if invalid**

When selected, the HTTPS connections that Oxygen XML Editor attempts to establish with will accept all security certificates, even if they are invalid.

⚠️ **Important**: By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate’s issuer.

**Lock WebDAV files on open**

If selected, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

**(S)FTP Preferences**

To configure the **(S)FTP** options, open the **Preferences** dialog box (Options > Preferences) (on page 79) and go to **Network Connection Settings > (S)FTP**. You can customize the following options:

Figure 45. **(S)FTP Configuration Preferences Panel**
• **Encoding for FTP control connection** - The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding Oxygen XML Editor will use it for communication. Otherwise, it will use ISO-8859-1.

• **Public known hosts file** - File containing the list of all SSH server host keys that you have determined are accurate. The default value is `{homeDir}/.ssh/known_hosts`.

• **Private key file** - The path to the file containing the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in the Open URL dialog box (on page 693).

• **Passphrase** - The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol. The user / password method of authentication has precedence if it is used in the Open URL dialog box (on page 693).

Trusted Hosts Preferences

This preferences page contains a list of domains that have been identified as trusted. You can add or remove domains from the list and Oxygen XML Editor will allow connections to the listed hosts without requesting user confirmation.

To configure the **Trusted Hosts** options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to **Network Connection Settings > Trusted Hosts**. The following options are available:

• **New** - Allows you to manually add a new entry to the list of trusted hosts.

  Tip: You can specify a specific port at the end of the URL (for instance, www.example.com:8080). Otherwise, if no port is specified, connections will be allowed on all ports for the particular host.

• **Delete** - Allows you to remove an entry from the list of trusted hosts.
SSH Preferences

To configure the SSH options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Connection settings > SSH. The following options are available:

SSH

Specifies the command line for an external SSH client that will be used when connecting to a SVN+SSH repository. Absolute paths are recommended for the SSH client executable and the file paths given as arguments (if any). Depending on the SSH client used and your SSH server configuration, you may need to specify the user name and/or private key/passphrase in the command line. You can also choose whether to use the Default SVN user (the same user name as the SSH client user) or Prompt for a SVN user for SVN repository operations whenever SVN authentication is required. For example, on Windows the following command line uses the plink.exe tool as the external SSH client for connecting to the SVN repository with SVN+SSH:

```
C:\plink-install-fold\plink.exe -l username -pw password -ssh -batch host_name_or_IP_address_of_SVN_server
```

XML Structure Outline Preferences

To configure options regarding the Outline view (on page 347), open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML Structure Outline. It contains the following options:

- **Preferred attribute names for display**

  The preferred attribute names when displaying the attributes of an element in the Outline view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

- **Enable outline drag and drop**

  Drag and drop is disabled for the tree displayed in the Outline view only if there is a possibility to accidentally change the structure of the document by such operations.

Views Preferences

The Views preferences page allows you to configure some options regarding certain views. To edit these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Views.

The following options are available:

- **Project view section**
Enable drag-and-drop in Project view

Enables drag and drop support in the Project view (on page 333). It should be disabled only if there is a possibility of accidentally changing the structure of the project by drag and drop actions.

Information view section

Maximum number of lines

Specifies the maximum number of lines that can be written in the Information view (on page 822).

Elements view section

Show only items allowed at cursor position

If selected, when editing in Author mode, only the elements that are allowed at the current cursor position will be listed in the Elements view (on page 432). If not selected, two additional tabs (Before and After) will be displayed at the bottom of the view (in Author mode only). These tabs list the elements that are allowed before or after the element at the current cursor position.

Messages Preferences

The Messages preference page allows you to specify whether or not certain messages are displayed. To configure these options, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Messages.

The following warning messages can be enabled or disabled:

Show Java vendor warning at startup

If this option is selected, Oxygen XML Editor displays a warning on startup if a non-recommended version of the Java virtual machine is being used.

Show confirmation dialog when moving resources

Specifies whether or not to display a confirmation dialog box when you move a resource in the Project view (on page 333), Data Source Explorer view (on page 2198), and Archive Browser (on page 2191). In the confirmation dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select Restore Defaults at the bottom of this preferences page.

Show warning when adding resources already included in the project

Specifies whether or not to display a dialog box that warns you if you try to add files that already exist in your project.
Show warning for document size limit for bidirectional text, Asian languages, and other special characters

Specifies whether or not to display a warning message when an opened file that contains bidirectional characters is too large and bidirectional support is disabled.

Show warning message when changing the text orientation in the editor

Specifies whether or not to display a warning message when you change the text orientation in the editor.

Show warning when editing long expressions in the XPath toolbar

Specifies whether or not to display an information dialog box that allows you to specify if you want to use the XPath/XQuery Builder (on page 2185) view when editing long XPath expressions.

Show MathFlow recommendation

Specifies whether or not to display an information dialog box that recommends using the MathFlow Editor (on page 1058) to edit MathML equations.

Show SFTP certificate warning dialog

Specifies whether or not to display a warning dialog box each time the authenticity of the SFTP server host cannot be established.

Show Enterprise license related message when trying to connect to a Microsoft SharePoint server

Specifies whether or not to display an error message if you try to connect to a Microsoft SharePoint server without having the proper license.

Convert DB Structure to XML Schema

When tables from a database schema are selected in the Select database table section of the Convert DB Structure to XML Schema dialog box (on page 1328) and another database schema is expanded, a confirmation is needed since the previous selection will be discarded. This option specifies whether or not you are always asked if you want the other database schema to always be expanded without asking you, or it is never expanded.

Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions

Specifies whether or not to display a dialog box that allows you to choose a specific encoding whenever you use the Encode Selection or Decode Selection actions for Base64 (on page 876), Base32 (on page 877), or Hex conversions (on page 878). In the dialog box, there is an option to choose to not show this dialog box in the future. To reset that behavior, simply select Restore Defaults at the bottom of this preferences page.
Configuring Options

A set of options controls the behavior of Oxygen XML Editor, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Editor includes several distinct layers of option values.

Figure 46. Option Lookup Priority

The option layers are as follows (sorted from high priority to low):

- **Project Options** *(on page 266)*
  
  Allows project managers to establish a set of rules for a specific project. These rules standardize the information exchanged by the team members (for example, if the project is stored in a repository, a common set of formatting rules avoid conflicts that may appear when documents modified by various team members are committed to the repository).

- **Global Options** *(on page 265)*
  
  Allows individual users to personalize Oxygen XML Editor according to their specific needs.

- **Customized Default Options** *(on page 262)*
  
  Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

  **Note:** Once this layer is set, it represents the initial state of Oxygen XML Editor when an end-user selects the **Restore defaults** *(on page 80)* or **Reset Global Options** *(on page 268)* actions.

- **Default Options**
  
  The predefined default values, tuned so that Oxygen XML Editor behaves optimally in most working environments.

  **Important:** If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.
Customizing Default Options

Oxygen XML Editor has an extensive set of options that you can configure. When Oxygen XML Editor in installed, these options are set to default values. You can provide a different set of default values for an installation using an XML options file.

Creating an XML Options File

To create an options file, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Editor and open the Preferences dialog box (Options > Preferences) (on page 79).
3. Go through the options and set them to the desired defaults. Make sure that Global Options (on page 3283) is selected in each page.
4. Click OK and close the Preferences dialog box.
5. Go to Options > Export Global Options to create an XML options file.

Controlling Which Options are Stored in the Default Options File

If you want to control exactly which option pages will be stored in the default options file, you can choose to attach them to a project file (.xpr file extension) by following this procedure:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the Project view (on page 333), create a project or open an existing one.
3. Open the Preferences dialog box (Options > Preferences) (on page 79).
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to Project Options (on page 3286) in each page.

Note: Some pages do not have the Project Options button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.
5. Click OK and close the Preferences dialog box.

All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

Note: The project file extension (.xpr) must be preserved when the file is distributed to others.
**Note:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

**Configuring an Installation to Use Customized Default Options**

There are several methods that you can use to configure an Oxygen XML Editor installation to use the customized default options from the created XML options file.

**Warning:** The disadvantage of customizing the default options is that if the end user manually changes an option, the default value will no longer be used. An alternative would be to use a plugin to impose a set of options *(on page 264)*.

The possible methods for using customized default options during an installation include:

- **Copy the XML Options File to the Installation Directory**

  In the `{OXYGEN_INSTALL_DIR}`, create a folder called `preferences` and copy the created XML options file into it (for example, `{OXYGEN_INSTALL_DIR}/preferences/default.xml`).

- **Specify a Path to the XML Options File in a Startup Parameter**

  Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the startup parameters *(on page 290)*. The path can be specified with any of the following:

  - A URL or file path relative to the application installation folder. For example:
    ```
    -Dcom.oxygenxml.default.options=options/default.xml
    ```
  - A system variable that specifies the file path. For example:
    ```
    com.oxygenxml.default.options=${system(CONFIG)}/default.xml
    ```
  - An environmental variable that specifies the file path. For example:
    ```
    com.oxygenxml.default.options=${env(CONFIG)}/default.xml
    ```

**Impose a Set of Options Using a Plugin**

The Oxygen XML SDK includes a sample Java-based `oxygen-sample-plugin-impose-options` plugin that shows how to impose a set of options for the end users every time the API is called. It is possible to use this plugin to impose options but still allow the end user to change options by calling the API only once, the first time the plugin starts alongside Oxygen XML Editor.
A similar JavaScript-based sample `impose-options` plugin is also available here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins. This plugin imports a fixed set of options (saved in XML format) when Oxygen XML Editor starts.

### Related Information:
- Sharing Application Settings *(on page 266)*

### Storing Global and Project Level Options

When you configure the Oxygen XML Editor options, you can store them globally or bind them to a specific project by choosing the appropriate setting in the preferences pages. They can then be shared with others by exporting the global options *(on page 267)* or by sharing the stored project-level files *(on page 266)*. The same is true with transformation and validation scenarios.

For each preferences page, you can choose between **Global Options** *(on page 265)* and **Project Options** *(on page 266)* depending upon how you want to store the options in that particular preferences page.

*Note:* Some pages do not have the **Project Options** button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

If changes have been made to the options in a preferences page and you switch between **Project Options** and **Global Options**, a dialog box will be displayed that allows you to select one of the following:

- **Overwrite** - The existing options from the current preferences page will be overwritten.
- **Preserve** - The existing options from the current preferences page will be preserved.

![Figure 47. Controlling the Storage Options for the Preferences](image)

### Global Options

By default, **Global Options** is selected in the preferences pages, meaning that the options are stored locally on your computer and are not accessible to other users (unless you export them into an XML options file that can then be shared *(on page 266)*).

Global options are stored locally in option files (for example, `oxyOptionsSa19.1.xml` for a standalone distribution of Oxygen XML Editor version 19.1) located in the following directories:
• Windows (Vista, 7, 8, 10) - [user_home_directory]\AppData\Roaming\com.oxygenxml
• Windows XP - [user_home_directory]\Application Data\com.oxygenxml
• Mac OS X - [user_home_directory]/Library/Preferences/com.oxygenxml
• Linux/Unix - [user_home_directory]/.com.oxygenxml

**Project Options**

If you select **Project Options**, the preferences are stored in the project file (.xpr), which can easily be shared with other users (on page 266).

**Note:** Some pages do not have the Project Options button, since the options they host might contain sensitive data (passwords, for example), unsuitable for sharing with other users.

Related Information:

- Sharing Application Settings (on page 266)
- Customizing Default Options (on page 262)
- Importing/Exporting/Resetting Global Options (on page 268)

**Sharing Application Settings**

There are a variety of ways that you can share the settings in Oxygen XML Editor with other members of your team so that you all use a common set of options. This topic describes various possibilities.

**Share Settings Through a Project File**

Most of the preference pages in Oxygen XML Editor include a **Project Options** (on page 3286) button that allows you to pass changes to the settings to the current project file that is opened in the Project view (on page 333). That project file can then be shared with other users. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have access to the same option configuration that you stored in the project file.

For more information about sharing projects, see Sharing a Project - Team Collaboration (on page 723).
Share Settings by Exporting/Importing Global Options

Oxygen XML Editor includes actions in the Options menu that allow you to export and import the global settings (on page 3283). The Export Global Options action will save the global settings as an XML properties file. You can then share those settings with others by using the Import Global Options action to import that properties file on their computer.

For more information about global options, see Importing/Exporting/Resetting Global Options (on page 268).

Share Settings with a Custom Options File During Installation

When Oxygen XML Editor in installed, all the settings are set to default values. You can customize the set of default values by creating an XML options file that you will use when installing Oxygen XML Editor on each computer. You can then copy the XML options file to the installation directory or specify its path in a startup parameter.

For more information about creating and referencing a custom options file, see Customizing Default Options (on page 262).

Share Settings by Imposing Fixed Options with an API

The Maven-based Oxygen XML SDK includes a sample plugin called ImposeOptions that imposes a fixed set of options when the application starts. This can be achieved by using the PluginWorkspaceProvider.getPluginWorkspace().setGlobalObjectProperty(key, value) API method.

For more information about this API, see PluginWorkspaceProvider Class.

Related Information:

- Sharing a Project - Team Collaboration (on page 723)
- Sharing Transformation Scenarios (on page 1768)
- Sharing Validation Scenarios (on page 1105)
- Customizing Default Options (on page 262)
- Importing/Exporting/Resetting Global Options (on page 268)
Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the **Options** menu. The export operation allows you to save global preferences as an XML properties file and the import operation allows you to load the property file. You can use this file to reload saved options on your computer or to share with others.

The following actions are available in the **Options** menu:

**Reset Global Options**

Restores the preference to the factory defaults or to customized defaults. This action also resets the transformation and validation scenarios to the default scenarios and clears recently used document templates.

**Import Global Options**

Allows you to import a set of **Global Options** from an exported XML properties file. You can also select a project-level options file (.xpr) to import all the **Global Options** that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can select the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

**Export Global Options**

Allows you to export **Global Options** to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the **Review Author** is not included in the export operation.

Oxygen XML Editor automatically stores your global options in an XML properties file. Depending on the platform you are using, this file is located in the following directories:

- `{user-home-folder}\AppData\Roaming\com.oxygenxml` for Windows
- `{user-home-folder}/Library/Preferences/com.oxygenxml` for OS X
- `{user-home-folder}/.com.oxygenxml` for Linux

The name of the options file of Oxygen XML Editor 21.1 is oxyOptionsSa21.1.xml.
Configuring the Layout of the Views and Editors

All the Oxygen XML Editor views available in the Editor (on page 295), XSLT Debugger, and XQuery Debugger (on page 299) perspectives (on page 3285) are dockable (on page 3281) and there are various ways to configure and arrange the layout of the views and editing panes. You can also configure the layout of the toolbars (on page 273).

To open a view, select it from the Window > Show View menu. You can hide a view by closing it with the x button at the top-right corner of the view, or with the Window > Hide current view action.

Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Editor window. Once you create a layout that suites your needs, you can save it from Window > Export Layout. Oxygen XML Editor creates a layout file containing the preferences of the saved layout. To load a layout, go to Window > Load Layout. To reset it, select Window > Reset Layout.

Note: The Load Layout menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the Load Layout menu are also reflected in the Application Layout preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the preferences directory (on page 80) of Oxygen XML Editor.

To gain more editing space in the Oxygen XML Editor window, click Toggle auto-hide in any view. This button sets the view in the auto-hide state, making it visible only as a vertical tab, at the margins of the Oxygen XML Editor window. To display a view in the auto-hide state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere. A view can also be set to a floating state by using the Toggle floating action, making it independent from the rest of the Oxygen XML Editor window.

You can drag the editors and arrange them in any order, both horizontally and vertically.

The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In this example, the personal.xml file was dragged over the personal-schema.xml file. When doing this, a dark gray rectangle marks the rearranged layout.

Figure 48. Drag and Drop Editors
Tile/Stack Editor Actions

You can also tile or stack all open editors, both in the Editor perspective (on page 295) or in the Database perspective (on page 300), using the following actions from the Editor toolbar or Window menu:

- **Tile Editors Horizontally**
  Splits the editing area into horizontal tiles, one for each open file.

- **Tile Editors Vertically**
  Splits the editing area into vertical tiles, one for each open file.

- **Stack Editors**
  The reverse of the Tile Editors Horizontally/Vertically actions. Stacks all open editors.

- **Synchronous Scrolling**
  Select this action to scroll through the tiled editors at the same time.

**Note:** When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging,
you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

**Split Editor Actions**

You can divide the editing area vertically and horizontally using the following actions available in the Editor toolbar and Window menu:

- **Split Editor Horizontally** - Splits the editor horizontally. This is useful for comparing and merging content between two documents.
- **Split Editor Vertically** - Splits the editor vertically. This is useful for comparing and merging content between two documents.
- **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to Window > Maximize/Restore Editor Area.

**Switch or Move Editor Tabs**

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them.

**Switching Editor Tabs**

You can switch between editor tabs by using any of the following methods:

**Mouse and Scroll Wheel**

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many tabs opened to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

**Buttons on the Far-Right of the Tab Stripe**

You can use the arrow buttons (↑↓) on the right side of the tab stripe to scroll to the left or right and the Show List button opens a pop-up window that displays all the opened file tabs and allows you to select and switch to a specific opened file.

**Ctrl + Tab (Command + Tab on OS X) [NOTE: Ctrl + Page Down (Ctrl + Alt + Right Arrow on OS X) does the same]**

Switches to the next opened tab in the order specified in the Order of switching between editor tabs option (on page 83).
**Ctrl + Shift + Tab (Command + Shift + Tab on OS X)** [NOTE: Ctrl + Page Up (Ctrl + Alt + Left Arrow on OS X) does the same]

Switches to the previous opened tab in the order specified in the *Order of switching between editor tabs* option *(on page 83)*.

**Window > Switch editor tab (Ctrl + F9 (Command + F9 on OS X))**

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of file tabs opened and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific opened file tabs.

![Switch Editor Tab Dialog Box](image)

The **Switch Editor Tab** dialog box contains the following options and features:

**Search Filter**

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific opened files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, * to match any sequence of characters or ? to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

**Match all terms**

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

**Include file paths**
If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

**Case sensitive**

If this option is selected, the search operation will be case-sensitive.

**List of Opened File Tabs**

All files that are currently opened are displayed in the main pane of the dialog box. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.

**Moving Editor Tabs**

You can move editor tabs by using any of the following methods:

**Mouse Drag**

You can use your mouse to drag editor tabs to a new location on the tab stripe.

**Ctrl + Alt + Comma**

Moves the current file tab one position to the left.

**Ctrl + Alt + Period**

Moves the current file tab one position to the right.

For more information about configuring the interface of Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/anwjepfAdEk

**Related Information:**

- Configuring Toolbars (*on page 273*)

### Configuring Toolbars

You can configure the toolbars in Oxygen XML Editor to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (Text, Author, Design, or Grid) and in the current perspective (*on page 3285*) (Editor, XSLT Debugger, XQuery Debugger, or Database). You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:
• Right-click any toolbar and select **Configure Toolbars**.
• Select **Configure Toolbars** from the **Window** menu.

Figure 50. Configure Toolbars Dialog Box

The **Configure Toolbars** dialog box provides the following features:

**Filter Text Box**

You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

**Show or Hide Toolbars**

You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current perspective (on page 3285) and editing mode.

**Show or Hide Actions in a Toolbar**

To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

**Add Actions to a Toolbar**

Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from frameworks (on page 3282) or 3rd party plugins (on page 3285).

**Remove Actions from a Toolbar**
You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

**Move Actions in a Toolbar**

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Editor.

**Customize My Toolbar**

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

**Drop-down Menu Actions**

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

![Check Mark](Check Mark) ![Check Mark](Check Mark) [Valdast]

**Configure External Tools Action**

There is a **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

**Note:** If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

**Reset Toolbars**

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

**Reset Layout**

To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

**Export Layout**

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.
Hide Toolbars

You can use the Hide Toolbar action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

Related Information:

- Configuring the Layout of the Views and Editors (on page 268)

Import/Export Transformation or Validation Scenarios

You can export global transformation and validation scenarios into specialized scenarios files. You can import transformation and validation scenarios from various sources (such as project files, framework [on page 3282] option files, or exported scenario files). The import and export scenario actions are available in the Options menu. The following actions are available:

Import Transformation Scenarios

Loads a set of transformation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Transformation Scenarios

Stores a set of global transformation scenarios in a specialized scenarios file.

Import Validation Scenarios

Loads a set of validation scenarios from a project file, framework options file, or exported scenarios file.

Export Global Validation Scenarios

Stores a set of global validation scenarios in a specialized scenarios file.

The Export Global Transformation Scenarios and Export Global Validation Scenarios options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the Import Transformation Scenarios and Import Validation Scenarios actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word import.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of
a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Editor includes a variety of built-in editor variables. You can also create your own custom editor variables (on page 284) by using the Custom Editor Variables preferences page (on page 254).

You can use the following editor variables in Oxygen XML Editor commands of external engines or other external tools, and in various places in the application, such as in transformation scenarios, Author mode operations, and validation scenarios:

- **${activeConditionSet}** - Current active profiling condition set (on page 975) name. If there is no active condition set, the variable will be replaced with an empty string.
- **${af}** - The local file path of the ZIP archive that includes the current edited document.
- **${afd}** - The local directory path of the ZIP archive that includes the current edited document.
- **${afdu}** - The URL path of the directory of the ZIP archive that includes the current edited document.
- **${afn}** - The file name (without parent directory and without file extension) of the zip archive that includes the current edited file.
- **${afne}** - The file name (with file extension, for example .zip or .epub, but without parent directory) of the zip archive that includes the current edited file.
- **${afu}** - The URL path of the ZIP archive that includes the current edited document.
- **${ask(@id)}** - Used in conjunction with the **${ask}** editor variable. The @id parameter is required and identifies the answer from the **${ask}** editor variable with the same ID.

**Example:**

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="topic_lcf_lc4_tdb">
    <title></title>
    <body>
        <data name="${ask('Set a data name', String, 'name', @name)}"></data>
        <p>The name is: ${answer(@name)}</p>
    </body>
</topic>
```

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value') editor variable. You can set the following parameters:
- **message** - The displayed message. Note the quotes that enclose the message.
- **default-value** - Optional parameter. Provides a default value.
- **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the
  $\text{answer(@id)}$ editor variable.
- **type** - Optional parameter, with one of the following values:

  ![Note:](image) The title of the dialog box will be determined by the type of parameter and as follows:
  - For `url` and `relative_url` parameters, the title will be the name of the parameter and the
    value of the 'message'.
  - For the other parameters listed below, the title will be the name of that respective
    parameter.
  - If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: $\text{ask('message', parameter, 'default_value')}$</th>
</tr>
</thead>
</table>
| url       | **Description:** Input is considered a URL. Oxygen XML Editor checks that
the provided URL is valid. |
|           | **Example:**
|           |  ■ $\text{ask('Input URL', url)}$ - The displayed dialog box has the name
|           | Input URL. The expected input type is URL.
|           |  ■ $\text{ask('Input URL', url, 'http://www.example.com')}$ - The displayed
|           | dialog box has the name Input URL. The expected input type is URL.
|           | The input field displays the default value http://www.example.com. |
| password  | **Format:** $\text{ask('message', password, 'default')}$ |
|           | **Description:** The input is hidden with bullet characters. |
|           | **Example:**
|           |  ■ $\text{ask('Input password', password)}$ - The displayed dialog box
|           | has the name 'Input password' and the input is hidden with bullet
|           | symbols.
|           |  ■ $\text{ask('Input password', password, 'abcd')}$ - The displayed dialog
|           | box has the name 'Input password' and the input hidden with bullet
|           | symbols. The input field already contains the default abcd value. |
| generic   | **Format:** $\text{ask('message', generic, 'default')}$ |
|           | **Description:** The input is considered to be generic text that requires no
special handling. |
|           | **Example:**
|           |  ■ $\text{ask('Hello world!')}$ - The dialog box has a Hello world! message
|           | displayed.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| relative_url     | **Format:** `{$ask('message', relative_url, 'default')}`  
|                  | **Description:** Input is considered a URL. Oxygen XML Editor tries to make the URL relative to that of the document you are editing.                  |
|                  | **Note:** If the `$ask` editor variable is expanded in content that is not yet saved (such as an `untitled` file, whose path cannot be determined), then Oxygen XML Editor will transform it into an absolute URL. |
|                  | **Example:**  
|                 | `{$ask('File location', relative_url, 'C:/example.txt')}` - The dialog box has the name `File location`. The URL inserted in the input box is made relative to the current edited document location. |
| combobox         | **Format:** `{$ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}`  
|                  | **Description:** Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given `rendered_value` values. Choosing such a value will return its associated value (`real_value`). |
|                  | **Note:** The `default` parameter specifies the default selected value and can match either a key or a value.                                                                                           |
|                  | **Example:**  
|                 | - `{$ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}` - The dialog box has the name `Operating System`. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. |
|                  | **Note:** In this example, the default value is indicated by the `osx` key. However, the same result could be obtained if the default value is indicated by `Mac OS X`, as in the following example: `{$ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}` |
|                  | - `{$ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}` }
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: <code>${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>editable_combobox</strong></td>
<td>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The 'default' parameter specifies the default selected value and can match either a key or a value.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: <code>${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>radio</strong></td>
<td><strong>Description:</strong> Displays a dialog box that offers a series of radio buttons. Each radio button displays a rendered_value and will return an associated real_value.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The 'default' parameter specifies the default selected value and can match either a key or a value.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}</code> - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>In this example, Mac OS X is the default selected value and if selected, it would return osx for the output.</td>
</tr>
</tbody>
</table>

- `$(author.name)` - Expands to the current author name that is set in the Review preferences page (on page 140).
- `$(caret)` - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.
Note: The $({caret}) editor variable is available only for parameters that take XML content as values. It is replaced with the $({UNIQUE_CARET_MARKER_FOR_AUTHOR}) macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${cf}** - Current file as file path, that is the absolute file path of the current edited document.
- **${cfd}** - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- **${cfdu}** - Current file folder as URL, that is the path of the current edited document up to the name of the parent folder, represented as a URL.
- **${cfn}** - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- **${cfne}** - Current file name with extension. The current file is the one currently opened and selected.
- **${comma}** - Used to display a comma when the actual comma symbol would be considered part of some sort of instruction or delimiter.
- **${configured.ditaot.dir}** - The default directory of the DITA Open Toolkit distribution, as configured in the DITA preferences page (on page 225).
- **${cp}** - Current page number. Used to display the current page number on each printed page in the Editor / Print Preferences page.
- **${currentFileURL}** - Current file as URL, that is the absolute file path of the current edited document represented as URL.
- **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

- **${dbgXML}** - The local file path to the XML document that is current selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
- **${dbgXSL}** - The local file path to the XSL/XQuery document that is current selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).
- **${dita.dir.url}** - A special local contextual editor variable that gets expanded only in the Libraries dialog box that is accessible from the Advanced tab of DITA transformation scenarios. The Libraries dialog box allows you to specify additional libraries (JAR (on page 3283) files or additional class paths) to be used by the transformer. This $({dita.dir.url}) editor variable gets expanded to the value of the dita.dir parameter from the Parameters tab of the DITA transformation scenario.
- **${ds}** - The path of the detected schema as a local file path for the current validated XML document.
- **${dsu}** - The path of the detected schema as a URL for the current validated XML document.
• \$\{env(VAR_NAME)\} - Value of the \textit{VAR\_NAME} environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \$\{system(var.name)\} editor variable.

• \$\{framework(fr\_name)\} - The path (as URL) of the \textit{fr\_name framework}.

• \$\{framework\} - The path (as URL) of the current \textit{framework} directory.

• \$\{frameworkDir(fr\_name)\} - The path (as file path) of the \textit{fr\_name framework}.

\textbf{Note:} Since multiple frameworks might have the same name (although it is not recommended), for both \$\{framework(fr\_name)\} and \$\{frameworkDir(fr\_name)\} editor variables Oxygen XML Editor employs the following algorithm when searching for a given framework name:

\begin{itemize}
  \item All frameworks are sorted, from high to low, according to their \textit{Priority (on page 96)} setting from the Document Type configuration dialog box (on page 95). Only frameworks that have the \textit{Enabled} checkbox selected are taken into account.
  \item Next, if the two or more frameworks have the same name and priority, a further sorting based on the \textit{Storage} setting is made, in the exact following order:
    \begin{itemize}
      \item Frameworks stored in the internal Oxygen XML Editor options.
      \item Additional frameworks added in the Locations preferences page (on page 94).
      \item Frameworks installed using the add-ons support.
      \item Frameworks found in the main framework location (on page 94) (Default or Custom).
    \end{itemize}
\end{itemize}

• \$\{frameworkDir\} - The path (as file path) of the current \textit{framework} directory.

• \$\{frameworks\} - The path (as URL) of the frameworks directory.

• \$\{frameworksDir\} - The path (as file path) of the frameworks directory.

• \$\{home\} - The path (as URL) of the user home folder.

• \$\{homeDir\} - The path (as file path) of the user home folder.

• \$\{i18n(key)\} - Editor variable used only at framework-level to allow translating names and descriptions of \textit{Author} mode actions in multiple actions. For more details, see \textbf{Localizing Frameworks (on page 2333)}.

• \$\{id\} - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.

• \$\{makeRelative(base,location)\} - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

\textbf{Example:}

\begin{verbatim}
\$\{makeRelative($\{currentFileURL\}, $\{dictionaryURL\}#gogu)\}
\end{verbatim}

• \$\{oxygenHome\} - Oxygen XML Editor installation folder as URL.

• \$\{oxygenInstallDir\} - Oxygen XML Editor installation folder as file path.

• \$\{pd\} - The file path to the folder that contains the current project file (.xpr).

• \$\{pdu\} - The URL path to the folder that contains the current project file (.xpr).
• \${pluginDir(pluginID)} - Each plugin has an ID specified in its plugin.xml file. This editor variable expands to the file path of the folder that contains the plugin.xml file where that specific plugin ID is located.

• \${pluginDirURL(pluginID)} - Each plugin has an ID specified in its plugin.xml file. This editor variable expands to the URL path of the folder that contains the plugin.xml file where that specific plugin ID is located.

• \${pn} - Current project name.

• \${ps} - Path separator, which is the separator that can be used on the current platform (Windows, OS X, Linux) between library files specified in the class path.

• \${rootMapDir} - Will be expanded to the current root map parent directory file path.

• \${rootMapDirURL} - Will be expanded to the current root map parent directory URL.

• \${rootMapFile} - Will be expanded to the current root map file path.

• \${rootMapURL} - Will be expanded to the current root map URL.

• \${selection} - The current selected text content in the current edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

• \${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the \${env(VAR_NAME)} editor variable instead.

• \${timeStamp} - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

• \${tp} - Total number of pages in the document. Used to display the total number of pages on each printed page in the Editor / Print Preferences page.

• \${tsf} - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.

• \${uuid} - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.

• \${xmlCatalogFilesList} - A list of file paths that point to all known XML catalog files, separated by semi-colons (;).

• \${xpath_eval(expression)} - Evaluates an XPath expression. Depending on the context, the expression can be:

  ◦ static - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's Output tab.

    Example:

    ```
    \${xpath_eval(upper-case(substring('\${cfn}', 1, 4)))}
    ```

  ◦ dynamic - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an Author mode operation.
Custom Editor Variables

An editor variable (on page 276) can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the Custom Editor Variables preferences page (on page 254). To create a custom editor variable, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Custom Editor Variables.
2. Click the New button at the bottom of the table.
3. Use the subsequent dialog box to specify the Name, Value, and Description for the new editor variable.
4. Click OK to save your configuration.

Related Information:

• Editor Variables (on page 276)
Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior. For information about how to do this, see Setting a system property (on page 292).

**com.oxygenxml.disable.http.protocol.handlers**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** By default, Oxygen XML Editor uses the open source Apache HTTP Client software for HTTP(S) connections. If set to true, the default Java Sun HTTP(S) will be used instead. You will also lose WebDAV support and possibly other related features.

**com.oxygenxml.present.license.reminders**

- **Allowed Values:** true or false
- **Default Value:** true
- **Purpose:** When set to false, Oxygen XML Editor will not display the messages that remind you to renew your Support and Maintenance Pack that covers your current license.

**com.oxygenxml.enable.content.reference.caching**

- **Allowed Values:** true or false
- **Default Value:** true
- **Purpose:** Enables content reference caching.

**com.oxygenxml.eclipse.remove.grid.editing.mode**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** When set to false, Oxygen XML Editor does not show the Grid editing mode when opening an XML document.

**com.oxygenxml.default.java.accessibility**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** System property that can be set to true to force the default detection of java accessibility. If com.sun.java.accessibility.AccessBridge cannot be loaded, Oxygen XML Editor forces the Java accessibility to be disabled.
**com.oxygenxml.floating.license.timeout**

- **Allowed Values:** An integer (minutes)
- **Default Value:** 120
- **Purpose:** Stores the time interval (in minutes) before floating licenses are released in case of application’s inactivity.

**com.oxygenxml.language**

- **Allowed Values:** Language code (for example, en-us)
- **Default Value:** N/A
- **Purpose:** Property that holds the language code set during installation.

**com.oxygenxml.default.options**

- **Allowed Values:** A URL-type relative or absolute path.
- **Default Value:** N/A
- **Purpose:** Provides the path to an XML file containing default application options.
  
  For more details, see [Customizing Default Options](#) on page 262.

**com.oxygenxml.customOptionsDir**

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. For more details, see [Importing/Exporting/Resetting Global Options](#) on page 268.

**com.oxygenxml.ApplicationDataFolder (Windows only)**

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** %APPDATA%
- **Purpose:** When the application runs on Windows, you can set this property to change the location where the application considers that the APPDATA folder is located.

**com.oxygenxml.editor.frameworks.url**

- **Allowed Values:** A URL-type absolute path.
- **Default Value:** OXYGEN_DIR\frameworks
• **Purpose:** Changes the folder where the application considers that the main frameworks are installed. It has the same effect as changing the custom frameworks directory value in the Location preferences page (on page 94).

**com.oxygenxml.MultipleInstances**

- **Allowed Values:** true or false
- **Default Value:** false
- **Purpose:** If set to true, multiple instances of the application are allowed to be started.

**com.oxygenxml.xep.location**

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the FO Processors preferences page (on page 216).

**com.oxygenxml.additional.classpath**

- **Allowed Values:** A list of JAR (on page 3283)-type resources separated by a classpath separator.
- **Default Value:** N/A
- **Purpose:** An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the lib folder.

**com.oxygenxml.user.home** (Windows only)

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** USERPROFILE folder
- **Purpose:** Overwrites the user home directory that was implicitly detected for the application.

**com.oxygenxml.use.late.delegation.for.author.extensions**

- **Allowed Values:** true or false
- **Default Value:** true
- **Purpose:** All Java extensions in a framework configuration are instantiated in a separate class loader. When true, the JAR libraries used in a certain document type will have priority to resolve classes before delegating to the parent class loader. When false, the parent class loader will take precedence.

**com.oxygenxml.stack.size.validation.threads**
• **Allowed Values:** The number of bytes used for validation threads.
• **Default Value:** 5*1024*1024
• **Purpose:** Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger *Thread* stack size to parse complex schemas. The default value should be more than enough.

```
com.oxygenxml.jing.skip.validation.xhtml.data.attrs
```
• **Allowed Values:** true or false
• **Default Value:** true
• **Purpose:** By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.

```
com.oxygenxml.report.problems.url
```
• **Allowed Values:** User-defined URL
• **Default Value:** N/A
• **Purpose:** The URL where a problem reported through the Report Problem dialog box is sent. The report is sent in XML format using the report parameter with the POST HTTP method.

```
com.oxygenxml.parallel.title.computing.threads
```
• **Allowed Values:** Integers
• **Default Value:** 4
• **Purpose:** The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the *DITA Maps Manager* view.

```
com.oxygenxml.hidpi.scaling
```
• **Allowed Values:** Numerical values between 1 and 2 (1, 1.5, and 2 have been tested, and for example, 1.5 is for 150% scaling)
• **Default Value:** N/A
• **Purpose:** Used to override the HiDPI scaling detection to force a specific scaling setting. This is helpful if you encounter scaling detection issues in Windows or Linux.

```
com.oxygenxml.prefer.plugin.classloader.context.loader
```
• **Allowed Values:** true or false
• **Default Value:** true

• **Purpose:** Used to instruct the application to use the plugin class loader when there is code that loads content (usually Xerces code) using the thread's class loader. For instance, if you have a plugin that specifies a certain Xerces version and you want to load that version instead of the one from Oxygen's lib directory.

**Related Information:**

---

**Localizing the User Interface**

Oxygen XML Editor comes with the following built-in languages: English, French, German, Japanese, and Dutch. To change the interface language, go to **Options > Preferences > Global** preferences page, then choose the appropriate language from the **Language** drop-down menu.

You can also localize the interface in another language by creating an interface localization file.

**How to Create an Interface Localization File**

You can change the language of the Oxygen XML Editor user interface by creating an interface localization file:

1. Identify the code for the new language you want to translate the interface. It is composed from a language code (two or three lowercase letters that conform to the ISO 639 standard), followed by an underscore character, and a region code (two or three uppercase letters that conform to the ISO 3166 standard).
2. Write an email to the Oxygen XML Editor support team and ask them to send you the **translation.xml** sample file.
3. Open the **translation.xml** file in Oxygen XML Editor. The file contains all the interface messages that can be translated and is updated at every new release with the latest additions. Here is a small sample of its content:

```xml
<translation>
    <languageList>
        <language description="English" lang="en_US"/>
    </languageList>
    <key value="New">
        <comment>The File/New action. Creates a new document.</comment>
        <val lang="en_US">New</val>
    </key>
</translation>
```
4. Update the `language` element to reflect the new language. For example, set the `description` attribute to `Spanish` and the `lang` attribute to `es_ES`.

5. For each `key` element, translate the `comment` (optional) and `val` elements. For example, set the `lang` attribute to `es_ES`.

   ![Note: After you are finished, the file should look like this:](https://example.com)

   ```xml
   <translation>
   <languageList>
     <language description="Español" lang="es_ES"/>
   </languageList>
   <key value="New">
     <comment>El Archivo / Nueva acción. Crea un nuevo documento.</comment>
     <val lang="es_ES">Nuevo</val>
   </key>
   <key value="New_folder">
     <comment>Crea una carpeta en la vista del proyecto.</comment>
     <val lang="es_ES">Nueva carpeta</val>
   </key>
   …..
   </translation>
   ```

6. Open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and select the Other language option (on page 81). Browse for the translation.xml file.

7. Restart the application.

### Adding New Languages to the Interface

Oxygen XML Editor provides a plugin extension is available in the Oxygen SDK that provides the ability to contribute a new translation language to the interface. By using this plugin extension, you can bundle the new language translation and that new language will be available in the Languages dropdown menu in the Options > Preferences > Global preferences page (on page 81).
Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor

You can set Java Virtual Machine parameters (for example, if you want to increase the maximum amount of memory available) for the Oxygen XML Editor application launchers (on page 291) or command-line scripts (on page 292). You can also create a custom startup parameters file (on page 293).

Setting Parameters for the Application Launchers

Increasing the amount of memory that Oxygen XML Editor uses on Windows and Linux

For Windows and Linux installations of Oxygen XML Editor, the startup launchers for the application and its executable internal tools (Tree Editor, XML Schema Regular Expressions Builder, Large File Viewer, SVN Client, Compare Directories, and Compare Files) include a default .vmoptions file in the installation directory that contain some startup parameters (such the -Xmx parameter, which is used for allocating memory for that particular application). If your installation contains these .vmoptions files, you can edit the parameters in them so that the applications will launch with your desired values. However, if you re-install the application, install an update for the application, or deploy it to other users or machines, those parameters will be reset to their default values.

To increase the memory available to the Oxygen XML Editor application on Windows:

1. Browse the installation directory of Oxygen XML Editor.
2. Locate the -Xmx parameter in the oxygen21.1.vmoptions file. If it is located in a directory where you do not have write access, copy the file to another folder (where you do have write access), modify it there, and then copy it back to the original location.

Note: The parameters from the .vmoptions file are used when you start Oxygen XML Editor with the oxygen launcher (or with the desktop shortcut). If you use the command-line script (oxygen.bat or oxygen.sh) to launch Oxygen XML Editor, modify the -Xmx parameter in that script file.

Tip: For 32-bit Windows, modify the parameter to -Xmx1024m or larger, but not over -Xmx1200m. Make sure you do not exceed your physical RAM. For 64-bit Windows modify the parameter to a larger value (for example, -Xmx2048m). It is recommended to not use more than half of your existing physical RAM.
3. Restart Oxygen XML Editor. Go to Help > About and verify the amount of memory that is actually available (see the JVM Memory Used in the last row in the Copyright tab). If Oxygen XML Editor does not start and you receive and error message saying that it could not start the JVM, decrease the -Xmx parameter and try again.
Increasing the amount of memory that Oxygen XML Editor uses on OS X

To increase the memory available to Oxygen XML Editor on OS X:

1. **Ctrl + Single-Click (Command + Single-Click on OS X)** (or right-click) the Oxygen XML Editor icon in Finder.
2. From the contextual menu, select **Show Package Contents**.
3. Go to the contents directory and edit the **Info.plist** file.

   **Note:** You can open this file either with the **Property List Editor**, or the **TextEdit**.

4. Look for the **VMOptionArray** key and add the **-Xmx** parameter in a new string **element** from the array element. For example, for 1500 MB use the following:

   ```xml
   <string>-Xmx1500m</string>
   ```

   **Tip:** Try not to use more than half of your existing physical RAM if possible.

Setting a system property

To set a system property, edit the application launcher and add a parameter after the `%%OXYGEN_JAVA%%` token, using the following form:

```
-Dproperty.name=value
```

You can also set a system property through a parameter prefixed with `-Doxy` in the command line used to start the application:

```
oxygen20.1.exe "-Doxyproperty.name=value"
```

All system properties are displayed in the **System properties** tab of the **About** dialog box.

To view the list of Oxygen XML Editor system properties, go to **Custom System Properties** (on page 284).

Disabling DPI Scaling

Some users may prefer the look of smaller icons in an HiDPI display. To achieve this, display scaling needs to be disabled for high DPI settings. To disable the DPI scaling, set the following property in .vmoptions (or in the .bat script):

```
sun.java2d.dpiaware=false
```
Setting Parameters in the Command-Line Scripts

If you start Oxygen XML Editor with a command-line script (oxygen.bat/oxygen.sh), you have to add or modify parameters in the java command at the end of the script.

For example, to set the maximum amount of Java memory to 600 MB in Windows, modify the -Xmx parameter like this:

```
java -Xmx600m -Dsun.java2d.nodraw=true ...
```

On Mac OS X, the java command should look like this:

```
java "-Xdock:name=Oxygen"
-Dcom.oxygenxml.editor.plugins.dir="$OXYGEN_HOME/plugins"
-Xmx600m
...
```

On Linux, the Java command should look like this:

```
java -Xmx600m
-"Dcom.oxygenxml.editor.plugins.dir="$OXYGEN_HOME/plugins"
```

Creating Custom Startup Parameters File

You can create your own custom .vmoptions file and the application and the executable tools will automatically include your custom parameters at startup. The following custom files are recognized by the application and the executable tools:

- `custom_commons.vmoptions` - The parameters and their values of this file will be included in all the startup launchers.
- `custom_<app name>.vmoptions` - The `<app name>` is the name of the executable application or tool (for example, `custom_diffFiles.vmoptions` for the Compare Files tool). The parameters and their values of this file will be included in the startup launcher for this particular executable.

For example: To specify a different language for all launchers you can use the custom vmoptions file called `custom_commons.vmoptions` and the content would look like this:

```
-Dcom.oxygenxml.language=French
```

For example: To increase the memory available for a specific tool, such as the Compare Files tool (diffFiles.exe), you can use a custom vmoptions file called `custom_diffFiles.vmoptions` and the content would look like this:
To be recognized and included, these custom startup parameter files must be saved in the installation directory of Oxygen XML Editor.

## How to Increase the Amount of Available Memory

Determining how to increase the amount of memory that is allocated to Oxygen XML Editor depends on how you launch the application.

- **Windows/Linux Application Launcher** - If you start Oxygen XML Editor using the default startup launcher that was created during a Windows or Linux installation, see [Increasing the amount of memory that Oxygen XML Editor uses on Windows and Linux](#page-291).

- **Mac OS X Application Launcher** - If you start Oxygen XML Editor using the default startup launcher that was created during a Mac OS X installation, see [Increasing the amount of memory that Oxygen XML Editor uses on OS X](#page-292).

- **Command-Line Script** - If you start Oxygen XML Editor using a command-line script, see [Setting Parameters in the Command-Line Scripts](#page-292).

- **Custom Startup Parameters File** - You can also create your own custom startup parameters file and increase the memory using this file. For more information, see [Creating Custom Startup Parameters File](#page-293).
An Oxygen XML Editor perspective (on page 3285) is an interface layout geared towards a specific use. The Oxygen XML Editor interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several perspectives that you can use to work with documents in Oxygen XML Editor. You can change the perspective by selecting the respective icon (🎨 📈 🕵️‍♂️) in the top-right corner of Oxygen XML Editor or by selecting the perspective from the Window > Open Perspective menu.

Editor Perspective

The Editor perspective (on page 3285) is the most commonly used perspective and it is the default perspective when you start Oxygen XML Editor for the first time. It is the perspective that you will use to edit the content of your XML documents.

To switch the focus to this perspective, select the Editor button in the top-right corner of Oxygen XML Editor (or select Editor from the Window > Open perspective menu).

The layout of this perspective is composed of the following components:

**Menus**

Provides menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents. However, Oxygen XML Editor also includes some context-sensitive and framework (on page 3282)-specific menus that are only available for a specific context or type of document.

**Toolbars**

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, Author mode also includes framework (on page 3282)-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a DITA Author Custom Actions toolbar is available that includes operations that are specific to DITA documents). The toolbars can be configured (on page 273) to suit your specific needs.

**Editor Pane**
The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Editor includes a large variety of dockable views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the Window > Show View menu. The layout of the views can also be configured according to your preferences.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the toggle controls located on the top corner of the view ( on Mac OS X).

Some of the most helpful views in the Editor perspective include the following:

- **Project view** - Enables the definition of projects and logical management of the documents they contain.
- **DITA Maps Manager view** - For DITA document types, this view helps you organize, manage, and edit DITA topics and maps.
- **Open/Find Resource view** - Designed to offer advanced search capabilities in various scopes.
- **Outline view** - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** - Displays the messages generated as a result of user actions such as validations, transformation scenarios, spell checking in multiple files, search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view** - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in Text mode. Author mode also includes an in-place attribute editor.
- **Model view** - Presents the current edited element structure model and additional documentation as defined in the schema.
• **Elements view** *(on page 355)* - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author mode this view** *(on page 432)* includes tabs that present additional information relative to the cursor location.

• **Entities view** *(on page 356)* - Displays a list with all entities declared in the current document as well as built-in ones.

• **Transformation Scenarios view** *(on page 1768)* - Displays a list with all currently configured transformation scenarios.

• **XPath/XQuery Builder view** *(on page 2185)* - Displays the results from running an XPath expression.

• **WSDL SOAP Analyzer view** *(on page 1376)* - Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

**Related Information:**

• **Editing Documents** *(on page 827)*

• **Editing Modes** *(on page 303)*

• **Configuring the Layout of the Views and Editors** *(on page 268)*

---

**XSLT Debugger Perspective**

The **XSLT Debugger perspective** *(on page 3285)* allows you to detect problems in an XSLT transformation by executing the process step by step in a controlled environment. To switch the focus to this perspective, select the **XSLT Debugger** button in the top-right corner of the interface or **Window > Open perspective > XSLT Debugger**.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically *(on page 212)* in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in **Text mode** *(on page 303)* only.

The layout of this perspective is composed of the following components:

**Menus**

Provides menu driven access to all the features and functions available in the **XSLT Debugger**.
Toolbars

Contains all actions needed to configure and control the debugging process. The toolbars can be configured (on page 273) to suit your specific needs.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XSL Source Pane

The editing pane where you can display and edit XSL stylesheets.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML view, and one text view for each xsl:result-document element used in the stylesheet (if it is an XSLT 2.0 / 3.0 stylesheet).

Debugging Information Views (on page 2296)

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views (on page 2296) topic for a list of all the information views (and links to more details on each view).

Note: You can add XPath expression automatically in the XWatch view using the Watch expression action from the contextual menu. In case you select an expression or a fragment of it and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Using Watch expression without selecting an expression displays the value of the attribute from the cursor position in the XWatch view. Variables detected at the cursor position are also displayed. Expressions displayed in the XWatch view are normalized (unnecessary white spaces are removed from the expression).

For more information about the XSLT debugging capabilities in Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/m9d8c4V-LJw

Related Information:
• XQuery Debugger Perspective (on page 299)

XQuery Debugger Perspective

The XQuery Debugger perspective (on page 3285) allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select the XQuery Debugger button in the top-right corner of the interface or Window > Open perspective > XQuery Debugger.

The workspace in this perspective is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can split horizontally or vertically (on page 212) in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in Text mode (on page 303) only.

The layout of this perspective is composed of the following components:

**Menus**

Provides menu driven access to all the features and functions available in the XQuery Debugger.

**Toolbars**

Contains all actions needed to configure and control the debugging process. The toolbars can be configured (on page 273) to suit your specific needs.

**XML Source Pane**

The editing pane where you can display and edit data or document-oriented XML documents.

**XQuery Source Pane**

The editing pane where you can display and edit XQuery files.

**Output View**

Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

**Debugging Information Views (on page 2296)**
Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the Debugging Information Views (on page 2296) topic for a list of all the information views (and links to more details on each view).

Note: You can add XPath expression automatically in the XWatch view using the Watch expression action from the contextual menu. If you select an expression, or a fragment of it, and then click Watch expression in the contextual menu, the entire selection is presented in the XWatch view. Expressions displayed in the XWatch view are normalized (unnecessary white spaces are removed from the expression).

Related Information:

- Debugging XSLT Stylesheets and XQuery Documents (on page 2290)
- XSLT Debugger Perspective (on page 297)

Database Perspective

The Database perspective (on page 3285) allows you to manage databases. To switch the focus to this perspective, select the Database button in the top-right corner of Oxygen XML Editor or Window > Open perspective > Database from the Window > Open perspective menu.

The Database perspective offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both Relational and Native XML databases.
- Browsing the structure of databases.
- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
• Data export to XML.

Supported Databases

Oxygen XML Editor supports numerous types of databases, including:

• Oracle Berkeley DB XML Database
• eXist XML Database
• IBM DB2 (Enterprise edition only)
• JDBC-ODBC Bridge
• MarkLogic (Enterprise edition only)
• Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only)
• MySQL
• Oracle 11g (Enterprise edition only)
• PostgreSQL 8.3 (Enterprise edition only)
• SharePoint (CMS)

Note: For the databases marked with “Enterprise edition only”, the XML capabilities are only available in the Enterprise edition of Oxygen XML Editor. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Editor go to the Oxygen XML Editor website.

Supported Capabilities

The supported non-XML capabilities are as follows:

• Browsing the structure of the database instance.
• Opening a database table in the Table Explorer view (on page 2200).
• Handling the values from XML Type columns as String values.

Note: The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Editor by registering the database driver as a Generic JDBC type driver when defining the data source for accessing the database. For more information, see Database Connection Support (on page 2203).

The supported XML capabilities are as follows:

• Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Editor editor panel.
• Handling the values from XML Type columns as XML instance documents that can be opened and edited in an Oxygen XML Editor editor panel.
• Validating an XML instance document added to an XML Type (column of a table, etc.)

Tip: Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this perspective is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the XQuery Debugger.

Toolbars

Contains all actions needed to configure and control the debugging process. The toolbars can be configured (on page 273) to suit your specific needs.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Data Source Explorer View (on page 2198)

Provides browsing support for the configured connections.

Table Explorer View (on page 2200)

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

Related Information:

• Working with Databases (on page 2198)

• Data Source Explorer View (on page 2198)

• Table Explorer View (on page 2200)
6. Editing Modes

The main editing area in Oxygen XML Editor includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Editor offers the following editing modes:

- **Text (on page 303)** - This mode presents the source of an XML document.
- **Grid (on page 392)** - This mode displays an XML document as a structured grid of nested tables.
- **Author (on page 402)** - This mode enables you to edit in a WYSIWYG-like editor.
- **Design (on page 623)** - This mode is found in the schema editor and represents the schema as a diagram.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the **Allow Document Type specific edit mode setting to override the general mode setting option (on page 127)** is selected in the Edit Modes preferences page, then the edit mode specified in the Document Type configuration dialog box (on page 95) is used when that particular type of document is initially opened.
- If the **Allow Document Type specific edit mode setting to override the general mode setting option (on page 127)** is not selected, then the edit mode specified in the table in the Edit Modes preferences page (on page 127) is used when that particular type of document is initially opened.

Text Editing Mode

The **Text** mode editor in Oxygen XML Editor is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor also includes specialized editing actions, a powerful **Content Completion Assistant (on page 844)**, a helpful **Outline view (on page 347)**, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

**Related Information:**
Navigating the Document Content in Text Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents in Text mode.

**Navigation Keyboard Shortcuts**

- **Ctrl + CloseBracket (Command + CloseBracket on OS X)**
  Navigate to the next XML node.

- **Ctrl + OpenBracket (Command + OpenBracket on OS X)**
  Navigate to the previous XML node.

- **Ctrl + RightArrow (Command + RightArrow on OS X)**
  Navigate one word forward.

- **Ctrl + LeftArrow (Command + LeftArrow on OS X)**
  Navigate one word backward.

- **Ctrl + Home (Command + Home on OS X)**
  Position the cursor at the beginning of the document.

- **Ctrl + End (Command + End on OS X)**
  Position the cursor at the end of the document.

**Navigating to a Modification**

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar (they can also be accessed from the Find menu):

- ** Gdk ⌘ ← Last Modification**
  Navigates to the last modification in any opened tab.

- ** Gdk ⌘ ← Back**
  Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links in Text or Author mode.

- ** Gdk ⌘ → Forward**
Available after you use the Back button at least once, and it navigates in the opposite
direction as the Back button.

Navigating with the Outline View

Oxygen XML Editor includes an Outline view (on page 347) that displays a hierarchical tag overview
of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the
outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view,
the corresponding nodes are highlighted in the editor area.

Figure 51. Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A breadcrumb on the top stripe indicates the path from the document root element to the current
element. It can also be used as a helpful tool to navigate to specific elements throughout the structure
of the document.

Figure 52. Breadcrumb in Text Mode

The last element listed in the breadcrumb is the element at the current cursor position. The current
element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the
breadcrumb selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In Text mode, you can navigate precisely to a location in the document you are editing by using the Go
to dialog box. To open this dialog box, press Ctrl+L (Command+L on OS X) or select Find > Go to.

Figure 53. Go to Dialog Box
The dialog box includes the following fields for specifying a specific navigation location:

- **Line** - Destination line in the current document.
- **Column** - Destination column in the current document.
- **Offset** - Destination offset relative to the beginning of document.

### Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to navigate to any of the marked positions (\texttt{Ctrl+1} through \texttt{Ctrl+9}). There are also shortcuts for creating bookmarks (\texttt{Ctrl+Shift+1} through \texttt{Ctrl+Shift+9}). You can also configure these shortcut keys in the Options > Menu Shortcut Keys (on page \texttt{248}) menu.

![Editor Bookmarks](image)

Figure 54. Editor Bookmarks

To insert a bookmark in Text mode, do any of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Press \texttt{(F9)} on your keyboard or use any of the specific bookmark creation shortcuts ((\texttt{Ctrl+Shift+1} through \texttt{Ctrl+Shift+9})).
- Select the \textcircled{○} Create Bookmark action from the Edit > Bookmarks menu.

To remove bookmark in Text mode, do either of the following:

- Left-click its icon in the vertical stripe.
- Right-click its icon on the vertical stripe and select Remove or Remove all (\texttt{Ctrl+F7} (Command +\texttt{F7} on OS X)).
To navigate to a specific bookmark, do either of the following:

- Use any of the specific bookmark navigation shortcuts (**Ctrl+1** through **Ctrl+9**).
- Use one of the actions available on the **Edit > Bookmarks > Go to** menu.

**Tip:** The navigation shortcuts work even if the document where the bookmark was inserted has been closed. In this case, using the shortcut will automatically re-open the document.

**Smart Editing in Text Mode**

Oxygen XML Editor includes *smart editing features* to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>` , the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag> | </tag>`).

- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor will mirror-edit the name of the matching end tag. This feature can be controlled from the **Content Completion option page** (on page 166).

- **Auto-breaking the edited line** - The **Hard line wrap option** (on page 159) automatically breaks the edited line when its length exceeds the maximum line length **defined for the format and indent operation** (on page 159).

- **Indent on Enter** - The **Indent on Enter option** (on page 159) indents the new line inserted when you press **Enter**.

- **Smart Enter** - The **Smart Enter option** (on page 159) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.

- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  - If the click position is on a start tag or end tag, then the element name is selected.
  - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  - Otherwise, a double-click selects contiguous text.

- **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
  - If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.

- If the click position is immediately before an attribute, then the entire attribute and its value is selected.
- If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
- Otherwise, it selects the entire current line.

Shortcut Actions in Text Mode

Oxygen XML Editor includes numerous shortcut actions to help you edit content in the Text editing mode.

Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the Document > Font size menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))

Increases the font size (zooms in) with one point for each execution of the action.

Note: For Mac OS X, if you activate the Enable mouse-wheel zooming option (on page 126) in the Editor preferences page, you can use Command + MouseWheelForward to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))

Decreases the font size (zooms out) with one point for each execution of the action.

Note: For Mac OS X, if you activate the Enable mouse-wheel zooming option (on page 126) in the Editor preferences page, you can use Command + MouseWheelBackwards to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

Normal editor font (Ctrl + 0 (Command + 0 on OS X))

Resets the font size to the value of the editor font set in the Fonts preferences page (on page 88).
Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the Edit menu:

_undo (Ctrl + Z (Command + Z on OS X))

Reverses a maximum of 200 editing actions (configurable with the Undo history size option (on page 126) in the Editor preferences page) to return to the preceding state.

Note: Complex operations such as Replace All or Indent selection count as single undo events.

.redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the Undo function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the Edit menu):

.cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

.copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

.paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

.select all (Ctrl + A (Command + A on OS X))

Selects the entire content of the current document.

Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in Text mode:

.ctrl + alt + uparrow (Command + Alt + UpArrow on OS X)

Moves the node up one line.

.ctrl + alt + downarrow (Command + Alt + DownArrow on OS X)

Moves the node down one line.

Note: The requirements for these node moving actions to work are as follows:
• The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
• A start tag must be the first text occurrence on the line where the cursor is positioned.
• On the line where the element ends, only whitespaces are allowed after the end tag.

Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Editor also includes the following other miscellaneous shortcut actions in Text mode:

**Ctrl + Delete (Command + Delete on OS X)**
Deletes the next word.

**Ctrl + Backspace (Command + Backspace on OS X)**
Deletes the previous word.

**Ctrl + W (Command + W on OS X)**
Cuts the previous word.

**Ctrl + K (Command + K on OS X)**
Cuts to end of line.

**Ctrl + Single-Click (Command + Single-Click on OS X)**
Use this shortcut to open any of the following:

• Any absolute URL (URLs that have a protocol), regardless of their location in the document.
• URI attributes such as: `schemaLocation`, `noNamespaceSchemaLocation`, `href` and others.
• Processing instructions used for associating resources, xml-models, xml-stylesheets.

**Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**
Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Related Information:

• [Frequently Used Shortcut Keys](on page 27)
Editing XML Markup in Text Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in Text mode. These actions are available in the Refactoring submenu of the contextual menu and in the Document > Markup menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

The last element listed in the breadcrumb is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the breadcrumb selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Cut

Removes the selected element and copies it to the clipboard.

Copy
Copies the selected element to the clipboard.

❌ **Delete**

Deletes the currently selected element.

### Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

- **Alt + UpArrow**
  
  Moves the current node or selected nodes in front of the previous node.

- **Alt + DownArrow**
  
  Moves the current node or selected nodes after the subsequent node.

### Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

- **_rename_element**: The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

- **rename_prefix (Alt + Shift + P (Command + Shift + P on OS X))**
  
  The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

  - If you select the **rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.

  - If you select the **rename current prefix in all document** option, the application will apply the change on the entire document.

  - To also apply the action inside attribute values, select the **rename also attribute values that start with the same prefix** checkbox.
Surround Content with Tags (Wrap)

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Surround with submenu**
  Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

- **Surround with Tags (Ctrl + E (Command + E on OS X))**
  Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
  
  - If the Position cursor between tags option (on page 167) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
  - If the Position cursor between tags option (on page 167) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

- **Surround with [tag] (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**
  Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**
  Deletes the start and end tag of the current element.

Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Join elements (Alt + Shift + J (Command + Alt + J on OS X))**
  Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

- **Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**
Split the element from the cursor position into two identical elements. The cursor must be inside the element.

**Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  - Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  - Allows you to change an attribute into an element.

- **Delete attribute**
  - Allows you to remove one or more attributes.

- **Rename attribute**
  - Allows you to rename an attribute.

- **Replace in attribute value**
  - Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  - Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

- **Delete element**
  - Allows you to delete elements.

- **Delete element content**
  - Allows you to delete the content of elements.
Insert element
   Allows you to insert new elements.

Rename element
   Allows you to rename elements.

Unwrap element
   Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
   Allows you to surround elements with element tags.

Wrap element content
   Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions
   Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
   Allows you to insert an XML fragment.

Replace element content with XML fragment
   Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
   Allows you to replace elements with an XML fragment.

Related Information:

- Refactoring XML Documents (on page 1139)
- Contextual Menu Actions in Text Mode (on page 873)
- Frequently Used Shortcut Keys (on page 27)

Folding XML Elements in Text Mode

When working with a large document, the folding (on page 3282) support in Oxygen XML Editor can be used to collapse some element content leaving only those that you need to edit in focus.
Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the folding (on page 3282) feature is enabled in Oxygen XML Editor, but it can be disabled in the Text preferences page with the Enable folding option (on page 128).

Figure 56. Folding of XML Elements in Text Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Editor. The next time you open the document the folds are restored to its last state.

Folding Actions in Text Mode

Element folds are marked with a small triangle (↑ / ↓) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on OS X))
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad. (Command + NumPad. on OS X))
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on OS X))
  Unfolds all elements in the current document.

For more information about the folding support in Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE
Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to select content in Text mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in Text mode.

Standard Continuous Selection Shortcuts

**Ctrl + A (Meta + A on Mac OS X)**

Selects all content in the document.

**Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

**Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

**Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

**Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

**Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

**Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

**Ctrl + Shift + End**
Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects certain text, depending on the position of the click in the document. See Smart Editing: Double-Click *(on page 832)* for the specifics.

**Triple-Click**

Selects entire regions of text, depending on the position of the click in the document. See the Smart Editing: Triple-Click *(on page 832)* for the specifics.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Attributes**

Selects all the attributes of the element at the current cursor position.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

**Rectangular Selection Shortcuts**

Oxygen XML Editor also includes some keyboard shortcuts that allow you to select a rectangular block of content in **Text** mode and you can then copy, cut, paste, delete, or edit the selection.

⚠️ **Attention:** The rectangular selection shortcuts will not work if the **Line Wrap** option *(on page 128)* is selected in the **Text** preferences page.

The following shortcuts can be used to create a rectangular selection:

- **Alt + Mouse Click + Mouse Movement** *(Alt + Meta + Mouse Click + Mouse Movement on Mac OS X)*
Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release **Alt (Alt + Meta on Mac OS X)** to enter the *in-place editing mode* (on page 844).

**Shift + Alt + Left/Right Arrow Keys** (**Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X**)  
Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

**Shift + Alt + Up/Down Arrow Keys** (**Shift + Alt + Meta + Up/Down Arrow Keys on Mac OS X**)  
Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

**Ctrl + Shift + Alt + Left/Right Arrow Keys** (**Ctrl + Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X**)  
Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

**Shift + Alt + Home** (**Shift + Alt + Meta + Home on Mac OS X**)  
Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

**Shift + Alt + End** (**Shift + Alt + Meta + End on Mac OS X**)  
Begins a rectangular selection at the cursor position and extends it to the end of the current line.

**Shift + Alt + PageUp** (**Shift + Alt + Meta + PageUp on Mac OS X**)  
Begins a rectangular selection at the cursor position and extends it up one screen page.

**Shift + Alt + PageDown** (**Shift + Alt + Meta + PageDown on Mac OS X**)  
Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

**In-Place Editing Mode**

To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the **Alt** key (on Mac OS X, release both **Alt & Meta**). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either **Enter** or **Esc**.
Content Completion Assistant in Text Mode

Oxygen XML Editor includes an intelligent Content Completion Assistant (on page 3280) that offers proposals for inserting structured language elements, attributes, and attribute values that are valid in the current editing context.

The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Content Completion, and deselect the Enable content completion option (on page 167).

![Figure 57. Content Completion Assistant](image)

Content Completion and the Associated Schema

The Content Completion Assistant feature is schema-driven and the list of proposals in the Content Completion Assistant (on page 3280) depend on the associated schemas (DTD, XML Schema, Relax NG, or NVDL schema). For information about the various ways to associate a schema and the order of their precedence, see the Associating a Schema to XML Documents (on page 1112) section.

Using the Content Completion Assistant in Text Mode

The feature is activated in Text mode in the following situations:

- After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the Activation delay of the proposals window (ms) option (on page 168) from the Content Completion preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing Ctrl + Space (Command + Space on OS X) or Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X). If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example,
DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:** When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the Add Element Content option (on page 167) (in the Content Completion preferences page) is selected. The Content Completion Assistant can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the Add optional content (on page 167) and Add first Choice particle (on page 167) options in the Content Completion preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the > character of the start tag, if the element has no attributes.

**Where the Content Completion Assistant is Displayed**

The Content Completion Assistant is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.
Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

**Element Structure Specified in DTD or Schema**

The proposals that populate the Content Completion Assistant depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

**Note:** The Content Completion Assistant is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

**Current Cursor Position**

The number and type of elements displayed by the Content Completion Assistant is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

**Unique ID Attribute Values**

A schema may declare certain attributes as ID or IDREF/IDREFS. When the document is validated, Oxygen XML Editor checks the uniqueness and correctness of the ID attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

**Values for xml:id Attributes**

Values of all the xml:id attributes are handled as ID attributes. They are collected and displayed by the Content Completion Assistant as possible values for anyURI attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

**Links/References in DITA**

When entering values for the various types of links and references in DITA (for example, values for href or conref elements), the Content Completion Assistant will propose potential targets when you use the forward slash key (/).

**ID Values for DITA Key References**

In DITA, when inserting key references (keyref) or content key references (conkeyref), the ID values that are defined in the key reference are presented as possible targets. The Content Completion Assistant will only propose targets that are valid in the current context.
Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the Content Completion Assistant offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the Content Completion Assistant.

Related Information:

- Customizing the Content Completion Assistant (on page 2352)

Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The Content Completion Assistant (on page 3280).
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the F2 shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (on page 171) option in the Annotations preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (on page 172) option in the Annotations preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br,
ul, li), they are rendered as an HTML document loaded in a web browser. For example, \( p \) begins a new paragraph, \( br \) breaks the current line, \( ul \) encloses a list of items, and \( li \) encloses an item of the list.

### Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an \(<xs:annotation>\) element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

### Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the \(<documentation>\) element from the \(http://relaxng.org/ns/compatibility/annotations/1.0\) namespace like this:

```
<define name="person">
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person.
    </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (\(http://relaxng.org/ns/structure/1.0\)) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the \textbf{Use all Relax NG annotations as documentation} (on page 172) option in the Annotations preferences page.

### Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
## Information about a person.
```
Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** (on page 171) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

Content Completion Helper Views

Information about the current element being edited is also available in various **dockable** views, such as the **Model view** (on page 353), **Attributes view** (on page 351), **Elements view** (on page 355), and **Entities view** (on page 356). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline view** (on page 347), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Model View

The **Model view** presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 58. Model View
The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 59. Element Structure Panel
Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

![Annotation Panel](image)

Figure 60. Annotation panel

Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as **list** in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

![Attributes View](image)

Figure 61. Attributes View
Expand/Collapse Button

There is an Expand/Collapse (↑/↓) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

You can use the ✗ Remove button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the ➤ Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the ➻ Update button (or press Enter) to add the value to the attribute.

Note: For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a  ➢ Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the Attributes view when editing in Text mode:
Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the Allow only insertion of valid elements and attributes (on page 137) schema-aware option is selected.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Elements View in Text Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing F2 with an element selected will display information about that particular element.
Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 63. Entities View
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

### Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a .template symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

### How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.
Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking Duplicate.

Figure 64. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (on page 3280). HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
   - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
     - $M_1$ represents the Command key on MacOS X, and the Ctrl key on other platforms.
     - $M_2$ represents the Shift key.
     - $M_3$ represents the Option key on MacOS X, and the Alt key on other platforms.
     - $M_4$ represents the Ctrl key on MacOS X, and is undefined on other platforms.
   - **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 276) can be inserted in the text box using the Insert Editor Variables button.

4. Click OK to save your new code template.

Result: Your code template can now be selected using the Content Completion Assistant (on page 3280) (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). The code templates are displayed with a symbol.
How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Select Project Options at the bottom of the dialog box. This stores the preferences in the project file (.xpr).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their Project view (on page 333), the code templates will be available in their content completion list.

Tip: It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (on page 2352) for a particular framework. You could then share the whole framework (on page 2371) with other members of your team.

Text Mode Views

There is a variety of dockable (on page 3281) helper views that are displayed by default in Text mode. There are also a large selection of additional views available in the Window > Show View menu. This section presents some of the most helpful views for editing in Text mode.

Project View

The Project view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this
panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

Figure 65. Project View

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the Outline view (on page 347). If the view has been closed, it can be reopened at any time from the Window > Show View menu (or using the Show Project View action from the Project menu).

Project View Toolbar

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects. You can use this history drop-down menu to quickly switch to a recently opened project. If you enable the Remember layout changes for each project option in the Application Layout preferences page (on page 91), the application will remember the layout, files opened, and editing location for your session when you switch projects.

At the bottom of the drop-down menu there are the actions to open and create a project:

- **Open Project** (Ctrl + F2 (Command + F2 on OS X))
  
  Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

- **Note**: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

- **New Project**
  
  Creates a new, empty project.

The following actions are grouped in the upper right corner:

- **Collapse All**
Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

**Link with Editor**

When selected, the project tree highlights the currently edited file, if it is found in the project files.

**Note:** This button is disabled automatically when you move to the **Debugger perspective** (on page 3285).

**Settings**

A submenu that contains the following actions:

**Filters**

Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

**Show Full Path**

When selected, linked files and folders are presented with a full file path.

**Enable Master Files Support**

Select this option to enable the **Master Files support** (on page 726).

**Change Search and Refactor operations scope**

Allows you to change the collection of documents that define the context of the search and refactor operations (on page 1129).

- **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the master files (on page 3284) that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
- **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.
File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

- **Logical folders with Linked folders/files** - Marked with a blue icon on Windows and Unix/Linux and a magenta icon on Mac OS X, they help you group files within the project. This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. The logical folders are created on the project root or inside other logical folders by using the contextual menu action **New > Logical Folder**, and the linked folders/files are added using **Add Files, Add Folder**, or by dragging and dropping files/folders from the view or the system file explorer. **Remove from Project** can be used to remove them from the project and the **Remove from Disk (Shift +Delete)** action can be used to remove them from both the project and the local file system.

- **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File, New > Folder, Copy, and Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.

Figure 66. Project View with Both Types of Resources
Creating New Projects

The following action is available from the New menu when right-clicking any item, the Project menu, or from the drop-down menu in the top-left of the Project view:

- New Project
  Creates a new, empty project.

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

- Right-click any item > New > File
  Opens a New file dialog box (on page 676) that helps you create a new file and adds it to the project structure.

- Right-click any item in a physical folder > New > Folder
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

- Right-click any item in a logical folder > New > Logical Folder
  Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X).

- Right-click on a logical folder > New > Logical Folders from Web
  Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Adding Resources

You can add resources by using drag and drop (or Copy and Paste) actions from within the Project view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Adding Resources to Logical Folders

You can add resources to logical folders by using the following actions available in the contextual menu when invoked on a logical folder (or the project's root container):
### Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon for this action is different on Mac OS X).

### Add Files

Adds links to files on the local file system.

### Add Edited File

Adds a link to the currently edited file in the project.

### Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use

- **Remove from Project** from the contextual menu (or press **Delete** on your keyboard).

To remove folders or files from both the project and the local file system, use

- **Remove from Disk** from the contextual menu (or press **Shift+Delete** on your keyboard).

### Moving Folders and Files

You can move the resources by using drag and drop actions from within the **Project** view (the **Enable drag-and-drop in Project view** option must be selected in the **View preferences page**).

You can also use the usual **Cut**, **Copy**, and **Paste** actions to move resources in the project.

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (on page 1129) by using the button.

### Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):
• Select **Rename** from the contextual menu.
• Press **F2** on your keyboard.
• Select the item, then click the name, and type the new name.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

• **New name** - Presents the current name of the edited resource and allows you to modify it.
• **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope (on page 1129) by using the button.

**Opening Files**

There are several ways to open a file:

• Double-click the file.
• Select it and press **Enter** on your keyboard.
• Right-click the file and select **Open**.
• If there are no other files open in the editor area, you can drag the file from the project tree and drop it in the editor area.
• If you want to choose the application or location where to open it, you can right-click the file and select **Open with**.

**Saving the Project**

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

**Other Contextual Menu Actions**

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

**Show in submenu**

**Explorer (Finder on OS X)**

On Windows and Mac OS X, the parent directory of the selected file or folder is presented in a specific Explorer/Finder window, and the selected resource is highlighted. On Linux, the selected file or folder is not highlighted after opening its parent in the file explorer.
Terminal

Opens a console (terminal) at the location of the selected physical resource. If the resource is a file, it will start at the parent directory.

Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

Refactoring submenu

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

Rename resource (Available for certain types of XML documents)

Opens the Rename resource dialog box (on page 720) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

Move resource (Available for certain types of XML documents)

Opens the Move resource dialog box (on page 720) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 1139) that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 1139) that were finished or previewed will also appear in this submenu.

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (on page 1130) that allows you to see the resource hierarchy for an XML document.

Resource Dependencies

Opens the Resource Hierarchy/Dependencies view (on page 1130) that allows you to see the resource dependencies for an XML document.

Refresh
Refreshes the content and the dependencies between the resources in the Master Files
directory (on page 726).

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 745) that allows you to find and
replace text in multiple files.

XPath in Files

Opens the XPath/XQuery Builder view (on page 2185) that allows you to compose
XPath and XQuery expressions and execute them over the currently edited XML
document.

Open/Find Resource

Opens the Open/Find Resource dialog box (on page 733).

Check Spelling in Files

Allows you to check the spelling of multiple files. (on page 765)

Format and Indent Files

Opens the Format and Indent Files dialog box (on page 869) that allows you to
configure the format and indent (pretty-print (on page 3286)) action that will be applied
on the selected documents.

Open in SVN Client

Syncro SVN Client (on page 2806) tool is opened and it highlights the selected resource
in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection
determines where they are opened in the Compare Files (on page 2770) or Compare
Directories (on page 808) tool. If you select two files or folders, your first selection will
be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the three-way
comparison mode (on page 2774). If you select three files, your first selection will be
opened in the left panel, the second in the right panel, and the third selection will be the
base (ancestor) file.

Transform submenu

The currently selected files in the Project view can be transformed in one step with one
of the following actions available from contextual menu in the Transform submenu:

Apply Transformation Scenario(s)
Obtains the output with one of the built-in scenarios (on page 1641).

Configure Transformation Scenario(s)
Opens a dialog box (on page 1762) that allows you to configure predefined transformation scenarios.

Transform with
Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu
The currently selected files in the Project view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

Check Well-Formedness
Checks if the selected file or files are well-formed.

Validate
Validates the selected file or files against their associated schema.
For EPUB files, this action triggers an EPUB Validate and Check for Completeness (on page 2194) operation.

Validate with Schema
Validates the selected file of files against a specified schema.

Configure Validation Scenario(s)
Allows you to configure and run a validation scenario (on page 1093).

Generate Documentation submenu

Generate Documentation > XML Schema Documentation
Opens the XML Schema Documentation Dialog Box (on page 1313).

Generate Documentation > XSLT Stylesheet Documentation
Opens the XSLT Stylesheet Documentation Dialog Box (on page 1223).

Generate Documentation > XQuery Documentation
Opens the XQuery Documentation Dialog Box (on page 1349).

Generate Documentation > WSDL Documentation
Opens the WSDL Documentation Dialog Box (on page 1371).

Properties
Displays the properties of the current file in a Properties dialog box.
Enable Master Files Support (Available from the project container)

Allows you to enable the Master Files Support (on page 727) for each project you are working on.

Detect Master Files (Available from the project container when Master Files Support is enabled)

Opens the Detect Master Files wizard (on page 728) that enables the automatic detection of master files.

Add to Master Files (Available when Master Files Support is enabled)

Adds the selected files to the Master Files folder (on page 729).

Project Menu Actions

The following actions are available in the Project menu:

New Project

Creates a new, empty project.

Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

Note: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Save Project As

Allows you to save the current project under a different name.

Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Filters

Opens the Project filters dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Master Files Support

Allows you to enable the Master Files Support (on page 727) for each project you are working on.
Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the Project view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the Clear history action.

Open/Find Resource View

The Open/Find Resource view is designed to offer advanced search capabilities either by using a simple text search or by using the Apache Lucene - Query Parser Syntax. By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the Project view (on page 333) or DITA Maps Manager (on page 2990). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 67. Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps (on page 3281) opened in the DITA Maps Manager view (on page 2990) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The
Open/Find Resource view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the In reviews option (on page 345).

Note: Full support for searching in document edits (the In reviews option) is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers limited support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the Results view (on page 357) at the bottom of the editor. To display the search history, position the cursor in the search field and press Ctrl + DownArrow (Command + DownArrow on OS X) or Ctrl + UpArrow (Command + UpArrow on OS X) on your keyboard. Pressing only the DownArrow key moves the selection to the list of results.

Note: Searches are not case-sensitive. For example, if you search for car you get the same results as when you search for Car.

Tip: Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *ing with the in content option selected, you will find documents that contain the word presenting. If you search for */samples/*.gif with the in file paths option selected, you will find all the gif images from the samples directory.

Options Available in the View

The Open/Find Resource view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - Clear Index - Clears the index.
  - Show description - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - Options - Opens the Open/Find Resource preferences page (on page 251) where you can configure various search options. For example, you can specify a Content language that differs from the default UI language in case your document contains multiple languages.
- **In file paths** (on page 739) - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content** (on page 736) - Select this option to search through the content of your resources.
- **In reviews** (on page 739) - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
• **Reindex** - Use this option to reindex your resources.

**Contextual Menu Actions**

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the Internal editor or an external System application.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

**Indexing Process**

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index in not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called stop words): a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of stop words in the Open/Find Resource preferences page (on page 251).

**Caching Mechanism**

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

⚠️ **Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.
Opening the Results

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file *(on page 250)*.

**Note:** You can drag a resource from the **Open/Find Resource** view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

https://www.youtube.com/embed/PENO6NdaGao

**Related Information:**
- **Open/Find Resource Dialog Box (on page 733)**

Outline View for XML Documents

The **Outline** view displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.
Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

It also includes a Settings menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

• If you drag an XML element in the Outline view and drop it on another node, then the dragged element will be moved after the drop target element.
• If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
• You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
• If you hold down the (Ctrl (Command on OS X)) key after dragging, a copy operation will be performed instead of a move.

Figure 68. Outline View
Outline View Filters

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view:

Filter returns exact matches

The text filter of the Outline view returns only exact matches.

Selection update on cursor move (Available in Text mode)

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the Outline view.

Show element name

Show/hide element name.

Show text
Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (on page 259).

Configure displayed attributes

Displays the XML Structured Outline preferences page (on page 259).

Outline View Contextual Menu Actions

The contextual menu of the Outline view contains the following actions:

Edit Attributes

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Edit Profiling Attributes (Available in Author mode)

Allows you to change the profiling attributes (on page 969) defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.
**Paste as XML (Available in Author mode)**

Pastes copied content that is considered to be valid XML, preserving its XML structure.

**Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

**Rename Element (Available in Author mode)**

Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

**Expand More**

Expands the structure tree of the currently selected element.

**Collapse All**

Collapses all of the structure tree of the currently selected node.

**Tip:** You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.

**Attributes View in Text Mode**

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:
• By attribute name in ascending order.
• By attribute name in descending order.
• Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 69. Attributes View

Expand/Collapse Button

There is an Expand/Collapse (↑ / ↓) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view. You can use the Remove button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the Update button (or press Enter) to add the value to the attribute.
**Note:** For built-in frameworks, if the selected attribute in the Name field is an `@id` attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

### Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the Attributes view when editing in **Text** mode:

**Add**

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the Allow only insertion of valid elements and attributes (on page 137) schema-aware option is selected.

**Set empty value**

Specifies the current attribute value as empty.

**Remove**

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

**Copy**

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

**Paste**

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.
Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 70. Model View

![Model View](image)

The Model view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 71. Element Structure Panel
Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 72. Annotation panel

Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

Figure 73. Elements View in Text Mode
Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (\&lt;, \&gt;, \&amp;, \&apos;, \&quot;).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 74. Entities View
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the `?` and `*` wildcards. Also, you can enter multiple filters by separating them with a comma.

### Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages.

**Tip:** To shift focus to the opened **Results** view without using the mouse, there is an action in the **Window > Results** menu called **Focus Results** that can be used for this purpose and you can assign a keyboard shortcut (on page 248) to this action.

The actions that contribute messages to this view include:

- **Validation** actions (on page 1082)
- **Transformation** actions (on page 1640)
- **Check Spelling in Files** action (on page 765)
- **Find All** action from the **Find/Replace** dialog box (on page 740)
- **Find/Replace in Files** dialog box (on page 745)
- **Search References** action (on page 1209)
Results View Toolbar Actions

The view includes a toolbar with the following actions:

Grouping options drop-down menu

A set of Group by toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

- Ungroup all
  Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the Group by options are selected, you can use this option to show or hide grouping columns.

Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:
• Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the Check Spelling in Files action (on page 765).
• No grouping rule for the results of applying an XPath expression (on page 2182).

Highlight all results in editor

Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: Find All, Find in Files, Search References, and Search Declarations. Click Highlight all results in editor again to turn off highlighting.

Note: To customize highlighting behavior, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Highlights category. You can do the following customizations:

• Set a specific color of the highlights depending on the type of action you make.
• Set a maximum number of highlights that the application displays at any given time.

Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Learn Word(s) (Available when spelling errors are reported in the Results view)

Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

Show message

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

Previous message

Navigates to the message above the current selection.
Next message
Navigates to the message below the current selection.

Remove selected
Removes selected messages from the view.

Remove all
Removes all messages from the view.

Copy
Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- The path of the master file (on page 3284) (in the case of a validation scenario (on page 1093), it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of validation scenario (on page 1093).
- The line and column in the file that triggered the message.

Copy Description
Copies the description values for all selected items. It is possible to assign a shortcut key (on page 249) for this action.

Select All
Extends the selection to all the messages from the view.

Print Results
Sends the complete list of messages to a printer. For each message, the included details are the same as the ones for the Copy action (on page 360). This action is also available in the Window > Results menu.

Save Results
Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the Copy action (on page 360). This action is also available in the Window > Results menu.

Save Results as XML
Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the Copy action (on page 360).

Save Results as HTML
Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the Copy action (on page 360).

**Group by**

A set of Group by toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

- **Ungroup all**
  
  Removes the grouping rules so that the messages are presented in a continuous list.

**Show group columns**

If any of the Group by options are selected, you can use this option to show or hide grouping columns.

**Restore Defaults**

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the Check Spelling in Files action (on page 765).
- No grouping rule for the results of applying an XPath expression (on page 2182).

**Expand All**

Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

**Collapse All**

Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Making a Persistent Copy of Results

The Results view (on page 357) displays the results from the following operations:

- Document validation (on page 1081)
- Checking the form of documents (on page 1079)
- XSLT or FO transformations (on page 1640)
• Finding all occurrences of a string in a file (on page 740)
• Finding all occurrences of a string in multiple files (on page 745)
• Applying an XPath expression to the current document (on page 2185)

To make a persistent copy of the Results view (on page 357), use one of these actions:

File > Save Results

Displays the Save Results dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the Results panel.

File > Print Results

Displays the Page Setup dialog box used to define the page size and orientation properties for printing the result list of the current Results panel. The action is also available on the right-click menu of the Results panel.

Save Results as XML from the contextual menu

Saves the content of the Results panel in an XML file with the format:

```xml
<Report>
  <Incident>
    <engine>The engine who provide the error.</engine>
    <severity>The severity level</severity>
    <Description>Description of output message.</Description>
    <SystemID>The location of the file linked to the message.</SystemID>
    <Location>
      <start>
        <line>Start line number in file.</line>
        <column>Start column number in file</column>
      </start>
      <end>
        <line>End line number in file.</line>
        <column>End column number in file</column>
      </end>
    </Location>
  </Incident>
</Report>
```

Syntax Highlighting in XML Documents

Oxygen XML Editor supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79).
2. Go to Editor > Syntax Highlight (on page 178).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the XML tab in the Preview pane to see the effects of your changes.

Tip: Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page (on page 179).

Related Information:

- Customize Syntax Highlight colors (on page 178)

Syntax Highlight Depending on Namespace Prefix

The syntax highlight scheme of an XML file type (on page 178) allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. Marking tags with different colors based on the namespace prefix (on page 179) allows easier identification of the tags.

Figure 76. Example of Coloring XML Tags by Prefix

```xml
<template match="name">
  <li item-type="label">
    <xsl:apply-templates select="*"/>
  </li>
</template>
```
Related Information:

- Changing the colors displayed in the Text Mode Editor (on page 178)

**Presenting Validation Errors in Text Mode**

By default, Oxygen XML Editor automatically validates documents (on page 1082) while editing in the Text mode, and actions are also available to manually validate documents (on page 1082) on-request.

Figure 77. Presenting Validation Errors in Text Mode

**Validation Marker Locations**

In Text mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the Attributes view (on page 351), with the attribute and its value colored according to the type of issue.

**Validation Marker Colors**

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in red.
• **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.

• **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the **Document Checking preferences page (on page 180).**

**Validation Markers in the Right-Side Stripe**

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the **Preferences** dialog box (**Options > Preferences**) *(on page 79)*, go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option *(on page 180)*.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking preferences page (on page 180).**

**Bottom Part of the Stripe**

Two navigation arrows (стрелка) allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X))** and **Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X))**. Also, the **Remove All** button can be used to clear all the validation markers.
Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (on page 1109) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (on page 180) where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the Information view (on page 822).
- If you want to see all the validation messages grouped in the Results panel (on page 357), you should use the Validate action from the toolbar or Document > Validate menu.

Special Character Support in Text Mode

If bidirectional text, such as Arabic or Hebrew languages, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Editor displays a Special Characters Detected dialog box that prompts you to Enable or Disable support for these special characters (you can also enable or disable the support for special characters in the Open preferences page (on page 155).

Enabled

If you choose to enable support for special characters and as long as you chose a font (on page 88) that supports the particular special characters, this means that the glyphs will be rendered properly in Text mode and the cursor navigation mechanism will recognize them as they are shown.
Example: The Ā glyph could be inserted using a consecutive combination of two characters (U+00C2 followed by U+0323). With the special characters support enabled and the SansSerif font chosen, that glyph will be rendered properly (a capital letter A with a circumflex above it and a dot below) and you can navigate through the glyph in one step (pressing the right/left arrow key once).

⚠️ Restriction: When support for special characters is enabled, the folding support (on page 840) is not available.

**Disabled**

If you choose to disable support for special characters, it may affect text rendering, cursor navigation, and text management operations. However, this is helpful if you need to open very large documents (on page 781) since disabling the bidirectional editing support can enhance performance.

Example: The Ā glyph could be inserted using a consecutive combination of two characters (U+00C2 followed by U+0323). With the special characters support disabled, that glyph may or may not be rendered properly and when navigating through the glyph, it would take two steps (pressing the right/left arrow key twice).

⚠️ Restriction: Bidirectional content in the Text mode cannot be rendered using Bold or Italic.

Inserting or Opening a File at Cursor Location

When editing content in Text mode, the following actions (with regard to inserting, opening, or comparing files) are available in the Document > File menu:

**Insert File**

Inserts the content of the file with the specified file path into the current document, at the current position of the cursor.

**Open File at Cursor**
Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

**Open File at Cursor in System Application**

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

**Compare**

Opens the current file in the Compare Files tool (on page 2770).

### Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Editor offers the option of reducing the visibility of the markup by increasing their transparency when displayed in Text mode. To change the level of transparency, use the Tags Transparency Selector drop-down menu that is available from the Source toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using the Configure Toolbars action (on page 273). There are several levels of transparency that can be adjusted to make the content more or less visible:

- **Normal Contrast** - Resets the transparency level back to normal.
- **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
- **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
- **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
- **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

Figure 78. Tags Transparency Selector
Locking and Unlocking XML Markup

For documents with fixed markup, such as forms in which the XML tags are not allowed to be modified (only their text content), the possibility to edit the XML tag names can be toggled on or off with the Lock / Unlock the XML tags action available in Text editing mode from the Source submenu from the contextual menu (or Document > Source menu).

You can set the default lock state for all opened editors using the Lock the XML tags option in the Text preferences page (on page 129).

Formatting and Indenting XML Documents

Oxygen XML Editor creates XML documents using several edit modes (on page 303). In Text mode (on page 303), you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Editor must decide how to format and indent the XML. Oxygen XML Editor will also format and indent your XML for you in Text mode if you use one of the Format and Indent options:

- **Document > Source ➤ Format and Indent** - Formats and indents the whole document.
- **Document > Source ➤ Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the Source submenu of the contextual menu.
- **Document > Source ➤ Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the Source submenu of the contextual menu.

A number of settings affect how Oxygen XML Editor formats and indents XML. Many of these settings have to do with how whitespace is handled.
Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```xml
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom, or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise destroyed; nor will we not pass upon him, nor condemn him, but by lawful judgment of his Peers, or by the <xref href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html" scope="external">Law of the land</xref>. We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```xml
<codeblock>
 class HelloWorld
 {
     public static void main(String args[]) {
         System.out.println("Hello World");
     }
 }
</codeblock>
```

Here every whitespace character between the `codeblock` tags should be treated as significant.
How Oxygen XML Editor determines when whitespace is significant

When Oxygen XML Editor formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor assigns each element in the document to one of four categories:

**Ignore space**

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

**Normalize space**

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

**Mixed content**

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```xml
<p>The file is located in <i>HOME</i>/USER/hello.
This is a <strong>big</strong> deal.</p>
```
In this example, whitespace should not be introduced around the i tags as it would introduce extra significant whitespace into the document. The space between the end \texttt{/strong} tag and the beginning \texttt{<emphasis>} tag should be normalized to a single space, not zero spaces.

**Preserve space**

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor consults. For instance, if the element is named on the Default elements list (as described below) but it has an xml:space="preserve" attribute in the source file, it will be assigned to the preserve space category. If an element has the xml:space="default" attribute in the source, but is listed on the Mixed content elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor consults information from the following sources:

- **xml:space**
  - If the XML element contains the xml:space attribute, the element is promoted to the appropriate category based on the value of the attribute.

- **CSS whitespace property**
  - If the CSS stylesheet controlling the Author mode editor applies the \texttt{whitespace: pre} setting to an element, it is promoted to the preserve space category.

- **CSS display property**
  - If a text node contains only white-spaces:
    - If the node has a parent element with the CSS display property set to \texttt{inline} then the node is promoted to the mixed content category.
    - If the left or right sibling is an element with the CSS display property set to \texttt{inline} then the node is promoted to the mixed content category.
    - If one of its ancestors is an element with the CSS display property set to \texttt{table} then the node is assigned to the ignore space category.

**Schema aware formatting**
If a schema is available for the XML document, Oxygen XML Editor can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type *xs:string*, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for Author mode, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Edit modes > Author > Schema aware, and select/deselect the Schema aware normalization, format and indent option (on page 137).
- To turn it on or off for the Text editing mode, open the Preferences editing mode (Options > Preferences) (on page 79), go to Editor > Format > XML, and select/deselect the Schema aware format and indent option (on page 163).

**Preserve space elements list**

If an element is listed in the Preserve space tab of the Element Spacing list (on page 162) in the XML formatting preferences (on page 160), it is promoted to the preserve space category.

**Default space elements list**

If an element is listed in the Default space tab of the Element Spacing list (on page 162) in the XML formatting preferences (on page 160), it is promoted to the default space category.

**Mixed content elements list**

If an element is listed in the Mixed content tab of the Element Spacing list (on page 162) in the XML formatting preferences (on page 160), it is promoted to the mixed content category.

**Element content**

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.
Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, a element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In Author mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as blocks by the associated CSS (that is, they have a CSS property of display: block). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only block elements (on page 3280). In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the Schema Aware Editing option (on page 138) in the Schema-Aware preferences page.

How Oxygen XML Editor formats and indents XML

You can control how Oxygen XML Editor formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- Format preferences page (on page 157)
- XML Formatting preferences page (on page 160)
- Whitespaces preferences page (on page 164)

When Oxygen XML Editor formats and indents XML

Oxygen XML Editor formats and indents a document, or part of it, on the following occasions:

- In Text mode when you select one of the format and indent actions (Document > Source > Format and Indent, Document > Source > Indent Selection, or Document > Source > Format and Indent Element).
- When saving documents in Author mode.
- When switching from Author mode to another mode.
- When saving documents in Design mode.
- When switching from Design mode to another mode.
- When saving or switching to Text mode from Grid mode, if the Format and indent when passing from grid to text or on save option (on page 130) is selected in the Grid preferences page.
Setting an Indent Size to Zero

Oxygen XML Editor will automatically format and indent (on page 863) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

**Note:** Changing the indent size does not override the rules that Oxygen XML Editor uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

**Maintaining zero indent in documents with zero indent**

If you have existing documents with zero indent and you want Oxygen XML Editor to maintain a zero indent when editing or formatting those documents:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format (on page 157).
2. Select Detect indent on open.
3. Select Use zero-indent if detected.

Oxygen XML Editor will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor will use the indent closest to what it detects in the document.

**Enforcing zero indent for all documents**

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format (on page 157).
2. Deselect Detect indent on open.
3. Set Indent size to 0.

All documents will be formatted and indented with an indent of zero.

**Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.
Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (pretty-print (on page 3286)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the Format and Indent Files action that is available in the contextual menu of the Project view (on page 333) or from the Tools menu. This opens the Format and Indent Files dialog box that allows you to configure options for the action.

Figure 79. Format and Indent Files Dialog Box

The Scope section allows you choose from the following scopes:

- **All opened files** - The pretty-print (on page 3286) is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the pretty-print (on page 3286) is performed in the files located at a specified path.

The Options section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the pretty-print (on page 3286) is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
- **Include hidden files** - When selected, the pretty-print (on page 3286) is also performed in the hidden files.
• Make backup files with extension - When selected, Oxygen XML Editor makes backup files of the modified files. The default extension is .bak, but you can change the extension as you prefer.

Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Editor includes a feature, Manage Highlighted Content, that is designed to help you achieve this.

When you are in Text mode and you perform a search operation or apply an XPath that highlights multiple results, you can access the Manage Highlighted Content submenu by right-clicking any of the highlights in the editing pane. If the results are displayed only in the Results panel at the bottom of the screen, you can use the Highlight all results in editor button (on the right side of the Results panel) to display all the highlights in the editor (then you can access the Manage Highlighted Content submenu from the contextual menu of any highlight).

The following options are available in the Manage Highlighted Content submenu:

Modify All

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Note: If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the Find/Replace operation (on page 740), or continue the operation.

Surround All

Use this option to surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:
Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Quick Assist Support for IDs and IDREFS

The Quick Assist support (on page 3286) is activated automatically when you place the cursor inside an ID or IDREF in Text mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the Quick Assist menu from the contextual menu or by pressing Alt+1 (Command+Alt+1 on Mac OS X) on your keyboard.

The following actions are available:

- **Rename in**
  Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (on page 1129). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- **Search Declarations**
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

- **Search References**
  Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

- **Change scope**
  Opens the Select the scope for the Search and Refactor operations (on page 1129) dialog box.

- **Rename in File**
  Renames the ID you are editing and all its occurrences from the current file.

- **Search Occurrences**
Searches for the declaration an references of the ID located at the cursor position in the current document.

Related Information:

- Working with Modular XML Files in the Master Files Context (on page 1126)

Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the Text mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

**Note:** Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Mark Occurrences (on page 179).

- Working with Modular XML Files in the Master Files Context (on page 1126)

Contextual Menu Actions in Text Mode

When editing XML documents in Text mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu):

**Add File to Review Task**

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

**Cut, Copy, Paste**

Executes the typical editing actions on the currently selected content.
Copy XPath

Copies the XPath expression of the current element or attribute (or property for JSON documents) from the current editor to the clipboard.

Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

Go to submenu

This submenu includes the following actions:

Go to Matching Tag (Ctrl + Shift + G)

Moves the cursor to the end tag that matches the start tag, or vice versa.

Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))

Moves the cursor to the end of the next tag.

Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))

Moves the cursor to the end of the previous tag.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Attributes

Selects all the attributes of the element at the current cursor position.

Parent

Selects the parent element at the current cursor position.

Source submenu

This submenu includes the following actions:
Shift Right (Tab)
Shifts the currently selected block to the right.

Shift Left (Shift + Tab)
Shifts the currently selected block to the left.

Indent selection (Ctrl + I (Command + I on OS X))
Corrects the indentation of the selected block of lines if it does not follow the current indenting preferences (on page 157).

Escape Selection
Escapes a range of characters by replacing them with the corresponding character entities.

Unescape Selection
Replaces the character entities with the corresponding characters.

Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X))
Pretty-prints (on page 3286) the element that surrounds the current cursor position.

To Upper Case
Converts the selected content to upper case characters. This works with contiguous and multiple selections.

To Lower Case
Converts the content selection to lower case characters. This works with contiguous and multiple selections.

Capitalize Lines
It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))
Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 770). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters.
and may or may not be preceded by the \texttt{0x} or \texttt{0X} prefix. Examples of valid sequences and the characters they will be converted to:

- \texttt{0x0045} will be converted to \texttt{E}
- \texttt{0X0125} to \texttt{#}
- \texttt{265} to \texttt{#}
- \texttt{2190} to \texttt{#}

\textbf{Note:} For more information about finding the hexadecimal value of a character, see \textit{Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 779)}.

\textbf{Base64 Encode/Decode submenu}

This submenu include the following actions for encoding or decoding base 64 schemes:

\textbf{Import File to Encode and Insert}

Encodes a file and then inserts the encoded content into the current document at the cursor position.

\textbf{Decode Selection and Export to File}

Decodes a selection of text from the current document and then exports (saves) the result to another file.

\textbf{Encode Selection}

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the \hyperref[Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 125)]{Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 125)} will be used. Likewise, the same is true if the \textit{Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions} option is not selected in the \hyperref[Messages preference page (on page 261)]{Messages preference page (on page 261)}.

\textbf{Decode Selection}

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case,
the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 125)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 261)*.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Base32 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding base32 schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(on page 125)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(on page 261)*.

**Decode Selection**
Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 125) will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page (on page 261).

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding hex schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 125) will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for
Base64, Base 32, Hex conversions option is not selected in the Messages preference page (on page 261).

**Decode Selection**

Replace a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 125) will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page (on page 261).

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Join and Normalize Lines (Ctrl + J (Command + J on OS X))**

For the current selection, this action joins the lines by replacing the line separator with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

**Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))**

This action has the same result as moving the cursor to the end of the current line and pressing the ENTER key.

**Insert XInclude**

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

**Note:** In the Author mode, this dialog box presents a preview of the inserted document as an author page in the Preview tab and as a text page in the Source tab. In the Text mode, the Source tab is presented.
Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files chapter1.xml and chapter2.xml inserts the following section in the DOCTYPE:

```xml
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

Lock / Unlock the XML Tags

Disables or enables the ability to edit XML tags.

Canonicalize

Opens the Canonicalize dialog box that allows you to select a canonicalization (on page 3280) algorithm to standardize the format of the document.

Sign

Opens the Sign dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.

Remove All
Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Go to Definition (Ctrl + Shift + Enter)

Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a “type” belonging to the “http://www.w3.org/2001/XMLSchema-instance” namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

Refactoring submenu

This submenu includes the following actions:

 Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

 Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the Rename dialog box.

- If you select the Rename current element prefix option, the application will recursively traverse the current element and all its children. For example, to change the xmlns:p1="ns1" association in the current element to xmlns:p5="ns1", if the xmlns:p1="ns1" association is applied on the parent element, then Oxygen XML Editor will introduce xmlns:p5="ns1" as a new declaration in the current element and will change the prefix from p1 to p5. If p5 is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from p1 to p5 without inserting a new declaration.
- If you select the Rename current prefix in all document option, the application will apply the change on the entire document.
• To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

**Surround with submenu**

Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

**Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the **Position cursor between tags** option (on page 167) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
• If the **Position cursor between tags** option (on page 167) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

**Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

**Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

**Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**
Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**
Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

**Rename in**

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (on page 1129). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

**Rename in File**

Renames the ID you are editing and all its occurrences from the current file.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

**Search References in**

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 1129).
Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 1129).

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Quick Assist (Alt + 1 (Command + Alt + 1 on OS X))

Available when the cursor is inside an ID or IDREF, this action opens the Quick Assist (on page 3286) window that allows you to select some search and refactoring actions for the selected ID or IDREF.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the Compare Files tool (on page 2770).

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (on page 1130) that allows you to see the resource hierarchy for an XML document.
**Resource Dependencies**

Opens the **Resource Hierarchy/Dependencies view** (on page 1130) that allows you to see the resource dependencies for an XML document.

**Grid Editing Mode**

The Oxygen XML Editor **Grid** editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select **Grid** at the bottom of the editing area.

![Figure 80. Grid Editing Mode](image)

For more information about some of the features available in the **Grid** editor, watch our video demonstration:

https://www.youtube.com/embed/PoYm2VqisWk

**Related Information:**

- Editing XML Documents in Grid Mode (on page 886)

**Layouts: Grid and Tree**

The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the
attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

Figure 81. Grid Layout

![Grid Layout](image)

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

Figure 82. Tree Layout

![Tree Layout](image)

To switch between the two modes, select Document > Grid Layout > Grid mode/Tree mode.

Grid Mode Navigation

When you first open a document in Grid mode, the content is collapsed. Only the root element and its attributes are displayed. An arrow sign (↑) displayed at the left of the node name indicates that this node has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (↓). The expand/collapse actions can also be invoked with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu or from Document > Grid Expand/Collapse.

Expand/Collapse Submenu

The following actions are available on the Expand/Collapse submenu:

- **Expand All**
  
  Expands the selection and all its children.

- **Collapse All**
  
  Collapses the selection and all its children.
Expand Children

Expands all the children of the selection but not the selection.

Collapse Children

Collapses all the children of the selection but not the selection.

Collapse Others

Collapses all the siblings of the current selection but not the selection.

Keyboard Shortcuts

A variety of other keyboard shortcuts are also available in Grid mode:

Table 3. Shortcuts in the Grid Mode

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tab</td>
<td>Moves the cursor to the next editable value in a table row.</td>
</tr>
<tr>
<td>Shift + Tab</td>
<td>Moves the cursor to the previous editable value in a table row.</td>
</tr>
<tr>
<td>Enter</td>
<td>Begins editing and lets you insert a new value. Also commits the changes after you finish editing.</td>
</tr>
<tr>
<td>UpArrow/PageUp</td>
<td>Navigates toward the beginning of the document.</td>
</tr>
<tr>
<td>DownArrow/PageDown</td>
<td>Navigates toward the end of the document.</td>
</tr>
<tr>
<td>Shift</td>
<td>Used in conjunction with the navigation keys to create a continuous selection area.</td>
</tr>
<tr>
<td>Ctrl (Command on OS X key)</td>
<td>Used in conjunction with the mouse cursor to create discontinuous selection areas.</td>
</tr>
</tbody>
</table>

The following key combinations can be used to scroll the grid:

- Ctrl + UpArrow (Command + UpArrow on OS X) - scrolls the grid upwards.
- Ctrl + DownArrow (Command + DownArrow on OS X) - scrolls the grid downwards.
- Ctrl + LeftArrow (Command + LeftArrow on OS X) scrolls the grid to the left.
- Ctrl + RightArrow (Command + RightArrow on OS X) scrolls the grid to the right.

Related Information:

- Editing Actions in Grid Mode (on page 886)
Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the Change Text Orientation (Ctrl + Shift + O (Command + Shift + O on OS X)) action that is available from the Edit menu in the Grid editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

**Note:** This change applies only to the text from the cells, and not to the layout of the grid editor.

Figure 83. Default left to right text orientation

```xml
<xml version="1.0" encoding="UTF-8">
sample (9 rows)
1
2 Guan el món vol conversar, parla Unicode
3 Unicode
4 Ha a vallòg beszélni akar, azt Unicode-ül mondja
5 Quando il mondo vuole comunicare, parla Unicode
6 世界的に話すなら、Unicode です。
7 せせを言いたい時に、ユニコードで発表します
8 Når verden vil snakke, snakker den Unicode
9 Når verda ønsker å snakke, taler ho Unicode
</xml>
```

Figure 84. Right to left text orientation

```xml
<xml version="1.0" encoding="UTF-8">
sample (9 rows)
1
2 Guan el món vol conversar, parla Unicode
3 Unicode
4 Ha a vallòg beszélni akar, azt Unicode-ül mondja
5 Quando il mondo vuole comunicare, parla Unicode
6 世界的に話すなら、Unicode です。
7 せせを言いたい時に、ユニコードで発表します
8 Når verden vil snakke, snakker den Unicode
9 Når verda ønsker å snakke, taler ho Unicode
</xml>
```

Editing Actions in Grid Mode

Since Grid mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the Content Completion Assistant (on page 891) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Editor provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

Tip: There are two different types of layouts available in Grid mode. Most people prefer to leave it on the default Grid mode layout, but there is also a Tree mode layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the Document > Grid Layout menu.

Expanding/Collapsing Nodes

An arrow sign (↑) displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (↓). The expand/collapse actions can also be invoked with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select Expand All from the Expand/Collapse submenu. To collapse all node, right-click any cell and select Collapse All from the Expand/Collapse submenu.

Editing Elements or Attributes

To edit elements or attributes in Grid mode, simply double-click the cell that contains the element or attribute (or select the cell and press Enter) to invoke the Content Completion Assistant (on page 891). This opens a pop-up window that offers a list of proposals that are valid for that particular node.

Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press Enter (or double-click the cell), and start editing.

To stop editing a cell value, press Enter again.

To cancel the editing without saving the current changes in the document, press the Esc key.
Editing the Structure of the Nested Tables

To edit the structure of the nested tables in Grid mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu, or the toolbar):

- **Cut**, **Copy**, **Paste**, **Delete common editing actions**
  - Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

- **Paste as Child**
  - Pastes the copied content as the last child of the current selection.

- **Duplicate**
  - Creates a new node by duplicating the currently selected one.

- **Insert Before**
  - Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

- **Insert After**
  - Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

- **Append Child**
  - Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

- **Sort Ascending**, **Sort Descending**
  - The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between numerical and alphabetical.

- **Insert Row**
  - Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press Enter.

- **Insert Column**
  - Inserts a column after the current selection.

- **Clear Content**
Removes all content from the current cell.

**Expand/Collapse > Expand All**
Expands the selection and all its children.

**Expand/Collapse > Collapse All**
Collapses the selection and all its children.

**Expand/Collapse > Expand Children**
Expands all the children of the selection but not the selection.

**Expand/Collapse > Collapse Children**
Collapses all the children of the selection but not the selection.

**Expand/Collapse > Collapse Others**
Collapses all the siblings of the current selection but not the selection.

**Refresh Selected**
Forces the layout to be recomputed.

- Grid Mode Navigation *(on page 393)*
- Copy and Paste in the Grid Editing Mode *(on page 889)*
- Drag and Drop in the Grid Editing Mode *(on page 889)*
- Content Completion Assistant in Grid Mode *(on page 891)*

**Drag and Drop in the Grid Editing Mode**
You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.
These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the Grid editor and text from other applications into the Grid.

**Tip:** When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the **Refresh Selected** action that is available in the contextual menu and in the Document > Grid Edit menu.

Copy and Paste in the Grid Editing Mode

Selecting content in the Grid mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

Pasting Content Within Grid Mode

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

- **Paste (Ctrl + V (Command + V on OS X))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the Grid editor can also be pasted into Text mode or other external applications. When pasting copied content from Grid mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

Figure 85. Copying from Grid to Other Editors
Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the Grid editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

Figure 86. Pasting XML Data into Grid

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the Grid editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

Figure 87. Pasting Tab-Separated Values into Grid
If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

### Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the **Grid** editing mode offers a **Content Completion Assistant** (on page 3280) for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).

![Content Completion in Grid Editing Mode](image)

### Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:
1. Open the XML document in Oxygen XML Editor and switch to Grid mode.
2. Expand the nodes *(on page 886)* to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export *(Ctrl+C)*.
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Editor also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in Grid mode). For more information, see Import from MS Excel Files – Grid Mode Method *(on page 2278)*.

For more information about exchanging data between Oxygen XML Editor and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

**Related Information:**

- Import from MS Excel Files - Grid Mode Method *(on page 2278)*
- Pasting Content from Other Editors into Grid Mode *(on page 890)*

**Author Editing Mode**

The Author editing mode in Oxygen XML Editor allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. Oxygen XML Editor provides support for visually editing the most commonly used XML vocabularies in Author mode, including DITA, DocBook, TEI, and XHTML. Adding text content is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output.

To switch to this mode, click the Author button at the bottom of the editing area.

To see more about some of the features available in the visual Author editing mode, watch our video demonstration:

https://www.youtube.com/embed/bnQwJZD58wY
Author Mode User Roles

There are two main types of users for the Author mode: framework developers and content authors.

Framework Developers

A framework developer is a technical person with advanced XML knowledge who defines the framework for authoring XML documents in the visual editor. Once the framework is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The framework (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in Author mode.

The framework details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of XML Catalogs.
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor includes some ready-to-use built-in document types for XML frameworks, such as DocBook, DITA, TEI, JATS, and XHTML.

Content Authors

A content author does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the framework set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.
Styling XML Documents in Author Mode

The Author mode renders the content of the XML documents visually, based on CSS stylesheets associated with the document.

Selecting and Combining Multiple CSS Styles

Oxygen XML Editor provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style and multiple alternate CSS styles. This makes it easy to change the look of the document as it appears in Author mode and the output without having to continually edit the CSS stylesheets.

Tip: For information about configuring the Styles drop-down menu, see Configuring and Managing Multiple CSS Styles for a Framework.

You can select a main CSS style that applies to the whole document and then alternate styles that are applied as layers to specific parts of the document. For example, in the subsequent figure, a DITA document has the Century style selected for the main CSS and the alternate styles Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.

The selections from the Styles drop-down menu are persistent, meaning that Oxygen XML Editor will remember the selections when subsequent documents are opened.

Figure 89. Styles Drop-down Menu in a DITA Document
Navigating the Document Content in Author Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents.

### Navigation Keyboard Shortcuts

**Tab**

Navigate to the next XML node.

**Tip:** If you encounter a *space-preserved element (on page 3287)* when you navigate through a document and you do not press another key, pressing the Tab key
will continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

**Shift + Tab**

Navigate to the previous XML node.

**Ctrl + RightArrow (Command + RightArrow on OS X)**

Navigate one word forward.

**Ctrl + LeftArrow (Command + LeftArrow on OS X)**

Navigate one word backward.

**Ctrl + Home (Command + Home on OS X)**

Position the cursor at the beginning of the document.

**Ctrl + End (Command + End on OS X)**

Position the cursor at the end of the document.

### Navigating to a Modification

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar (they can also be accessed from the **Find** menu):

- **Last Modification**
  
  Navigates to the last modification in any opened tab.

- **Back**
  
  Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links in **Text** or **Author** mode.

- **Forward**
  
  Available after you use the **Back** button at least once, and it navigates in the opposite direction as the **Back** button.

### Navigating with the Outline View

Oxygen XML Editor includes an **Outline view (on page 347)** that displays a hierarchical tag overview of the currently edited XML Document.
You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

Figure 90. Outline View Navigation in Author Mode

Using the Breadcrumb to Navigate

A breadcrumb on the stripe at the top of the document indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 91. Breadcrumb in Author Mode

The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc.), the linking support is useful for navigating between the documents. In the built-in frameworks that are bundled with Oxygen XML Editor, links are marked with an icon representing a chain link (🔗). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by using the Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X)) action when the cursor is inside a link element.

Note: Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor or in the default system application. If the target file does not exist, Oxygen XML Editor prompts you to create it.
Navigating with Bookmarks

A position in a document can be marked with a bookmark. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The bookmarks are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to navigate to any of the marked positions (Ctrl+1 through Ctrl+9). There are also shortcuts for creating bookmarks (Ctrl+Shift+1 through Ctrl+Shift+9). You can also configure these shortcut keys in the Options > Menu Shortcut Keys (on page 248) menu.

Figure 92. Editor Bookmarks

To insert a bookmark in Author mode, do any of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Press (F9) on your keyboard or use any of the specific bookmark creation shortcuts ((Ctrl+Shift +1 through Ctrl+Shift+9).
- Select the Create Bookmark action from the Edit > Bookmarks menu.

To remove bookmark in Author mode, do either of the following:

- Left-click its icon in the vertical stripe.
- Right-click its icon on the vertical stripe and select Remove or Remove all (Ctrl+F7 (Command +F7 on OS X)).

To navigate to a specific bookmark, do either of the following:

- Use any of the specific bookmark navigation shortcuts (Ctrl+1 through Ctrl+9).
- Use one of the actions available on the Edit > Bookmarks > Go to menu.

Tip: The navigation shortcuts work even if the document where the bookmark was inserted has been closed. In this case, using the shortcut will automatically re-open the document.
Author Mode Views

The content author is supported by a variety of dockable (on page 3281) helper views that are displayed by default when editing in Author mode. These views are automatically synchronized with the current editing context of the editor panel. They present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is also a large selection of additional useful views available in the Window > Show View menu. This section presents some of the most helpful views for editing in Author mode.

Project View

The Project view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

Figure 93. Project View

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the Outline view (on page 347). If the view has been closed, it can be reopened at any time from the Window > Show View menu (or using the Show Project View action from the Project menu).

Project View Toolbar

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects. You can use this history drop-down menu to quickly switch to a recently opened project. If you enable the Remember layout changes for each project option in the Application Layout preferences page (on page 91), the application will remember the layout, files opened, and editing location for your session when you switch projects.
At the bottom of the drop-down menu there are the actions to open and create a project:

- **Open Project (Ctrl + F2 (Command + F2 on OS X))**
  Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

  **Note:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

- **New Project**
  Creates a new, empty project.

The following actions are grouped in the upper right corner:

- **Collapse All**
  Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

- **Link with Editor**
  When selected, the project tree highlights the currently edited file, if it is found in the project files.

  **Note:** This button is disabled automatically when you move to the **Debugger perspective (on page 3285)**.

- **Settings**
  A submenu that contains the following actions:

  - **Filters**
    Allows you to filter the information displayed in the Project view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

  - **Show Full Path**
    When selected, linked files and folders are presented with a full file path.

  - **Enable Master Files Support**
    Select this option to enable the **Master Files support (on page 726)**.

  - **Change Search and Refactor operations scope**
    Allows you to change the collection of documents that define the context of the **search and refactor operations (on page 1129)**.
• **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the *master files (on page 3284)* that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.

• **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.

**File Explorer Area**

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (*.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

• **Logical folders with Linked folders/files** - Marked with a blue icon on Windows and Unix/Linux (blue) and a magenta icon on Mac OS X (magenta), they help you group files within the project. This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol (🔗) and names of folder shortcuts are displayed in bold text. The logical folders are created on the project root or inside other logical folders by using the contextual menu action **New > Logical Folder**, and the linked folders/files are added using **Add Files, Add Folder**, or by dragging and dropping files/folders from the view or the system file explorer. **Remove from Project** can be used to remove them from the project and the **Remove from Disk (Shift+Delete)** action can be used to remove them from both the project and the local file system.

• **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File, New > Folder, Copy**, and **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.

Figure 94. Project View with Both Types of Resources
Creating New Projects

The following action is available from the New menu when right-clicking any item, the Project menu, or from the drop-down menu in the top-left of the Project view:

- **New Project**
  
  Creates a new, empty project.

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

- **Right-click any item > New > File**
  
  Opens a New file dialog box *(on page 676)* that helps you create a new file and adds it to the project structure.

- **Right-click any item in a physical folder > New > Folder**
  
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

- **Right-click any item in a logical folder > New > Logical Folder**
  
  Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X 📁).
Right-click on a logical folder > New > Logical Folders from Web

Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Adding Resources

You can add resources by using drag and drop (or Copy and Paste) actions from within the Project view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Adding Resources to Logical Folders

You can add resources to logical folders by using the following actions available in the contextual menu when invoked on a logical folder (or the project's root container):

- Add Folder
  Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon for this action is different on Mac OS X).

- Add Files
  Adds links to files on the local file system.

- Add Edited File
  Adds a link to the currently edited file in the project.

Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use

- Remove from Project from the contextual menu (or press Delete on your keyboard).

To remove folders or files from both the project and the local file system, use

- Remove from Disk from the contextual menu (or press Shift+Delete on your keyboard).

Moving Folders and Files

You can move the resources by using drag and drop actions from within the Project view (the Enable drag-and-drop in Project view option must be selected in the View preferences page (on page 259)).

You can also use the usual Cut, Copy, and Paste actions to move resources in the project.
You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (on page 1129) by using the button.

### Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):

- Select **Rename** from the contextual menu.
- Press **F2** on your keyboard.
- Select the item, then click the name, and type the new name.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope (on page 1129) by using the button.

### Opening Files

There are several ways to open a file:

- Double-click the file.
- Select it and press **Enter** on your keyboard.
- Right-click the file and select **Open**.
- If there are no other files open in the editor area, you can drag the file from the project tree and drop it in the editor area.
- If you want to choose the application or location where to open it, you can right-click the file and select **Open with**.
Saving the Project

The project file is automatically saved every time the content of the Project view is saved or modified by actions such as adding or removing files and drag and drop.

Other Contextual Menu Actions

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

**Show in submenu**

**Explorer (Finder on OS X)**

On Windows and Mac OS X, the parent directory of the selected file or folder is presented in a specific Explorer/Finder window, and the selected resource is highlighted. On Linux, the selected file or folder is not highlighted after opening its parent in the file explorer.

**Terminal**

Opens a console (terminal) at the location of the selected physical resource. If the resource is a file, it will start at the parent directory.

**Copy Location**

Copies an application-specific URL for the selected resource to the clipboard.

**Refactoring submenu**

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

**Rename resource (Available for certain types of XML documents)**

Opens the Rename resource dialog box (on page 720) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

**Move resource (Available for certain types of XML documents)**

Opens the Move resource dialog box (on page 720) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.
Opens the **XML Refactoring tool wizard (on page 1139)** that presents refactoring operations to assist you with managing the structure of your XML documents.

### Other XML Refactoring Actions

For your convenience, the last 5 **XML Refactoring tool operations (on page 1139)** that were finished or previewed will also appear in this submenu.

#### Resource Hierarchy

Opens the **Resource Hierarchy/Dependencies view (on page 1130)** that allows you to see the resource hierarchy for an XML document.

#### Resource Dependencies

Opens the **Resource Hierarchy/Dependencies view (on page 1130)** that allows you to see the resource dependencies for an XML document.

#### Refresh

Refreshes the content and the dependencies between the resources in the **Master Files directory (on page 726)**.

#### Find/Replace in Files

Opens the **Find/Replace in Files dialog box (on page 745)** that allows you to find and replace text in multiple files.

#### XPath in Files

Opens the **XPath/XQuery Builder view (on page 2185)** that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

#### Open/Find Resource

Opens the **Open/Find Resource dialog box (on page 733)**.

#### Check Spelling in Files

Allows you to **check the spelling of multiple files. (on page 765)**

#### Format and Indent Files

Opens the **Format and Indent Files dialog box (on page 869)** that allows you to configure the format and indent (**pretty-print (on page 3286)**) action that will be applied on the selected documents.

#### Open in SVN Client

**Syncro SVN Client (on page 2806)** tool is opened and it highlights the selected resource in its corresponding working copy.
Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the Compare Files (on page 2770) or Compare Directories (on page 808) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the three-way comparison mode (on page 2774). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Transform submenu

The currently selected files in the Project view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

- **Apply Transformation Scenario(s)**
  Obtains the output with one of the built-in scenarios (on page 1641).

- **Configure Transformation Scenario(s)**
  Opens a dialog box (on page 1762) that allows you to configure pre-defined transformation scenarios.

- **Transform with**
  Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu

The currently selected files in the Project view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

- **Check Well-Formedness**
  Checks if the selected file or files are well-formed.

- **Validate**
  Validates the selected file or files against their associated schema.
  For EPUB files, this action triggers an EPUB Validate and Check for Completeness (on page 2194) operation.

- **Validate with Schema**
  Validates the selected file of files against a specified schema.
Allows you to configure and run a validation scenario (on page 1093).

Generate Documentation submenu

Generate Documentation > XML Schema Documentation
Opens the XML Schema Documentation Dialog Box (on page 1313).

Generate Documentation > XSLT Stylesheet Documentation
Opens the XSLT Stylesheet Documentation Dialog Box (on page 1223).

Generate Documentation > XQuery Documentation
Opens the XQuery Documentation Dialog Box (on page 1349).

Generate Documentation > WSDL Documentation
Opens the WSDL Documentation Dialog Box (on page 1371).

Properties
Displays the properties of the current file in a Properties dialog box.

Enable Master Files Support (Available from the project container)
Allows you to enable the Master Files Support (on page 727) for each project you are working on.

Detect Master Files (Available from the project container when Master Files Support is enabled)
Opens the Detect Master Files wizard (on page 728) that enables the automatic detection of master files.

Add to Master Files (Available when Master Files Support is enabled)
Adds the selected files to the Master Files folder (on page 729).

Project Menu Actions

The following actions are available in the Project menu:

New Project
Creates a new, empty project.

Open Project (Ctrl + F2 (Command + F2 on OS X))
Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

Note: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.
Save Project As

Allows you to save the current project under a different name.

Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Filters

Opens the Project filters dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Master Files Support

Allows you to enable the Master Files Support (on page 727) for each project you are working on.

Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the Project view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the Clear history action.

Open/Find Resource View

The Open/Find Resource view is designed to offer advanced search capabilities either by using a simple text search or by using the Apache Lucene - Query Parser Syntax. By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the Project view (on page 333) or DITA Maps Manager (on page 2990). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 95. Open/Find Resource View
You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps (on page 3281) opened in the DITA Maps Manager view (on page 2990) by typing only a few letters of the file name of a document or a fragment of the content you are searching for. The Open/Find Resource view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the In reviews option (on page 345).

**Note:** Full support for searching in document edits (the In reviews option) is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers limited support to search through a maximum of 10 edits.

### Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area.

To remove the highlighting from your document, close the corresponding tab in the Results view (on page 357) at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the DownArrow key moves the selection to the list of results.

**Note:** Searches are not case-sensitive. For example, if you search for car you get the same results as when you search for Car.
Tip: Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *ing with the in content option selected, you will find documents that contain the word presenting. If you search for */samples/*.*.gif with the in file paths option selected, you will find all the gif images from the samples directory.

Options Available in the View

The Open/Find Resource view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - **Options** - Opens the Open/Find Resource preferences page (on page 251) where you can configure various search options. For example, you can specify a Content language that differs from the default UI language in case your document contains multiple languages.
- **In file paths (on page 739)** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content (on page 736)** - Select this option to search through the content of your resources.
- **In reviews (on page 739)** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
- **Reindex** - Use this option to reindex your resources.

Contextual Menu Actions

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the Internal editor or an external System application.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

Indexing Process

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index in not updated on project changes.
To improve performance, the indexing process skips the following set of common English words (the so-called stop words): a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of stop words in the Open/Find Resource preferences page (on page 251).

Caching Mechanism

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the Reindex button.

⚠️ Important: Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the Reindex button enables the file to be found. The date and time of the last index operation are displayed below the file list.

Opening the Results

Once you find the files that you want to open, select them in the list and press the Open button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file (on page 250).

⚠️ Note: You can drag a resource from the Open/Find Resource view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

For more information about the Open/Find Resource feature and its search capabilities, watch our video demonstration:

https://www.youtube.com/embed/PENoDNdaGao

Related Information:

- Open/Find Resource Dialog Box (on page 733)
Outline View for XML Documents

The **Outline** view displays a general tag overview of the currently edited XML Document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

**Outline View Interface**

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * , ? ) and separate multiple patterns with commas.

It also includes a 🛠. **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

**Drop and Drop Actions in the Outline View**

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
• If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.

• You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.

• If you hold down the (Ctrl (Command on OS X)) key after dragging, a copy operation will be performed instead of a move.

Figure 96. Outline View

Outline View Filters

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view:

Filter returns exact matches

The text filter of the Outline view returns only exact matches.

Selection update on cursor move (Available in Text mode)

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.
- **Flat presentation mode of the filtered results**
  When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  Show/hide comments and processing instructions in the Outline view.

- **Show element name**
  Show/hide element name.

- **Show text**
  Show/hide additional text content for the displayed elements.

- **Show attributes**
  Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (on page 259).

- **Configure displayed attributes**
  Displays the XML Structured Outline preferences page (on page 259).

### Outline View Contextual Menu Actions

The contextual menu of the Outline view contains the following actions:

- **Edit Attributes**
  Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

- **Edit Profiling Attributes (Available in Author mode)**
  Allows you to change the profiling attributes (on page 969) defined on all selected elements.

- **Append Child**
  Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

- **Insert Before**
  Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

- **Insert After**
Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand More

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.

Attributes View in Author Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:
• The CSS stylesheet associated with the document does not specify a `false` value for the `-oxy-editable` property associated with the element.
• The element is entirely included in a deleted `Track Changes` marker.
• The element is part of a content fragment that is referenced in `Author` mode from another document.

The attributes are rendered differently depending on their state:

• The names of the attributes are rendered with a bold font, and their values with a plain font.
• Default values are rendered with a plain font, painted gray.
• Empty values display the text `[empty]`, painted gray.
• Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

• By attribute name in ascending order.
• By attribute name in descending order.
• Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 97. Attributes View
A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Expand/Collapse Button**

There is an Expand/Collapse (↑/↓) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

You can use the **Remove** button to delete an attribute and its value from the selected element.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the **Update** button (or press **Enter**) to add the value to the attribute.

**Note:** For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the **Browse** button is replaced by a **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the Attributes view when editing in Author mode:

**Set empty value**

Specifies the current attribute value as empty.

**Remove**

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.

**Copy**

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:
The value of the attribute.
• The value of the default attribute, if the attribute does not appear in the edited document.
• Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

• If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
• If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
• If the clipboard only contains text, the value of the selected attribute is modified.

In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

• Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
• Double-click any named start tag when the document is edited in one of the following display modes. (on page 441): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

Figure 98. In-place Attributes Editor

Name Combo Box
Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:** For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

**Figure 99. In-place Attributes Editor (Full Version)**

![In-place Attributes Editor (Full Version)](image)

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

**Model View**

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

**Figure 100. Model View**
The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 101. Element Structure Panel
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 102. Annotation panel

Elements View in Author Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the Show only items allowed at cursor position option (on page 260) is not selected in the Views preferences page (on page 259), two additional tabs (Before and After) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing F2 with an element selected will display information about that particular element.

Figure 103. Elements View in Author Mode
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 104. Entities View
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

**Results View**

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages.

**Tip:** To shift focus to the opened **Results** view without using the mouse, there is an action in the Window > Results menu called **Focus Results** that can be used for this purpose and you can assign a keyboard shortcut (on page 248) to this action.

The actions that contribute messages to this view include:

- **Validation** actions (on page 1082)
- **Transformation** actions (on page 1640)
- **Check Spelling in Files** action (on page 765)
- **Find All** action from the **Find/Replace** dialog box (on page 740)
- **Find/Replace in Files** dialog box (on page 745)
- **Search References** action (on page 1209)
• XPath expression results (on page 2182)
• SQL results (on page 2259)

Figure 105. Results View

Results View Toolbar Actions

The view includes a toolbar with the following actions:

💡 Grouping options drop-down menu

A set of Group by toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

This drop-down menu also includes the following additional grouping actions:

☑️ Ungroup all

Removes the grouping rules so that the messages are presented in a continuous list.

Show group columns

If any of the Group by options are selected, you can use this option to show or hide grouping columns.

Restore Defaults

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:
• Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the Check Spelling in Files action (on page 765).
• No grouping rule for the results of applying an XPath expression (on page 2182).

![Highlight all results in editor]

Oxygen XML Editor highlights all matches obtained after executing an XPath expression, or performing one of the following operations: Find All, Find in Files, Search References, and Search Declarations. Click Highlight all results in editor again to turn off highlighting.

**Note:** To customize highlighting behavior, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Highlights category. You can do the following customizations:

- Set a specific color of the highlights depending on the type of action you make.
- Set a maximum number of highlights that the application displays at any given time.

**Remove selected**

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

**Remove all**

Removes all messages from the view.

**Results View Contextual Menu Actions**

The following actions are available when the contextual menu is invoked in this view:

**Learn Word(s) (Available when spelling errors are reported in the Results view)**

Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

**Show message**

Displays a dialog box with the full error message, which is useful for a long message that does not have enough room to be displayed completely in the view.

**Previous message**

Navigates to the message above the current selection.
Next message
Navigates to the message below the current selection.

Remove selected
Removes selected messages from the view.

Remove all
Removes all messages from the view.

Copy
Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- The path of the master file (on page 3284) (in the case of a validation scenario (on page 1093), it is the path of the file from which the validation starts and can be different from the validated file).
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- Name of validation scenario (on page 1093).
- The line and column in the file that triggered the message.

Copy Description
Copies the description values for all selected items. It is possible to assign a shortcut key (on page 249) for this action.

Select All
Extends the selection to all the messages from the view.

Print Results
Sends the complete list of messages to a printer. For each message, the included details are the same as the ones for the Copy action (on page 360). This action is also available in the Window > Results menu.

Save Results
Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the Copy action (on page 360). This action is also available in the Window > Results menu.

Save Results as XML
Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the Copy action (on page 360).

Save Results as HTML
Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the Copy action (on page 360).

**Group by**

A set of Group by toggle actions that allow you to group the messages according to a selected criteria so that they can be presented in a hierarchical layout. The criteria used for grouping can be the severity of the errors (error, warning, info message, etc.), the resource name, the description of the message, and so on.

- **Ungroup all**
  Removes the grouping rules so that the messages are presented in a continuous list.

**Show group columns**

If any of the Group by options are selected, you can use this option to show or hide grouping columns.

**Restore Defaults**

Restores the column size for each column and the grouping rules that were saved in the user preferences the last time when this view was used. If it is the first time this view is used, the action sets an initial default column size for each column and a grouping rule that is appropriate for the type of messages. For example:

- Group the messages by the path of the validated file if there are error messages from a validation action or spelling errors reported by the Check Spelling in Files action (on page 765).
- No grouping rule for the results of applying an XPath expression (on page 2182).

- **Expand All**
  Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

- **Collapse All**
  Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

**Making a Persistent Copy of Results**

The Results view (on page 357) displays the results from the following operations:

- Document validation (on page 1081)
- Checking the form of documents (on page 1079)
- XSLT or FO transformations (on page 1640)
• Finding all occurrences of a string in a file (on page 740)
• Finding all occurrences of a string in multiple files (on page 745)
• Applying an XPath expression to the current document (on page 2185)

To make a persistent copy of the **Results view (on page 357)**, use one of these actions:

**File > Save Results**

Displays the **Save Results** dialog box, used to save the result list of the current message tab. The action is also available on the right-click menu of the **Results** panel.

**File > Print Results**

Displays the **Page Setup** dialog box used to define the page size and orientation properties for printing the result list of the current **Results** panel. The action is also available on the right-click menu of the **Results** panel.

**Save Results as XML from the contextual menu**

Saves the content of the **Results** panel in an XML file with the format:

```
<Report>
  <Incident>
    <engine>The engine who provide the error.<engine>
    <severity>The severity level<severity>
    <Description>Description of output message.</Description>
    <SystemID>The location of the file linked to the message.</SystemID>
  </Incident>
</Report>
```

**Related Information:**

• **Results View (on page 357)**
CSS Inspector View

The purpose of the **CSS Inspector** view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

**Figure 106. CSS Inspector View**

Displaying the CSS Inspector View

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

Displaying Rules

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule Oxygen XML Editor opens the associated CSS file at the line number where the properties of the rule are defined.

**Figure 107. CSS Inspector View - Displaying Rules**
The **CSS Inspector** view contains five tabs:

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:before** - Displays the rules matching the `:before` pseudo-element.
- **:after** - Displays the rules matching the `:after` pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.
- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane
- **Show empty rules** - forces the view to show all the matching rules, even if they do not declare any CSS properties (by default, the empty rules are not displayed)

**Displaying the Markup**

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

The following dedicated tag modes are available from the Tags Display Mode drop-down menu (available on the toolbar):

- **Full Tags with Attributes**
  
  Displays full tag names with attributes for both block and inline elements.
Full Tags
Displays full tag names without attributes for both block and inline elements.

Block Tags
Displays full tag names for block elements and simple tags without names for inline elements.

Inline Tags
Displays full tag names for inline elements, while block elements are not displayed.

Partial Tags
Displays simple tags without names for inline elements, while block elements are not displayed.

No Tags
No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Opens the Author preferences page (on page 131) where you can configure options regarding tags, such as the default Tags Display Mode, Tags Background Color, Tags Foreground Color, Tags Font, and whether or not Oxygen XML Editor will use a Compact Tag Layout for displaying the tags (this option tries to group consecutive block tags on the same line).

Note: The associated CSS information is used to determine whether a tag should be considered inline or block. If the current document does not have an associated CSS stylesheet, then the Full Tags mode will be used.

Displaying Referenced Content
The references to entities, XInclude, DITA conrefs, and constructs in other vocabularies with displayable referenced content (on page 2402) are expanded by default in Author mode and the referenced content is displayed. You can control this behavior from the Author preferences page (on page 131). The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in current document.

Figure 108. XInclude reference

```
<xi:include href="included.xml">
  <!-- Referenced content -->
  Included paragraph.
</xi:include>
```
When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the icon) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the **XML Catalog** set in the **XML Catalog preferences page**.

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Editor.
- On demand, by using the **Refresh references** action. This is useful when the referenced content is modified outside the Oxygen XML Editor scope.

**Related Information:**

- Configuring a Reference Resolver (on page 2402)

**Visual Hints for the Cursor Position**

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first block** - The cursor is positioned before the first *block* child of the current node.
• **Between two block elements** - The cursor is positioned between two block elements (on page 3280).

• **After last block** - The cursor is positioned after the last block element (on page 3280) child of the current node.

• **Inside a node** - The cursor is positioned inside a node.

• **Before an inline element** - The cursor is positioned inside an element, before a child inline element (on page 3283).

• **Between two inline elements** - The cursor is positioned between two inline elements (on page 3283).

• **After an inline element** - The cursor is positioned inside an element, after an child inline element (on page 3283).

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, open the Preferences dialog box (Options > Preferences) (on page 79), go to Author > Cursor Navigation, and deselect the Show cursor position tooltip option (on page 136). Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.
Note: The position information tooltip is not displayed if Full Tags with Attributes or Full Tags is selected in the Tags display mode drop-down menu (on page 441).

Location Tooltip

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor displays a transparent preview of the position information, called the Location Tooltip:

Oxygen XML Editor displays a Location Tooltip when the following conditions are met:

- You are editing the document in one of the following tags display modes (on page 441): Inline Tags, Partial Tags, No Tags.
- The mouse pointer is moved between block elements (on page 3280).

To activate or deactivate this feature, use the Show location tooltip on mouse move option (on page 136) in the Cursor Navigation preferences page (on page 136).

Presenting Validation Errors in Author Mode

By default, Oxygen XML Editor automatically validates documents (on page 1082) while editing in the Author mode, and actions are also available to manually validate documents (on page 1082) on-request.

Figure 111. Presenting Validation Errors in Author Mode
Validation Marker Locations

In **Author** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes** view (on page 426), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the **Preferences** dialog box (Options > Preferences) (on page 79), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option (on page 180).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the
message area on the bottom of the editor panel (clicking the « Document checking options » button opens the Document Checking preferences page (on page 180).

**Bottom Part of the Stripe**

Two navigation arrows (↩️) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)). Also, the �ibox Remove All button can be used to clear all the validation markers.

You can configure the color for each type in the Document Checking preferences page (on page 180).

**Hovering Over Validation Issues**

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (on page 1109) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.

**Details About Validation Issues**

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the « Document checking options » button opens the Document Checking preferences page (on page 180) where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the Information view (on page 822).
- If you want to see all the validation messages grouped in the Results panel (on page 357), you should use the Validate action from the toolbar or Document > Validate menu.

**Related Information:**

- Validating XML Documents Against a Schema (on page 1081)
- Presenting Schematron Validation Issues (on page 1464)
Whitespace Handling in Author Mode

When you edit a document in Author mode, Oxygen XML Editor must serialize the resulting document as XML. Oxygen XML Editor serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor formats and indents the XML document (on page 863) according to the current format and indent settings (on page 157).

Minimizing Whitespace Differences Between Versions

When serializing a document to XML, Author mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

Entering Whitespace in Author Mode

Oxygen XML Editor controls the entry of whitespace characters in Author mode according the XML whitespace rules (on page 863), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its built-in document types (on page 1537), Oxygen XML Editor is correctly configured to recognize preserve space elements (on page 160) and to allow you to enter additional spaces in them.

If you are using a built-in document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is configured correctly (on page 2322) so that Oxygen XML Editor recognizes that the current element is a preserve-space element.

Serialization Options for Author Mode

The Author preferences page (on page 131) (open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author) includes a Serialization section (on page 134) that contains some options that control how the formatting and indenting is applied when a document is saved in Author mode or when switching from Author to Text mode. It also
includes a **Compatibility with other tools** option *(on page 135)* that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

**Editing Content in Author Mode**

The **Author** mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

**Undo/Redo Actions**

The typical undo and redo actions are available with shortcuts or in the *Edit* menu:

- **Undo** *(Ctrl + Z (Command + Z on OS X))*
  
  Reverses a maximum of 200 editing actions (configurable with the **Undo history size** option *(on page 126)* in the Editor preferences page) to return to the preceding state.

  **Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

- **Redo** *(Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))*
  
  Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

**Copy and Paste Actions**

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the *Edit* menu):

- **Cut** *(Ctrl + X (Command + X on OS X))*
  
  Removes the current selected content from the document and places it in the clipboard.

- **Copy** *(Ctrl + C (Command + C on OS X))*
  
  Places a copy of the current selected content in the clipboard.

- **Paste** *(Ctrl + V (Command + V on OS X))*
  
  Inserts the current clipboard content into the document at the cursor position.

- **Select All** *(Ctrl + A (Command + A on OS X))*
  
  Selects the entire content of the current document.
Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as empty or element only in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

Figure 112. Editing in empty element warning

To allow text to be inserted in these instances, go to the Schema-Aware preferences page and deselect the Reject action when its result is invalid option in the Typing actions section (on page 139).

Editing Text Content Without Modifying the XML Markup

You can use the options in the Tags Display Mode drop-down menu (on page 441) (available on the toolbar) to control how tags are displayed in Author mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the XML markup. You can also switch to the Grid editing mode (on page 886) to modify text content without affecting the XML tags.

Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the Document > Font size menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))

Increases the font size (zooms in) with one point for each execution of the action.

Note: For Mac OS X, if you activate the Enable mouse-wheel zooming option (on page 126) in the Editor preferences page, you can use Command + MouseWheelForward to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))

Decreases the font size (zooms out) with one point for each execution of the action.
Note: For Mac OS X, if you activate the **Enable mouse-wheel zooming** option (on page 126) in the Editor preferences page, you can use **Command + MouseWheelBackwards** to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

**Normal editor font (Ctrl + 0 (Command + 0 on OS X))**

Resets the font size to the value of the editor font set in the Fonts preferences page (on page 88).

Related Information:

- Editing XML Markup in Author Mode (on page 906)
- Drag and Drop in Author Mode (on page 918)
- Smart Paste Mechanism (on page 918)
- Content Completion Assistant in Author Mode (on page 921)
- Contextual Menu Actions in Author Mode (on page 1065)
- Frequently Used Shortcut Keys (on page 27)

**Editing XML Markup in Author Mode**

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

**Selecting XML Markup in Author Mode**

Selecting XML tags in Oxygen XML Editor is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the breadcrumb (on page 907) displayed at the top of the editing window.
- **Outline View** - Click the element name in the **Outline** view (on page 347).
• **Full Tags Mode** - While editing in Full Tags mode (on page 441), click the start or end tag of the element in the editor.

• **Mouse Selection** - While editing in Full Tags mode (on page 441), click before the start tag of the element, drag the selection, and release the mouse button after the end tag.

• **Shift + Arrow Keys** - While editing in Full Tags mode (on page 441), place the cursor before the start tag of the element, press and hold **Shift**, and use the arrow keys to make the selection (including the end tag).

**Note**: If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in well-formed XML (on page 1079).

### Using the Breadcrumb in Author Mode

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

Figure 113. Breadcrumb in Author Mode

The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

- **Edit Attributes**
  
  Opens the in-place attributes editor (on page 429) that allows you to easily edit the attributes of an element.

- **Edit Profiling Attributes**

  Allows you to select the profiling attributes (on page 969) that apply to a certain element.

- **Append child**

  Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

- **Insert before**

  Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

- **Insert after**
Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

☐ Cut

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

COPY Copy

Copies the selected element to the clipboard, while preserving the styles of the copied content.

COPY Paste

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

Paste before

Insert a well-formed element (from the clipboard) before the currently selected element.

Paste after

Insert a well-formed element (from the clipboard) after the currently selected element.

Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

☒ Delete

Deletes the currently selected element.

بك Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

Rename Element

Opens the Rename dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip: The tag names displayed in the breadcrumb can be customized with an Author mode extension class that implements the AuthorBreadCrumbCustomizer API. See the Oxygen SDK for more details.

Move Nodes

You can move XML nodes in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):
Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Tip: The easiest way to move nodes is to use the Alt + UpArrow and Alt + DownArrow shortcut keys.

Promote/Demote List Item Nodes

You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

Promote (Shift + Tab)

Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Demote (Tab)

Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Join Elements

Joins two adjacent block elements (on page 3280) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Tip: Specifically, the Delete or Backspace keys can be used to join block elements in the following situations:

- The cursor is located before the end position of the first element and (Delete) key is pressed.
- The cursor is located after the end position of the first element and (Backspace) key is pressed.
- The cursor is located before the start position of the second element and (Delete) key is pressed.
• The cursor is located after the start position of the second element and (Backspace) key is pressed.

If the element has no sibling or the sibling element has a different name, an Unwrap operation will be performed.

Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Rename Elements

You can rename elements by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Surround with Tags (Ctrl + E (Command + E on OS X))

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option (on page 167) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (on page 167) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with [tag] (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.
Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Delete Element Tags**
  Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Tip:** Specifically, the Delete or Backspace keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and (Delete) key is pressed.
- The cursor is located after the start position of the element and (Backspace) key is pressed.
- The cursor is located before the end position of the element and (Delete) key is pressed.
- The cursor is located after the end position of the element and (Backspace) key is pressed.

If the element has no sibling or the sibling element has a different name, an Unwrap operation will be performed.

Remove Markup from Blocks of Content

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Remove All Markup**
  Removes all the XML markup inside the selected block of content and keeps only the text content.

**Tip:** You can use the (Delete) or (Backspace) keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

Remove Text from Selected Markup

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- **Remove Text**
Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Other Refactoring Actions**

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the Refactoring submenu of the contextual menu:

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

- **Change Topic ID to File Name**
  
  Use this operation to change the ID of a topic to be the same as its file name.

- **Convert CALS Tables to Simple Tables**
  
  Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

- **Convert conrefs to conkeyrefs**
  
  Use this operation to convert `conref` attributes to `conkeyref` attributes.

- **Convert Simple Tables to CALS Tables**
  
  Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

- **Convert to Concept**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

- **Convert to General Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

- **Convert to Reference**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).
Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
Allow you to delete elements.

**Delete element content**
Allow you to delete the content of elements.

**Insert element**
Allows you to insert new elements.

**Rename element**
Allows you to rename elements.

**Unwrap element**
Allow you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**
Allow you to surround elements with element tags.

**Wrap element content**
Allow you to surround the content of elements with element tags.

**Fragments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**
Allow you to insert an XML fragment.

**Replace element content with XML fragment**
Allow you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**
Allow you to replace elements with an XML fragment.

Related Information:

- Editing Content in Author Mode *(on page 903)*
- Displaying the Markup *(on page 441)*
Editing Attributes in Author Mode

You can easily edit attributes in **Author** mode by using the Attributes View (on page 426) and Oxygen XML Editor also allows you to edit attribute and element values in-place, directly in the **Author** mode, using an in-place attribute editor.

**In-place Attributes Editor**

Oxygen XML Editor includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes. (on page 441): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

Figure 114. In-place Attributes Editor

![Name Combo Box](image)
Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:** For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 115. In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

**Related Information:**

- Attributes View in Author Mode (on page 426)
Folding XML Elements in Author Mode

When working with a large document, the folding (on page 3282) support in Oxygen XML Editor can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 116. Folding of XML Elements in Author Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Editor, meaning the next time you open the document the folds are restored to its last state.

Folding Actions in Author Mode

Foldable elements (on page 3282) are marked with a small triangle (折叠/ 展开) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the Folding sub-menu of the contextual menu or from the Document > Folding menu:

- **Toggle Fold** (or you can simply click on the折叠/ 展开 arrow)
  
  Toggles the state of the current fold.

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on OS X))
  
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad. (Command + NumPad. on OS X))
  
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds**
  
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on OS X))
  
  Unfolds all elements in the current document.

For more information about the folding support in Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE
Drag and Drop in Author Mode

The Oxygen XML Editor Author mode includes support for dragging and dropping content in XML documents.

When editing content in Author mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the Author mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the Author mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the Author mode editor is inserted without changes.

Smart Paste Mechanism

The Author editing mode includes a Smart Paste feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Editor, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in Author mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would
not be valid, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

Tip: When pasting text fragments formatted with the *Courier New* font, the *Smart Paste* mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a `codeph` element).

**Smart Paste Options**

By default, the *Smart Paste* feature is enabled in Oxygen XML Editor. There are several options in the *Schema Aware* preferences page (on page 137) that control the *Smart Paste* mechanism:

- **Smart paste and drag and drop** (on page 138) - This option determines whether or not Oxygen XML Editor will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.

- **Reject action when its result is invalid** (on page 139) - If you select this option, Oxygen XML Editor will not let you paste content into a position where it would be invalid. This option is deselected by default.

- **Convert external content on paste** (on page 140) - This option determines whether or not Oxygen XML Editor will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.

- **Convert even when pasting inside space-preserve elements** (on page 140) - If you select this option, the *Smart Paste* feature will also work when pasting external content into a *space-preserve* element (such as a `codeblock`). This option is deselected by default.

**Smart Paste Supported Document Types**

The *Smart Paste* feature is supported for the following document types (*frameworks* (on page 3282)):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

For more information about the *Smart Paste* support, watch our video demonstration:

[https://www.youtube.com/embed/bpiXZQwzBfA](https://www.youtube.com/embed/bpiXZQwzBfA)
Selecting Content in Author Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to easily select content in Author mode.

Selection Shortcuts in Author Mode

- **Ctrl + A (Meta + A on Mac OS X)**
  Selects all content in the document.

- **Shift + Left/Right Arrow Keys**
  Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

- **Shift + Up/Down Arrow Keys**
  Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

- **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**
  Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

- **Shift + Home**
  Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

- **Shift + End**
  Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

- **Ctrl + Shift + Home**
  Begins a continuous selection at the cursor position and extends it to the beginning of the document.

- **Ctrl + Shift + End**
Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects the word at the cursor position.

**Triple-Click**

Selects the node at the cursor position.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

Content Completion Assistant in Author Mode

One of the most useful features in **Author** mode is the *Content Completion Assistant (on page 3280)*. It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

Figure 117. Content Completion Assistant in Author Mode
The Content Completion Assistant is enabled by default. To disable it, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Content Completion, and deselect the Enable content completion option (on page 167).

Using the Content Completion Assistant in Author Mode

To activate the feature in Author mode, use any of the following shortcut keys:

- Enter
- Ctrl + Space (Command + Space on OS X)
- Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can use Tab and Shift + Tab to navigate to those links and Space to trigger them. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in Author mode, simply press Enter.

Types of Proposals Listed in the Content Completion Assistant

The Content Completion Assistant offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert code templates (on page 855).
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode (on page 441)), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the Show all possible elements in the content completion list option from the Schema-Aware preferences page (on page 139) is selected, the content completion pop-up window will
present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

**Note:** By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the *Allow only insertion of valid elements and attributes* check box from the *Schema-Aware* preferences page (on page 139).

### Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the *Content Completion Assistant* in certain contexts:

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the *Content Completion Assistant* is a *New <Element>* item. Selecting this item will insert an empty element.

  Figure 118. Example (New [Element Name])

- If the cursor is positioned somewhere inside the element, the first entry in the *Content Completion Assistant* is a *Split <Element>* item. In most cases, you can only split the closest *block element (on page 3280)* to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting *Split <Element>* splits the content of the specified element around the cursor position.

  Figure 119. Example (Split [Element Name])

- If the cursor is positioned inside a *space-preserved element (on page 3287)* (for example, a *codeblock*), the first choice in the *Content Completion Assistant* is *Enter*, which will insert a new line in the content of the element, followed by *New <Element>*.

  Figure 120. Example (‘ENTER’ New Line)
• If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode (on page 441)), it will allow you to rename the element.

Figure 121. Example (Rename)

• If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

Figure 122. Example (Surround)

Related Information:

• Customizing the Content Completion Assistant (on page 2352)

Set the Schema to be Used for Content Completion

The proposals that are presented in the Content Completion Assistant (on page 3280) depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the Content Completion Assistant is specified in the following methods, in the order of their precedence:
• The schema specified explicitly in the document (on page 1120). In this case, Oxygen XML Editor reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.

• The default schema declared (on page 1121) in the Schema tab of the Document Type configuration dialog box (on page 99) for the particular document type.

Schema Annotations in Author Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the Content Completion Assistant (on page 3280).

Figure 123. Schema Annotation in the Content Completion Assistant

The schema annotations support is available if the schema type is one of the following:

• XML Schema
• Relax NG
• NVDL schema
• DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (on page 171) option in the Annotations preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (on page 172) option in the Annotations preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins
a new paragraph, \texttt{br} breaks the current line, \texttt{ul} encloses a list of items, and \texttt{li} encloses an item of the list.

### Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an \texttt{<xs:annotation>} element like this:

\begin{verbatim}
<xs:annotation>
    <xs:documentation>
        Description of the element.
    </xs:documentation>
</xs:annotation>
\end{verbatim}

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

### Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the \texttt{<documentation>} element from the \texttt{http://relaxng.org/ns/compatibility/annotations/1.0} namespace like this:

\begin{verbatim}
<define name="person">
    <element name="person">
        <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
            Information about a person.
        </a:documentation>
        <ref name="name"/>
        <zeroOrMore>
            <ref name="email"/>
        </zeroOrMore>
    </element>
</define>
\end{verbatim}

However, any element outside the Relax NG namespace (\texttt{http://relaxng.org/ns/structure/1.0}) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the \textbf{Use all Relax NG annotations as documentation} (on page 172) option in the \textbf{Annotations} preferences page.

### Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

\begin{verbatim}
## Information about a person.

element person { name, email*}
\end{verbatim}
Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** (on page 171) option in the Annotations preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

**Related Information:**

- Customizing the Rendering of Elements (on page 2364)
- Customizing Annotations in the Content Completion Assistant (on page 2369)

Content Completion Helper Views

Information about the current element being edited is also available in various dockable (on page 3281) views, such as the Model view (on page 353), Attributes view (on page 351), Elements view (on page 355), and Entities view (on page 356). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view (on page 347), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the Window > Show View menu.

**Model View**

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 124. Model View
The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

**Figure 125. Element Structure Panel**
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 126. Annotation panel

Attributes View in Author Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a false value for the -oxy-editable (on page 2515) property associated with the element.
- The element is entirely included in a deleted Track Changes (on page 942) marker.
- The element is part of a content fragment that is referenced in Author mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

Note: If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.
You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 127. Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Expand/Collapse Button**

There is an Expand/Collapse (↑/↓) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

You can use the **Remove** button to delete an attribute and its value from the selected element.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have
entered or selected a value, use the Update button (or press Enter) to add the value to the attribute.

Note: For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the Attributes view when editing in Author mode:

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.
In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes. (on page 441): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

![In-place Attributes Editor](image)

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:** For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

![In-place Attributes Editor (Full Version)](image)
The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

Elements View in Author Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the Show only items allowed at cursor position option (on page 260) is not selected in the Views preferences page (on page 259), two additional tabs (Before and After) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing F2 with an element selected will display information about that particular element.

Figure 130. Elements View in Author Mode
Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 131. Entities View
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

Note: When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a .tm symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.
Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

Figure 132. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:

   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant (on page 3280)**. HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
   - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
     - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
     - M2 represents the **Shift** key.
     - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
     - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
   - **Content** - Text box where you define the content that is used when the code template is inserted. An **editor variable (on page 276)** can be inserted in the text box using the **Insert Editor Variables** button.

4. Click **OK** to save your new code template.

**Result**: Your code template can now be selected using the **Content Completion Assistant (on page 3280)** (**Enter** in **Author** mode or **Ctrl + Space (Command + Space on OS X)** in **Text** mode). The code templates are displayed with a ✨ symbol.
How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

**Method 1: Export/Import**

1. Open the **Preferences** dialog box (**Options > Preferences** *(on page 79)*) and go to **Editor > Templates > Code Templates**.
2. Click the **Export** button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the **Preferences** dialog box (**Options > Preferences**) *(on page 79)*, go to **Editor > Templates > Code Templates**, click the **Import** button, and select the file you sent them.

**Result:** The code templates will be now available in their content completion list.

**Method 2: Share Project**

1. Open the **Preferences** dialog box (**Options > Preferences**) *(on page 79)* and go to **Editor > Templates > Code Templates**.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (`.xpr`).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

**Result:** When they open the updated project file in their **Project view** *(on page 333)*, the code templates will be available in their content completion list.

**Tip:** It is also possible to configure certain actions that function similar to code templates and add them to the content completion list *(on page 2352)* for a particular framework. You could then share the whole framework *(on page 2371)* with other members of your team.

Finding and Replacing Text

You can search for a specific word or string of characters using the following features:

- **Find/Replace** dialog box *(on page 740)*
- **Find/Replace in Files** dialog box *(on page 745)*
- **Quick Find** toolbar *(on page 752)*
- **Find all Elements** dialog box *(on page 751)*
Complex search operations may take some time to complete. If a search operation takes more than 5 seconds, you are prompted to decide whether you want to continue the operation or stop it.

Reviewing Documents

Oxygen XML Editor includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

Tracking Document Changes

The Track Changes feature (on page 3288) is a way to keep track of the changes you make in a document. The Track Changes feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the Track Changes feature is activated (on page 944), insertions are rendered in Author mode with an underline while deletions are rendered with a strike through.

The tracked changes are also displayed in the Review view (on page 964) and you can also choose to present the changes in callouts (on page 958) by selecting the Track Changes Deletions (on page 144) and Track Changes Insertions (on page 144) options in the Callouts preferences page (on page 143).

Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of read-only text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in callouts (on page 958) with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the Review preferences page (on page 140).

Highlighting Content

Oxygen XML Editor includes a highlighting feature that allows you to create digital markers to emphasize important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.
Using the Review View

Oxygen XML Editor includes a Review view (on page 964) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The Review view is also useful for managing tracked changes and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from Author mode, whatever review information is shown in the main editing area will be included in the printed output. For example, tracked changes will be included and as long as the Comments option (on page 143) is selected in the Callouts preferences page (on page 143), comment callouts will also be included (same with tracked change callouts if their corresponding options are selected in the Callouts preferences page (on page 143).

Managing Tracked Changes

Oxygen XML Editor includes a Track Changes feature (on page 3288) that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view (on page 964).

The Track Changes feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the Review view (on page 964) and Attributes view (on page 426).

Types of Tracked Changes

The types of tracked changes include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
• Cutting or pasting content (text or elements)
• Inserting, deleting, and changing the structure of tables
• Inserting and editing lists and their content
• Inserting and deleting entities
• Inserting and deleting element tags
• Editing attributes
• Performing a Split operation
• Performing a Surround with operation
• Changes in referenced content (for example, XInclude fragments or DITA conrefs)

⚠️ **Important:** If you copy content in **Author** mode that contains tracked changes, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

**Activating the Change Tracking Feature**

To activate the **Track Changes** feature for the current document, use any of the following methods:

- Click the 💰 **Track Changes** button on the toolbar.
- Select 🍇 **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.
- Select 🍇 **Track Changes** from the **Edit > Review** menu.

To activate the **Track Changes** feature globally for all documents that you open in Oxygen XML Editor, change the **Initial State** option to **Always On** (on page 141) in the **Review** preferences page (on page 140).

**Rendering Tracked Changes in Author Mode**

When **Track Changes** (on page 3288) is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the **Review preferences page** (on page 140), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Figure 133. Change Tracking in Author Mode
When hovering over a change a tooltip displays information about the author and modification time.

**Change Tracking Contextual Menu Actions**

You can right-click any change in **Author** mode to access the following contextual menu actions:

- **Accept Change(s)**

  Accepts the *Tracked Change* (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

- **Reject Change(s)**

  Rejects the *Tracked Change* (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

- **Comment Change**

  Opens a dialog box that allows you to add a comment to an existing *Tracked Change* (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.
Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or tracking changes (on page 3288) (similar actions are also available in the Edit > Review menu and the Review submenu of the contextual menu):

_track_changes_actions

- **Track Changes**
  Enables or disables the Track Changes (on page 3288) support for the current document.

- **Accept Change(s) combo box**
  This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

  - **Accept Change(s) and Move to Next** - Accepts the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.
  - **Accept Change(s)** - Accepts the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection.
  - **Accept All Changes** - Accepts all Tracked Changes (on page 3288) in the current document.

  **Tip:** You can assign shortcut keys (on page 248) for these actions to make it easier to access them.

- **Reject Change(s) combo box**
  This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

  - **Reject Change(s) and Move to Next** - Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.
  - **Reject Change(s)** - Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection.
  - **Reject All Changes** - Rejects all Tracked Changes (on page 3288) in the current document.
Tip: You can assign shortcut keys (on page 248) for these actions to make it easier to access them.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- Track Changes Visualization Modes Drop-Down Menu

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

- **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the Author mode.

- **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.

- **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.

- **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to View All Changes/Comments.

Note: If you use **View Final** mode and **View Original** mode, callouts (on page 3280) are not displayed for comments or changes. To display callouts, use the **View All Changes/Comments** mode.

Highlight

Enables or disables the Highlight tool (on page 956). Use the Highlight drop-down menu to select a new color.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.
Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 964).

Tracked Change Callouts

You can also choose to display insertion and deletion changes in callouts (on page 3280) in Author mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the Track Changes Deletions (on page 144) and Track Changes Insertions (on page 144) options in the Callouts preferences page (on page 143). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see Author Callouts (on page 958).

Tracked Changes in the Review View

The Review view (on page 964) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see Review View (on page 964).

Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validation or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an insertion change is stored in a document:

```xml
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```
**Example - Deletion Change:** The following processing instruction is an example of how a deletion change is stored in a document:

```xml
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

For more information about the Track Changes support, watch our video demonstration:

- Author Callouts ([on page 958](#))
- Review View ([on page 964](#))

**Tracked Changes Behavior**

The behavior of the Track Changes feature ([on page 3288](#)) depends on the context, the type of change, and whether or not it is activated.

**Inserting Content**

If the Track Changes feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the Track Changes feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
• If inserted in regular content, the current inserted content appears marked as an **Insert** change.

**Surrounding Content**

If the *Track Changes* feature is enabled and you surround content in a new XML element, the following behavior is possible:

• Making a surround in a **Delete** change results in nothing happening.
• Making a surround in an **Insert** change results in the following:
  ◦ If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  ◦ If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.
• Making a surround in regular content results in the operation being marked as a surround change.

**Deleting Characters**

If the *Track Changes* feature is disabled and you delete content character by character, the following behavior is possible:

• Deleting content in an existing **Delete** change results in nothing happening.
• Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
• Deleting in regular content results in a regular deletion.

If the *Track Changes* feature is enabled and you delete content character by character, the following behavior is possible:

• Deleting content in an existing **Delete** change results in the following:
  ◦ If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
  ◦ If another author created the **Delete** change, nothing happens.
• Deleting content in an existing **Insert** change results in the following:
  ◦ If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
  ◦ If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
• Deleting in regular content results in the content being marked as a **Delete** change by the current author.
Deleting Selections of Content

If the Track Changes feature is disabled and you delete a selection of content, the following behavior is possible:

• If the selection contains an entire Delete change, the change disappears and the content is deleted.
• If the selection intersects with a Delete change (starts or ends in one), it results in nothing happening.
• If the selection contains an entire Insert change, the change disappears and the content is deleted.
• If the selection intersects with an Insert change (starts or ends in one), the Insert change is shrunk and the content is deleted.

If the Track Changes feature is enabled and you delete a selection of content, the following behavior is possible:

• If the selection contains an entire Delete change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
• If the selection intersects a Delete change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
• If the selection contains an entire Insert change, the following is possible:
  ◦ If the Insert is made by the same author, the change disappears and the content is deleted.
  ◦ If the Insert is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
• If the selection intersects an Insert change (starts or ends in one), the Insert change shrinks and the part of the Insert change that intersects with the selection is deleted.

Deleting Tags

Assuming you are using any of the Tag Display Modes (on page 441) other than No Tags and the Track Changes feature is disabled, if you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the Tag Display Modes (on page 441) other than No Tags and the Track Changes feature is enabled, if you delete a start tag of an inline element (on page 3283), both the start and end tag are marked as a Delete change by the current author, while any content that was inside the element is preserved.
Copying Content

If the Track Changes feature is disabled and you copy content, if the copied area contains Insert or Delete changes (or attribute edits), these are also copied to the clipboard.

If the Track Changes feature is enabled and you copy content, if the copied area contains Insert or Delete changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

Pasting Content

If the Track Changes feature is disabled and you paste content, if the clipboard content contains Insert or Delete changes (or attribute edits), they will be preserved on paste.

If the Track Changes feature is enabled and you paste content, if the clipboard content contains Insert or Delete changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

Tracked Changes Limitations

There are some inherent limitations to the Change Tracking feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.

- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.

- **Limitations to using certain actions** - Some actions cannot be implemented with the Track Changes feature enabled. For example, some of the table-related actions (Delete Row(s), Delete Column(s), Join Cells, Split Cell) ignore the Track Changes feature when executing the action.

Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the Track Changes feature:

<table>
<thead>
<tr>
<th>Edit Type</th>
<th>Processing Instruction Start Marker</th>
<th>Processing Instruction End Marker</th>
<th>Attributes</th>
</tr>
</thead>
</table>
## Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of read-only content. The difference between using comments and tracked changes (on page 3288) is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the **Author** mode as callouts (on page 3280) (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the **Comments** option (on page 143) in the Callouts preferences page (on page 143). Comments are also displayed in the **Review** view (on page 964).

![Figure 134. Comments in Author Mode](image)

### Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in **Author** mode.
To insert a comment at the cursor position or on a specific selection of content, select the Add Comment action from the toolbar (or in the Review submenu of the contextual menu).

Tip: When adding or editing a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

Show/Edit Comments

To edit an existing comment that you have added in the main editing area in Author mode, select the Show/Edit Comments action from the toolbar (or in the Review submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select Remove Comment(s) from the toolbar (or in the Review submenu of the contextual menu).

Copy/Paste

If you copy content that includes comments, they will be preserved when you paste it.

Managing Comments in Callouts

As long as the Comments option (on page 143) is selected in the Callouts preferences page (on page 143), comments are also displayed in callouts (on page 958). By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout.
When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the Callouts preference page (on page 143) where you can configure various callout options.

Tip: When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

Managing Comments in the Review View

The Review view (on page 964) is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the Review view, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot
be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Show only reviews by '<author name>'**

Filters the comments to only show comments for the particular author.

**Remove all Comments**

Removes all comments from the document.

**Comments XML Source Code**

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```xml
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300" comment="Do not change this content">
  Important content
</oxy_comment_end>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```xml
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200" comment="We should not forget about recycling the oil and oil filter!"
  parentID="vws_x4l_1v" mid="4">
```

**Related Information:**

- Author Callouts *(on page 958)*
Managing Highlights

Use the Highlight tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that needs additional editing or to draw the attention of others to particular content.

Using the Highlight Tool

You can find the Highlight action on the main toolbar, in the Edit > Review menu, or in the Review submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to Stop highlighting from the same menus.

To highlight content, follow these steps:

1. Click the Highlight icon on the toolbar.
   
   **Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the Highlight icon and select the color that you want to use for the highlighting.

3. Select the content you want to highlight. To mark multiple parts of a document, press and hold Ctrl (Meta on Mac OS) and select the parts you want to highlight.

4. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press Ctrl + A (Command + A on OS X) if you want to select all of the text.

2. Click the small arrow next to the Highlight icon and select No color (erase), or right-click the highlighted content and select Remove highlight(s).

3. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

**Note:** Oxygen XML Editor preserves the highlighting of a document between working sessions. Also, if you copy content that includes highlights, the highlighting will be preserved when you paste it.
Review View

The Review view (on page 964) is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with tracked changes (on page 3288) and comments. The following actions are available in the contextual menu of each highlight in the Review view:

**Change Color**

Allows you to change the color of an existing highlight by selecting the new color from this menu.

**Remove Highlight**

Removes the selected highlight.

**Remove Highlights with the Same Color**

Removes the selected highlight and all others that have the same color.

**Remove All Highlights**

Removes all highlights from the document.

Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
The highlights are stored<?oxy_custom_end?>
```

For more information about using the Highlight tool, watch our video demonstration:

[https://www.youtube.com/embed/RMFyuMfisZY](https://www.youtube.com/embed/RMFyuMfisZY)

Related Information:

- Review View (on page 964)

Author Callouts

Oxygen XML Editor uses callouts (on page 3280) to present comments and tracked change (on page 3288) modifications that you or other members of your team have added to the document.
Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in Author mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the Review preferences page (on page 140). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the Fixed option for the particular type of change and choose a color from the color box. If the Automatic option is selected, Oxygen XML Editor automatically assigns a color based upon the Colors for automatic assignment list (on page 143).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the Show all connecting lines option (on page 144) in the Callouts preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

Figure 135. Multiple Author Callouts

Note: Oxygen XML Editor displays callouts only if View All Changes/Comments or View Only Changes/Comments by is selected in the Track Changes Visualization Modes drop-down menu. Oxygen XML Editor does not display callouts in View Final and View Original modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or space-preserved elements (on page 3287) that
contain long fragments (such as a DITA `codeblock` element or `programlisting` in DocBook). To help you view the text under the covered area, Oxygen XML Editor applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

Figure 136. Transparent Callout

Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the Initial Width option (on page 144) in the Callouts preferences page.

You can also adjust the maximum number of lines to be shown in the callouts using the Text Lines Count Limit option (on page 144). Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

Type of Callouts in Oxygen XML Editor

Oxygen XML Editor uses callouts to display comments and Tracked Changes (on page 3288) that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the Callouts preferences page (on page 143).

You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the Comments option (on page 143) is selected in the Callouts preferences page (on page 143), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the Show review time option (on page 144) to include timestamp information in the comment callouts.

Figure 137. Comment Callouts
There are several types of comments that can be added in Author mode:

- **Author Review Comments** - Comments that you associate with specific content. To insert this type of comment, select the content and use the Add Comment action that is available on the toolbar (or in the Review submenu of the contextual menu).

- **Comments Added to Tracked Changes** - Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select Comment Change.

- **Replies to Comments** - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in the its callout and select Reply. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

![Callout for a Comment with Replies](image1.png)

**Tip:** When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the Track Changes Deletions option (on page 144) is selected in the Callouts preferences page (on page 143), deletions that are made while the Track Changes feature is enabled are displayed in callouts. A deletion callout contains the type of callout (Deleted) and the name of the author that made the deletion. You can also select the Show deleted content in callout option (on page 144) to display the actual deleted content in the callout. Additionally, you can select the Show review time option (on page 144) to include timestamp information in the deletion callouts.

![Deletion Callouts](image2.png)
• **Tracked Change Insertion Callouts** - As long as the [Track Changes Insertions option](on page 144) is selected in the [Callouts preferences page](on page 143), insertions that are done while the [Track Changes](feature is enabled are displayed in callouts. An insertion callout contains the type of callout (Inserted) and the name of the author that inserted the content. You can also select the [Show inserted content in callout option](on page 144) to display the actual deleted content in the callout. Additionally, you can select the [Show review time option](on page 144) to include timestamp information in the deletion callouts.

Figure 140. Insertion Callouts

Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu of an insertion or deletion callout:

- **Reply**
  
  Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](on page 964).

- **Mark as Done**
  
  A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

  ✓ **Accept Change**
Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

**Reject Change**

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

**Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3288)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the *Callouts preference page (on page 143)* where you can configure various callout options.

**Comment Callout Actions**

The following options are available in the contextual menu of a comment callout:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes (on page 3288)*. When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and *Review view (on page 964)*.

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes (on page 3288)* that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments
or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the Callouts preference page (on page 143) where you can configure various callout options.

Printing Callouts

When you print a document from Author mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to File > Print Preview.

Review View

The Review view (on page 964) is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see Review View (on page 964).

To watch our video demonstration about the Callouts support, see our video demonstration:

https://www.youtube.com/embed/kCCWyFqBaUM

Related Information:

• Managing Tracked Changes (on page 943)
Review View

The Review view is an independent panel, available both for built-in and custom XML document frameworks (on page 3282). It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes (on page 3288) using a single view.

The Review view is useful when you are working with documents that contain a large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the Review view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Figure 141. Review View

Activating the Review View

To activate the Review view, do one of the following:

- Click the Manage reviews button on the toolbar.
• Right-click anywhere in a document and select **Review > Manage reviews**.
• Open it from the **Window > Show View** menu.

**Review View Toolbar Actions and Settings**

The upper part of the view contains a filtering area that allows you to search for specific edits. The filter field also includes a search history drop-down list. The toolbar also includes **Previous** and **Next** navigation buttons and a **Settings** menu button.

**Previous**

Use this button to navigate to the previous review item. By default, if you reach the first review item in the document, clicking this button will open a dialog box asking if you want to open the previous document (from the current DITA map hierarchy) that contains review items. This default behavior can be changed by choosing one of the options in the **When navigating items in the Review view and you reach the last/first item** section of the **DITA preferences page (on page 226)**.

**Next**

Use this button to navigate to the next review item. By default, if you reach the last review item in the document, clicking this button will open a dialog box asking if you want to open the next document (from the current DITA map hierarchy) that contains review items. This default behavior can be changed by choosing one of the options in the **When navigating items in the Review view and you reach the last/first item** section of the **DITA preferences page (on page 226)**.

**Settings**

The **Settings** menu includes the following options:

**Show highlights**

Controls whether or not the **Review** view displays the highlighting in your document.

**Show comments**

Controls whether or not the **Review** view displays the comments in the document you are editing.

**Show track changes**

Controls whether or not the **Review** view displays the inserted and deleted content in your document.

**Show reviews in read-only content**
Controls whether or not the Review view displays review items from content referenced with a `@conref` or `@conkeyref` attribute.

**Show review time**

Displays the time when the edits from the Review view were made.

**Sort by date**

Expands to offer the following sorting options: Oldest to newest, Newest to oldest, and No sorting.

**Configure review options**

Opens the Review preferences page (on page 140) where you can configure various options for review information.

---

**Hover Actions in the Review View**

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the Review view:

- **Remove**
  
  Available for highlights and comments presented in the Review view and it removes the particular highlight or comment from your document and moves to the next change.

- **Accept**
  
  Available for inserted and deleted content presented in the Review view and it accepts the particular change in your document and moves to the next change.

- **Reject**
  
  Available for inserted and deleted content presented in the Review view and it rejects the particular change in your document and moves to the next change.

---

**Contextual Menu Actions in the Review View**

Depending on the type of an edit, the following additional actions are available in the contextual menu of the Review view:

- **Reply**
  
  Opens the Reply dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

- **Mark as Done**
Toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

Show Comment

Available for comments added by other users and you can use this option to view it in a Show comment dialog box.

Edit Comment

Available for comments you have added and you can use this action to edit a comment.

Remove Comment

Use this action to remove the selected comment.

Show only Reviews by '<author name>'

Use this action to filter the edits to only show them for a certain author.

Remove All Comments

Use this action to remove all the comments that appear in the edited document.

Change Color

Available for highlights and it opens a palette where you can choose a new color for the highlighted content.

Remove Highlight

Available for highlights and you can use this action to remove the selected highlight.

Remove Highlights with the Same Color

Available for highlights and you can use this action to remove all the highlights with the same color from the entire document.

Remove All Highlights

Available for highlights and you can use this action to remove all the highlights in your document.

Accept Change

Accepts the selected change and moves to the next change.

Reject change

Rejects the selected change and moves to the next change.

Comment change

Available for insertions or deletions and you can use this option to add a comment for the particular change.
Accept all changes
Accepts all the changes in the current document.

Reject all changes
Rejects all the changes in the current document.

For more information about the Review view, watch our video demonstration:

https://www.youtube.com/embed/W22jkbwlh60

Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appears in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for expert users and another section for novice users, while unmarked sections are included in all renditions.

Profiling Attributes and Condition Sets

Oxygen XML Editor allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in Author mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
• Multiple outputs for various releases of a product.
• Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

Figure 142. Example: Profiling Content

Oxygen XML Editor includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the Profiling/Conditional Text preferences page (on page 144). You can also define your own profiling attributes and condition sets for each document type (framework (on page 3282)) and your profiling configuration can be shared among content authors through the project file.

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes (on page 970) (for information about sharing them, see Sharing Profiling Attribute Configurations (on page 973)).

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets (on page 975) (for information about sharing them, see Sharing Condition Set Configurations (on page 978)).

Related Information:

• Customizing Elements that Wrap Profiled Content (on page 2425)

Creating and Editing Profiling Attributes

Oxygen XML Editor includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework (on page 3282)). You can then apply the profiling attributes to content in Author mode to see how the profiling will affect the output.
Create or Editing Profiling Attributes

To create or edit profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

   Information: The Profiling Attributes section (on page 145) is used to define the attributes and their values for each document type.
3. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   Step Result: In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.

Figure 143. Profiling Attribute Dialog Box

The following options are available in this dialog box:

**Document type**

Select the document type (framework (on page 3282)).
Tip: You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).

The columns are as follows:

- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (Edit Profiling Attributes dialog box on page 973, Condition Set dialog box on page 975, and other UI components where the profiling is shown (on page 980)). If the Label is not specified, the Value will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the Profiling Attributes configuration dialog box.
5. Click **Apply** to save the changes.

**Adding Profiling Attribute Values Directly in a Document**

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (on page 915) in Author mode, the Attributes view (on page 426), or in the source code in Text mode. However, this just adds them to the document and does not change the
conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Profiling / Conditional Text preferences page (on page 144) where you can edit the profiling configuration.

Note: If the Allow contributing extra profiling attribute values (on page 146) option is not selected in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.

Figure 144. Profiling Values Conflict Dialog Box

Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select Project Options (on page 3286) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 723).

Related Information:

- Applying Profiling Attributes (on page 973)
- Creating and Editing Profiling Condition Sets (on page 975)
Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To apply a profiling attribute to content in Author mode, follow these steps:

1. To apply a profiling attribute to content in Author mode, highlight the content and select Edit Profiling Attributes from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select Edit Profiling Attributes (you can also right-click the element in the breadcrumb or Outline view).

Step Result: The Edit Profiling Attributes dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (framework). If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All / Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have defined profiling attribute values on page 970 for the DITA document type in the Profiling/Conditional Text preferences page on page 144 and you store them at project-level (on page 3286), those values are displayed in the dialog box.
- If you have defined profiling attribute values on page 970 for the DITA document type in the Profiling/Conditional Text preferences page on page 144 and you store them at global-level (on page 3283), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

Figure 145. Edit Profiling Attributes Dialog Box
2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the *document fragment (on page 3281)*.

3. Click **OK** to finish the profiling configuration.

**Result:** The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the **Show Profiling Attributes** option (on page 981) (available in the *Profiling / Conditional Text* toolbar menu) is selected, a green border is painted around profiled text in the **Author mode** and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 146. Profiling Attribute Value Form Control Pop Up
Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A Profiling Condition Set is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

   **Information:** The Profiling Condition Sets section (on page 146) is used to define condition sets.

2. To add new condition set, click the New button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the Edit button.

   **Step Result:** In either case, this opens a Condition Set configuration dialog box where you can define attributes that exist in your schema.

   Figure 147. Condition Set Configuration Dialog Box
The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type (*framework (on page 3282)*) for which you have defined profiling attributes.

**Use DITAVAL file**

For DITA projects, select this option if you want the *Profiling Condition Set* to reference a *DITAVAL file (on page 3248)*. You can specify the path by using the text field, its history drop-down, the *Insert Editor Variables (on page 276)* button, or the browsing actions in the *Browse* drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the *filter* text field to search for specific conditions.

**Shortcut key**
You can click the **Choose** button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.

4. Click **Apply** to save the condition set.

**Result:** All saved profiling condition sets are available in the **Profiling / Conditional Text** toolbar drop-down menu (*on page 980*).

### Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select **Project Options** (*on page 3286*) at the bottom of the **Profiling/Conditional Text** preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see **Sharing a Project - Team Collaboration** (*on page 723*).

#### Related Information:

- Applying Profiling Condition Sets (*on page 978*)
- Creating and Editing Profiling Attributes (*on page 970*)
- Applying Profiling Attributes (*on page 973*)
- Showing and Filtering Profilesd Content in Author Mode (*on page 980*)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (*on page 3240*)

### Applying Profiling Condition Sets

All defined **Profiling Condition Sets** (*on page 975*) are available as shortcuts in the **Profiling / Conditional Text** toolbar menu (*on page 980*). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode and **Outline view** (*on page 347*). An element
is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:

Suppose that you have the following document:

```xml
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.
This is how the document looks in **Author** mode after you apply the condition set:

```
```

### Showing and FilteringProfiled Content in Author Mode

You can visualize the effects of profiled content in **Author** mode by using the options in the **Profiling/Conditional Text** drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in **Author** mode. You can configure the colors and styles or specify whether or not this option is selected by default in the **Profiling/Conditional Text > Colors and Styles** preferences page (on page 147).

---

**Related Information:**

- Creating and Editing Profiling Condition Sets *(on page 975)*
- Creating and Editing Profiling Attributes *(on page 970)*
- Applying Profiling Attributes *(on page 973)*
- Showing and Filtering Profiled Content in Author Mode *(on page 980)*
- Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 983)*
Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode. You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page (on page 148).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode and the Outline (on page 347) view. When this option is selected and a condition set is selected in this drop-down menu (on page 981), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 981), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 146).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 981) to access a dialog box that presents all of them.

❖ Profiling Settings

Opens the Profiling/Conditional Text preferences page (on page 144) where you can add and edit profiling attributes and condition sets.

Figure 148. Example: Profiling Controls in Author Mode
If the Show Profiling Attributes option is selected, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 149. Profiling Attribute Value Form Control Pop Up

Related Information:

- Creating and Editing Profiling Attributes (on page 970)
- Applying Profiling Attributes (on page 973)
- Creating and Editing Profiling Condition Sets (on page 975)
- Applying Profiling Condition Sets (on page 978)
Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode, allowing you to easily recognize the differences.

Figure 150. Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:
1. Select the **Show Profiling Colors and Styles** option (on page 980) from the **Profiling / Conditional Text** toolbar drop-down menu.

2. Select **Profiling Settings** (on page 981) from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text** preferences page (on page 144).

3. Go to the **Colors and Styles** preferences page (on page 146) to configure the colors and styling for the profiling attributes.

4. Go to the **Attributes Rendering** preferences page (on page 148) to configure how you want the profiling attributes to appear in Oxygen XML Editor.

**Result:** The styling is now applied in the **Author** editing mode and the **Outline view** (on page 347). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box (on page 970) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Figure 151. Profiling Attribute Value Form Control Pop Up

Adding Tables in Author Mode

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in various frameworks (on page 3282) (DITA, DocBook, TEI, and XHTML). This opens the Insert Table dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor includes some general editing actions for configuring tables in Author mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

Editing Tables in Author Mode

Oxygen XML Editor provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in Author mode and they include the following:

**Adjusting Column Width**

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a colspecs section that appears above the table in Author mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The built-in DITA, DocBook, and XHTML frameworks (on page 3282) support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

![Figure 152. Resizing a Table Column in Author Mode](image)

**Selecting Columns and Rows**

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to for row selection and to for column selection and that specific row or column is highlighted.
You can use the Ctrl and Shift keys to select multiple rows.

**Selecting Cells**

To select a cell in a table, press and hold the Ctrl key and click anywhere inside the cell. You can also use the Ctrl and Shift keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a RTL document (on page 621)) to select it. The cursor changes to \( \text{cell selection} \) when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

**Drag and Drop**

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

**Copy/Cut and Paste**

In Oxygen XML Editor, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a CALS table, Oxygen XML Editor preserves column width information. This information is then used when you paste the column into another CALS table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.
Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the **Delete Row(s)** or **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the **Delete Row(s)** or **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the Quick navigation in tables option (on page 137) is not selected in the Cursor Navigation preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Related Information:

- Adding Tables in DocBook (on page 987)
- Adding Tables in DITA Topics (on page 999)
- Adding Tables in XHTML Documents (on page 1013)

Adding Tables in DocBook

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.
Inserting a CALS Table Model in DocBook

To insert a CALS table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure a few more properties than the HTML model.

Figure 153. Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:
• **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.

• **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

• **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspecs` (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row separator**

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

**Column separator**

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

• **left** - Aligns the text to a left position.
• **right** - Aligns the text to a right position.
• **center** - Aligns the text to a centered position.
• **justify** - Stretches the line of text so that it has equal width.
Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- char - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Note: The options in the Insert Table dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 154. CALS Table in DocBook

Inserting an HTML Table Model

To insert an HTML table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select HTML for the table Model.

Figure 155. Insert Table Dialog Box - Simple Model
The dialog box allows you to configure the following options when you select the HTML table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the width attribute...
are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form “0*” (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author mode** (on page 402), it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 426) (Window > Show View > Attributes).

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (on page 1010) action from the toolbar or contextual menu to modify many of the properties of the table (on page 995).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 303).

DocBook Table Layouts

The DocBook framework (on page 3282) supports the following two table model layouts:

- CALS table model (on page 993)
- HTML table model (on page 994)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (colwidth attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 156. CALS Table in DocBook
HTML Table Model Layout

Choosing an HTML table model from the Insert Table dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an HTML table includes a section above the table that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although these properties appear as part of the Author mode (on page 402), they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 157. HTML Table in DocBook

Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the CALS model. If you want to overwrite this behavior and instruct Oxygen XML Editor to convert them to HTML tables, set the docbook.html.table parameter to 1. You can find this parameter in the following stylesheet:

• [OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db5Driver.xsl for DocBook 5
Table Validation in DocBook

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

**HTML Tables**

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 426) (Window > Show View > Attributes).

You can use the Table Properties (Ctrl + T (Command + T on OS X)) action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.
Note: Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the Table properties dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in the four tabs include a Preview pane that shows a representation of the modification.

Figure 158. Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)

The options in the four tabs include the following:

**Horizontal alignment** (Available in the Table, Column, and Cell tabs)
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

 помечено: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row type (Available in the Row tab only)**

Allows you to change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).
Edit Table Properties for an HTML Table Model

For an HTML table model, the Table properties dialog box includes four tabs of options (Table, Row, Column, and Cell) and the options include a Preview pane that shows a representation of the modification.

The options in the four tabs include the following:

Frame (Available only in the Table tab)

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).

Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (align attribute). The allowed values are:

- left - Aligns the text to a left position.
- right - Aligns the text to a right position.
- center - Aligns the text to a centered position.
- justify - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.
- char - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (valign attribute). The allowed values are:

- top - Aligns the text at the top of the cell.
- middle - Aligns the text in a vertically centered position.
- bottom - Aligns the text at the bottom of the cell.
- baseline - Sets the row so that all the table data share the same baseline. This often has the same effect as the bottom value. However, if the fonts are different sizes, the baseline value often makes the table look better.
Adding Tables in DITA Topics

You can use the `Insert Table` action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model (on page 999)** - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model) (on page 1001)** - This is used for more advanced functionality.
- **DITA Choice table model (on page 1004)** - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model (on page 1005)** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a Simple DITA table, select the `Insert Table` action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select Simple for the table Model.

Figure 159. Insert Table Dialog Box - Simple Model
The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**
Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

### Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the **Simple** model.

![Figure 160. Insert Table Dialog Box - CALS Model](image-url)
The dialog box allows you to configure the following options when you select the **CALS** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, colwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the colspeccs (column specifications) section above the table or in **Text** mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Row separator**

Specifies whether or not to include row separators ( `rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Column separator**

Specifies whether or not to include column separators ( `colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Alignment**

Specifies the alignment of the text within the table ( `align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

• **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
• **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although
they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 161. CALS Table in DITA

```
<table>
<thead>
<tr>
<th>Sample CALS Table with Fixed Width</th>
</tr>
</thead>
<tbody>
<tr>
<td>name c1</td>
</tr>
<tr>
<td>name c2</td>

<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>
```

**Inserting a Choice Table Model**

To insert a Choice table within a step element in a DITA Task document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select choicetable from the Content Completion Assistant (on page 3280). The Insert Table dialog box appears. Select Simple for the table Model.

Figure 162. Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.
Column widths

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click Insert, a Choice table is inserted into your DITA Task document at the current cursor position (within a step element).

Inserting a Properties Table Model

To insert a Properties table within a refbody element in a DITA Reference document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table...
submenu from the DITA menu), or select properties (wizard) from the Content Completion Assistant (on page 3280). The Insert Table dialog box appears. Select Properties for the table Model.

Figure 163. Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more
When you click **Insert**, a **Properties** table is inserted into your DITA Reference document at the current cursor position (within a **refbody** element).

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 426) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the **Table Properties** (Ctrl + T (Command + T on OS X)) (on page 1010) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 1010).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 303).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor includes a **Smart Paste feature** (on page 918) that preserves certain style and structure information when pasting content.

**Tip:** When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

**Related Information:**

- Editing Tables in Author Mode (on page 985)

**DITA Table Layouts**

Depending on the context, DITA accepts the following table layouts:

- **CALS table model** (on page 1008)
- **Simple table model** (on page 1008)
- **Choice table model** (on page 1008)
- **Properties table model** (on page 1009)
CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (colwidth attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 164. CALS Table in DITA

Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Figure 165. DITA Simple Table

Choice Table Model Layout

A Choice table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The choicetable element is a useful...
device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting \textit{choicetable} from the \textit{Content Completion Assistant (on page 3280)} (within a \texttt{step} element) or by using the \textbf{Insert Table} action on the toolbar or from the contextual menu. The options and layout of a Choice table is similar to the Simple table model.

Figure 166. DITA Choice Table

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

Properties Table Model Layout

A Properties table model is used within a \texttt{refbody} element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting \textit{properties(wizard)} from the \textit{Content Completion Assistant (on page 3280)} (within a \texttt{refbody} element) or by using the \textbf{Insert Table} action on the toolbar (or from the contextual menu) and selecting Properties for the \texttt{Model}. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 167. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a \textit{DITA map (on page 3281)} with the \textbf{Validate and Check for Completeness} action, if the \textit{Report table layout problems} option is selected in the \textit{DITA Map Completeness Check} dialog box (on page 3040), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table \texttt{cols} attribute.
- A row has more cells than the number of columns detected from the table \texttt{cols} attribute.
• A cell has a vertical span greater than the available rows count.
• The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
• The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
• The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
• The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

Simple or Choice Tables

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the `Table Properties (Ctrl + T (Command + T on OS X))` action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

• `<not set>` - Use this value if you want to remove a property.
• `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the Table properties dialog box includes four tabs of options:

• Table tab - The options in this tab apply to the entire table.
• Row tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
• Column tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
• Cell tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a Preview pane that shows a representation of the modification.
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Vertical alignment (Available in the Row and Cell tabs)**
Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (\texttt{valign} attribute). The allowed values are as follows:

- \textbf{top} - Aligns the text at the top of the cell.
- \textbf{middle} - Aligns the text in a vertically centered position.
- \textbf{bottom} - Aligns the text at the bottom of the cell.
- \textbf{-dita-use-conref-target} - Normally, when using a \texttt{conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}.

\textbf{Column separator (Available in the Table, Column, and Cell tabs)}

Specifies whether or not to include column separators (borders/grid lines) in the form of the \texttt{colsep} attribute. The allowed values are: 0 (no separator) and 1 (include separators).

\textbf{Row separator (Available in all four tabs)}

Specifies whether or not to include row separators (borders/grid lines) in the form of the \texttt{rowsep} attribute. The allowed values are: 0 (no separator) and 1 (include separators).

\textbf{Frame (Available only in the Table tab)}

Allows you to specify a value for the \texttt{frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- \textbf{none} - No border will be added.
- \textbf{all} - A border will be added to all frames.
- \textbf{top} - A border will be added to the top frame.
- \textbf{topbot} - A border will be added to the top and bottom frames.
- \textbf{bottom} - A border will be added to the bottom frame.
- \textbf{sides} - A border will be added to the side frames.
- \textbf{-dita-use-conref-target} - Normally, when using a \texttt{conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}.

\textbf{Edit Table Properties for a Simple, Choice, or Properties Table Model}

For a \textit{Simple}, \textit{Choice}, \textit{Properties} table model, the \textbf{Table properties} dialog box only allows you to edit a few options.
Table tab

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row tab (not available for Properties tables)

Row type

Allows you to change the row to a body or header type of row.

Related Information:

- Adding Tables in DITA Topics (on page 999)
- Editing Tables in Author Mode (on page 985)

Adding Tables in XHTML Documents

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the Insert Table dialog box.

Figure 169. Insert Table Dialog Box in XHTML
The dialog box allows you to configure the following options:

**Caption**

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If
you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the section above the table or in Text mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the Insert Table dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click Insert, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (on page 402), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 426) (Window > Show View > Attributes). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 303).

XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an XHTML table includes a colspecs section that allows you to easily configure some properties. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 170. Table Layout in XHTML Documents

Table Validation in XHTML

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the colspan, rowspan, or span attributes are not numeric.
- A cell has a vertical span greater than the available rows count.
Adding Tables in TEI Documents

You can use the `Insert Table` action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the `Insert Table` dialog box.

Figure 171. Insert Table Dialog Box in TEI

The dialog box allows you to configure the following options:

**Head**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Note:** The options in the `Insert Table` dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the `Attributes view` (on page 426) (Window > Show View > Attributes). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 303).

**Sorting Content in Tables and List Items**

Oxygen XML Editor offers support for sorting the content of tables and list items of ordered and unordered lists.
Sorting a Table

To sort rows in a table, select the entire table (or specific rows) and use the \Sort action from the main toolbar or the contextual menu. This opens the \Sort dialog box.

Figure 172. Sort Dialog Box

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

Note: When you invoke the sorting operation over an entire table, the \Selected rows option is disabled.

The Criteria section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - Text - Alphanumeric characters.
  - Numeric - Regular integer or floating point numbers are accepted.
  - Date - Default date and time formats from the local OS are accepted (such as short, medium, long, full, xs:date, and xs:dateTime).
- The sorting direction (either ascending or descending).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the Sort dialog box, click OK to complete the sorting operation. If you want to revert to the initial order of your content, press Ctrl + Z (Command + Z on OS X) on your keyboard.

Note: The sorting support takes the value of the xml:lang attribute into account and sorts the content in a natural order.
Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose **Sort**, or click **Sort** on the main toolbar. This opens the **Sort** dialog box.

Figure 173. Sort Selected Rows

![Sort dialog box](image)

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as short, medium, long, full, xs:date, and xs:dateTime).
- The sorting direction (either **ascending** or **descending**).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.
Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the Criteria section of the Sort dialog box, configure the applicable items, and click OK to complete the sorting operation.

Figure 174. Sorting Based on Multiple Criteria

Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain rowspans.

Note: For this type of table, the Sort dialog box keeps the All rows option disabled even if you perform the sorting operation over a selection of rows.

Sorting List Items

A sorting operation can be performed on various types of lists and list items. The types of lists that can be sorted in Oxygen XML Editor depend on the framework (document type), but examples of the types that can be sorted include:

- Ordered list (DITA, DocBook, XHTML, TEI)
- Unordered list (DITA, DocBook, XHTML, TEI)
- Definition list (DITA)
- Variable list (DocBook)
- Parameter list (DITA)
- Simple list (DITA)
- Required conditions (DITA Machinery Task)
- Supplies list (DITA Machinery Task)
The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the $\mathsection{Sort}$ action from the main toolbar or the contextual menu. This opens the Sort dialog box.

Figure 175. Sorting List Items

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:** When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as short, medium, long, full, xs:date, and xs:dateTime).
- The sorting direction (either **ascending** or **descending**).

After you finish configuring the options in the Sort dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on OS X)** on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.
Inserting Images

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Editor tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the `file:/C:/project/xml/dir/img1.jpg` image into the `file:/C:/project/xml/doc1.xml` document, Oxygen XML Editor inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

  **Note:** The **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `href` attribute in an `image` element:

  ```xml
  <image href="../images/image_file.png"/>
  ```

  **Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Editor will insert it as a reference to the image file the same as the drag/drop method.

- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Editor will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

**Related Information:**

- Image Map Editor ([on page 1029](#))

- Image Rendering in **Author** Mode ([on page 1022](#))

- Adding Video, Audio, and Embedded HTML Resources in DITA Topics ([on page 3066](#))
Image Rendering in Author Mode

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

<td>Rendered by installing the Java Advanced Imaging (JAI) Image I/O Tools plug-in <em>(on page 1027)</em>.</td>
</tr>
</tbody>
</table>

When an image cannot be rendered, Oxygen XML Editor **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the **Show very large images** option *(on page 133)*.
- The image format is not supported by default. It is recommended to install the Java Advanced Imaging (JAI) Image I/O Tools plug-in *(on page 1027)*.

**Tip:** If you are using a custom XML format and you want images to be displayed in **Author** mode, you could use a custom CSS to define the rendering.

For example, if your XML has something like this:

```xml
<image href="blue.png"/>
```

You can add a selector in your custom CSS like this:

```css
image[href]{
    content: attr(href, url);
}
```
Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.
- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
- If you want to scale both the width and height of an image proportionally, use the `scale` attribute.

**Note:** As a Java application, Oxygen XML Editor uses the Java Advanced Imaging API that provides a pluggable support for new image types. If you have an ImageIO library that supports additional image formats, just copy this library to the `{OXYGEN_INSTALL_DIR}/lib` directory.

Rendering CGM Images (Experimental Support)

Oxygen XML Editor offers a few add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in Author mode, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the Oxygen CGM support add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** You should be able to see CGM images in Author mode.

**Note:** If you want to render CGM images in your PDF output, make sure you add support for this image format in the transformation scenario (on page 2179).

Alternate Method for ISOView Active X Component

**Restriction:** This support will only work on 32 bit versions of Oxygen XML Editor.

If you already have the ISOView Active X component for Internet Explorer installed, you may want to use it to render CGM images instead of the components provided in the plugin described above.

To use your existing ISOView Active X component to render CCM images, follow these steps:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select CGM Form control (Active X-based) plugin and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.
6. The CGM Form Control plugin automatically renders CGM files in DITA, DocBook, and XHTML, so for those frameworks, this step is not necessary. For other frameworks (on page 3282), modify your CSS according to your particular framework.

If you have an XML:

```xml
<image href="MyCGMFile.cgm"/>
```

You need a CSS rule like this:

```css
image[href$=".cgm"],
image[href$=".CGM"]{
    content: oxy_editor(saHeavyFormControlClassName , "com.oxygenxmlactivex.fctrl.ActiveXFormControl",
                        href, oxy_url(oxy_base-uri() , attr(href)));
}
```

You should be able to see CGM images in Author mode.

### Rendering PDF Images

Starting with version 20.0, Oxygen XML Editor provides built-in support for rendering PDF images in Author mode and PDF output. For previous versions, they are not rendered by default and you need to add the Apache PDFBox library by using one of the following procedures:

#### Installing the PDF Image Rendering Add-on

Oxygen XML Editor offers an add-on that contributes the Apache PDFBox library for you. To install this add-on, follow these steps:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the PDF Image Rendering add-on and click Next.
4. Select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.
Result: The Apache PDFBox libraries are now contributed to the Oxygen installation directory and you should be able to see PDF images in Author mode.

For more information, see the details about this PDF Image Rendering add-on in GitHub.

Manually Adding the ApachePDFBox Libraries

To manually add the Apache PDFBox library so that PDF images are rendered in Author mode, follow this procedure:

1. Go to http://pdfbox.apache.org/downloads.html and download the pre-built PDFBox standalone binary JAR (on page 3283) files: pdfbox-2.0.3.jar, fontbox-2.0.3.jar, and xmpbox-2.0.3.jar. Alternatively, you can use the 1.8.12 version of these files, as they have been tested and work properly.

Note: It is not recommended to use pdfbox-app-2.0.3.jar file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Editor.

2. Create a subfolder called pdfImageJars in the [OXYGEN_INSTALL_DIR]\lib directory.

3. Copy the downloaded JAR libraries to that newly created subfolder.

4. Restart the application.

Rendering PSD Images

Oxygen XML Editor provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in Author mode, follow this procedure:

1. Download the following JAR (on page 3283) files:
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar
   - http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar
2. Copy the downloaded JAR libraries to the \{OXYGEN_INSTALL_DIR\}\lib directory.
3. Restart the application.

Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor cannot render the image.
- The EPS image includes a TIFF preview picture.

Note: Some newer versions of the TIFF picture preview are rendered in gray-scale.
- The AI image contains a JPEG preview picture. Oxygen XML Editor renders the image correctly.

 Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Editor by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

How to Install JAI Image I/O Tools Plugin

To install this plug, follow this procedure:

1. Start Oxygen XML Editor and open the Help > About dialog box. Go to the System properties tab and look for the java.runtime.name and java.home properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the java.runtime.name property). A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.

   Note: The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.
3. Run the installer. When the installation wizard displays the Choose Destination Location page, fill-in the Destination Folder field with the value of the java.home property. Continue with the installation procedure and follow the on-screen instructions.

OS X Workaround

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.
Use the following procedure for this OS X workaround:

2. In the \{OXYGEN_INSTALL_DIR\}/lib directory, create a directory named endorsed (\{OXYGEN_INSTALL_DIR\}/lib/endorsed).
3. Unpack the tar.gz. Copy the clibwrapper_jiio.jar and jai_imageio.jar files from its lib directory and paste them in the \{OXYGEN_INSTALL_DIR\}/lib/endorsed directory.
4. Restart the application and the JAI Image I/O support will be up and running.

Retina/HiDPI Images in Author Mode

Oxygen XML Editor provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include @2x in the name (for example, myImage@2x.png). Oxygen XML Editor displays the larger set of icons starting with 150% (1.5x) scaling.

You can reference an image to style an element in a CSS by using the url function in the content property, as in the following example:

```css
listItem:before{
    content: url('..//img/myImage.png');
}
```

This would place the image that is loaded from the myImage.png file just before the listItem element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a normal DPI image and a high DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Editor interprets the argument of the url function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor would first try to find myImage@2x.png. If this file is not found, it defaults back to the normal resolution image file (myImage.png).

Oxygen XML Editor also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it
useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

**Retina/HiDPI Naming Convention**

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor:

<table>
<thead>
<tr>
<th>Color Theme</th>
<th>Referred Image File</th>
<th>Double Density Image File</th>
<th>Triple Density Image File</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>../img/myImage.png</td>
<td>../img/myImage@2x.png</td>
<td>../img/myImage@3x.png</td>
</tr>
<tr>
<td>dark</td>
<td>../img/myImage_dark.png</td>
<td>../img/myImage_dark@2x.png</td>
<td>../img/myImage_dark@3x.png</td>
</tr>
</tbody>
</table>

- [Adding Retina/HiDPI Icons in a Framework (on page 2332)]

**Image Map Editor**

Oxygen XML Editor includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an image map is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor is available for images in DITA, DocBook, TEI, and XHTML document types (*frameworks (on page 3282)*). To create an image map on an existing image and open the **Image Map Editor**, right-click the image and select **Image Map Editor**.

Figure 176. Image Map Rendered in Author Mode
Image Maps in DITA

Oxygen XML Editor includes support for *image maps* in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 177. Image Map Editor in DITA
Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate
Use this button to create a duplicate of the currently selected shape.

Delete
Use this button to delete the currently selected shape.

Undo
Use this button to undo the last action.

Redo
Use this button to redo the last action that was undone.

Show/Hide Numbers
Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front
Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward
Use this button to bring the currently selected shape forward one layer.

Send Shape Backward
Use this button to send the currently selected shape back one layer.

Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.
Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

**Add Point**

Adds a point to Polygon or Free Form shapes.

**Remove Point**

Removes the current point from Polygon or Free Form shapes.

**Duplicate**

Create a duplicate of the currently selected shape.
Delete
Delete the currently selected shape.

New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle
Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo
Use this action to undo the last action.

Redo
Use this action to redo the last action that was undone.

Shape Table
The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties
Type
Displays information about the selected coordinate.

Target
Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in
DITA (on page 3164) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an xref element will be inserted with either an href attribute or a keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor (on page 3164).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (on page 1036) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.

   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1031) to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1033). For example, the easiest way to remove a point is to right-click the point and select Remove Point.

4. With the shape selected, use one of the linking options (on page 1034) in the Link drop-down menu to select a target resource (or enter its path in the Target (on page 1034) text field).

5. (Optional) Enter a Description (on page 1035) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.

   Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image
includes an alt element, its value will be displayed under the image. The following two buttons will also now be available under the image in Author mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Figure 178. Image Map Details

How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the Image Map Editor toolbar (on page 1031)). To change the
layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1031).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

- Working with Images in DITA Topics (on page 3062)

Image Maps in DocBook

Oxygen XML Editor includes support for image maps in DocBook documents through the use of the areaspect element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 179. Image Map Editor in DocBook
Image Map Editor Interface in DocBook

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Duplicate**
  
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  
  Use this button to delete the currently selected shape.

- **Undo**
  
  Use this button to undo the last action.

- **Redo**
  
  Use this button to redo the last action that was undone.
Show/Hide Numbers
Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front
Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward
Use this button to bring the currently selected shape forward one layer.

Send Shape Backward
Use this button to send the currently selected shape back one layer.

Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider
Use this slider to zoom the image in or out in the main image pane.

Image Pane
This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts
- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
• You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.

• To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.

• You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last undone action.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

- **Type**
  Displays information about the selected coordinate.

- **ID**
The identifier for the selected area. This will become the value of the <xml:id> attribute for the particular <area> element.

**Target**

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference or Web Link. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an <xlink:href> attribute.

**Description**

You can enter an optional description for the selected area that will be displayed in the Image Map Details section (on page 1042) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

**How to Create an Image Map in DocBook**

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select Image Map Editor.
   
   **Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting the New Rectangle button.

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1038) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the shapes or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1040).

4. With the shape selected, enter an ID (on page 1040) and use one of the linking options (on page 1041) in the Link drop-down menu to select a target resource (or enter its path in the Target (on page 1041) text field).

5. (Optional) Enter a Description (on page 1041) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select New Rectangle button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.
Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in Author mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Note:** If you want to link a set of related area elements, you can use areaset elements. To add areaset elements, and area elements to the areaset, switch to Text mode and insert them manually.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the Image Map Editor toolbar (on page 1038)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1038) (🥝, 🍿, 🍽️, 🍽️).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.
Image Maps in TEI

Oxygen XML Editor includes support for image maps in TEI documents through the use of the `facsimile` element. In TEI documents, this feature provides an easy way to create areas (using `zone` elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual Author editing mode includes an Image Map Editor that helps you to easily create the areas in the image.

Figure 180. Image Map Editor in TEI

Image Map Editor Interface in TEI

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- New Rectangle
Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

**New Polygon**

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.
Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions
You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to *Polygon* or *Free Form* shapes.

- **Remove Point**
  Removes the current point from *Polygon* or *Free Form* shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Polygon**
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

**Type**

Displays information about the selected coordinate.
ID

The identifier for the selected area. This will become the value of the xml:id attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a facsimile element to support the Image Map Editor feature.
2. Right-click the image and select Image Map Editor.

   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.
3. Add areas (zones) in the image by selecting one of the shape buttons (New Rectangle or New Polygon).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1043) to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1045). For example, the easiest way to remove a point is to right-click the point and select Remove Point.
5. With the shape selected, enter an ID (on page 1047).
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click OK to process your changes.

   Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

   • Image Map Editor - Click this button to open the Image Map Editor.
   • Image Map Details - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:
• Simply double-click the image.
• Right-click the image and select Image Map Editor.
• Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

⚠️ Restriction: Currently, if zone elements contain additional content (such as text or comments) and you edit the image map, the Image Map Editor does not preserve the additional content. Therefore, if you do need to insert additional content inside the zone elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in Text mode.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar (on page 1043)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1043) (↑, ↓, ■, ▼).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

⚠️ Warning: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Image Maps in XHTML

Oxygen XML Editor includes support for image maps in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `<img>` element) may be associated with an image map (in the form of a `<map>` element) by specifying a `usemap` attribute on the `<img>` element. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 181. Image Map Editor in XHTML

![Image Map Editor Interface in XHTML](image)

Image Map Editor Interface in XHTML

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

😊 New Polygon
Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

xcf New Free Form Shape
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

_duplicate Duplicate
Use this button to create a duplicate of the currently selected shape.

✖️ Delete
Use this button to delete the currently selected shape.

.undo Undo
Use this button to undo the last action.

.redo Redo
Use this button to redo the last action that was undone.

.show Hide Numbers
Use this button to toggle between showing or hiding the numbers for the shapes.

드리 Bring Shape to Front
Use this button to bring the currently selected shape forward to the top layer.

드리 Bring Shape Forward
Use this button to bring the currently selected shape forward one layer.

드리 Send Shape Backward
Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

• Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
• You can also drag any of the points of a selected shape to adjust its size and shape.
• You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
• You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
• To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
• You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:
+ **Add Point**

   Adds a point to *Polygon* or *Free Form* shapes.

× **Remove Point**

   Removes the current point from *Polygon* or *Free Form* shapes.

☐ **Duplicate**

   Create a duplicate of the currently selected shape.

× **Delete**

   Delete the currently selected shape.

☐ **New Rectangle**

   Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

☐ **New Circle**

   Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

☐ **New Polygon**

   Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

⇦ **Undo**

   Use this action to undo the last action.

⇨ **Redo**

   Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the *Alternative* property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**
Type
Displays information about the selected coordinate.

Href
Specifies the hyperlink target for the selected area. This will become the value of the href attribute for the particular area element. The possible values are:

- **An Absolute URL** - A URL of another website (for example, http://www.example.com/index.htm).
- **A Relative URL** - A link to a file within your website (for example, index.htm).
- **An Element** - A link to the ID of an element within the page (for example, #top).
- **Other Protocols** - A specified path using other protocols (such as https://, ftp://, mailto:, file:).
- **A Script** - A link to a script (for example, javascript:alert('Hello');)

Alternate
The description for the selected area. The value is inserted in an alt attribute in the particular area element. This is a required attribute to present a text alternative for browsers that do not display images.

Target
Specifies where to open the linked resource. The allowed values are:

- **_blank** - Opens the linked resource in a new window or tab.
- **_self** - Opens the linked resource in the same frame as it was clicked.
- **_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   **Result:** This action will apply an image map to the current image and open the **Image Map Editor** dialog box.
2. Add hyperlinks to the image by selecting one of the shape buttons (□ New Rectangle, ○ New Circle, or □ New Polygon).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1049) to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1051). For example, the easiest way to remove a point is to right-click the point and select ✗ Remove Point.
4. With the shape selected, specify the hyperlink target in the Href field (on page 1053) and enter a description for the selected area in the Alternate field (on page 1053).
5. (Optional) Specify where the hyperlink resource will be opened in the Target field (on page 1053).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click OK to process your changes.

   Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

• Simply double-click the image.
• Right-click the image and select Image Map Editor.
• Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

In Author mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the
Show/Hide Numbers button on the Image Map Editor toolbar (on page 1049). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1049) (*, *, *, *).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

### Adding Video, Audio, and Embedded HTML Resources

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button (ня) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project view (on page 333) and drop them into your documents (or copy and paste them).

**Table 5. Supported Media Types**

<table>
<thead>
<tr>
<th>Media</th>
<th>Description</th>
<th>Type</th>
<th>Supported Size Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>mp3</td>
<td>Moving Picture Experts Group Layer-3 Audio</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>wav</td>
<td>Windows Wave</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>pcm</td>
<td>Pulse Code Modulation</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>m4a</td>
<td>Moving Picture Experts Group Layer-4 Audio</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>aif</td>
<td>Audio Interchange Format</td>
<td>audio</td>
<td>Width</td>
</tr>
<tr>
<td>mp4</td>
<td>Moving Picture Experts Group Layer-4 Video</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
<tr>
<td>flv</td>
<td>Flash Video</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
<tr>
<td>m4v</td>
<td>iTunes Video File</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
</tbody>
</table>
### Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the **Insert Media Resource** action from the toolbar. A **Chose Media** dialog box appears.
   
   ![Note: You can also drag media files from your system explorer or the Project view (on page 333) and drop them into your documents (or copy and paste them).](image)

3. Select the URL for the media resource and click **Ok**.

**Result in Author Mode:** A reference to the specified media object is inserted and rendered in **Author** mode so that it can be played directly from there.

**Attention:**

- On Ubuntu 17.10, if you receive an error when trying to play videos in **Author** mode, you need to install the `libavformat57` library.

**Result in Output:** In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

### Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Editor includes a pre-installed plugin (on page 3285) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```xml
<foreign outputclass="html-embed"><![CDATA[
  <iframe width="420" height="315"
      src="https://www.youtube.com/embed/qepRkQxhTX"
      frameborder="0" allowfullscreen="true">
  </iframe>
]]>
</foreign>
```
The converted HTML output would look like this:

```html
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
    frameborder="0" allowfullscreen="true">
</iframe>
```

The **plugin** is also available on the oxygenxml GitHub projects page.

Related Information:

- How to Add Video and Audio Objects in DITA WebHelp Output *(on page 1964)*

Editing MathML Notations

The **Author** editor includes a built-in editor for **MathML** notations. To start the **MathML** editor, double-click a **MathML** notation (for embedded notations, you can also select the **Edit Equation** action from its contextual menu). In the **MathML** editor you can edit the mathematical symbols of a **MathML** notation. You can open a **MathML** file of your current project directly in the **MathML** editor. To do this, select **Open with > MathML editor** from the contextual menu in the **Project view** *(on page 333)*.

Figure 182. Default **MathML** Editor
The font size and font family that is used for the equations is based upon the context in which the MathML equation appears. To configure the minimum font size of the equation, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > MathML.

Configure the MathFlow Editor

The MathFlow Components product can replace the default MathML editor with a specialized MathML editor. You have to purchase a MathFlow Component from Design Science and configure it in Oxygen XML Editor with the following procedure:

1. Install MathFlow by using the Universal installer (for versions prior to 2.1, use the MathFlow SDK).

2. Set the path to the MathFlow install folder in the MathML preferences page (on page 149).

3. Set the path to the MathFlow license file in the MathML preferences page (on page 149).

Figure 183. Default MathFlow Editor
MathML Equations in HTML Output

Currently, only **Firefox** can render MathML equations embedded in the HTML code. **MathJax** is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"
src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

For DITA documents, you can also use the following procedure:

1. Edit the DITA Map WebHelp transformation scenario *(on page 1758)* and open the Parameters tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
   - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your resource file.
   - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

### Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the **Reload** action.

To refresh the content of the referenced resources you can use the **Refresh references** action that is available in the current **framework** menu (for example, the DITA or DocBook5 menu). However, this action will not refresh the expanded external entities, for which you will need to use the **Reload** action.

### Generating IDs for Elements in Author Mode

Oxygen XML Editor allows you to manually assign or edit values of `id` attributes in **Author** mode by using the **Attributes View** (on page 426) or an in-place attribute editor (on page 915). Oxygen XML Editor also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

#### Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu. This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options** dialog box (on page 1061). To open this dialog box, select **ID Options** from the DITA, DocBook, or TEI menu (depending on your document type).

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

#### Automatically Generate IDs

Oxygen XML Editor includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options** dialog box (on page 1061) that is displayed when you select the **ID Options** action from the **framework** (on page 3282)-specific menu (DITA, DocBook, or TEI). If this **Auto generate IDs for elements** option is selected, Oxygen XML Editor automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the
ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

**ID Options Dialog Box**

To configure options for generating IDs, select **ID Options** from the **DITA**, **DocBook**, or **TEI** menu (depending on your document type).

Figure 184. ID Options Dialog Box

The **ID Options** dialog box allows you to configure the following options with regard to generating ID values:

- **ID Pattern**
  - The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor **Editor Variables** (on page 276).

- **Element name or class value to generate ID for**
  - The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

- **Auto generate IDs for elements**
  - If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

- **Remove IDs when copying content in the same document** (DITA or TEI)
When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is *cut* and *pasted*.

**Remove IDs when copying content (DocBook)**

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

**Duplicating Elements with Existing IDs**

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the **Auto generate IDs for elements** option (on page 1061) is selected and you duplicate elements with existing IDs, Oxygen XML Editor assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements** option (on page 1061) is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the **Remove IDs when copying content in the same document** option (on page 1061) is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no effect on elements that are duplicated in other documents.
- For DocBook, if the **Remove IDs when copying content** option (on page 1062) is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.
Controlling the Default ID Generation Options

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the frameworks folder for each of those document types, there is an XML configuration file called idGenerationDefaultOptions.xml that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the resources folder within the particular framework (on page 3282). For example, the configuration file for the DITA framework is located in: [OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml.

Sharing Default ID Generation Options

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the idGenerationDefaultOptions.xml file for your framework according to your needs.
2. Bundle a modified version of the entire framework folder (for example, [OXYGEN_INSTALL_DIR]/frameworks/dita/). To do this:
   a. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.
   b. Select your document type and click the Extend button.
   c. In the Document type configuration dialog box (on page 95) that is now displayed, select External for the Storage option. By default, this will save the extension in a new folder in the frameworks folder (for example, [OXYGEN_INSTALL_DIR]/frameworks/dita-extension (1)), but you can also use the Browse button to specify a specific name and folder.
   d. In this new extension folder, create a new folder called resources and add your modified idGenerationDefaultOptions.xml file to this new resources folder.
   e. Go back to the Document Type Association preferences page, select the extended framework, and click Edit.
   f. Go to the Classpath tab (on page 99), add a reference to your new resources folder, and move this reference up (using the Move Up button) so that it is the first one that appears in the list.
   g. Click OK and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in Sharing a Custom Framework (on page 2371).
Using Form Controls in Author Mode

Form controls make it easier to capture, organize, and edit content. They are especially helpful for less technical users because form controls provide a way to interact with the content of a document in a graphical manner without intimidating the user with the XML structure.

Oxygen XML Editor includes a variety of built-in form controls (on page 2541) that can be defined in CSS stylesheets that are used to render Author mode (on page 2541). You can also implement custom form controls (on page 2573) for more specific needs. The types of built-in form controls that are available include:

- **Audio (on page 2542)** - A media object that plays audio clips.
- **Browser (on page 2543)** - A media object that renders HTML frames or interact with SVG documents
- **Button (on page 2547)** - A graphical user interface object that performs a specific action.
- **Button Group (on page 2550)** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Checkbox (on page 2553)** - A graphical user interface box that you can click to select or deselect a value.
- **Combo Box (on page 2556)** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Date Picker (on page 2558)** - A form control object that allows you to select a date in a specified format.
- **HTML Content (on page 2560)** - A graphical user interface box that is used for rendering HTML content.
- **Pop-up (on page 2562)** - A contextual menu that provides quick access to various actions.
- **Text Area (on page 2565)** - A box that allows you to enter multiple lines of text.
- **Text Field (on page 2568)** - A graphical user interface box that allows you to enter a single line of text.
- **URL Chooser (on page 2570)** - A dialog box that allows you to select the location of local or remote resources.
- **Video (on page 2572)** - A media object that plays videos.

The following image is an example of several form controls rendered in Author mode. The first (Direct manager) is a combo box with both a drop-down menu and an editable text field. This is followed by a simple text field (Homepage), and the [+ ] and [- ] icons also represent button form controls that are assigned specific actions to add or delete records from the document.

Figure 185. Example of Form Controls in Author Mode
You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled samples project (located in the samples folder inside the Oxygen XML Editor installation directory) contains a file called personal.xml that contains form controls. You can use this file, along with its corresponding personal.css file to experiment with an example of how form controls can be implemented in Author mode.

- Form Controls (on page 2541)

Contextual Menu Actions in Author Mode

Oxygen XML Editor includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in Author mode, the contextual menu includes general actions that are available for all of the recognized document types and framework (on page 3282)-specific actions that are configured for each document type.

General Contextual Menu Actions in Author Mode

The general actions that are available in the contextual menu (some of them are also available in the submenus of the Document menu) for all built-in document types include the following:

**Add File to Review Task**

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your
organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Quick Fix (Alt + 1 (Command + Alt + 1 on OS X))

Available when the contextual menu is invoked on an error where Oxygen XML Editor can provide a Quick Fix (on page 1109).

Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Editor Image Viewer (on page 721) or in a default system application associated with the current image type.

Track Changes Actions

Available when the Track Changes feature (on page 3288) is enabled and the contextual menu is invoked on a change. The following options are available:

✓ Accept Change(s)

Accepts the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

✗ Reject Change(s)

Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

�建议 Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Author Callout Actions

Available when the contextual menu is invoked on a callout (on page 3280). If the corresponding options in the Show review callouts section (on page 143) are selected in
the Callouts preferences page (on page 143), the callouts are displayed in Author mode for comments, tracked insertion changes, or tracked deletion changes.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an insertion or deletion callout box:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✔️ **Accept Change(s)**

Accepts the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

❌ **Reject Change(s)**

Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the
selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

**Comment Change**

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the [Callouts preference page](on page 143) where you can configure various callout options.

**Comment Callout Actions**

The following actions are available in the contextual menu when invoked on a *comment* callout box:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](on page 964).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This
is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Callouts Options**

Select this option to open the Callouts preference page (on page 143) where you can configure various callout options.

**Edit Attributes**

Displays an in-place attributes editor (on page 429) that allows you to manage the attributes of an element.

**Edit Profiling Attributes**

Allows you to change the profiling attributes (on page 969) defined on all selected elements.

**Insert submenu**

This submenu includes insert actions that are specific to each framework (on page 3282), along with the following general action:

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e. g. #65
- `&#<decimal value>;` - e. g. &#65
- `#x<hexadecimal value>` - e. g. #x41
- `&#x<hexadecimal value>;` - e. g. &#x41

**Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.
**Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

**Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes special paste actions that are specific to each framework (on page 3282), as well as the following general paste actions:

- **Paste As XML**
  - Pastes clipboard content that is considered to be XML, preserving its XML structure.

- **Paste As Text**
  - Pastes clipboard content, ignoring any structure or styling markup.

**Select submenu**

This submenu allows you to select the following:

- **Element**
  - Selects the entire element at the current cursor position.

- **Content**
  - Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

- **Parent**
  - Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

- **To Lower Case**
  - Converts the selected content to lower case characters.

- **To Upper Case**
  - Converts the selected content to upper case characters.

- **Capitalize Sentences**
  - Converts to upper case the first character of every selected sentence.
Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note: The content marked as deleted with change tracking (on page 3288) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 770). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 779).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

†† Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Ctrl + E (Command + E on OS X))

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 167) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 167) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with 'tag' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according to the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text
Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).
Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

 Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.
Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

**JATSKit Refactoring Actions**

Available for JATS documents. Contains built-in XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  
  Enables or disables the *Track Changes (on page 3288)* support for the current document.

- **Accept Change(s) and Move to Next**
  
  Accepts the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is accepted.

- **Accept All Changes**
  
  Accepts all *Tracked Changes (on page 3288)* in the current document.

- **Reject Change(s) and Move to Next**
  
  Rejects the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion or insertion* change, only the selected content is rejected.

- **Reject All Changes**
  
  Rejects all *Tracked Changes (on page 3288)* in the current document.

- **Comment Change**
Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

🎉 Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

✍ Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

>Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

✉️ Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

🛠️ Manage Reviews

Opens the Review view (on page 964).

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA documents). It includes the following actions:

🔍 Rename in
Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

**Search References in**

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 1129).

**Search Occurrences in file**

Searches for the occurrences of the ID in the current document.

**Folding submenu**

This submenu includes the following actions:

- **Toggle Fold**
  
  Toggles the state of the current fold.

- **Collapse Other Folds** (Ctrl + NumPad/ (Command + NumPad/ on OS X))
  
  Folds all the elements except the current element.

- **Collapse Child Folds** (Ctrl + NumPad. (Command + NumPad. on OS X))
  
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  
  Unfolds all child elements of the currently selected element.

- **Expand All** (Ctrl + NumPad* (Command + NumPad* on OS X))
  
  Unfolds all elements in the current document.

**Inspect Styles**

Opens the CSS Inspector view (on page 439) that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the Author mode options page (on page 131).
Document Type-Specific Contextual Menu Actions in Author Mode

Other document type-specific actions are available in the contextual menu of Author mode for the following document types (click the links to see the default actions that are available for each specific document types):

- DocBook4 Author Actions (on page 1539)
- DocBook5 Author Actions (on page 1555)
- DITA Author Actions (on page 1575)
- DITA Map Author Actions (on page 1598)
- XHTML Author Actions (on page 1605)
- TEI ODD Author Actions (on page 1623)
- TEI P5 Author Actions (on page 1613)
- JATS Author Actions (on page 1632)

Special Character Support in Author Mode

Oxygen XML Editor offers support for bidirectional text, such as Arabic or Hebrew languages that require right-to-left scripts, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters). To achieve this, Oxygen XML Editor implements the Unicode Bidirectional Algorithm, as specified by the Unicode Consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in Author mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the Arrow keys move the cursor in the writing direction option (on page 137) in the Cursor Navigation preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Tip: If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Editor is faster than the standalone version when working with bidirectional text.
- You could try changing the font. For example, you could try using the David font in Hebrew content. If it is not already installed in your operating system, this font is available at: https://www.microsoft.com/typography/fonts/family.aspx?FID=234. To change the font in Oxygen XML Editor, open the Preferences dialog box (Options > Preferences) (on page 79), go to Appearance
> **Fonts**, and change the font using the **Author default font** option in the **Fonts** preferences page *(on page 88)*.

For more information about the bidirectional text support in the **Author** mode, watch our video demonstration:

[https://www.youtube.com/embed/IC0ahH1IS7s](https://www.youtube.com/embed/IC0ahH1IS7s)

**Related Information:**

- Special Character Support in Text Mode *(on page 366)*
- Special Character Support in Grid Mode *(on page 394)*
- Inserting Special Characters with the Character Map *(on page 778)*

### Controlling the Text Direction Using XML Markup

**Oxygen XML Editor** Supports the following CSS properties that control the direction of text:

**Table 6. CSS Properties Controlling Text Direction**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>direction</strong></td>
<td>Specifies the writing direction of the text. The possible values are <strong>ltr</strong> (the text direction is left to right), <strong>rtl</strong> (the text direction is right to left), and <strong>inherit</strong> (the direction property is inherited from the parent element).</td>
</tr>
<tr>
<td><strong>unicodeBidi</strong></td>
<td>Used along with the <strong>direction</strong> property to create levels of embedded text with different text directions in the same document. The possible values of this property are <strong>bidi-override</strong> (creates an additional level of embedding and forces all strong characters to the direction specified in the <strong>direction</strong>), <strong>embed</strong> (creates an additional level of embedding), <strong>normal</strong> (does not use an additional level of embedding), and <strong>inherit</strong> (the value of the <strong>unicodeBidi</strong> property is inherited from parent element).</td>
</tr>
</tbody>
</table>

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

**XML File:**

```xml
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLpara>
</article>
```

**Associated CSS File:**

```css
myRTLpara{
}
```
Oxygen XML Editor recognizes the `dir` attribute on any XML document. The supported values are:

<table>
<thead>
<tr>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ltr</code></td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td><code>rtl</code></td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
<tr>
<td><code>lro</code></td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td><code>rlo</code></td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
</tbody>
</table>

The following XML document types make use of the `dir` attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:** When the inline element (on page 3283) tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the No Tags mode versus viewing it in the Full Tags mode.

Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

**Table 7. Directional Formatting Codes**

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>U+202A</td>
<td>LEFT-TO-RIGHT EMBEDDING Treats the following text as embedded left-to-right.</td>
</tr>
<tr>
<td>U+202B</td>
<td>RIGHT-TO-LEFT EMBEDDING Treats the following text as embedded right to left.</td>
</tr>
<tr>
<td>U+202D</td>
<td>LEFT-TO-RIGHT OVERRIDE Forces the following characters to be treated as strong left-to-right characters.</td>
</tr>
<tr>
<td>U+202E</td>
<td>RIGHT-TO-LEFT OVERRIDE Forces the following characters to be treated as strong right-to-left characters.</td>
</tr>
<tr>
<td>U+202C</td>
<td>POP DIRECTIONAL FORMATTING CODE Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.</td>
</tr>
<tr>
<td>U+200E</td>
<td>LEFT-TO-RIGHT MARK Left-to-right strong zero-width character.</td>
</tr>
</tbody>
</table>
To insert Unicode Direction Formatting Codes, use the Character Map (on page 778) dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the Details tab to enter the codes name.

Oxygen XML Editor offers the support for bi-directional text in all the side views (Outline view (on page 347), Attributes view (on page 426) and so on) and text fields.

**Design Editing Mode (XML Schema Diagram Editor)**

XML Schemas allow document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Editor provides a simple and expressive XML Schema diagram editor (Design mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The diagram font can be increased using the usual Oxygen XML Editor shortcuts: (Ctrl (Meta on Mac OS) + “*”), (Ctrl (Meta on Mac OS)+”-”), (Ctrl (Meta on Mac OS) + 0) or (Ctrl (Meta on Mac OS) - mouse wheel). The whole diagram can also be zoomed with one of the predefined factors available in the Schema preferences panel (on page 153). The same zoom factor is applied for the print and save actions.

To switch to this mode, select Design at the bottom of the editing area.

Figure 186. XML Schema Diagram
For more information about designing XML Schemas, watch our video demonstration:

https://www.youtube.com/embed/vz1eIZELQgc

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema Design mode:

- Select consecutive components on the diagram (components from the same level) using the Shift key. You can also make discontinuous selections in the schema diagram using the Ctrl (Meta on...
Mac OS) key. To deselect one of the components, use Ctrl + Single-Click (Command + Single-Click on OS X).

- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use Home/End keys to jump to the first/last component from the same level. Use Ctrl + Home (Command + Home on OS X) key combination to go to the diagram root and Ctrl + End (Command + End on OS X) to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the Outline view (on page 625):
  - Back (go to previous schema component).
  - Forward (go to next schema component).
  - Go to Last Modification (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the Cut/Copy and Paste/Paste as Reference actions.
- Go to the definition of an element or attribute with the Go to Definition action.
- Search in the diagram using the Find/Replace dialog box (on page 740) or the Quick find toolbar (on page 752). You can find/replace components only in the current file scope.
- You can expand and see the contents of the imports/includes/redefines in the diagram. To edit components from other schemas, the schema for each component will be opened as a separate file in Oxygen XML Editor.

Tip: If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

- Recursive references are marked with a recurse symbol (recurse symbol). Click this symbol to navigate between the element declaration and its reference.

Figure 187. Recursive Reference
XML Schema Outline View

The Outline view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 188. Outline View for XML Schema

The Outline view provides the following options in the Settings menu on the Outline view toolbar:

- **Filter returns exact matches**
  
  The text filter of the Outline view returns only exact matches;

- **Selection update on cursor move**
  
  Allows a synchronization between Outline view and schema diagram. The selected view from the diagram is also selected in the Outline view.

- **Sort**
  
  Allows you to sort alphabetically the schema components.

- **Show all components**
  
  Displays all components that were collected starting from the master files (on page 3284). Components that are not referable from the current file are marked with an
orange underline. To reference them, add an import directive with the `componentNS`
namespace.

**Show referable components**

Displays all components (collected starting from the *master files (on page 3284)*) that
can be referenced from the current file. This option is set by default.

**Show only local components**

Displays the components defined in the current file only.

**Group by location/namespace/type**

These three operations allow you to group the components by location, namespace,
or type. When grouping by namespace, the main schema target namespace is the first
presented in the Outline view.

The following contextual menu actions are available in the Outline view:

**Remove (Delete)**

Removes the selected item from the diagram.

**Search References (Ctrl (Meta on Mac OS)+Shift+R)**

Searches all references of the item found at current cursor position in the defined scope,
if any.

**Search References in**

Searches all references of the item found at current cursor position in the specified
scope.

**Component Dependencies (Ctrl (Meta on Mac OS)+Shift+F4)**

Opens the Component Dependencies view (on page 1300) that allows you to see the
dependencies for the current selected component.

**Resource Hierarchy (F4)**

Opens the Resource Hierarchy / Dependencies view (on page 1130) that allows you to
see the hierarchy for the current selected resource.

**Resource Dependencies (Shift + F4)**

Opens the Resource Hierarchy / Dependencies view (on page 1130) that allows you to
see the dependencies for the current selected resource.

**Rename Component in**

Renames the selected component.

**Generate Sample XML Files**
Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

**Tip:** The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the Outline view and the editing area are synchronized. When you select a component in the Outline view, its definition is highlighted in the editing area.

- Editing Relax NG Schema in the Master Files Context *(on page 1389)*

**XML Schema Attributes View**

The Attributes view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 189. Attributes View
The default value of a property is presented in the Attributes view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the Document checking user preferences (on page 180).

For imports, includes and redefines, the properties are not edited directly in the Attributes view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in Attributes view. You can view/edit these by choosing Edit Schema Namespaces from the contextual menu on the schema root. See more in the Edit Schema Namespaces (on page 1286) section.

The Attributes view has five actions available on the toolbar and also on the contextual menu:

- **Add**
  Allows you to add a new member type to an union's member types category.

- **Remove**
  Allows you to remove the value of a property.
Move Up

Allows you to move up the current member to an union's member types category.

Move Down

Allows you to move down the current member to an union's member types category.

Copy

Copy the attribute value.

Go to Definition

Shows the definition for the selected type.

Show Facets

Allows you to edit the facets for a simple type.

XML Schema Facets View

The Facets view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 190. Facets View

The default value of a facet is rendered in the Facets view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: Enumerations and Patterns) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

Important: Usually inherited facets are presented as default in the Facets view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the Patterns category.
Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the Document Checking user preferences (on page 180).

The Facets view provides the following actions in its toolbar and contextual menu:

- **Add**
  Allows you to add a new enumeration or a new pattern.

- **Remove**
  Allows you to remove the value of a facet.

- **Edit Annotations**
  Allows you to edit an annotation for the selected facet.

- **Move Up**
  Allows you to move up the current enumeration/pattern in Enumerations/Patterns category.

- **Move Down**
  Allows you to move down the current enumeration/pattern in Enumerations/Patterns category.

- **Copy**
  Copy the attribute value.

**Open in Regular Expressions Builder**

Rather than editing regular expressions manually, this action allows you to open the pattern in the XML Schema Regular Expressions Builder (on page 1332) that guides you through the process of testing and constructing the pattern.

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the **Pin** button.

**XML Schema Palette View**

The Palette view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the Palette to drag and drop components
in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the **XML Schema preferences page** (on page 192). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Figure 191. Palette View**

Components are organized functionally into 4 collapsible categories:

- Basic components: *elements, group, attribute, attribute group, complex type, simple type, type alternative.*
- Compositors and Wildcards: *sequence, choice, all, any, any attribute, open content.*
- Directives: *import, include, redefine, override.*
- Identity constraints: *key, keyref, unique, selector, field, assert.*

**Note:** The *type alternative, open content, override,* and *assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

**Note:** You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into ![cursor]. Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color option** (on page 180) (default color is red).

For more information about the Schema palette, watch our video demonstration:
Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline view (on page 625)** to a compositor in the diagram. Also, the components order in an `xs:sequence` can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **move** - Context dependent, the selected component is moved to the destination.
- **reference** - Context dependent, the selected component is referenced from the parent.
- **copy** - If *(Ctrl (Meta on Mac OS))* key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

- ![arrows](https://www.youtube.com/embed/KalHUXmpuAA)

- **-** When moving a component.
- **-** When referencing a component.
- **-** When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double clicking the value you want to edit. If you want to edit the name of a selected component, you can also press *(Enter)*. The list of properties that can be displayed for each component can be customized in the **Preferences (on page 154)**.

When editing references, you can choose from a list of available components. Components from an imported schema for which the target namespace does not have an associated prefix is displayed in the list as `componentName#targetNamespace`. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the current edited schema.
You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press (Enter) on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.

- Schema Design Preferences (on page 153)

Contextual Menu Actions in the Design Mode

The contextual menu of the Design mode includes the following actions:

- Go to Definition (Ctrl + Shift + Enter)
  Shows the definition for the current selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

- Open Schema (Ctrl + Shift + Enter)
  Opens the selected schema. This action is available for xsd:import, xsd:include and xsd:redefine elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

- Edit Attributes ()
  Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the Attributes view (on page 628) and the Facets view (on page 630). The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

Append child
Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

**Insert before**

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

**Insert after**

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

**New global**

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `xsd:include` or `xsd:redefine` element.

**Note:** If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

**Edit Schema Namespaces**

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes view** (on page 628) for the schema or by double-clicking the schema component.

**Edit Annotations**

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all appinfo/documentation items for a specific annotation** - All *appinfo/documentation* items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (documentation/appinfo), content, source (optional, specify the source of the `documentation/appinfo` element) and `xml:lang`. The content of a `documentation/appinfo` item can be edited in the **Content** area below the table.

- **Insert/Insert before/Remove documentation/appinfo**. The ✪ Add button allows you to insert a new annotation item (*documentation/appinfo*). You can add a new
item before the item selected in table by pressing the "Insert Before" button. Also, you can delete the selected item using the "Remove" button.

- **Move items up/down** - to do this use the "Move up" and "Move down" buttons.
- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.
- **Specify an ID for the component annotation**. An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are also presented in the diagram below the referenced component. To edit the annotations, use the **Edit Annotations** action from the contextual menu. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

**Note:** For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

**Extract Global Element**

Action that is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

**Figure 192. Extracting a Global Element**

If you use the **Extract Global Element** action on a `name` element, the result is:

**Figure 193. Extracting a Global Element on a name Element**
Extract Global Attribute

Action available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

Figure 194. Extracting a Global Attribute

If you use the Extract Global Attribute action on a note attribute, the result is:

Figure 195. Extracting a Global Attribute on a note Attribute
Extract Global Group

Action available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is available only if the parent of the compositor is not a group.

Figure 196. Extracting a Global Group

If you use the Extract Global Group action on the sequence element, the Extract Global Component dialog box is displayed and you can choose a name for the group. If you type personGroup, the result is:

Figure 197. Extracting a Global Group on a sequence Element
Extract Global Type

Action used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

Figure 198. Extracting a Global Simple Type

If you use the action on the union component and choose numericST for the new global simple type name, the result is:

Figure 199. Extracting a Global Simple Type on a union Component

If you use the action on a person element and choose person_type for the new complex type name, the result is:

Figure 201. Extracting a Global Complex Type on a person Element
Rename Component in

Rename the selected component.

Cut Ctrl + X (Command + X on OS X)

Cut the selected component(s).

Copy Ctrl + C (Command + C on OS X)

Copy the selected component(s).

Copy XPath

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

Paste Ctrl + V (Command + V on OS X)

Paste the component(s) from the clipboard as children of the selected component.

Paste as Reference

Create references to the copied component(s). If not possible a warning message is displayed.

Remove (Delete)

Remove the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for xs:override components.

Redefine component
The referenced component is added in the current XML Schema. This option is available for `xs:redefine` components.

**Optional**

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `minOccurs` property is set to 0 and the `use` property for attributes is set to `optional`.

**Unbounded**

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `maxOccurs` property is set to `unbounded` and the `use` property for attributes is set to `required`.

**Search**

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

- **Search References**
  
  Searches all references of the item found at current cursor position in the defined scope if any.

- **Search References in**
  
  Searches all references of the item found at current cursor position in the specified scope.

- **Search Occurrences in File**
  
  Searches all occurrences of the item found at current cursor position in the current file.

- **Component Dependencies**
  
  Opens the Component Dependencies view (on page 1300) that allows you to see the dependencies for the current selected component.

**Resource Hierarchy**

Opens the Resource Hierarchy / Dependencies view (on page 1297) that allows you to see the hierarchy for the current selected resource.

**Flatten Schema**

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

**Resource Dependencies**

Allows you to see the dependencies for the current selected resource.

- **Expand All**
Recursively expands all sub-components of the selected component.

Collapse All

Recursively collapses all sub-components of the selected component.

Save as Image

Save the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files

Generate XML files using the current opened schema. The selected component is the XML document root. See more in the Generate Sample XML Files (on page 1306) section.

Options

Show the Schema preferences panel (on page 153).

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, family is a required element).

Figure 202. Example: Required Component

- A thin line to identify a connection with an optional component (in the following image, email is an optional element).

Figure 203. Example: Optional Component

The following topics explain in detail all available components and their symbols as they appear in an XML schema diagram.

xs:schema

Figure 204. The xs:schema Component
Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at http://www.w3.org/TR/xmlschema11-1/#element-schema.

By default, it displays the `targetNamespace` property when rendered.

<table>
<thead>
<tr>

</tbody>
</table>

Figure 205. The `xs:element` Component
Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-element.

An element by default displays the following properties when rendered in the diagram: default, fixed, abstract and type. When referenced or declared locally, the element graphical representation also contains the value for the minOccurs and maxOccurs properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

Table 9. xs:element Properties

<table>
<thead>

<td>Specifies the target namespace for local element and attribute declarations. The namespace URI may be different from the schema target namespace. This property is available for local elements only.</td>
<td>Not editable property</td>
<td>For all elements</td>
</tr>
<tr>
<td><strong>Block</strong></td>
<td>Controls if the element can be subject to a type or substitution group substitution. '#all' blocks any substitution, 'substitution' blocks any substitution through substitution groups and 'extension'/'restriction' block any substitution (both through xsi:type and substitution groups) by elements or types, derived respectively by extension or restriction from the type of the element. Its default value is defined by the blockDefault attribute of the parent xs:schema.</td>
<td>#all, restriction, extension, substitution, extension restriction, extension substitution, restriction substitution, restriction extension substitution</td>
<td>For global elements and element references</td>
</tr>
<tr>
<td><strong>Final</strong></td>
<td>Controls whether the element can be used as the head of a substitution group for elements whose types are derived by extension or restriction from the type of the element. Its default value is defined by the finalDefault attribute of the parent xs:schema.</td>
<td>#all, restriction, extension, restriction, [Empty]</td>
<td>For global elements and element references</td>
</tr>
</tbody>
</table>
### xs:attribute

Figure 206. The xs:attribute Component

Defines an attribute. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-attribute](http://www.w3.org/TR/xmlschema11-1/#element-attribute).

An attribute by default displays the following properties when rendered in the diagram: default, fixed, use and type. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

#### Table 10. xs:attribute Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Value</th>
<th>Mentions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Attribute name (always required)</td>
<td>Any NCName for global/local attributes, all declared attributes’ QName (<a href="#">on page 3286</a>) for references</td>
<td>For all local or global attributes. If missing, will be displayed as ‘[attribute]’ in the diagram.</td>
</tr>

**xs:complexType**

Figure 208. The *xs:complexType* Component
Defines a top-level complex type. Complex Type Definitions provide for: See more data at http://www.w3.org/TR/xmlschema11-1/#element-complexType.

• Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
• Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
• Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
• Specifying post-schema-validation infoset contributions for elements.
• Limiting the ability to derive additional types from a given complex type.
• Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

Tip: A complex type that is a base type to another type will be rendered with yellow background.

**xs:simpleType**

Figure 209. The *xs:simpleType* Component

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-simpleType](http://www.w3.org/TR/xmlschema11-1/#element-simpleType).

**Tip:** A simple type that is a base type to another type will be rendered with yellow background.

### xs:field

Figure 226. The `xs:field` Component

Specifies an XPath expression that specifies the value used to define an identity constraint. See more info at [http://www.w3.org/TR/xmlschema11-1/#element-field](http://www.w3.org/TR/xmlschema11-1/#element-field).

**Table 28. `xs:field` Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>XPath</td>
<td>Relative XPath expression identifying the field(s) composing the key, key reference, or unique constraint</td>
<td>An XPath expression</td>
</tr>
<tr>
<td>ID</td>
<td>The component ID</td>
<td>Any ID</td>
</tr>
<tr>
<td>Component</td>
<td>The edited component name</td>
<td>Not editable property</td>
</tr>
<tr>
<td>System ID</td>
<td>The component system ID</td>
<td>Not editable property</td>
</tr>
</tbody>
</table>

### xs:assert

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

**Note:** `xs:assert` is available for XML Schema 1.1.

Figure 227. The `xs:assert` Component

**Table 29. `xs:assert` Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test</td>
<td>Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor</td>
<td>An XPath expression</td>
</tr>
</tbody>
</table>
elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>XPath Default Namespace</td>
<td>The default namespace used when the XPath expression is evaluated</td>
<td>##defaultNamespace, ##targetNamespace, ##local</td>

<td>Any ID</td>
</tr>
<tr>
<td>Component</td>
<td>The edited component name</td>
<td>Not editable property</td>
</tr>
<tr>
<td>System ID</td>
<td>The component system ID</td>
<td>Not editable property</td>
</tr>
</tbody>
</table>

**xs:openContent**

Figure 228. The *xs:openContent* Component

The *openContent* element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the *complexType* definition) or at the schema level.

For further details about the *openContent* component, go to [http://www.w3.org/TR/xmlschema11-1/#element-openContent](http://www.w3.org/TR/xmlschema11-1/#element-openContent).

**Table 30. *xs:openContent* Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Specifies where the extension elements can be inserted</td>
<td>The value can be: &quot;interleave&quot;, &quot;suffix&quot; or &quot;none&quot;. The default value is &quot;interleave&quot;.</td>
</tr>
<tr>
<td>ID</td>
<td>The component ID</td>
<td>Any ID</td>
</tr>
<tr>
<td>Component</td>
<td>The edited component name</td>
<td>Not editable property</td>
</tr>
<tr>
<td>System ID</td>
<td>The component system ID</td>
<td>Not editable property</td>
</tr>
</tbody>
</table>

**Note:** This component is available for XML Schema 1.1 only. To change the version of the XML Schema, open the Preferences dialog box (**Options > Preferences**) (**on page 79**) and go to **XML > XML Parser > XML Schema**.

**Constructs Used to Group Schema Components**

This section explains the components that can be used for grouping other schema components.
Attributes

Figure 229. Attributes Construct

Groups all attributes and attribute groups belonging to a complex type.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>The element for which the attributes are displayed</td>
<td>Not editable property</td>
</tr>
<tr>
<td>System ID</td>
<td>The component system ID</td>
<td>Not editable property</td>
</tr>
</tbody>
</table>

Constraints

Figure 230. Constraints Construct

Groups all constraints (xs:key (on page 1280), xs:keyRef (on page 1280), or xs:unique (on page 1279)) belonging to an element.

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>The element for which the constraints are displayed</td>
<td>Not editable property</td>
</tr>
<tr>
<td>System ID</td>
<td>The component system ID</td>
<td>Not editable property</td>
</tr>
</tbody>
</table>

Substitutions

Figure 231. Substitutions Construct
Groups all elements that can substitute the current element.

**Table 33. substitutions Properties**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>The element for which the substitutions are displayed</td>
<td>Not editable property</td>
</tr>
<tr>
<td>System ID</td>
<td>The component system ID</td>
<td>Not editable property</td>
</tr>
</tbody>
</table>

**Schema Validation**

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor [XML documents validation (on page 1079)](#) capability.

**Figure 232. XML Schema Validation**

A schema validation error is presented by highlighting the invalid component:

- In the **Attributes View (on page 628)**.
- In the diagram by surrounding the component that has the error with a red border.
• A marker on the errors stripe at the right of the diagram view.
• A status label with a red icon (🔴) below the diagram view.

Invalid facets for a component are highlighted in the Facets View (on page 630).

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the Document checking user preferences (on page 180). When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the Validate action from the Document > Validate menu or from the Validation toolbar drop-down menu, all validation errors will be presented in the Errors tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

⚠️ Important: If the schema imports only the namespace of other schema without specifying the schema location and a catalog is set up (on page 1123) that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

Tip: If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the current edited schema is an XML Schema module.

Edit Schema Namespaces

You can use the XML Schema Namespaces dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the Design mode these namespaces can be modified anytime by choosing Edit Schema Namespaces from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The XML Schema Namespaces dialog box allows you to edit the following information:

• Target namespace - The target namespace of the schema.
• Prefixes - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.
7.

Working with Documents

Oxygen XML Editor includes a variety of general features that can be used when working with any type of document. More specialized features are available when working with specific type of documents, such as the various types of XML documents, CSS, JavaScript, Markdown, and more. For details about those specialized features for specific types of documents, see Editing Documents (on page 827).

This chapter includes information about how to create and work with documents, working with projects, and various editing features that are provided in Oxygen XML Editor for all document types. This chapter also includes information about some of the special tools that are included in Oxygen XML Editor, such as the file and directory comparison tools.

Getting Familiar with the Interface

Oxygen XML Editor includes several perspectives (on page 3285) and editing modes (on page 303) to help you accomplish a wide range of tasks. Each perspective and editing mode also includes a large variety of helper view, menu actions, toolbars, and contextual menu functions.

There are various ways that you can configure the layout of the views or editors (on page 268), and you can customize the toolbars (on page 273).

Regardless of the perspective (on page 3285) or editing mode (on page 303) that you are working with, the default layout consists of the following areas:

**Menus**

Menu driven access to all the features and functions available in Oxygen XML Editor. Most of the menus are common for all types of documents, but Oxygen XML Editor also includes some context-sensitive and framework-specific menus and actions that are only available for a specific context or type of document.

**Toolbars**

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all perspectives, editing modes, and types of documents, while others are specific to the particular perspective or mode. Some toolbars are also framework-specific, depending on the type of document that is being edited. All the toolbars can be configured (on page 273) to suit your specific needs.

**Helper Views**
Oxygen XML Editor includes a large variety of dockable views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each perspective and editing mode are displayed by default and you can choose to display others to suit your specific needs. The layout of the views can also be configured according to your preferences.

**Editor Pane**

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes a variety of contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them.

**Perspectives**

Oxygen XML Editor includes several different perspectives that you can use to work with your documents. The Editor perspective is the most commonly used perspective used for displaying and editing the content of your XML documents, and it is the default perspective when you start Oxygen XML Editor for the first time. Oxygen XML Editor also includes a Database perspective that allows you to manage databases and their connections and a few debugging perspectives that allow you to detect problems in XSLT or XQuery transformations.

**Status Bar**

The status bar at the bottom of the application contains some useful information when you are working with documents. It includes the following information, in the order it is displayed from left to right:

- The path of the current document.
- The Unicode value for the character directly to the right of the current cursor position.
- The status of the current document. The status of Modified is displayed for documents that have not yet been saved. Otherwise, this section is left blank.
- In Text editing mode, the current line and character position is displayed.
- If the Check for notifications option is selected, this section will show you when new messages have been received. The types of messages include the addition of new videos on the Oxygen XML Editor website, the announcement
of upcoming webinars and conferences where the Oxygen XML Editor team will participate, and more.

- The memory consumption, including the memory used by the application and the maximum amount that is allocated to the application.

- If the **Show memory status** option *(on page 83)* is selected, a 💻 **Free unused memory** icon is displayed in the bottom-right corner and you can use this icon to free up unused memory.

### Configuring the Layout of the Views and Editors

All the Oxygen XML Editor views available in the **Editor** *(on page 295)*, **XSLT Debugger**, and **XQuery Debugger** *(on page 299)* perspectives *(on page 3285)* are **dockable** *(on page 3281)* and there are various ways to configure and arrange the layout of the views and editing panes. You can also **configure the layout of the toolbars** *(on page 273)*.

To open a view, select it from the **Window > Show View** menu. You can hide a view by closing it with the ✗ button at the top-right corner of the view, or with the **Window > Hide current view** action.

### Arranging the Layout

You can drag any view to any margin of another view or editor inside the Oxygen XML Editor window. Once you create a layout that suits your needs, you can save it from **Window > Export Layout**. Oxygen XML Editor creates a layout file containing the preferences of the saved layout. To load a layout, go to **Window > Load Layout**. To reset it, select **Window > Reset Layout**.

**Note:** The **Load Layout** menu lets you select between the default layout, a predefined layout, or a custom layout. The changes you make using the **Load Layout** menu are also reflected in the **Application Layout** preferences page.

The changes you make to any layout are preserved between working sessions. The predefined layout files are saved in the **preferences directory** *(on page 80)* of Oxygen XML Editor.

To gain more editing space in the Oxygen XML Editor window, click ✅ **Toggle auto-hide** in any view. This button sets the view in the **auto-hide** state, making it visible only as a vertical tab, at the margins of the Oxygen XML Editor window. To display a view in the **auto-hide** state, hover its side-tab with your cursor, or click it to keep the view visible until you click elsewhere. A view can also be set to a floating state by using the **Toggle floating** action, making it independent from the rest of the Oxygen XML Editor window.

You can drag the editors and arrange them in any order, both horizontally and vertically.
The following image presents two editors arranged as horizontal tiles. To arrange them vertically, drag one of them on top of the other. In this example, the `personal.xml` file was dragged over the `personal-schema.xml` file. When doing this, a dark gray rectangle marks the rearranged layout.

Figure 233. Drag and Drop Editors

Tile/Stack Editor Actions

You can also tile or stack all open editors, both in the Editor perspective (on page 295) or in the Database perspective (on page 300), using the following actions from the Editor toolbar or Window menu:

- **Tile Editors Horizontally**
  Splits the editing area into horizontal tiles, one for each open file.

- **Tile Editors Vertically**
  Splits the editing area into vertical tiles, one for each open file.

- **Stack Editors**
  The reverse of the Tile Editors Horizontally/Vertically actions. Stacks all open editors.

- **Synchronous Scrolling**
Select this action to scroll through the tiled editors at the same time.

**Note:** When tiled, you can still drag and drop the editors, but note that they are docked in the same way as a window/view (instead of just tabs). You are actually rearranging the editor windows, so drag the editor tab and drop it to one of the sides of an editor (left/right/top/bottom). While dragging, you will see the dark gray rectangle aligned to one of the sides of the editor, or around the entire editor window. If you drop it to one of the sides it will dock to that side of the editor. If you drop it when the rectangle is around the entire window of the editor it will get stacked on top of that editor. You can also grab one of the stacked editors and tile it to one of the sides.

### Split Editor Actions

You can divide the editing area vertically and horizontally using the following actions available in the Editor toolbar and Window menu:

- **Split Editor Horizontally** - Splits the editor horizontally. This is useful for comparing and merging content between two documents.
- **Split Editor Vertically** - Splits the editor vertically. This is useful for comparing and merging content between two documents.
- **Unsplit Editor** - Removes a split action on the editing area.

To maximize or restore the editors, go to **Window > Maximize/Restore Editor Area**.

### Switch or Move Editor Tabs

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them.

#### Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

- **Mouse and Scroll Wheel**
  
  Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many tabs opened to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

- **Buttons on the Far-Right of the Tab Stripe (⌘) or (⎇)**
  
  You can use the arrow buttons (↑ or ↓) on the right side of the tab stripe to scroll to the left or right and the ▼ **Show List** button opens a pop-up window that displays all the opened file tabs and allows you to select and switch to a specific opened file.
Ctrl + Tab (Command + Tab on OS X) [NOTE: Ctrl + Page Down (Ctrl + Alt + Right Arrow on OS X) does the same]

Switches to the next opened tab in the order specified in the **Order of switching between editor tabs** option (on page 83).

Ctrl + Shift + Tab (Command + Shift + Tab on OS X) [NOTE: Ctrl + Page Up (Ctrl + Alt + Left Arrow on OS X) does the same]

Switches to the previous opened tab in the order specified in the **Order of switching between editor tabs** option (on page 83).

**Window > Switch editor tab (Ctrl + F9 (Command + F9 on OS X))**

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of file tabs opened and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific opened file tabs.

**Figure 234. Switch Editor Tab Dialog Box**

The **Switch Editor Tab** dialog box contains the following options and features:

**Search Filter**

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific opened files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, * to match any sequence of characters or ? to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

**Match all terms**
If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

Include file paths
If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

Case sensitive
If this option is selected, the search operation will be case-sensitive.

List of Opened File Tabs
All files that are currently opened are displayed in the main pane of the dialog box. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click OK.

Moving Editor Tabs
You can move editor tabs by using any of the following methods:

Mouse Drag
You can use your mouse to drag editor tabs to a new location on the tab stripe.

Ctrl + Alt + Comma
Moves the current file tab one position to the left.

Ctrl + Alt + Period
Moves the current file tab one position to the right.

For more information about configuring the interface of Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/anwjepfAdEk

Related Information:
- Configuring Toolbars (on page 273)

Configuring Toolbars
You can configure the toolbars in Oxygen XML Editor to personalize the interface for your specific needs. You can choose which toolbars to show or hide in the current editor mode (Text, Author, Design, or Grid) and in the current perspective (on page 3285) (Editor, XSLT Debugger,
You can also choose which actions to display in each toolbar, add actions to toolbars, and customize the layout of the toolbars.

To configure the toolbars, open the **Configure Toolbars** dialog box by doing one of the following:

- Right-click any toolbar and select **Configure Toolbars**.
- Select **Configure Toolbars** from the **Window** menu.

The **Configure Toolbars** dialog box provides the following features:

- **Filter Text Box**
  
  You can use the filter text box at the top of the dialog box to search for a specific toolbar or action.

- **Show or Hide Toolbars**
  
  You can choose whether to show or hide a toolbar by using the checkbox next to the toolbar name. This checkbox is only available for toolbars that are available for the current perspective (on page 3285) and editing mode.

- **Show or Hide Actions in a Toolbar**
  
  To show or hide actions in a toolbar, expand it by clicking the arrow next to the toolbar name, then use the checkbox to select or deselect the appropriate actions. The toolbar configuration changes in the **Preview** column according to your changes.

- **Add Actions to a Toolbar**
Use the **Add Actions** button to open the **Add Actions** dialog box that displays all the actions that can be added to any of the toolbars, with the exception of those that are contributed from *frameworks (on page 3282)* or 3rd party *plugins (on page 3285)*.

**Remove Actions from a Toolbar**

You can remove actions that you have previously added to toolbars by using the **Remove Action** button.

**Move Actions in a Toolbar**

Use the **Move Up** and **Move Down** actions to change the order of the actions in a toolbar.

The **Configure Toolbars** dialog box also provides a variety of other ways to customize the layout in Oxygen XML Editor.

**Customize My Toolbar**

You can customize the **My Toolbar** to include your most commonly used actions. By default, this toolbar is listed first. Also, it is hidden until you add actions to it and you can easily hide it with the **Hide "My Toolbar" Toolbar** action that is available when you right-click anywhere in the toolbar area.

**Drop-down Menu Actions**

Composite actions that are usually displayed as a drop-down menu can only be selected in one toolbar at a time. These actions are displayed in the **Configure Toolbars** dialog box with the name in brackets.

![Configure external tools](image)

**Configure External Tools Action**

There is a **Configure external tools** composite action that appears in the toolbar called **Tools**. It is a drop-down menu that contains any external tools that are configured in the **External Tools** preferences page.

**Note:** If no external tools are configured, this drop-down menu is not shown in the toolbar.

Additional actions are available from the **Window** menu or contextual menu when invoked from a toolbar that allows you to further customize your layout. These actions include:

**Reset Toolbars**

To reset the layout of toolbars to the default setting, select the **Reset Toolbars** action from the contextual menu or **Window** menu.

**Reset Layout**
To reset the entire layout (including toolbars, editing modes, views, etc.) to the default setting, select **Reset Layout** from the contextual menu or **Window** menu.

**Export Layout**

You can use the **Export Layout** action that is available in the **Window** menu to export the entire layout of the application to share it with other users.

**Hide Toolbars**

You can use the **Hide Toolbar** action from the contextual menu to easily hide a displayed toolbar. When you right-click a toolbar it will be highlighted to show you which actions are included in that toolbar.

---

### Creating and Working with Documents

Oxygen XML Editor includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

### Creating New Documents and Templates

Oxygen XML Editor includes a helpful **New Document** wizard that allows you to customize and create new files from a large list of document types and built-in templates. You can also create your own templates *(on page 683)* and share them with others *(on page 688)*.

To quickly create a new document:

1. Click the **New** button on the toolbar or select **File > New**.
2. Select the type of document that you want to create.

   **Tip:** You can use the text filter field at the top of the dialog box to search for a specific template.
3. Click the **Create** button at the bottom of the dialog box.
New Document Wizard

Oxygen XML Editor supports a wide range of document types. The **New Document** wizard presents the default associations between a file extension and the type of editor that opens the file. To customize these default associations, open the **Preferences** dialog box (**Options > Preferences**) (on page 79) and go to **File Types** (on page 250).

The **New Document** wizard creates a skeleton document that may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type. You can also create your own custom document templates (on page 683) and select them from this wizard.

**New Document Wizard**

To create a new document using this wizard, follow these steps:

1. Click the **New** button on the toolbar or select **File > New**.

   **Result:** The **New Document** wizard is displayed:

   Figure 236. New Document Wizard

   ![New Document Wizard](image)

   The first page of the wizard displays the supported document types and groups them in the following categories:

   **Recently Used**
Contains the list of the most recently used file types. To clear the history of this folder, right-click an entry and select **Remove all** (or select an entry and press **Ctrl + Delete** on your keyboard). To remove a single entry, right-click and select **Remove** (or select the entry and press **Delete** on your keyboard).

**New Document**

Contains the list of all supported document types. This list includes XML, XSL, XML Schema, Document Type Definition, Relax NG Schema, XQuery, Web Services Definition Language, Schematron Schema, CSS, Text, PHP, JavaScript, Java, C, C++,
Batch, Shell, Properties, SQL, **XML Catalog**, PERL, JSON, and more.

**Global Templates**

Contains the list of built-in templates as well as user-defined custom templates. You can create your own custom document templates (on page 683) and add them to the templates folder of the Oxygen XML Editor installation directory.

**Framework Templates**

Contains the list of templates defined in the Document Type configuration dialog box (Templates tab) (on page 118) for each framework.

**User-defined template directory**

You can add your own custom templates by creating template files (on page 683) in a directory and then add that directory to the list of template directories that Oxygen XML Editor uses in the Document Templates preferences page (on page 123). This user-defined directory will also appear in the New Document wizard.

2. Select the type of document that you want to create.

**Tip:** You can use the text filter field at the top of the dialog box to search for a specific template.

3. If you want to change the default name and path of the file, select the Save as option and specify the file path (the Show "Save as" option to save newly created documents in the "New" document wizard option (on page 156) must be selected in the Save preferences page). Otherwise, the file will be opened in a new tab with a default untitled name and the document path will not yet exist until you save it.

**Note:** For DITA documents, the dialog box includes some additional options for generating a title, file name, and root ID attribute. For more information, see Creating a New DITA Topic (on page 3050).

4. If you want to use the default settings in the creation process, select Create at the bottom of the dialog box.

**Result:** The document is created using the default settings and the new file is opened in the appropriate editor.
5. If you want to configure properties before creating the file, select **Customize**. This action is available for XML, XML Schema, Schematron, and XSL documents.

**Result:** A new file configuration dialog box is opened that allows you to customize various options, depending on the document type you selected. After configuring the options in this wizard, click **Create** to create the file and open it in the appropriate editor.

**XML Document Configuration Page**

Figure 237. New XML Document Configuration Wizard Page

If you selected **XML Document** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following options:

**Schema URL**

Specifies the path to the schema file. When you select a file, Oxygen XML Editor analyzes its content and tries to fill in the rest of the dialog box.

**Schema Type**

Allows you to select the schema type. The following options are available: **XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.**

**Public ID**

Specifies the PUBLIC identifier declared in the document prolog.
Namespace

Specifies the document namespace.

Prefix

Specifies the prefix for the namespace of the document root.

Root Element

Populated with elements defined in the specified schema, enables selection of the element used as document root.

Description

A small description of the selected document root.

Add Optional Content

If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.

Add First Choice Particle

If you select this option, Oxygen XML Editor generates the first element of an `xs:choice` schema element in the skeleton XML document. Oxygen XML Editor creates this document in a new editor panel when you click OK.

XSLT Document Configuration Page

Figure 238. New XSLT Stylesheet Configuration Wizard Page

If you selected XSLT Stylesheet for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following options:

Stylesheet version
Allows you to select the **Stylesheet version** number. You can select from: 1.0, 2.0, and 3.0.

Add documentation annotations

Select this option to generate the stylesheet annotation documentation.

**XML Schema Document Configuration Page**

Figure 239. New XML Schema Configuration Wizard Page

If you selected XML Schema for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following options:

**Default XML Schema version**

Uses the XML Schema version defined in the XML Schema preferences page (on page 192).

**XML Schema 1.0**

Sets the minVersion attribute to 1.0 and the maxVersion attribute to 1.1.

**XML Schema 1.1**

Sets the minVersion attribute to 1.1.

**Target namespace**
Allows you to specify the schema target namespace.

**Namespace prefix declaration table**

This table contains namespace prefix declarations. Table information can be managed using the **New** and **Delete** buttons.

![Image](image.png)

Tip: For further details on how you can set the version of an XML Schema, go to Setting the XML Schema Version (on page 1335).

**Schematron Document Configuration Page**

If you selected Schematron for the type of file you want to create and selected the Customize option, the configuration dialog box will include the following option:

**Schematron version**

Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.

Note: Starting with version 16.0 of Oxygen XML Editor, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

**JSON Document Configuration Page**

Figure 241. New JSON Configuration Wizard Page
If you select **JSON** for the type of file you want to create and select the **Customize** option, the configuration dialog box will include the following options:

**Schema URL**

Specifies the path to a JSON Schema file that will be used to generate key-value pairs.

**Associate Schema in the Document**

If you select this option, the JSON instance will be generated with the JSON Schema associated directly in the document.

**Generate Optional Properties**

If you select this option, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

**Generate Additional Content**

If you select this option, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

Creating New Document Templates

Oxygen XML Editor allows you to create your own custom document templates and they will appear in the **New document wizard** *(on page 676)*.

**Creating a New Document Template**

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.
Tip: You can use editor variables (on page 276) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (on page 685) for other template customization tips (for example, you could add placeholders or hints (on page 687) to assist authors).

2. Save the new document template and reference that location in Oxygen XML Editor. There are several options for doing this:

- **Saving the new template in a specific framework's directory** - Save the new template in a directory (for example, called templates) within that specific framework directory (usually a custom framework (on page 2322)). Then open the Document Type configuration dialog box (on page 95) for that specific framework, go to the Templates tab (on page 118), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, ${frameworkDir}/templates). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework. Click OK to close the configuration dialog box and then OK or Apply to save your changes.

- **Saving the new template in the Oxygen installation directory** - Save the new template in the templates directory of the Oxygen XML Editor installation directory ([OXYGEN_INSTALL_DIR]/templates). Document templates saved in this directory will appear in the Global templates category in the New document wizard (on page 676).

- **Saving the new template in a custom directory** - Save the new template in any directory of your choice and then add that directory to the list of templates in the Document Templates preferences page (on page 123). This user-defined directory will appear in the New document wizard (on page 676) along with all the new document templates that you save inside it. Click OK or Apply to save your changes.

Attention: The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as My Custom Template1). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (on page 686) section.

3. Open the new document wizard (New toolbar button or File > New) and you should see your custom template in the appropriate folder.

Note: For DITA templates, they will also appear in the dialog box for creating new DITA topics from the DITA Maps Manager, but if you customize the template (on page 685), you need to set the type property to dita in the corresponding properties file.

Related Information:

- Customizing Document Templates (on page 685)
Customizing Document Templates

Oxygen XML Editor allows you to customize certain aspects of built-in or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the New document wizard (on page 676).

Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

1. Create a new properties file or edit an existing one following these guidelines:
   a. If you want to create a new properties file, you can use the Properties template found in the New Document folder in the New document wizard (on page 676). If you want to edit an existing template, you can find them within the subfolders in the templates folder for each framework (for example, the DITA topic properties file is located in: OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/topic.properties).
   b. Use the same name as your custom template file except with a .properties extension (for example, MyTemplate.properties).
   c. In this properties file, specify the paths to the icons that will be used in the new file wizard.
      The properties file should look like this:
      
      ```
      type=general
      smallIcon=../icons/Article_16.png
      bigIcon=../icons/Article_48.png
      ```

      **Tip:** For DITA files, the type property needs to be set to dita. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the DITA Maps Manager (on page 2990). For all other types of files, set it to general. The icons specified in this properties file will only be used for the new file wizards and not in any other part of the interface.

      **Important:** If you created a new template and chose to use a custom directory for the new template (in step 2 of the new template procedure (on page 684)), make sure the path to the icons is relative to that directory.

2. Save the properties file in the same directory as your custom template.
3. Open the new file wizard (File > New) and you should see your custom icons next to the document template in the appropriate folder.
Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you click the **New** button on the toolbar (or **File > New**). The prefix or suffix is added to the name of the file in the **Save as** field.
- The new document dialog box that appears when you select **New > File** from the contextual menu in the **Project view (on page 333)**. The prefix or suffix is added to the name of the file in the **Filename** field.
- For DITA files, it also applies to the new document dialog box that appears when you select **Append Child > New, Insert Before > New, or Insert After > New** from the **DITA Maps Manager (on page 2990)**. The prefix or suffix is added to the name of the file in the **Save as** field.
- For DITA files, it also applies to the **Fast Create Topics** dialog box (**on page 3053**) that you can use to create multiple skeleton topics at once.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.
   - If you create a new properties file, use the same name as the template file except with a **.properties** extension (for example, **MyTemplate.properties**). This properties file will specify the prefix/suffix that will be used to propose the file name in the new file wizards.
   - When defining the prefix/suffix, the properties file should look something like this:
     ```
     type=general
     filenamePrefix=prod_
     filenameSuffix=_test
     ```
     **Important:** For DITA files, the **type** property needs to be set to **dita**. For all other types of files, set it to **general**.
   - If you edit an existing template, simply define the prefix/suffix as specified **above (on page 686)**.

2. Save the properties file in the same directory as the document template.

3. Open the new document wizard (using the methods described above (**on page 686**)) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

Configure the Displayed Names for Document Templates

To change the name that is displayed for a document template, use the following procedure:
1. Create a new properties file or edit an existing one. If you create a new properties file, use the same name as the template file except with a .properties extension (for example, MyTemplate.properties).
2. Add a displayName property in the properties file:
   
   ```
   displayName=My Template Name
   ```

   **Tip:** The names for framework (on page 3282)-specific document templates (such as DITA Topic or DocBook Article, as you would see in the Framework templates folder in the New file wizard) can be translated via the internationalization support. In this case, the properties file should contain something like:

   ```
   displayName=${i18n(tag)}
   ```

   where tag refers to an entry in the translation.xml file for that specific framework (for example, OXYGEN_INSTALL_DIR/frameworks/dita/i18n/translation.xml for DITA).
3. Save the properties file in the same directory as the document template.
4. Open the new file wizard (File > New) and you should see the new name for the template.

### Adding Placeholders or Hints in a Document Template

Document templates sometimes contain empty elements and it may not be clear to the Author what should be inserted. You can define placeholders in document templates that provide hints for Authors to help them understand what type of content should be added in any particular empty element within the document. The placeholder text is specified using a processing instruction and the placeholders are removed when the Author inserts content in the corresponding element.

To define placeholders in a document template to provide authors with hints, follow this procedure:

1. Edit the document template.
2. Add placeholders in the form of processing instructions within the elements where you want hints to be displayed when an Author creates a document from the template. For example:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
   <topic id="pi">
     <title><?oxy-placeholder content="Enter a title"?></title>
     <shortdesc><?oxy-placeholder content="Writing short descriptions induces the writer to clarify the main thesis of the topic. We recommended a 50 word limit."?></shortdesc>
     <body>
       <p><?oxy-placeholder content="A paragraph element should be a self-contained unit dealing with one idea or point."?></p>
   ```
3. Save the template file.

4. Use the **New document wizard (on page 676)** to create a new document using your customized template and you should see the hints in the opened document.

**Related Information:**

- Creating New Document Templates (on page 683)
- Sharing Custom Document Templates (on page 688)

**Sharing Custom Document Templates**

Your **custom document templates (on page 683)** can be shared with the other members of your team so that they all have access to the templates in the **New document wizard (on page 676)**. The best way to share them is by integrating them in an extended **framework (on page 3282)** (document type) configuration and then sharing the whole framework with the other users.

**Sharing Custom Document Templates**

To share custom document templates with other members of your team:

1. Create a custom framework by extending an existing one (on page 2322), if you haven't already done so.
2. Create the new document template (on page 683), if you haven't already done so.
3. Save the new template in a directory (for example, called templates) within your custom framework directory. Then open the **Document Type configuration dialog box (on page 95)** for that specific framework, go to the **Templates tab (on page 118)**, and click the **+ button** in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework.
4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.
5. All that remains is to share the entire framework with anyone who needs to have access to the custom templates. There are several methods for sharing frameworks and you can find details here: **Sharing a Custom Framework (on page 2371)**.
Opening Documents

To open a document in Oxygen XML Editor, do one of the following:

- Go to File > Open (Ctrl + O (Command + O on OS X)) or click the Open toolbar button to display the Open File dialog box. The start folder of this dialog box can be either the last folder it visited or the folder of the currently selected file. This can be configured in the Global preferences page. (on page 81)
- Go to File > Open URL or click the Open URL toolbar button to display a dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.
- Click the Open/Find Resource toolbar button to search for a file to open.
- Go to File > Reload to load the last saved file content. All unsaved modifications are lost.
- Go to File > Reopen to reopen one of the recently opened document files. The list containing recently opened files can be emptied by invoking the Clear history action.
- Select the Open or Open with action from the contextual menu of the Project view (on page 333).

Opening the Current Document in a System Application

To open the currently edited document in the associated system application, use the View in Browser/System Application action that is available in the File menu and on the File toolbar. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.
Opening Local Files at Start-up

There are two possibilities for opening local files at startup from a command line by adding their file paths as parameters:

• scriptName [pathToXMLFile1] [pathToXMLFile2]
  - scriptName is the name of the startup script for your platform (oxygen.bat on Windows, oxygen.sh on Mac OS X and Linux).
  - pathToXMLFileN is the name of a local XML file.

• An XML file and a schema file to be associated automatically to the file and used for validation and content completion:

  scriptName -instance pathToXMLFile -schema pathToSchemaFile -schemaType XML_SCHEMA|DTD_SCHEMA|RNG_SCHEMA|RNC_SCHEMA -dtName documentTypeName

  - scriptName is the name of the startup script for your platform (oxygen.bat on Windows, or oxygen.sh on Mac OS X and Linux).
  - pathToXMLFile is the name of a local XML file.
  - pathToSchemaFile is the name of the schema that you want to associate to the XML file, the four constants (XML_SCHEMA, DTD_SCHEMA, RNG_SCHEMA, RNC_SCHEMA) are the possible schema types (XML Schema, DTD, Relax NG schema in full syntax, Relax NG schema in compact syntax).
  - documentTypeName specifies the name of the document type for which the schema is defined. If the document type is already set in preferences, its schema and type are updated.

Tip: You can use the -h or --help parameters to see more detailed information about possible values.

Related Information:

- Opening a Document at a Specific Location Using a Command-Line Interface (on page 690)

Opening a Document at a Specific Location Using a Command-Line Interface

Oxygen XML Editor offers support for opening a file at a specific position using a command-line interface to transmit parameters to the Oxygen XML Editor application launching script file (oxygen.bat/oxygen.sh). The following methods are available, depending on how you identify the position that is needed:

1. Specific position values (line and column number, or character offset)
Oxygen XML Editor supports the following position parameters:

- **line** - The line number.
- **column** - The column number (has meaning if the line parameter is also defined).
- **char** - The character offset.

### Examples for Windows:

The following examples show how you can open an XML document in Oxygen XML Editor from a Windows command-line interface:

- `oxygen.bat file:samples/personal.xml#line=4` (line parameter only)
- `oxygen.bat file:samples/personal.xml#line=4;column=5` (both line and column parameters)
- `oxygen.bat file:samples/personal.xml#char=334` (char parameter)

### 2. Simplified XPath index path

Oxygen XML Editor will open an XML file and select one of its elements identified by a simplified XPath index path. For example, an index path of the form 1/5/7 identifies the seventh child of the fifth child of the root element.

**Restriction:** Oxygen XML Editor will display a selection that starts with the first character of the content of the identified element and spans until the end of the line.

### Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Editor and select the third child of the root element using a Windows command-line interface:

- `oxygen.bat file:samples/personal.xml#element(1/3)`

### 3. Anchors identified by ID attribute values

Oxygen XML Editor will open an XML file and select the element whose id attribute value is an exact match of the anchor (on page 3279) attached to a command-line instruction.

### Examples for Windows:

The following example shows how you can open an XML document in Oxygen XML Editor and select the element that has the id element set to titleID using a Windows command-line interface:

- `oxygen.bat file:samples/personal.xml#titleID`
Saving Documents

You can save the document you are editing with one of the following actions:

- File > Save.
- Save toolbar button - If the document was not yet saved, it displays the Save As dialog box.
- File > Save As - Displays the Save As dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- File > Save To URL - Displays a Save to URL dialog box that can be used to save a file identified by its URL (defined by a protocol, host, resource path, and an optional port). You can also use the browsing actions in the Browse for remote file drop-down menu.
- File > Save All - Saves all open documents. If any document does not have a file, displays the Save As dialog box.

Auto Recover Documents

Oxygen XML Editor includes an Auto Recover feature to help prevent losing unsaved content if you encounter an application or system crash. The feature is enabled by default and it automatically saves documents you are working on to a specified auto-recover file location. At every specified interval, all documents that have been modified since the last auto-save are saved to the specified location.

This feature is controlled by two options in the Save preferences page. You can disable it, or configure how often content is saved by selecting the desired value in the drop-down list of the Save auto-recover information every option (on page 157), and you can specify the location of the saved documents in the Auto-recover file location option (on page 157).

In the event of an application or system crash, when you restart the application, Oxygen XML Editor looks for an auto-recover file for each document that was open when the editing session was last saved (by the application). If any auto-recover files are found, a dialog box is displayed with options for how to handle the auto-recovered information. If a previously opened file was not restored from the previous editing session, re-opening the file will also trigger this dialog box.

Figure 242. Auto Recover Dialog Box
The dialog box offers the following choices:

- **Open recovered content in a new tab** - Opens the recovered document in a new tab.

  **Tip:** You can use the **Compare Files** tool (available in the **Tools** menu) to compare the recovered content with the last saved version of the document.

- **Replace current file content with recovered content** - Replaces the content of the last saved version of the document with the content of the recovered version of the document and removes the auto-recover file from disk.

- **Use current file content and discard recovered content** - Discards the recovered document and retains the last saved version of the document.

**Notes About the Auto-Recover Feature:**

- The **Auto Recover** feature works for both local and remote files.
- For DITA projects, the **Auto Recover** feature also works for DITA maps opened in the **DITA Maps Manager**.
- The **Auto Recover** feature does **NOT** work if there is not enough space available on the disk where the auto-recover file location is specified (on page 157).
- The **Auto Recover** feature does **NOT** work on files opened in the huge file editor (on page 783) (if you select the **Optimize loading for huge files** option when opening large documents (on page 781)).

**Working with Remote Documents**

Oxygen XML Editor supports editing remote files, using the FTP, SFTP, WebDAV, SharePoint, and SharePoint Online for Office 365 protocols. You can edit remote files in the same way you edit local files. For example, you can add remote files to a project, or use them in XSL and FO transformations.

You can open one or more remote files in the **Open URL** dialog box (on page 694).

A WebDAV resource can be locked when it is opened in Oxygen XML Editor by selecting the **Lock WebDAV files on open** option (on page 257) to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Editor displays an error message that contains
the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Editor.

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can check out the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Editor and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current WebDAV Connection (on page 2254) details can be saved by switching to the Database perspective (on page 3285) and then you can browse and manage the connection in the Data Source Explorer view (on page 2198).

Open URL

To open this dialog box, go to File > Open URL (or click the Open URL toolbar button), then choose the Browse for remote file option from the drop-down action list.

Figure 243. Open URL Dialog Box

The displayed dialog box is composed of the following:

Server URL
Specifies the protocol (HTTP, HTTPS or FTP) and the host name or IP of the server.

**Tip:** When specifying a URL, follow these rules:

- To access an FTP server, write the protocol, host, and port (if using a non-standard one). For example, `ftp://server.com` or `ftp://server.com:7800/`.
- To access a WebDAV server, write the path to the directory of the WebDAV repository along with the protocol and the host name. For example, `https://www.some-webdav-server.com:443/webdav-repository/`.

**Important:** Make sure that the repository directory ends in a slash "/". For example, `https://www.some-webdav-server.com:443/webdav-repository/`.

**Autoconnect**

If selected, the browse action is performed every time when you open the dialog box.

**User and Password**

To browse for a file on a server, you have to specify the user and password for the server. This information is bound to the selected URL displayed in the **File URL** combo box, and used further in opening/saving the file. If the **Save** option is selected, then the user and password are saved between editing sessions. The password is kept encrypted in the options file.

**Note:** Your password is well protected. If the options file is used on another machine by a user with a different username, the password will become unreadable since the encryption is dependent on the username. This is also true if you add URLs that contain a username and password to your project.

**Connect**

When you press this button, the directory listing will be shown in the main section of the dialog box. If the selected URL points to a SharePoint server, a dedicated SharePoint browsing component is presented.

**Browser view**

- If you are browsing a WebDAV or FTP repository, the items are presented in a tree-like fashion. You can browse the directories, and make multiple selections. Additionally, you may use the **Rename**, **Delete**, and **New Folder** actions to manage the file repository.

  **Note:** The file names are sorted in a case-insensitive way.

- When you browse a SharePoint repository, a specialized component renders the SharePoint site content.
The left side navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as sites, libraries, and folders).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

**Note:** The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the
documents and folders are organized depends on the currently selected view of the parent library.

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

**Note:** A column can be filtered or sorted only if it was configured this way on the server side.

Figure 246. Column Filter

![Column Filter](image)

**File URL**

You can use this combo box to directly specify the URL to be opened or saved. You can type a URL such as `http://some.site/test.xml` (if the file is accessible through normal HTTP protocol), or `ftp://anonymous@some.site/home/test.xml` (if the file is accessible through anonymous FTP).

This combo box also displays the current selection when the user changes selection by browsing the tree of folders and files on the server.

**Changing File Permissions on a Remote FTP Server**

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP/WebDAV file browser dialog box by right-clicking a tree node and selecting the **Change permissions** menu item.

In this dialog box, the usual Unix file permissions **Read**, **Write**, and **Execute** are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the **Permissions** text field when it is modified with one of the checkboxes.

**WebDAV over HTTPS**

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Editor allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.
When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Editor will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Editor. This means that Oxygen XML Editor can find the certificate in the key store of the Java Runtime Environment in which it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

**Troubleshooting HTTPS**

When Oxygen XML Editor cannot connect to an HTTPS-capable server, most likely there is no certificate set in the *Java Runtime Environment (JRE)* that Oxygen XML Editor runs into. The following procedure describes how to:

- Export a certificate to a local file using any HTTPS-capable Web browser (for example, Internet Explorer).
- Import the certificate file into the JRE using the *keytool* that comes bundled with Oxygen XML Editor.

**Tip:** To make Oxygen XML Editor accept a certificate even if it is invalid, open the *Preferences* dialog box (*Options > Preferences*) (on page 79), go to *Connection settings > HTTP(S)/WebDAV*, and select the *Automatically accept a security certificate, even if invalid* option.

1. Export the certificate into a local file
   a. Point your HTTPS-aware Web browser to the repository URL.

   If this is your first visit to the repository it will be displayed a security alert stating that the security certificate presented by the server is not trusted.

   Figure 247. Security alert - untrusted certificate
b. Go to menu **Tools > Internet Options**.
   **Internet Options** dialog box is opened.

c. Select **Security** tab.

d. Select **Trusted sites** icon.

e. Press **Sites** button.
   This will open **Trusted sites** dialog box.

f. Add repository URL to **Websites** list.

g. Close the **Trusted sites** and **Internet Options** dialog boxes.

h. Try again to connect to the same repository URL in Internet Explorer.
   The same error page as above will be displayed.

i. Select **Continue to this website** option.
   A clickable area with a red icon and text **Certificate Error** is added to Internet Explorer address bar.

j. Click the **Certificate Error** area.
   A dialog box containing a **View certificates** link is displayed.

k. Click the **View certificates** link.
   **Certificate** dialog box is displayed.

l. Select **Details** tab of **Certificate** dialog box.

m. Press **Copy to File** button.
Certificate Export Wizard is started.

n. Follow indications of wizard for DER encoded binary X.509 certificate. Save certificate to local file server.cer.

2. Import the local file into the JRE running Oxygen XML Editor.

a. Open a text-mode console with administrative rights.

   If Oxygen XML Editor has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases administrative rights will be required.

b. Go to the lib/security directory of the JRE running Oxygen XML Editor. You find the home directory of the JRE in the java.home property that is displayed in the About dialog box (System properties tab).

   On OS X, for the distribution of Oxygen XML Editor that bundles the JRE from Oracle, the JRE uses the .install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts path within its installation directory.

c. Run the following command:

   ```bash
   ..\..\bin\keytool -import -trustcacerts -file server.cer -keystore cacerts
   ```

   The server.cer file contains the server certificate, created during the previous step. The keytool requires a password before adding the certificate to the JRE keystore (on page 3283). The default password is changeit. If someone changed the default password, then that person is the only one who can perform the import.

   Tip: If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the -alias command-line argument, as in the following example:

   ```bash
   ..\..\bin\keytool -import -alias myalias1 -trustcacerts -file server1.cer -keystore cacerts
   ..\..\bin\keytool -import -alias myalias2 -trustcacerts -file server2.cer -keystore cacerts
   ```

3. Restart Oxygen XML Editor.

Related Information:

- HTTP(S)/WebDAV Preferences (on page 256)
HTTP Authentication Schemes

Oxygen XML Editor supports the following HTTP authentication schemes:

- **Basic** - The *basic* authentication scheme defined in the RFC2617 specifications.
- **Digest** - The *digest* authentication scheme defined in the RFC2617 specifications.
- **NTLM** - The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

**Note:** For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\username
```

- **Kerberos (on page 701)** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

**Single Sign-on**

Oxygen XML Editor implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the *Kerberos* protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Editor obtains from the operating system.

**Restriction:** This *Single sign-on* support is not available for SharePoint integrations.

To turn on the *Kerberos*-based authentication, you need to add the following system property in the `.vmoptions` configuration file or start-up script:

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

**Related Information:**

- Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor (on page 290)

**Switching and Moving Editor Tabs**

Each file that has been opened has a tab at the top of the editing pane and there are several ways to switch between tabs or move them.
Switching Editor Tabs

You can switch between editor tabs by using any of the following methods:

Mouse and Scroll Wheel

Of course, you can switch to a different editor tab by left-clicking the tab with your mouse, but when there are too many tabs opened to fit on the screen, you can hover over the tab stripe and use the scroll wheel on your mouse to scroll to the left or right (same as using the two arrows on the far-right of the tab stripe).

Buttons on the Far-Right of the Tab Stripe (☞)

You can use the arrow buttons (☞) on the right side of the tab stripe to scroll to the left or right and the ☞ Show List button opens a pop-up window that displays all the opened file tabs and allows you to select and switch to a specific opened file.

Ctrl + Tab (Command + Tab on OS X) [NOTE: Ctrl + Page Down (Ctrl + Alt + Right Arrow on OS X) does the same]

Switches to the next opened tab in the order specified in the Order of switching between editor tabs option (on page 83).

Ctrl + Shift + Tab (Command + Shift + Tab on OS X) [NOTE: Ctrl + Page Up (Ctrl + Alt + Left Arrow on OS X) does the same]

Switches to the previous opened tab in the order specified in the Order of switching between editor tabs option (on page 83).

Window > Switch editor tab (Ctrl + F9 (Command + F9 on OS X))

This action opens a dialog box that allows you to switch to a particular editor tab by selecting it from a filterable list. This is especially helpful when you have a large amount of file tabs opened and you want to switch to a certain tab this is not shown on the screen. It includes a search filter field and several options to help you find specific opened file tabs.

Figure 248. Switch Editor Tab Dialog Box
The **Switch Editor Tab** dialog box contains the following options and features:

**Search Filter**

You can enter text in the filter field at the top of the dialog box to filter the list and search for specific opened files. You can enter any number of terms, separated by space, and wildcards are allowed (for example, `*` to match any sequence of characters or `?` to match a single character). This field also has a history drop-down that allows you to select previously used search terms.

**Match all terms**

If this option is selected, only the files that match all of your search terms will be displayed. If you use a wildcard in the search filter, this option is automatically disabled.

**Include file paths**

If this option is selected, the search is expanded to include file paths, and also the paths are displayed in this dialog box.

**Case sensitive**

If this option is selected, the search operation will be case-sensitive.

**List of Opened File Tabs**

All files that are currently opened are displayed in the main pane of the dialog box. Files that have been modified but not yet saved are prefixed by an asterisk. To switch to a particular file tab, double-click the file or select it and click **OK**.
Moving Editor Tabs

You can move editor tabs by using any of the following methods:

**Mouse Drag**

You can use your mouse to drag editor tabs to a new location on the tab stripe.

**Ctrl + Alt + Comma**

Moves the current file tab one position to the left.

**Ctrl + Alt + Period**

Moves the current file tab one position to the right.

Closing Documents

To close open documents, use one of the following actions that are available in the contextual menu of the current editor tab (or from the File menu):

**Close (Ctrl + W (Command + W on OS X))**

Closes the currently selected editor.

**Close Other Files**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing. If this action is selected from the File menu, it closes all opened editors in all groups/stacks of tabs except for the current one.

**Close Files to the Right**

Available only from the contextual menu of the current editor tab and it closes all opened editors to the right of the currently selected editor.

**Close All**

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the File menu, it closes all opened editors in all groups/stacks of tabs.

Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.
The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

**Close (Ctrl + W (Command + W on OS X))**
Closes the currently selected editor.

**Close Other Files**
If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

**Close Files to the Right**
Closes all opened editors to the right of the currently selected editor.

**Close All**
If multiple files are opened, this action is available to close all opened editors.

**Move editor tab to the left (Ctrl + Alt + Comma)**
Moves the current editor tab one position to the left.

**Move editor tab to the right (Ctrl + Alt + Period**
Moves the current editor tab one position to the right.

**Reopen last closed editor Ctrl + Alt + T (Command + Alt + T on OS X)**
Reopens the last closed editor.

**Maximize/Restore Editor Area**
Collapses all the side views and spans the editing area to cover the entire width of the main window.

**Add to project**
Adds the file you are editing to the current project.

**Add all to project**
If multiple files are opened, this action is available to add all the opened files in the current group/stack of tabs to the current project.

**Copy Location**
Copies the disk location of the file.

**Show in Explorer (Show in Finder on OS X)**
Opens the Explorer to the file path of the file.
Viewing File Properties

The Properties view displays information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from Window > Show View > Properties.

To copy a value from the Properties view in the clipboard (for example, the full file path), use the Copy action available on the contextual menu of the view.

Simple Text Editor

While Oxygen XML Editor specializes in XML-related technologies, you can also use it to create and edit various types of non-XML files. Non-XML files are opened in a simple text editor and many of the helpful features that are commonly used when editing XML files in the Oxygen XML Editor Text editing mode (on page 828) are available in this simple editor.

Types of Non-XML Files That are Supported in the Simple Text Editor

The types of non-XML files that can be created and edited in the simple text editor include:

- Java
- C++
- C
- PHP
- Perl
- Properties
- SQL
- Shell executables
Features Available in the Simple Text Editor

When editing files in the simple text editor, the features that are available include the following:

- **Project Support** - The unique features that are designed to help you work with projects (on page 707) are available for all types of files.
- **Shortcut Actions** - Many of the shortcut actions that are available in Text mode (on page 832) are also available in the simple text editor.
- **Drag and Drop** - The normal drag and drop support is available in the simple text editor.
- **Content Selection Features** - The content selection shortcuts (on page 841) that are available in Text mode (including the Rectangular Selection feature) are also available in the simple text editor.
- **Bookmarks** - You can use bookmarks to mark positions (on page 306) in any type of file so that you can return to it later.
- **Convert Hexadecimal Characters** - You can convert a sequence of hexadecimal characters to the corresponding Unicode character (on page 875).
- **Encoding/Decoding Actions** - Contextual menu actions are available to encode or decode Base 64, Base 32, and Hex schemes (on page 876).
- **Code Templates** - You can define your own code templates (on page 855) for any type of file and use the Content Completion Assistant (on page 3280) to invoke them.
- **Syntax Highlighting** - Non-XML files also support syntax highlighting with dedicated coloring schemes. To customize them, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Syntax Highlight (on page 178). Select and expand the appropriate section in the top pane for the type of file you are editing and you can see the effects of your changes in the Preview pane.
- **Find/Replace** - You can use the Find/Replace action (on page 740) to find or replace all the occurrences of a word or string of characters in any type of file that you are editing.
- **File Comparison Tool** - The Compare Files tool (on page 2770) can also be used to compare non-XML files.

Using Projects to Group Documents

Oxygen XML Editor includes a Project view (on page 333) that helps you organize your projects. Oxygen XML Editor offers a variety of helpful features for working with projects and makes it easy to
share your projects with other members of your team. This section presents various unique features that will help you to create and work with projects.

Creating a New Project

Oxygen XML Editor allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. You can also share your project settings and transformation/validation scenarios (on page 723) with other users. Use the Project view (on page 333) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select New Project from the Project menu, the New menu in the contextual menu, or the drop-down menu at the top-left of the Project view. This opens a dialog box that allows you to assign a name to the new project and adds it to the structure of the project in the Project view (on page 333).

Adding Items to the Project

To add items to the project, select any of the following actions that are available when invoking the contextual menu in the Project view:

- **New > File**
  
  Opens a New file dialog box that helps you create a new file and adds it to the project structure.

- **New > Folder**
  
  Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

The project itself is considered a logical folder. You can add a logical folder, or content to a logical folder, by using one of the following actions that are available in the contextual menu, when invoked from the project root:

- **New > Logical Folder**
  
  Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X - [ ].)

- **New > Logical Folders from Web**
Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon of this action is different on Mac OS X - 🖥).

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the Refresh (F5) action from the toolbar or contextual menu and the Project view (on page 333) will display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (Mac OS X Finder) to the project tree, or by selecting Add Folder in the contextual menu from the project root. Linked folders are displayed in the Project view (on page 333) with bold text. To create a file inside a linked folder, select the New > File action from the contextual menu. The linked files presented in the Project view (on page 333) are marked with a special icon.

Note: Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see Project View (on page 333).

For more details about how you can share projects with other users, see Sharing a Project - Team Collaboration (on page 723).

Related Information:

- Using Projects to Group Documents (on page 707)
Project View

The Project view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

Figure 249. Project View

By default, the view is positioned on the left side of the Oxygen XML Editor window, above the Outline view (on page 347). If the view has been closed, it can be reopened at any time from the Window > Show View menu (or using the Show Project View action from the Project menu).

Project View Toolbar

The tree structure occupies most of the view area. In the upper left side of the view, there is a drop-down menu that contains all recently used projects. You can use this history drop-down menu to quickly switch to a recently opened project. If you enable the Remember layout changes for each project option in the Application Layout preferences page (on page 91), the application will remember the layout, files opened, and editing location for your session when you switch projects.

At the bottom of the drop-down menu there are the actions to open and create a project:

- **Open Project** (Ctrl + F2 (Command + F2 on OS X))
  
  Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

  **Note:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

- **New Project**
Creates a new, empty project.

The following actions are grouped in the upper right corner:

- **Collapse All**
  Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

- **Link with Editor**
  When selected, the project tree highlights the currently edited file, if it is found in the project files.

  **Note:** This button is disabled automatically when you move to the **Debugger perspective** (on page 3285).

- **Settings**
  A submenu that contains the following actions:

  - **Filters**
    Allows you to filter the information displayed in the **Project** view. Click the toolbar button to set filter patterns for the files you want to show or hide. Also, you can set filter patterns for the linked directories that are hidden.

  - **Show Full Path**
    When selected, linked files and folders are presented with a full file path.

  - **Enable Master Files Support**
    Select this option to enable the **Master Files support** (on page 726).

  - **Change Search and Refactor operations scope**
    Allows you to change the collection of documents that define the context of the **search and refactor operations** (on page 1129).

    - **Use only Master Files, if enabled** - Restricts Oxygen XML Editor to perform the search and refactor operations starting from the **master files** (on page 3284) that are defined for the current resource. This option is available when you select **Project** in the **Select the scope for Search and Refactor operations** dialog box and the **Master Files** support is enabled.
    
    - **Working sets** - Allows you to specify the set of files that will be used for the scope of the search and refactor operations.
File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

- **Logical folders with Linked folders/files** - Marked with a blue icon on Windows and Unix/Linux and a magenta icon on Mac OS X, they help you group files within the project. This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol and names of folder shortcuts are displayed in bold text. The logical folders are created on the project root or inside other logical folders by using the contextual menu action **New > Logical Folder**, and the linked folders/files are added using **Add Files**, **Add Folder**, or by dragging and dropping files/folders from the view or the system file explorer. **Remove from Project** can be used to remove them from the project and the **Remove from Disk (Shift+Delete)** action can be used to remove them from both the project and the local file system.

- **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on Mac OS X). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, **Copy**, and **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action **Remove from Disk (Shift+Delete)** can be used to remove them from the project and local file system.

Figure 250. Project View with Both Types of Resources
Creating New Projects

The following action is available from the New menu when right-clicking any item, the Project menu, or from the drop-down menu in the top-left of the Project view:

- **New Project**
  - Creates a new, empty project.

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

- **Right-click any item > New > File**
  - Opens a New file dialog box (on page 676) that helps you create a new file and adds it to the project structure.

- **Right-click any item in a physical folder > New > Folder**
  - Opens a New Folder dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

- **Right-click any item in a logical folder > New > Logical Folder**
  - Creates a logical folder in the tree structure (the icon is a magenta folder on Mac OS X).

- **Right-click on a logical folder > New > Logical Folders from Web**
  - Replicates the structure of a remote folder accessible over FTP/SFTP/WebDAV, as a structure of logical folders. The newly created logical folders contain the file structure of the folder it points to.

Adding Resources

You can add resources by using drag and drop (or Copy and Paste) actions from within the Project view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Adding Resources to Logical Folders

You can add resources to logical folders by using the following actions available in the contextual menu when invoked on a logical folder (or the project's root container):
Add Folder

Adds a link to a physical folder, whose name and content mirror a real folder that exists in the local file system (the icon for this action is different on Mac OS X).

Add Files

Adds links to files on the local file system.

Add Edited File

Adds a link to the currently edited file in the project.

Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use Remove from Project from the contextual menu (or press Delete on your keyboard).

To remove folders or files from both the project and the local file system, use Remove from Disk from the contextual menu (or press Shift+Delete on your keyboard).

Moving Folders and Files

You can move the resources by using drag and drop actions from within the Project view (the Enable drag-and-drop in Project view option must be selected in the View preferences page (on page 259)).

You can also use the usual Cut, Copy, and Paste actions to move resources in the project.

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Move resource action from the contextual menu. This action opens the Move resource dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (on page 1129) by using the button.

Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):
• Select **Rename** from the contextual menu.
• Press **F2** on your keyboard.
• Select the item, then click the name, and type the new name.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

• **New name** - Presents the current name of the edited resource and allows you to modify it.
• **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can **select or configure the scope** *(on page 1129)* by using the **button.

**Opening Files**

There are several ways to open a file:

• Double-click the file.
• Select it and press **Enter** on your keyboard.
• Right-click the file and select **Open**.
• If there are no other files open in the editor area, you can drag the file from the project tree and drop it in the editor area.
• If you want to choose the application or location where to open it, you can right-click the file and select **Open with**.

**Saving the Project**

The project file is automatically saved every time the content of the **Project** view is saved or modified by actions such as adding or removing files and drag and drop.

**Other Contextual Menu Actions**

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

**Show in submenu**

**Explorer (Finder on OS X)**

On Windows and Mac OS X, the parent directory of the selected file or folder is presented in a specific Explorer/Finder window, and the selected resource is highlighted. On Linux, the selected file or folder is not highlighted after opening its parent in the file explorer.
Terminal

Opens a console (terminal) at the location of the selected physical resource. If the resource is a file, it will start at the parent directory.

Copy Location

Copies an application-specific URL for the selected resource to the clipboard.

Refactoring submenu

Oxygen XML Editor includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the Refactoring submenu:

Rename resource (Available for certain types of XML documents)

Opens the Rename resource dialog box (on page 720) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

Move resource (Available for certain types of XML documents)

Opens the Move resource dialog box (on page 720) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 1139) that presents refactoring operations to assist you with managing the structure of your XML documents.

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 1139) that were finished or previewed will also appear in this submenu.

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (on page 1130) that allows you to see the resource hierarchy for an XML document.

Resource Dependencies

Opens the Resource Hierarchy/Dependencies view (on page 1130) that allows you to see the resource dependencies for an XML document.

Refresh
Refreshes the content and the dependencies between the resources in the Master Files directory (on page 726).

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 745) that allows you to find and replace text in multiple files.

XPath in Files

Opens the XPath/XQuery Builder view (on page 2185) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

Open/Find Resource

Opens the Open/Find Resource dialog box (on page 733).

Check Spelling in Files

Allows you to check the spelling of multiple files. (on page 765)

Format and Indent Files

Opens the Format and Indent Files dialog box (on page 869) that allows you to configure the format and indent (pretty-print (on page 3286)) action that will be applied on the selected documents.

Open in SVN Client

Syncro SVN Client (on page 2806) tool is opened and it highlights the selected resource in its corresponding working copy.

Compare

Allows you to compare multiple files or directories and the order of your selection determines where they are opened in the Compare Files (on page 2770) or Compare Directories (on page 808) tool. If you select two files or folders, your first selection will be opened in the left panel and the other one in the right panel.

You can also select 3 files and the tool will automatically be opened in the three-way comparison mode (on page 2774). If you select three files, your first selection will be opened in the left panel, the second in the right panel, and the third selection will be the base (ancestor) file.

Transform submenu

The currently selected files in the Project view can be transformed in one step with one of the following actions available from contextual menu in the Transform submenu:

- Apply Transformation Scenario(s)
Obtains the output with one of the built-in scenarios (on page 1641).

Configure Transformation Scenario(s)
Opens a dialog box (on page 1762) that allows you to configure predefined transformation scenarios.

Transform with
Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu
The currently selected files in the Project view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the Validate submenu:

Check Well-Formedness
Checks if the selected file or files are well-formed.

Validate
Validates the selected file or files against their associated schema.
For EPUB files, this action triggers an EPUB Validate and Check for Completeness (on page 2194) operation.

Validate with Schema
Validates the selected file of files against a specified schema.

Configure Validation Scenario(s)
Allows you to configure and run a validation scenario (on page 1093).

Generate Documentation submenu
Generate Documentation > XML Schema Documentation
Opens the XML Schema Documentation Dialog Box (on page 1313).

Generate Documentation > XSLT Stylesheet Documentation
Opens the XSLT Stylesheet Documentation Dialog Box (on page 1223).

Generate Documentation > XQuery Documentation
Opens the XQuery Documentation Dialog Box (on page 1349).

Generate Documentation > WSDL Documentation
Opens the WSDL Documentation Dialog Box (on page 1371).

Properties
Displays the properties of the current file in a Properties dialog box.
Enable Master Files Support (Available from the project container)

Allows you to enable the Master Files Support (on page 727) for each project you are working on.

Detect Master Files (Available from the project container when Master Files Support is enabled)

Opens the Detect Master Files wizard (on page 728) that enables the automatic detection of master files.

Add to Master Files (Available when Master Files Support is enabled)

Adds the selected files to the Master Files folder (on page 729).

Project Menu Actions

The following actions are available in the Project menu:

New Project

Creates a new, empty project.

Open Project (Ctrl + F2 (Command + F2 on OS X))

Opens an existing project. Alternatively, you can open a project by dropping an Oxygen XML Editor XPR project file from the file explorer into the Project panel.

Note: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

Save Project As

Allows you to save the current project under a different name.

Validate all project files

Checks if the project files are well-formed and their mark-up conforms with the specified DTD, XML Schema, or Relax NG schema rules. It returns an error list in the message panel.

Filters

Opens the Project filters dialog box that allows you to decide which files and directories will be shown or hidden.

Enable Master Files Support

Allows you to enable the Master Files Support (on page 727) for each project you are working on.
Change Search and Refactor operations scope

Opens a dialog box that allows you to define the context of search and refactor operations.

Show Project View

Displays the Project view.

Reopen Project

Contains a list of links of previously used projects. This list can be emptied by invoking the Clear history action.

Moving/Renaming Resources in the Project View

The Refactoring submenu in the contextual menu of the Project view (on page 333) provides actions for moving or renaming certain types of XML resources in the current project while offering the option to update the references to the resources.

Moving Resources

You can move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Move resource action from the contextual menu. This action opens the Move resource dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope (on page 1129) by using the button.

Renaming Resources

You can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the Refactoring > Rename resource action from the contextual menu. This action opens the Rename resource dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope (on page 1129) by using the button.
Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource cannot be updated. For example, when a resource is resolved through an XML Catalog (on page 3289) or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Editor displays a warning dialog box.

Figure 251. Problems Dialog Box

![Problems Dialog Box](image)

Image Preview from the Project View

Images and SVG files from the Project view (on page 333) can be previewed in a separate panel.

To preview an image, either double-click the image name or click the Preview action from the contextual menu of the Project view (on page 333). Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the Preview panel using the actions from the contextual menu, you can scale the image to its original size (1:1 action) or scale it down to fit in the view’s available area (Scale to fit action).
To preview an SVG file (on page 1499), click the Preview action from the contextual menu of the Project view (on page 333). Once the SVG is displayed in the Preview panel, the following actions are available on the contextual menu: Zoom in, Zoom out, Rotate and Refresh.

Note: You can drag an image from the Image Preview view and drop it in a DITA, DocBook, or TEI document.

Batch Validation and Transformation

Oxygen XML Editor provides support for batch validation and batch transformation. Actions are available in the Project view that provide the ability to validate or transform one or more files attached to a project.

Batch Validation

To batch validate files, select the files (or directories), right-click, and choose one of the following actions from the Validate submenu:

- **Check Well-Formedness**
  Checks if the selected file or files are well-formed.

- **Validate**
  Validates the selected file or files against their associated schema. For EPUB files, this action triggers an EPUB Validate and Check for Completeness (on page 2194) operation.

- **Validate with Schema**
  Validates the selected file of files against a specified schema.

- **Configure Validation Scenario(s)**
  Allows you to configure and run a validation scenario (on page 1093).

Batch Transformation

To batch transform files, select the files (or directories), right-click, and choose one of the following actions from the Transform submenu:

- **Apply Transformation Scenario(s)**
  Obtains the output with one of the built-in scenarios (on page 1641).

- **Configure Transformation Scenario(s)**
Opens a dialog box (on page 1762) that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Related Information:

- Quick Validation and Transformation for Master Files (on page 729)

Sharing a Project - Team Collaboration

You can use XML projects to make team collaboration and synergy efficient and effective. Not only can you share the project files and folders, but Oxygen XML Editor also allows you to store preferences, transformation scenarios, and validation scenarios at project level (on page 3286) in a project file (.xpr file extension). It can be saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, so that your team will have access to the same resources stored in the project file.

Sharing Preferences (Creating a Project-Level Options File)

To share options that are configured in certain preferences pages, you can store them in a project file (.xpr file extension) that can easily be shared with others. To do so, follow these steps:

1. You may want to use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. In the Project view (on page 333), create a project or open an existing one.
3. Open the Preferences dialog box (Options > Preferences) (on page 79).
4. Configure the options in each preferences page that you want to be included in the project file and switch the storage preference to Project Options (on page 3286) in each page.

Note: Some pages do not have the Project Options button, since the options they host might contain sensitive data (such as passwords, for example) that is unsuitable for sharing with other users.
5. Click OK and close the Preferences dialog box.
All explicitly set values are now saved in the project file. You can then share the project file so that your team will have the same option configuration that you stored in the project file.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Note:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Sharing Transformation Scenarios

To share created and edited transformation scenarios, you can store them in a project file (.xpr file extension) by following these steps:

1. In the **Project view (on page 333)**, create a project or open an existing one.
2. When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), there is a **Storage** option. Switch the storage preference to **Project Options (on page 3286)** in each transformation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.

You can then share the project file so that your team will have access to the same transformation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

**Note:** The project file extension (.xpr) must be preserved when the file is distributed to others.

**Note:** When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

### Sharing Validation Scenarios

To share created and edited validation scenarios, you can store them in a project file (.xpr file extension) by following these steps:

1. In the **Project view (on page 333)**, create a project or open an existing one.
2. When you create a new validation scenario (on page 1094) or edit an existing one (on page 1100), there is a **Storage** option. Switch the storage preference to **Project Options (on page 3286)** in each validation scenario you want to be included in the project file.
3. Click **OK** to store the scenario in the project file.
You can then share the project file so that your team will have access to the same validation scenarios that you stored in the project file. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Note: The project file extension (.xpr) must be preserved when the file is distributed to others.

Note: When a project is opened for the first time, a confirmation dialog box will be displayed that asks you to confirm that the project came from a trusted source. This is meant to help prevent potential security issues.

**Syncro SVN Client (Apache Subversion™)**

To assist you with team collaboration and sharing projects, Oxygen XML Editor includes an embedded SVN (Subversion) Client (on page 2806). Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team.

It can be accessed from the Tools menu and can be used for synchronizing your working copy with a central repository.

It can also be started by selecting the Open in SVN Client action from the contextual menu of the Project view (on page 333). This action opens the Syncro SVN Client and shows the selected project file in the Working Copy view.

- Sharing Transformation Scenarios (on page 1768)
- Sharing Validation Scenarios (on page 1105)

Minimize Differences Between Versions Saved on Multiple Computers

The number of differences between versions of the same file saved by multiple content authors on multiple computers can be minimized by imposing the same set of formatting options when saving the file, for all the content authors. An example, the following procedure can be used to minimize the differences:
1. Create an Oxygen XML Editor project file (.xpr) that will be shared by all content authors.
2. Configure your own formatting preferences. To do this, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Format, configure the appropriate options in this page, then go to Editor > Format > XML and configure the options there.
3. Save the configured options into your project file by selecting Project Options (on page 3286) in both of the preferences pages.
4. Save the project and commit the project file to your versioning system so all the content authors can use it.
5. Make sure the project is opened in the Project view (on page 333).
6. Open and save your XML files in the Author mode.
7. Commit the saved XML files to your versioning system.

When other content authors change the files, only the changed lines will be displayed in your diff tool instead of one big change that does not allow you to see the changes between two versions of the file.

Master Files Support

Oxygen XML Editor allows you to define Master Files (on page 3284) at project level. These master files are automatically used by Oxygen XML Editor to determine the context for operations such as validation, transformation, content completion, refactoring, or searches for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Editor maintains the hierarchy of the master files, helping you to determine the editing context.

Oxygen XML Editor also provides unique support for using the Master Files support in DITA projects. In DITA, when you rename or move non-DITA resources, it allows you to update all the references to these resources in the scope of the Master Files (in this case the main DITA map (root map) (on page 3287)). For more information, see Master Files Support in DITA (on page 3266).

For more information about the Master Files support for XML documents, watch our video demonstrations:

https://www.youtube.com/embed/e2oo4RWNxW8

https://www.youtube.com/embed/UZwg385RKNw

https://www.youtube.com/embed/FQNSsg57S4E

https://www.youtube.com/embed/gn_YPDSxDCo
Master Files Benefits

Using the Master Files support in Oxygen XML Editor includes the following benefits:

- When the master file is validated, Oxygen XML Editor automatically identifies the modules included in the master file and validates all of them.
- When the master file is transformed, Oxygen XML Editor automatically identifies the modules included in the master file and transforms them accordingly.
- The Content Completion Assistant (on page 3280) presents all the components that are collected from the master files for the modules they include.
- The Outline view (on page 347) displays all the components that are defined in the master files hierarchy.
- The master files that are defined for the current module determines the scope of the search and refactoring actions (on page 1129). Oxygen XML Editor performs the search and refactoring actions in the context that the master files determine, thus improving the speed of execution.

Enabling the Master Files Support

Oxygen XML Editor stores the master files in a folder located in the Project view (on page 333), as the first child of the project root. The Master Files Support is disabled by default and Oxygen XML Editor allows you to enable or disable the Master Files Support for each project you are working on.

To enable Master Files support, do one of the following:

- Select Enable Master Files Support from the Settings menu in the top-right corner of the Project view (on page 333).
- Select Enable Master Files Support from the contextual menu of the project root folder in the Project view (on page 333). If a disabled Master Files folder exists, you can also select that option from its contextual menu.
- Click the Enable button in the tooltip located at the bottom of the Project view (on page 333). This tooltip window is displayed when the Master Files support is disabled. Clicking the Read more link takes you to the user guide. Clicking the Enable button opens the Enable Master Files dialog box. This dialog box contains general information about the Master Files Support and allows you to enable it. You can also use the Detect and Enable button in this dialog box to detect the master files from the current project.

⚠️ Warning: Once you close this window tip, Oxygen XML Editor hides it for all projects. You can make the window tip reappear by resetting Oxygen XML Editor to its default settings (on page 268). However, doing so will result in you losing your customized options.
Detecting Master Files

Oxygen XML Editor allows you to detect the master files using the Detect Master Files option. This action applies to the folders you select in the project.

To detect master files over the entire project, do one of the following:

- Right-click the root of the project and select Detect Master Files.
- Use the Detect Master Files from Project option, available in the contextual menu of the Master Files folder.

Both of these options display the Detect Master Files wizard. In the first panel you can select the type of master files you want Oxygen XML Editor to detect. In the subsequent panel the detected master files are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible master files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as master files.

  **Note:** For DITA projects, only DITA Maps are reported as possible master files.

- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any file presented on the first level of a cycle is a possible master file.

- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as master files.

To set them as master files, simply select their checkboxes. Oxygen XML Editor marks all the children of a master file as modules. Modules are rendered in gray and their tool-tip presents a list of their master files. A module can be accessed from multiple master files.

The master files that are already defined in the project are automatically marked in the tree and cannot be removed. The only way to disable a master file is to delete it from the Master Files folder.

The next panel displays a list with the selected master files. Click the Finish button to add the master files in the Master Files folder.

You can use the Select Master Files option to automatically mark all master files. This action sets all the resources from the Possible Master Files category and the first resource of each Cycle as master files. The Deselect All button simply removes all of your selections.
**Tip:** It is recommended that you only add top-level files (files that are at the root of the include/import graph) in the Master Files directory.

**Attention:** If the Master Files Support is disabled, the Master Files directory is rendered only if it contains master files.

Related Information:

- Enabling the Master Files Support (on page 727)
- Adding Files to the Master File Directory (on page 729)

Adding Files to the Master File Directory

The Master Files directory only contains logical folders and linked files. To add files in the Master Files directory, use one of the following methods:

- Right-click a file from your project and select Add to Master Files from the contextual menu.
- Select Add Files or Add Edited File from the contextual menu of the Master Files directory.
- Drag and drop files into the Master Files directory.
- From the contextual menu of the Resource Hierarchy Dependencies view (on page 1130), use the Add to Master Files action.

You can view the master files for the current resource by selecting Properties from the contextual menu (on page 342) of the Project view (on page 333) and the master files for the current editor in the Properties (on page 705) and Information (on page 822) views.

Related Information:

- Enabling the Master Files Support (on page 727)
- Detecting Master Files (on page 728)

Quick Validation and Transformation for Master Files

If Master Files Support is enabled (on page 727), you can hover the cursor over the Master Files directory, or a node within the directory, and Oxygen XML Editor will display inline Validate and
Transform buttons that can be used to quickly run a validation or transformation over the directory or node. For nodes within the Master Files directory, hovering over the Validate and Transform buttons also displays the most recently used validation or transformation scenario. To change the assigned validation or transformation scenario, right-click the node and select Validate > Configure Validation Scenario(s) or Transform > Configure Transformation Scenario(s), respectively.

Searching Documents

Oxygen XML Editor includes advanced search capabilities to help you locate documents and resources.

Open/Find Resource View

The Open/Find Resource view is designed to offer advanced search capabilities either by using a simple text search or by using the Apache Lucene - Query Parser Syntax. By default, the view is presented in the left side of the Oxygen XML Editor layout, next to the Project view (on page 333) or DITA Maps Manager (on page 2990). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 252. Open/Find Resource View

You can use this view to find a file in the current Oxygen XML Editor project or in one of the DITA maps (on page 3281) opened in the DITA Maps Manager view (on page 2990) by typing only a
few letters of the file name of a document or a fragment of the content you are searching for. The **Open/Find Resource** view also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content) by selecting the **In reviews option (on page 345)**.

**Note:** Full support for searching in document edits (the In reviews option) is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers limited support to search through a maximum of 10 edits.

**Search Results**

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the **Results view (on page 357)** at the bottom of the editor. To display the search history, position the cursor in the search field and press **Ctrl + DownArrow (Command + DownArrow on OS X)** or **Ctrl + UpArrow (Command + UpArrow on OS X)** on your keyboard. Pressing only the **DownArrow** key moves the selection to the list of results.

**Note:** Searches are not case-sensitive. For example, if you search for *car* you get the same results as when you search for *Car*.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for *ing* with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for */samples/*.gif with the **in file paths** option selected, you will find all the *gif* images from the **samples** directory.

**Options Available in the View**

The **Open/Find Resource** view offers the following options:

- **Settings** - Drop-down menu that includes the following settings for the view:
  - **Clear Index** - Clears the index.
  - **Show description** - Presents the search results in a more compact form, displaying only the title and the location of the resources.
  - **Options** - Opens the **Open/Find Resource preferences page (on page 251)** where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **In file paths (on page 739)** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content (on page 736)** - Select this option to search through the content of your resources.
• **In reviews (on page 739)** - Select this option to search through the comments, tracked change insertions/deletions, or highlights in your resources.
• **Reindex** - Use this option to reindex your resources.

**Contextual Menu Actions**

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

• **Open** - Opens the document in one of Oxygen XML Editor internal editors.
• **Open with** - Allows you to choose to open the document in the Internal editor or an external System application.
• **Show in Explorer** - Identifies the document in the system file explorer.
• **Copy Location** - Copies the file path and places it in the clipboard.

**Indexing Process**

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index in not updated on project changes.

To improve performance, the indexing process skips the following set of common English words (the so-called **stop words**): a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of **stop words** in the Open/Find Resource preferences page (on page 251).

**Caching Mechanism**

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

⚠️ **Important:** Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.
Opening the Results

Once you find the files that you want to open, select them in the list and press the Open button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file (on page 250).

Note: You can drag a resource from the Open/Find Resource view and drop it in a DocBook, DITA, TEI or XHTML document to create a link to that resource.

For more information about the Open/Find Resource feature and its search capabilities, watch our video demonstration:

https://www.youtube.com/embed/PENoDNdaGao

Related Information:

• Open/Find Resource Dialog Box (on page 733)

Open/Find Resource Dialog Box

The Open/Find Resource dialog box offers advanced search capabilities. To open the dialog box, go to Find > Open/Find Resource (Ctrl + Shift + R (Command + Shift + R on OS X)). You can also click the Open/Find Resource toolbar button or use the Search for file action that is available in some URL input fields.

Figure 253. Open/Find Resource Dialog Box
You can use this dialog box to find a file in the current Oxygen XML Editor project or in one of the DITA maps (on page 3281) opened in the DITA Maps Manager view (on page 2990) by typing a few letters of the file name or a fragment of the content you are searching for. The Open/Find Resource dialog box also supports searching in document edits (comments, tracked change insertions/deletions, and highlighted content).

Note: Full support for searching in document edits (the In reviews option) is available only in the Enterprise edition of Oxygen XML Editor. The Professional edition offers limited support to search through a maximum of 10 edits.

Search Results

Search results are presented instantly, after you finish typing the content. The matching fragments of text are highlighted in the results list displayed in the dialog box. When you open one of the documents from the results list, the matching fragments of text are highlighted in the editing area. To remove the highlighting from your document, close the corresponding tab in the Results view (on page 357) at the bottom of the editor. To display the search history, position the cursor in the search field and press Ctrl + DownArrow (Command + DownArrow on OS X) or Ctrl + UpArrow (Command + UpArrow on OS X) on your keyboard. Pressing only the DownArrow key moves the selection to the list of results.
**Note:** Searches are not case-sensitive. For example, if you search for `car` you get the same results as when you search for `Car`.

**Tip:** Suffix searches are also supported, both for searching in the content of your resources and in their name. For this, you can use wildcards. If you search for `*ing` with the **in content** option selected, you will find documents that contain the word *presenting*. If you search for `*/samples/*.gif` with the **in file paths** option selected, you will find all the *gif* images from the `samples` directory.

---

**Options Available in the Dialog Box**

The **Open/Find Resource** dialog box includes the following options:

- **In file paths (on page 739)** - Select this option to search for resources by their name or by its path (or a fragment of its path).
- **In content (on page 736)** - Select this option to search through the content of your resources.
- **In reviews (on page 739)** - Select this option to search through the comments, **tracked change** insertions/deletions, or highlights in your resources.
- **Options** - Opens the **Open/Find Resource preferences page (on page 251)** where you can configure various search options. For example, you can specify a **Content language** that differs from the default UI language in case your document contains multiple languages.
- **Clear Index** - Clears the index.
- **Reindex** - Use this option to reindex your resources.

---

**Contextual Menu Actions**

A contextual menu is available on each search result and provides actions applicable to that particular document. These actions include:

- **Open** - Opens the document in one of Oxygen XML Editor internal editors.
- **Open with** - Allows you to choose to open the document in the **Internal editor** or an external **System application**.
- **Show in Explorer** - Identifies the document in the system file explorer.
- **Copy Location** - Copies the file path and places it in the clipboard.

---

**Indexing Process**

The content of the resources used to search in is parsed from an index. The indexing is performed both automatically and on request. Automatic indexing is performed when you modify, add, or remove resources in the currently indexed project. If the index was never initialized, the index in not updated on project changes.
To improve performance, the indexing process skips the following set of common English words (the so-called *stop words*): a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with. This means that if you are searching for any of these words, the indexing process will not be able to match any of them. However, you can configure the list of *stop words* in the **Open/Find Resource preferences page (on page 251)**.

**Caching Mechanism**

When you perform a search, a caching mechanism is used to gather the paths of all files linked in the current project. When the first search is performed, all project files are indexed and added to the cache. The next search operation uses the information extracted from the cache, thus improving the processing time. The cache is kept for the currently loaded project only, so when you perform a search in a new project, the cache is rewritten. Also, the cache is reset when you press the **Reindex** button.

⚠️ **Important**: Files larger than 2GB are not indexed.

If there is no file found that matches your file pattern or text search, a possible cause is that the file you are searching for was added to the Oxygen XML Editor project after the last caching operation. In this case, re-indexing the project files with the **Reindex** button enables the file to be found. The date and time of the last index operation are displayed below the file list.

**Opening the Results**

Once you find the files that you want to open, select them in the list and press the **Open** button (or double-click them). Each of the selected files is opened in the editor associated with the type of the file (on page 250).

For more information about the **Open/Find Resource** feature and its search capabilities, watch our video demonstration:

https://www.youtube.com/embed/PENoDNdaGao

**Related Information:**

- **Open/Find Resource View (on page 344)**

- **Open/Find Resource Preferences Page (on page 251)**
Searching in Content

To perform a search through the content of your resources, open the **Open/Find Resource** dialog box (on page 733) (from the Find menu or with **Ctrl + Shift + R (Command + Shift + R on OS X)**) or the **Open/Find Resource** view (on page 344) (by default, located on the left side of the editor), select the in content option, and in the search field enter the terms that you want to search for.

The **Open/Find Resource** feature is powered by **Apache Lucene**. Apache Lucene is a free open source information retrieval software library.

You can use the **Open/Find Resource** feature to either perform a simple text search or a more complex search using the **Apache Lucene - Query Parser Syntax**.

**Complex Query Patterns Using Lucene Syntax**

Using the **Apache Lucene - Query Parser Syntax** means you can perform any of the following searches:

- **Term Searches**

  Searching for plain text:

  Garden Preparation

- **Element-Specific Searches**

  Searching for content that belongs to a specific element:

  title:"Garden Preparation"

- **Wildcard Searches**

  Using wildcards to make your search more permissive:

  Garden Prepar?tion

- **Fuzzy Searches**

  If you are not sure of the exact form of a term that you are interested in, use the fuzzy search to find the terms that are similar to the search term. To perform a fuzzy search, use the ~ symbol after the word that you are not sure of:

  Garden Preparing~

- **Proximity Searches**

  Use proximity searches to find words that are within a specific distance away. To perform a proximity search, use the ~ symbol at the end of your search. For example, to search for the word **Garden** and the word **Preparation** within 6 words of each other use:
Range Searches

Use range searches to match documents whose element values are between the lower and upper bound specified in the range query. For example, to find all documents whose titles are between Iris and Lilac, use:

```
title:{Iris TO Lilac}
```

The curly brackets denote an exclusive query. The results you get when using this query are all the documents whose titles are between Iris and Lilac, but not including Iris and Lilac. To create an inclusive query use square brackets:

```
title:[Iris to Lilac]
```

Term Boosting Searches

Use term prioritising searches if the fragment of text that you are searching for contains certain words that are more important to your search than the rest of them. For example, if you are searching for Autumn Flowers, a good idea is to prioritize the word Autumn since the word Flowers occurs more often. To prioritize a word use the `^` symbol:

```
Autumn^6 Flowers
```

Searches Using Boolean Operators

You can use the AND, +, OR, -, and NOT operators.

To search for documents that contain both the words Garden and Preparation, use:

```
Garden AND Preparation
```

To search for documents that must contain the word Garden and may contain the word Preparation, use:

```
+Garden Preparation
```

To search for documents that contain either the word Garden or the word Preparation, use:

```
Garden OR Preparation
```

To search for documents that contain Garden Preparation but not Preparation of the Flowers, use:

```
"Garden Preparation" - "Preparation of the Flowers"
```

Searches Using Grouping
To search either for the word Garden or Preparation, and the word Flowers, use:

\[(\text{Garden OR Preparation}) \text{ AND Flowers}\]

- **Searches Using Element Grouping**

To search for a title that contains both the word Flowers and the phrase Garden Preparation, use:

\[\text{title: (+Flowers +"Garden Preparation")}\]

- **Searching for Special Characters**

Sometimes you might need to search your content for special character, such as:

\[+ - & | ! ( ) { } [ ] ^ ~ * ? : \]

In this case, you should surround your search query with quotes. For example, to search for \((\text{Hydrogen + Oxygen})\text{=}\text{Water}\), use:

\["(\text{Hydrogen + Oxygen})\text{=}\text{Water}"\]

**Searching in File Paths**

To perform a search in the file paths of your resources, open the Open/Find Resource dialog box *(on page 733)* (from the Find menu or with Ctrl + Shift + R (Command + Shift + R on OS X)) or the Open/Find Resource view *(on page 344)* (by default, located on the left side of the editor), select the In file paths option, and in the search field enter the terms that you want to search for.

The Open/Find Resource feature allows you to search for a resource either by its name or by its path (or by a fragment of its path).

You can use wildcards when you perform such searches:

- Use "*" to match any sequence of characters.
- Use "?" to match any single character.

For example, if you search for 
*,-preferences-page* you will find all the resources that contain the *preferences-page* fragment in their name. If you search for *-/samples/*.gif, you will find all the .gif images from the samples directory.

**Searching in Reviews**

To perform a search in the edits of your resources, open the Open/Find Resource dialog box *(on page 733)* (from the Find menu or with Ctrl + Shift + R (Command + Shift + R on OS X)) or the Open/Find
Resource view (on page 344) (by default, located on the left side of the editor), select the In reviews option, and in the search field enter the terms that you want to search for.

The following options are available:

- **Type** - Specifies whether you want to search for content in comments, tracked change insertions/deletions, or highlighted content.
- **Author** - Displays all the authors of the edits in your resources. The authors are collected when indexing. You can set a specific author for your search or search all of them.
- **Time** - Specifies the time when the edits that you are searching through were created.

Both the view and the dialog box display the edits that contain the search results and their parent topics along with a short description. To hide this description, go to Settings and deselect the Show Description option.

Technical Aspects

When Oxygen XML Editor performs the indexing of your resources, the refereed content from your documents is not taken into account. For example, when DITA documents are indexed, the content from the `conref` elements is not parsed. The files that make up the index are stored on disk in the `\[user_home_directory]\AppData\Roaming\com.oxygenxml\lucene` folder.

Finding and Replacing Text

This section includes topics with regard to the find and replace features available in Oxygen XML Editor.

Related Information:

- Open/Find Resource Dialog Box (on page 733)
- Open/Find Resource View (on page 344)

Find/Replace Dialog Box

To open the Find/Replace dialog box, use the Find/Replace action that is available in the Find menu, on the toolbar, or by pressing Ctrl + F (Command + F on OS X). It is also invoked by the Find/Replace contextual menu action found in certain views.

You can use the Find/Replace dialog box to perform the following operations:
• Replace occurrences of target defined in the **Find** area with a new fragment of text defined in **Replace with** area.

• Find all the occurrences of a word or string of characters (that can span over multiple lines) in the document you are editing. This operation also takes into account all the whitespaces contained in the fragment you are searching for. The **Find/Replace** dialog box counts the number of occurrences of the text you are searching for and displays it at the bottom of the dialog box, above the **Close** button. This number is also displayed in the **Results view** (on page 357) after you press the **Find All** button.

The *find* operation works on multiple lines, meaning that a find match can cover characters on multiple lines of text. To input multiple-line text in the **Find** and **Replace with** areas, do one of the following:

• Press **Ctrl + Enter (Command + Enter on OS X)** on your keyboard.

• Use the **Insert newline** contextual menu action.

You can use **Perl-like regular expressions syntax** (on page 753) to define patterns. A content completion assistance window is available in the **Find** and **Replace with** areas to help you edit regular expressions. It is activated every time you type \ (backslash key) or on-demand if you press **Ctrl + Space (Command + Space on OS X)** on your keyboard.

The *replace* operation can bind regular expression capturing groups ( $1, $2, etc.) from the find pattern.

**Tip:** To replace the tag-name start tag and its attributes with the new-tag-name tag use as **Find** the expression `<tag-name\s+)(.*)>` and as **Replace with** the expression `<new-tag-name$1$2>`.

**Find/Replace Dialog Box**

Figure 254. The Find/Replace Dialog Box
The **Find/Replace** dialog box contains the following options:

**Find text area box**

This is where you enter the character string to search for. You can search for Unicode characters specified in the \uNNNN format. Also, hexadecimal notation ( \xNNNN ) and octal notation ( \0NNNN ) can be used. In this case you have to select the **Regular expression** option (on page 744). For example, to search for a space character you can use the \u0020 code.

You can use the  
button to select from a list of the most recently used expressions. Use the **Clear history** action from the bottom of the lists to remove these expressions.

**Replace with text area box**

The character string with which to replace the target. The string for replace can be on a line or on multiple lines. It can contain Perl notation capturing groups, only if the search expression is a regular expression and the **Regular expression** option (on page 744) is selected.

**Note:** Some regular expressions can indefinitely block the application. If the execution of the regular expression does not end in about 5 seconds, the application displays a dialog box that allows you to interrupt the operation.
Tip: Special characters such as newline and tab can be inserted in the Find and Replace with text boxes using dedicated actions in the contextual menu (Insert newline and Insert tab).

Unicode characters in the \uNNNN format can also be used in the Replace with area.

You can use the History button to select from a list of the most recently used expressions. Use the Clear history action from the bottom of the lists to remove these expressions.

XPath

The XPath 2.0 expression you input in this combo is used for restricting the search scope. Clicking the XPath Options button opens a preferences page where you can configure some XPath-related options.

Note: You can use the Content Completion Assistant (on page 3280) to help you input XPath expressions that are valid in the current context.

Direction

Specifies if the search direction is from current position to end of file (Forward) or to start of file (Backward).

Scope

Specifies whether the Find/Replace operation is executed over the entire content of the edited document (All option), or over the selected content/lines.

Options section

Case sensitive

When selected, the search operation follows the exact letter case of the text entered in the Find field.

Incremental

The search operation is started every time you type or delete a letter in the Find text box.

Wrap around

When the end of the document is reached, the search operation is continued from the start of the document, until its entire content is covered.

Whole words only
Only entire occurrences of a word are included in the search operation. This option is automatically disabled if the Regular expression option (on page 744) is selected.

**Regular expression**

When this option is selected, you can use regular expressions in Perl-like regular expressions syntax (on page 753) to look for specific pieces of text.

- **Dot matches all** - A dot used in a regular expression also matches end of line characters.
- **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full canonical (on page 3280) decompositions match. For example, the á symbol can be inserted as a single character or as two characters (the a character followed by the tilde ~ character). This option is not selected by default.

**Find All Elements link**

Available when editing in **Author** mode, you can use this link to extend the search scope to XML-specific markup (names and values of both attributes and elements).

**Find button**

Executes a find operation for the next occurrence of the target. It stops after highlighting the find match in the editor panel.

**Replace/Find button**

Executes a replace operation for the target followed by a find operation for the next occurrence.

**Replace button**

Executes a replace operation for the target without going to the next occurrence.

**Find All button**

Executes a find operation and displays all results in the **Results view** (on page 357).

**Replace All button**

Executes a replace operation in the entire scope of the document.

**Replace to End button**
Executes a replace operation starting from current target until the end of
the document, in the direction specified by the current selection of the
Direction switch (Forward or Backward).

Find/Replace in Multiple Files

The Find/Replace in Files feature enables you to define Search for or Search for and Replace
operations across multiple files (for example, in DITA projects you can search in the scope of an entire
DITA map (on page 3281)). To open the Find/Replace in Files dialog box, use the Find/Replace in Files action that is available in the following locations:

- The Find menu.
- The Find/Replace in Files button on the main toolbar.
- The contextual menu of the DITA Maps Manager view (on page 2990).
- The contextual menu of the Project view (on page 333).
- The contextual menu of the Data Source Explorer view (on page 2198) for most types of
database connections.

The operation works on both local and remote files from an (S)FTP, WebDAV or CMS server.

Find/Replace in Files Dialog Box

Figure 255. Find / Replace in Files Dialog Box (When Opened from the Toolbar Button)
The dialog box contains the following options:

**Text to Find section**

The first text field is where you enter the character string to search for. You can search for Unicode characters specified in the `\uNNNN` format. Also, hexadecimal notation (`\xNNNN`) and octal notation (`\0NNNN`) can be used. In this case you have to select the **Regular expression** option. For example, to search for a space character you can use the `\u0020` code.

The rest of the options in this section can be used to refine your search:

**Case sensitive**

When selected, the search operation follows the exact letter case of the value entered in the **Text to find** field.

**Whole words only**

Only entire occurrences of a word are included in the search operation. This option is automatically disabled if either the **Ignore extra whitespaces**
Ignore extra whitespaces

If selected, the application normalizes the content (collapses any sequence of whitespace characters into a single space) and trims its leading and trailing whitespaces when performing the search operation.

Regular expression

When this option is selected, you can use regular expressions in Perl-like regular expressions syntax (on page 753) to look for specific pieces of text.

- **Dot matches all** - A dot used in a regular expression also matches end of line characters.
- **Canonical equivalence** - If selected, two characters will be considered a match if, and only if, their full canonical (on page 3280) decompositions match. For example, the ŏ symbol can be inserted as a single character or as two characters (the a character followed by the tilde ~ character). This option is not selected by default.

Restrict to XPath

The XPath 2.0 expression you input in this combo is used for restricting the search scope. Clicking the XPath Options button opens a preferences page where you can configure some XPath-related options.

**Note:** You can use the Content Completion Assistant (on page 3280) to help you input XPath expressions that are valid in the current context.

Enable XML search options

This option is only available when editing in Text mode. It provides access to a set of options that allow you to search specific XML component types:

- **Element names** - Only the element names are included in the search operation that ignores XML-tag notations ('<', '/', '>'), attributes or white-spaces.
- **Element contents** - Search in the text content of XML elements.
- **Attribute names** - Only the attribute names are included in the search operation, without the leading or trailing white-spaces.
- **Attribute values** - Only the attribute values are included in the search operation, without single quotes(') or double quotes(").
• **Comments** - Only the content of comments is included in the search operation, excluding the XML comment delimiters (`<!--`, `-->`).

• **PIs (Processing Instructions)** - Only the content is searched, skipping `<?...?>` (for example, `<?processing instruction?>`).

• **CDATA** - Searches inside content of CDATA sections.

• **DOCTYPE** - Searches inside content of DOCTYPE sections.

• **Entities** - Only the entity names are searched.

The two buttons **Select All** and **Deselect All** allow a simple activation and deactivation of all types of XML components.

**Note:** Even if you select all options of the **Enable XML search options** section, the search is still XML-aware. If you want to perform the search over the entire file content, deselect **Enable XML search options**.

**Replace with section**

Use the text field in this section to specify a character string to replace the target with. It may contain regular expression group markers if the search expression is a regular expression and the **Regular expression** checkbox is selected.

**Tip:** If you want to change the XML structure, you could use the built-in XML refactoring operations (on page 1142). You can even customize your own refactoring operations (on page 1153).

**Make backup files with extension**

In the replace process Oxygen XML Editor makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

**Scope section**

The options available in this section depend on the context (how the dialog box was opened). Select one of the listed options to specify the scope for the operation. The possible options include:

**Selected project resources**

Searches only in the selected files.

**Project files**

Searches in all files from the current project.

**All opened files**
Searches in all files opened in Oxygen XML Editor (regular files or DITA maps). You are prompted to save all modified files before any operation is performed.

**Current file directory**

The search is done in the directory of the file opened in the current editor panel. If there is no opened file, this option is not available.

**Current DITA Map hierarchy (only available if opened from the DITA Maps Manager)**

The search is done in all maps and topics referenced by the currently selected DITA map, opened in the DITA Maps Manager view (on page 2990).

**Selected references (only available if opened from the DITA Maps Manager)**

Searches only in the selected DITA references.

**Opened archive (only available if opened from the Archive Browser view)**

The search is done in an archive opened in the Archive Browser (on page 2191) view.

**Specified path**

Use this option to specify the search path.

**Filters section**

The options available in this section depend on the context (how the dialog box was opened) and they can be used to filter the search operation. The possible options include:

**Include files**

Narrows the scope of the operation only to the files that match the given filters. For example, you can choose to filter the search to only include files with a certain file extension (such as *.xml).

**Recurse subdirectories**

When selected, the search is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.

**Recurse references (only available if opened from the DITA Maps Manager)**

When selected, the search is performed recursively for the selected scope.

**Include hidden files**

When selected, the search is also performed in the hidden files.
Include archives
When selected, the search is also done in all individual file entries from all supported ZIP-type archives.

Show separate results for each search expression
When selected, the application opens a new tab to display the result of each new search expression. When the option is unchecked, the search results are displayed in the Find in Files tab, replacing any previous search results.

Find All
Use the Find All button to execute the search operation. The results are displayed in a view (on page 357) that allows grouping the results as a tree with two levels.

Replace All
Use the Replace All button to execute the search operation and replace all occurrences with the specified string. When you replace a fragment of text, Oxygen XML Editor offers an option to preview of the changes you make. The Preview dialog box is divided in two sections. The first section presents a list of all the documents containing the fragment of text you want to modify. The second section offers a view of the original file and a view of the final result. It also allows you to highlight all changes using the vertical bar from the right side of the view. The Next change and Previous change buttons allow you to navigate through the changes displayed in the Preview dialog box.

⚠️ CAUTION: Use the Replace All option with caution. Global searches may result in matching strings being replaced in instances that were not originally intended.

Note:

- You can use Perl-like regular expression syntax (on page 753) to match patterns in text content. The replace operation can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.
- Exclusion patterns are accepted. For example, *.java, !*Test.java would search for all files with a .java extension, with the exception of any file whose name ends in Test.
- To replace the tag-name start tag and its attributes with the new-tag-name tag use as Text to find the expression <tag-name'(s+)(.*)> and as Replace with the expression <new-tag-name $1$2>.
- The encoding used to read and write the files is detected from the XML header or from the BOM. If a file does not have an XML header or BOM Oxygen XML Editor uses by default the UTF-8 encoding for files of type XML, that is for files with one of the extensions: .xml, .xsl, .fo, .xsd, .rng, .nvd1, .sch, .wsdl or an extension associated with the XML editor type (on page 250). For the other files it uses the encoding configured for non-XML files (on page 123).
• You can cancel a long operation at any time by pressing the Cancel button of the progress dialog box, but doing so will not revert any replacements that have been processed up to that point.
• Since the content of read-only files cannot be modified, the Replace operation does not process those files. For every such file, a warning message is displayed in the message panel.

Related Information:

• Built-in Refactoring Operations (on page 1142)
• Custom Refactoring Operations (on page 1153)

Find All Elements Dialog Box

To open the Find All Elements dialog box, go to Find > Find All Elements (Ctrl + Shift + E (Command + Shift + E on OS X)) or from the shortcut Find All Elements that is available in the Find / Replace dialog box (on page 740). It assists you in defining XML element / attribute search operations in the current document.

Figure 256. Find All Elements Dialog Box

The dialog box can perform the following actions:

• Find all the elements with a specified name.
• Find all the elements that contain, or does not contain, a specified string in their text content.
• Find all the elements that have a specified attribute.
• Find all the elements that have an attribute with, or without, a specified value.

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:
• **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify *any* element name, leave the field empty.

**Note:** Use the qualified name of the element ( `<namespace prefix>:<element name>` ) when the document uses this element notation.

• **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For *any* element text, select `contains` from the drop-down menu and leave the field empty. If you leave the field empty but select `equals` from the drop-down menu, only elements with no text will be found. Select `not contains` to find all elements that do not include the specified text.

• **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For *any* or no attribute name, leave the field empty.

**Note:** Use the qualified name of the attribute ( `<namespace prefix>:<attribute name>` ) when the document uses this attribute notation.

• **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For *any* or no attribute value, select `contains` from the drop-down menu and leave the field empty. If you leave the field empty but select `equals` from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select `not contains` to find all elements that have attributes without a specified value.

• **Case sensitive** - When this option is selected, operations are case-sensitive.

When you press **Find All**, Oxygen XML Editor tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

**Quick Find Toolbar**

A reduced version of the **Find / Replace** dialog box (on page 740) is available as a dockable toolbar (on page 268). To display it press the **Alt + Shift + F (Command + Alt + F on OS X)** key combination or invoke the **Find > Quick Find** action. By default, the toolbar is displayed at the bottom of the Oxygen XML Editor window, above the status bar, but can be changed at any time by dragging (and docking) it to a different location. To hide the toolbar, use the **Close** button.

All matches are highlighted in the current editor.

**Figure 257. Quick Find Toolbar**

![Quick Find Toolbar](image)

The toolbar offers the following controls:
• Search input box - This is where you can insert the text you want to search for. The input box keeps a history of the last used search text. The background color of the input box turns red when no match is found.

• **Next** - Advances to the next match. You can also use the **Enter** key to jump forward to the next match.

• **Previous** - Jumps to the previous match. You can also use **Shift+Enter** to jump backward to the previous match.

• **All** - Highlights all matches of the search string in the current document.

• **Incremental** - If selected, the search operation is started every time you type or delete a character in the search input box.

• **Case sensitive** - If selected, the search operation follows the exact letter case of the search text.

• **Find/Replace** - Opens the **Find/Replace** dialog box (**on page 740**).

• **Find/Replace in Files** - Opens the **Find/Replace in Files** dialog box (**on page 745**).

• **Close** - Closes the **Quick Find** toolbar.

### Keyboard Shortcuts for Finding the Next and Previous Match

Navigating from one match to the next or previous one is very easy to perform using the **F3** and **Shift + F3 (Command + Shift + G on OS X)** keyboard shortcuts. They are useful for quickly repeating the last find action performed in the **Find / Replace** dialog box (**on page 740**), taking into account the same find options.

⚠️ **Restriction:** These shortcuts only take XPath expressions into account if the **Find / Replace** dialog box remains opened. Once you close it, the XPath expressions are no longer considered.

### Regular Expressions Syntax

Oxygen XML Editor uses the Java regular expression syntax. It is similar to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor does not support the following constructs:

- The conditional constructs `(?{X})` and `(?{condition}X|Y) .`
- The embedded code constructs `{{code}}` and `{{?{code}}} .`
- The embedded comment syntax `{{#comment}} .`
- The preprocessing operations `\l , \u , \L , and \U .`

When using regular expressions, note that some sets of characters from XPath/XML Schema/Schematron are slightly different than the ones used by Oxygen XML Editor/Java in the text searches from the **Find/Replace** dialog box (**on page 740**) and **Find/Replace in Files** dialog box (**on page 745**). The most common example is with the `\w` and `\w` set of characters. To ensure consistent
results between the two, it is recommended that you use the following constructs in the Find/Replace dialog box (on page 740) and Find/Replace in Files dialog box (on page 745):

- `/w - [\#x0000-\#x10FFFF]-[{P}\{P}\{Z}\{P\{C\}]` instead of `\w`
- `/W - [{P}\{P}\{Z}\{P\{C\}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, \1 through \9 are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, \1 through \9 are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression. Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.
- Perl uses the \g flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression *a, as well as dangling brackets, as in the expression abc), and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as +, ? and *.

Related Information:

- Comparison between the Java and Perl 5 regular expression syntax

Spell Checking

Oxygen XML Editor includes an automatic (as-you-type) spell checking feature (on page 764), as well as a manual spell checking action to open a Spelling dialog box that offers a variety of options.

To manually check spelling in the current document, use the ✝ Check Spelling action on the toolbar or from the Edit menu.

Figure 258. Check Spelling Dialog Box
The Spelling dialog box contains the following:

**Unrecognized word**

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

**Replace with**

The character string that will replace the misspelled word.

**Guess**

Displays a list of suggested words to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

**Default language**

Allows you to select the default language dictionary used by the spell checker engine.

**Paragraph language**

In an XML document, you can mix content written in multiple languages. You can set the language code in the `lang` or `xml:lang` attribute for any particular section and Oxygen XML Editor will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

**Begin at cursor position**

Instructs the spell checker to begin checking the document starting from the current cursor position.

**Action Buttons**
Replace

Use this button to replace the unrecognized word with the selected word from the Replace with field.

Replace All

Use this button to replace all occurrences of the unrecognized word with the selected word from the Replace with field, starting from the cursor's position to the end of the document.

Note: This action is case-sensitive.

Ignore

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Editor skips the content of the XML elements marked to be ignored (on page 763).

Ignore All

Ignores all instances of the unrecognized word in the current document.

Learn

Adds the unrecognized word to the list of valid words.

Options

Opens the Spell Check preferences page (on page 183) where you can configure various options regarding the feature.

Related Information:

- AutoCorrect Misspelled Words (on page 767)

Spell Check Dictionaries and Term Lists

Oxygen XML Editor uses the Hunspell engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Editor includes the following built-in dictionaries for the spell checker:

- English (US) [en_US]
- English (UK) [en_GB]
- French [fr]
Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Editor spell checker. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow these instructions and then add the dictionary to the Oxygen XML Editor spell checker by following this procedure (on page 758).

Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Editor provides a way of adding personalized term lists (on page 760) to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Editor uses for storing learned words (on page 763).

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, legal, medical, automotive). They can also be used to control forbidden words.

Adding Custom Dictionaries and Term Lists

The Oxygen XML Editor spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). The personalized term lists are custom files (with the .tdi file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Editor spell checker.
You can add dictionaries (on page 758) and personalized term lists (on page 760) to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the Spell Check Dictionaries preferences page (on page 186) and the Include dictionaries and term list from option (on page 186) allows you to choose a custom storage location. All the dictionaries and term lists for a particular language that are found in either location are merged and used by the spell checker in Oxygen XML Editor.

**Related Information:**
- Replacing a Spell Check Dictionary (on page 761)

### Adding Custom Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

### Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). If the dictionary does not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: [http://extensions.services.openoffice.org/dictionary](http://extensions.services.openoffice.org/dictionary).

   **Important:** The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: en_medical.dic). For a list of language codes, see [https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes](https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes).

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Spell Check > Dictionaries (on page 186).

3. Choose one of the following two options for adding the downloaded files.
a. Copy both files (\texttt{.dic} and \texttt{.aff}) to the default directory displayed in the \textit{Dictionaries and term lists default folder} option \textit{(on page 186)}.

b. Copy both files (\texttt{.dic} and \texttt{.aff}) to any other directory, select the \textit{Include dictionaries and term list from} option \textit{(on page 186)}, and select that directory. If you choose this option, make sure you read this important note \textit{(on page 186)}.

4. Restart the application for the spell checker to start using the new dictionary.

### Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a \textit{dictionary} file (with a \texttt{.dic} file extension) and an \textit{affix} file (with the \texttt{.aff} file extension). The affix file (\texttt{.aff}) can be left empty, but it is needed for the mechanism to work properly.

   \begin{itemize}
   \item \textbf{Important:} The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, \texttt{en\_US\_medical.dic} for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: \texttt{en\_medical.dic}). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.
   \end{itemize}

2. In the dictionary file (\texttt{.dic} extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

   
   \begin{verbatim}
   2
   parabola
   asimptotic
   \end{verbatim}

   \begin{itemize}
   \item \textbf{Tip:} Words stored in dictionaries are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.
   \end{itemize}

   \begin{itemize}
   \item \textbf{Note:} If you save the \texttt{.dic} file using UTF-8 encoding, then the corresponding \texttt{.aff} file should specify the encoding as a property inside it (if you do not specify the encoding, the default platform encoding will be used):
   \end{itemize}

   \begin{verbatim}
   SET UTF-8
   \end{verbatim}

3. Open the \textit{Preferences} dialog box (\textit{Options > Preferences}) \textit{(on page 79)} and go to \textit{Editor > Spell Check > Dictionaries} \textit{(on page 186)}.

4. Choose one of the following two options for saving the files.

   a. Save both files (\texttt{.dic} and \texttt{.aff}) to the default directory displayed in the \textit{Dictionaries and term lists default folder} option \textit{(on page 186)}. 

b. Save both files (.dic and .aff) to any other directory, select the Include dictionaries and term list from option (on page 186), and select that directory. If you choose this option, make sure you read this important note (on page 186).

5. Restart the application for the spell checker to start using the new dictionary.

Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Follow these instructions: Building and Testing Hunspell Dictionaries.

   Result: You should end up with a dictionary file (with a .dic file extension) and an affix file (with an .aff file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.

   ! Important: The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, en_US_medical.dic for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: en_medical.dic). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Spell Check > Dictionaries (on page 186).

3. Choose one of the following two options for saving the files.

   a. Save both files (.dic and .aff) to the default directory displayed in the Dictionaries and term lists default folder option (on page 186).

   b. Save both files (.dic and .aff) to any other directory, select the Include dictionaries and term list from option (on page 186), and select that directory. If you choose this option, make sure you read this important note (on page 186).

4. Restart the application for the spell checker to start using the new dictionary.

Related Information:

• Adding Custom Spell Check Term Lists (on page 760)

• Editing the Spell Checking Dictionaries
Adding Custom Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries, and the spell checker will merge them with all the dictionaries and other term lists for a particular language.

Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

1. Create a term list file (with the .tdi file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, en_US_myterms.tdi for term list in the US version of the English language or en_myterms.tdi for a less specific English term list). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the term list file (.tdi extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

   parabola
   asimptotic
   *hyperbola

   **Note:** Words stored in term lists are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

3. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Spell Check > Dictionaries (on page 186).

4. Choose one of the following two options for saving the file.
   a. Save the file (.tdi) to the default directory displayed in the Dictionaries and term lists default folder option (on page 186).
   b. Save the file (.tdi) to any other directory, select the Include dictionaries and term list from option (on page 186), and select that directory. If you choose this option, make sure you read this important note (on page 186).

5. Restart the application for the spell checker to start using the new term list.

Related Information:

- Adding Custom Spell Check Dictionaries (on page 758)
Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Editor spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

Download a Pre-Built Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). If the dictionary does not include an affix file (.aff), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: http://extensions.services.openoffice.org/dictionary.
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Spell Check > Dictionaries (on page 186).
3. Choose one of the following two options to replace existing files.
   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the Dictionaries and term lists default folder option (on page 186). Leave the Include dictionaries and term list from option deselected.
   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the Include dictionaries and term list from option (on page 186). If you choose this option, make sure you read this important note (on page 186).

⚠️ Important: Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, en_US.dic for a US English dictionary or en.dic for a less specific English dictionary). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.
4. Restart the application for the spell checker to start using the new dictionary.

Build a Full Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: Building and Testing Hunspell Dictionaries.

   Result: You should end up with a dictionary file (with a .dic file extension) and an affix file (with the .aff file extension). The affix file (.aff) can be empty, but it is needed for the mechanism to work properly.
2. Open the **Preferences** dialog box (*Options > Preferences*) *(on page 79)* and go to **Editor > Spell Check > Dictionaries** *(on page 186)*.

3. Choose one of the following two options to replace existing files.
   a. Replace the existing files (.dic and .aff) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option *(on page 186)*. Leave the **Include dictionaries and term list from** option deselected.
   b. Replace existing files (.dic and .aff) for the particular language in a directory specified in the **Include dictionaries and term list from** option *(on page 186)*. If you choose this option, make sure you read this important note *(on page 186)*.

4. Restart the application for the spell checker to start using the new dictionary.

### Related Information:

- *Adding Custom Dictionaries and Term Lists* *(on page 757)*

---

**Learned Words**

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select **Learn word**.
- Press the **Learn** button from the **Spelling** dialog box *(on page 754)* that is invoked by using the **Check Spelling** action on the toolbar.

**Note:** To delete items from the list of learned words, use the **Delete learned words** option in the **Editor > Spell Check > Dictionaries** preferences page *(on page 186)*.

### Related Information:

- *Adding Custom Spell Check Term Lists* *(on page 760)*

---

**Ignored Words (Elements)**

There are certain XML elements *(such as programlisting, codeblock, codeph, filepath, or screen)* in which you may want the content to always be skipped during the spell check process. This can be done in one of several ways:
• You can skip through them manually, word by word, using the Ignore button in the Spelling dialog box (on page 754) that is invoked by using the Check Spelling action on the toolbar.
• You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the Ignore elements section (on page 186) in the Spell Check preferences page.

Automatic Spell Check

Oxygen XML Editor includes an option to automatically check the spelling as you type. Not only does it check spelling when you are typing in the main editor, but also when you are typing in a comment (on page 952). This feature is disabled by default, but it can be enabled and configured in the Spell Check preferences page (on page 183). When the Automatic Spell Check option (on page 184) is selected, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

Figure 259. Automatic Spell Checking in Author Mode

![Image of automatic spell checking in Author Mode]

Figure 260. Automatic Spell Checking in Text Mode

![Image of automatic spell checking in Text Mode]

The contextual menu includes the following actions:

**Delete Repeated Word**

Allows you to delete words that were repeated in consecutive order.
List of Suggestions

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

Learn Word

Allows you to add the current unknown word to the persistent dictionary of learned words (on page 763).

Spell check options (Available in Author mode only)

Opens the Spell Check preferences page (on page 183).

Other actions

This submenu give you access to all the usual contextual menu actions.

Related Information:

• Learned Words (on page 763)

Spell Check Multiple Files

The Check Spelling in Files action allows you to check the spelling on multiple local or remote documents. This action is available in the following locations:

• The Edit menu.
• The contextual menu of the Project view (on page 333).
• The contextual menu of the DITA Maps Manager view (on page 2990), when editing DITA documents.

This action opens the Check Spelling in Files dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the Check All button to check the spelling in all specified files. The spelling corrections are displayed in the Results view (on page 357) at the bottom of the editor and you can group the reported errors as a tree with two levels.

Tip: If you want to instruct the spell checking engine to not report a particular word as being a spelling error in the future, use the Learn Word(s) action from the contextual menu in the Results view.

Figure 261. Check Spelling in Files Dialog Box (Invoked from Project View)
The following scopes are possible, depending on where the action was invoked:

- **All opened files** - The spell check is performed in all opened files.
- **Current file directory** - All the files in the folder of the current edited file.
- **Current DITA map hierarchy** - Option available when the dialog is invoked from the DITA Maps Manager view. Checks the spelling in all references contained in the DITA map.
- **Project** - All files from the current project.
- **Selected project resources** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allows you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the Spell Check preferences page (on page 183).

When working with DITA documents, if you invoke the **Check Spelling in Files** action in the DITA Maps Manager view (on page 2990), a slightly different version of the dialog box is displayed:

Figure 262. Check Spelling in Files Dialog Box (Invoked from the DITA Maps Manager View)
The following scopes are available when you check the spelling in files from the DITA Maps Manager (on page 2990):

- **Current DITA Map hierarchy** - All the files referenced in the currently selected DITA map (on page 3281), opened in the DITA Maps Manager view.
- **Selected references** - Checks the spelling in the selected references.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

### AutoCorrect Misspelled Words

Oxygen XML Editor includes an *AutoCorrect* feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in Author mode. Oxygen XML Editor includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the AutoCorrect feature use suggestions from the main spell checker. The suggestions will only be used if the misspelled words are not found in the Replacements Table (on page 150).

When enabled, the AutoCorrect feature can be used to do the following:

- Automatically correct misspelled words while you edit in Author mode. The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (, . ; ? ! " )].
- Easily insert symbols. For example, if you want to insert a ® character, you would type (R).
- Quickly insert text fragments.

*AutoCorrect* is enabled by default. To configure this feature, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit Modes > Author > AutoCorrect.
After the automatic operation of replacing a misspelled word (triggered by a space, dash, or certain punctuation characters), the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following options:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
- **Stop Automatically Correcting "[original word]"** - This option is presented if the correction is performed based on the *AutoCorrect Replacements Table (on page 150)* and selecting it will delete the corresponding entry from the Replacements Table.
- **Learn Word "[original word]"** - This option is presented if the *Use additional suggestions from the spell checker option (on page 150)* is selected in the *AutoCorrect preferences page (on page 150)* and the correction is performed based on the *Spell Checker*. Selecting this option will add the item to the list of *learned words (on page 763)*.
- **AutoCorrect options** - Opens the *AutoCorrect preferences page (on page 150)* that allows you to configure the feature.

Figure 263. AutoCorrect Widget

The *AutoCorrect* feature results in the following types of substitutions regarding case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "abotu" is replaced with "about").
- Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").
- Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

The *AutoCorrect* feature also uses the list of *ignored elements from the Spell Check preferences page (on page 186)*. All elements (along with their descendant elements) included in this list will be ignored by the *AutoCorrect* engine.
Add Dictionaries for the AutoCorrect Feature

To add new dictionaries for the AutoCorrect mechanism (on page 767), or to replace an existing one, follow these steps:

1. Download an AutoCorrect dictionary file for the desired language. The file needs to have a .dat file extension. An example of a website that includes some AutoCorrect dictionary files is: OpenOffice Extensions Search Page.
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit Modes > Author > AutoCorrect > Dictionaries (on page 152).
3. Choose one of the following two options for adding the downloaded files.
   a. Copy the downloaded .dat file to the default directory displayed in the Dictionaries default folder option (on page 152). Note that if you are replacing an existing dictionary file, this is the best option.
   b. Copy the downloaded .dat file to any other directory, select the Include dictionaries from option (on page 152), and select that directory. If you choose this option, make sure you read this important note (on page 152).
4. Restart the application for the AutoCorrect mechanism to start using the new dictionary.

Working with Special Characters and Encoding

While regular characters make up the English and European alphabets and the corresponding basic set of figures and symbols, there are many other special characters that belong to various other language representations, such as Arabic, Indian, Japanese, Chinese, or Korean. Oxygen XML Editor provides support for special characters in various ways:

Opening and Saving Documents

The Unicode standard provides support for all the character symbols in all known languages and Oxygen XML Editor provides support for all Unicode characters (on page 770). There are various encoding options and features to help determine how to handle documents with unsupported characters (on page 771).

Fonts

Oxygen XML Editor provides the ability to choose the fonts to be used in the various editing modes (on page 88). In some cases, changing the font may be a solution when special characters are not rendered as expected.
For special characters that are not included in any of the default fonts, Oxygen XML Editor tries to find that symbol in a fallback font (on page 772). For the Author editing mode, you can specify a set of fallback fonts in the `font-family` CSS property (in the particular CSS file used for rendering your documents). For more information, see the Customizing Author Mode Through CSS (on page 2477) section.

Tip: For documents written in languages that use special characters (such as Japanese or Chinese), change the font to one that supports the specific characters (a Unicode font). For the Windows platform, Arial Unicode MS or MS Gothic is recommended. To change the font in Oxygen XML Editor, open the Preferences dialog box (Options > Preferences) (on page 79), go to Appearance > Fonts. You can select a font for each editing mode in this preferences page.

Navigation and Layout

Oxygen XML Editor supports bidirectional text, such as Arabic, Hebrew, and certain Asian languages, or other special characters that are combined into a single glyph. In Text mode, you can enable or disable the support for special characters. See Special Character Support in Text Mode (on page 366) for details about which option to choose.

Editing

Oxygen XML Editor includes a contextual menu action that converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 875).

If you do not have a special way of inserting special characters using your keyboard, you can insert special characters using the Character Map feature (on page 778).

Unicode Support

Unicode is a standard for providing consistent encoding, representation, and handling of text. There is a unique Unicode number for every character, independent of the platform and language. Unicode is internationally recognized and is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.).

Oxygen XML Editor provides support for the Unicode standard, enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Editor uses 16-bit characters covering the Unicode Character set.

As a Java application, Oxygen XML Editor includes a default Java input method for typing characters with Unicode codes. However, the default input method does not cover all the Unicode codes (for example, the codes for some accented characters or characters found in East Asian languages). Such characters can be inserted in the editor panel of Oxygen XML Editor either with the Character Map dialog box (on page 779) available from Edit > Insert from Character Map or by installing a
Java input method that supports the insertion of the needed characters. The installation of a Java input method depends on the platform (Windows, Mac OS X, Linux, etc.) and is the same for any Java application.

**Note:** Oxygen XML Editor may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

**Tip:** On windows, you can enable the support for CJK (Chinese, Japanese, Korean) languages from Control Panel / Regional and Language Options / Languages / Install files for East Asian languages.

Related Information:

- Unicode Fallback Font Support *(on page 772)*
- Inserting Special Characters with the Character Map *(on page 778)*

Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Editor reads the document prolog to determine the specified encoding type. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart. When the encoding type cannot be determined, Oxygen XML Editor displays the Available Java Encodings dialog box that provides a list of all encodings supported by the Java platform.

**Opening Documents with Unsupported Characters**

When opening a document in Oxygen XML Editor, if it contains characters that are not supported by the specified encoding standard (these unrecognized characters are rendered as an empty box □), the application determines how to handle them based upon the setting specified in the Encoding Errors Handling option in the Encoding preferences page *(on page 124)*. The default setting is REPORT, which means an error message is displayed for characters that cannot be represented in the specified encoding. If the option is set to REPLACE, the character is replaced with a standard replacement character for the particular encoding. If the option is set to IGNORE, the error is ignored and the character is not rendered.
Saving Documents with Unsupported Characters

When saving a document edited in the Text, Grid, or Design modes, if it contains characters that are not supported by the encoding declared in the document prolog, Oxygen XML Editor displays a notification that you need to resolve the conflict before saving the document.

When saving a document edited in the Author mode, all characters that fall outside the detected encoding will be automatically converted to hexadecimal character entities.

When saving a document with UTF-16 encoding, the saved document has a Byte Order Mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is UnicodeLittle) has a different BOM than one created on a Mac OS platform (where the byte order mark is UnicodeBig). The byte order and the BOM of an existing document are preserved when the document is edited and saved. This behavior can be changed in Oxygen XML Editor from the Encoding preferences page (on page 123).

Unicode Fallback Font Support

Oxygen XML Editor provides fonts for most common Unicode ranges. However, if you use special symbols or characters (on page 778) that are not included in the default fonts, they will be rendered as small rectangles. A fallback font is a reserve typeface that contains symbols for as many Unicode characters (on page 770) as possible. When a display system encounters a character that is not part of the range of any of the available fonts, Oxygen XML Editor will try to find that symbol in a fallback font.

Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol (_wheelchair_ symbol) into your content in a Windows operating system. By default, Oxygen XML Editor does not render this symbol correctly since it is not included in any of the default fonts. It is included in Segoe UI Symbol, but this font is not part of the default fonts that come with Oxygen XML Editor. To allow Oxygen XML Editor to recognize and render the symbol correctly, you can add Segoe UI Symbol as a fallback font.

Adding a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Editor installation, use the following procedure:

1. Start Windows Explorer and browse to the [OXYGEN_INSTALL_DIR]/jre/lib/fonts directory.
2. Create a directory called fallback (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

   **Tip:** You could, for example, copy the *Segoe UI Symbol Regular* font from `C:\Windows\Fonts`.

4. Restart Oxygen XML Editor for the changes to take full effect.

**Result:** Whenever Oxygen XML Editor finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the *fallback* folder.

### Adding a Fallback Font in Other Platforms

For Mac OS X or other platforms, you could use the following approach:

1. Use a font editor (such as *FontForge*) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Editor, open the *Preferences* dialog box (*Options > Preferences*) *(on page 79)*, go to *Appearance > Fonts*.
4. Click the *Choose* button for the particular editing mode (*Editor* for *Text* mode) and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Editor for the font changes to take full effect.

**Related Information:**

- [Unicode Support](on page 770)
- [Inserting Special Characters with the Character Map](on page 778)

### Special Character Support in Author Mode

Oxygen XML Editor offers support for bidirectional text, such as Arabic or Hebrew languages that require right-to-left scripts, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters). To achieve this, Oxygen XML Editor implements the *Unicode Bidirectional Algorithm*, as specified by the Unicode Consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in *Author* mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite
direction. However, if the Arrow keys move the cursor in the writing direction option (on page 137) in the Cursor Navigation preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

**Tip:** If you experience performance issues when editing documents that contain bidirectional text, you could try one of the following solutions:

- The Eclipse plugin distribution of Oxygen XML Editor is faster than the standalone version when working with bidirectional text.
- You could try changing the font. For example, you could try using the David font in Hebrew content. If it is not already installed in your operating system, this font is available at: https://www.microsoft.com/typography/fonts/family.aspx?FID=234. To change the font in Oxygen XML Editor, open the Preferences dialog box (Options > Preferences) (on page 79), go to Appearance > Fonts, and change the font using the Author default font option in the Fonts preferences page (on page 88).

For more information about the bidirectional text support in the Author mode, watch our video demonstration:

https://www.youtube.com/embed/IC0ahH1IS7s

- Special Character Support in Text Mode (on page 366)
- Special Character Support in Grid Mode (on page 394)
- Inserting Special Characters with the Character Map (on page 778)

### Controlling the Text Direction Using XML Markup

Oxygen XML Editor Supports the following CSS properties that control the direction of text:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>direction</td>
<td>Specifies the writing direction of the text. The possible values are ltr (the text direction is left to right), rtl (the text direction is right to left), and inherit (the direction property is inherited from the parent element).</td>
</tr>
<tr>
<td>unicodeBidi</td>
<td>Used along with the direction property to create levels of embedded text with different text directions in the same document. The possible values of this property are bidi-override (creates an additional level of embedding and forces all strong characters to the direction specified in the direction), embed (creates an additional level of...</td>
</tr>
</tbody>
</table>
embedding), normal (does not use an additional level of embedding), and inherit (the value of the unicodeBidi property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

XML File:

```xml
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLPara>
</article>
```

Associated CSS File:

```css
myRTLpara{
  direction:rtl;
  unicode-bidi:embed;
}
```

Oxygen XML Editor recognizes the dir attribute on any XML document. The supported values are:

<table>
<thead>
<tr>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ltr</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td>rtl</td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
<tr>
<td>lro</td>
<td>The text from the current element is Left to Right, embedded.</td>
</tr>
<tr>
<td>rlo</td>
<td>The text from the current element is Right to Left, embedded.</td>
</tr>
</tbody>
</table>

The following XML document types make use of the dir attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

**Note:** When the inline element (on page 3283) tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the No Tags mode versus viewing it in the Full Tags mode.

Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.
Table 35. Directional Formatting Codes

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>U+202A</td>
<td>LEFT-TO-RIGHT EMBEDDING</td>
</tr>
<tr>
<td>U+202B</td>
<td>RIGHT-TO-LEFT EMBEDDING</td>
</tr>
<tr>
<td>U+202D</td>
<td>LEFT-TO-RIGHT OVERRIDE</td>
</tr>
<tr>
<td>U+202E</td>
<td>RIGHT-TO-LEFT OVERRIDE</td>
</tr>
<tr>
<td>U+202C</td>
<td>POP DIRECTIONAL FORMATTING CODE</td>
</tr>
<tr>
<td>U+200E</td>
<td>LEFT-TO-RIGHT MARK</td>
</tr>
<tr>
<td>U+200F</td>
<td>RIGHT-TO-LEFT MARK</td>
</tr>
</tbody>
</table>

To insert Unicode Direction Formatting Codes, use the Character Map (on page 778) dialog box. To easily find such a code, you can either enter directly the hexadecimal value, or use the Details tab to enter the codes name.

Oxygen XML Editor offers the support for bi-directional text in all the side views (Outline view (on page 347), Attributes view (on page 426) and so on) and text fields.

Special Character Support in Text Mode

If bidirectional text, such as Arabic or Hebrew languages, certain Asian languages (such as Devanagari, Bengali, Gurmukhi, Gujarati, Oriya, Tamil, Telugu, Kannada, Malayalam, Sinhala, Thai, Khmer), or other special characters (such as combining characters) are detected in a document, Oxygen XML Editor displays a Special Characters Detected dialog box that prompts you to Enable or Disable support for these special characters (you can also enable or disable the support for special characters in the Open preferences page (on page 155).

Enabled

If you choose to enable support for special characters and as long as you chose a font (on page 88) that supports the particular special characters, this means that the glyphs will be rendered properly in Text mode and the cursor navigation mechanism will recognize them as they are shown.

Example: The À glyph could be inserted using a consecutive combination of two characters (U+00C2 followed by U+0323). With the special characters support enabled and the SansSerif font chosen, that glyph will be rendered properly (a capital letter A with a circumflex above it and a dot below) and you can navigate through the glyph in one step (pressing the right/left arrow key once).
Restriction: When support for special characters is enabled, the folding support (on page 840) is not available.

Disabled

If you choose to disable support for special characters, it may affect text rendering, cursor navigation, and text management operations. However, this is helpful if you need to open very large documents (on page 781) since disabling the bidirectional editing support can enhance performance.

Example: The Ậ glyph could be inserted using a consecutive combination of two characters (U+00C2 followed by U+0323). With the special characters support disabled, that glyph may or may not be rendered properly and when navigating through the glyph, it would take two steps (pressing the right/left arrow key twice).

Restriction: Bidirectional content in the Text mode cannot be rendered using Bold or Italic.

Related Information:

- Special Character Support in Author Mode (on page 620)
- Special Character Support in Grid Mode (on page 394)
- Inserting Special Characters with the Character Map (on page 778)

Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the Change Text Orientation (Ctrl + Shift + O (Command + Shift + O on OS X)) action that is available from the Edit menu in the Grid editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

Note: This change applies only to the text from the cells, and not to the layout of the grid editor.

Figure 264. Default left to right text orientation
Inserting Special Characters with the Character Map

Oxygen XML Editor includes a **Character Map** for inserting special characters. It can also be used to find the decimal, hexadecimal, or *character entity* equivalent for a particular character or symbol.

**Inserting Special Characters**

To insert a special character at the current location within a document, follow these steps:

1. Open the Character Map.
2. Select the character you wish to insert.
3. Click on the character to insert it at the current location in your document.
1. Open the **Character Map** dialog box (*on page 779*) by selecting **More symbols** from the 💡 Symbols drop-down menu on the toolbar (if this button is not displayed, right-click in the toolbar area, select **Configure Toolbars** and chosen to display the Symbols toolbar (*on page 273*)).

2. Find the symbol you want to insert and double-click it (or select it and click **Insert**).

   **Tip:** The most recently used characters and some of the most common characters are listed when you click the 💡 Symbols drop-down button so you can easily insert any of those characters by simply selecting it from the drop-down.

### Finding the Decimal, Hexadecimal, or Character Entity Equivalent

You can see the hexadecimal value for any character that is already inserted in your document by placing the cursor right after the character and you can see its value in the status bar at the bottom of the application.

For other characters, or to find the decimal equivalent, or even the *character entity* equivalent, following these steps:

1. Open the **Character Map** dialog box (*on page 779*) by selecting **More symbols** from the 💡 Symbols drop-down menu on the toolbar (if this button is not displayed, right-click in the toolbar area, select **Configure Toolbars** and chosen to display the Symbols toolbar (*on page 273*)).

2. Find the symbol and select it. You can use the filters and the **Search** field at the top of the dialog box to narrow the search.

3. Click the **Details** tab on top of the preview window to see the decimal, hexadecimal, and description of the character. The *character entity* equivalent (both its decimal and hexadecimal values) are displayed at the bottom of the dialog box.

### Character Map Dialog Box

Figure 266. Character Map Dialog Box
The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

**Font**

Use this drop-down list to choose the font for which you want to display characters.

**Unicode Block**

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

**Search**

Use this filter to search for a character by one of the following attributes:

- hexadecimal
- decimal
- description

⚠️ **Note:** Selecting *description* opens the Details tab (on page 781). If you enter a character description in the Search field, *description* is selected automatically.
Character Table Section

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in the Text editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in Text mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in Author mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Press the **Insert** button to insert the selected character in the current editor at cursor position. You will see the character in the editor if the **editor font (on page 88)** is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

**Note:** The **Character Map** dialog box cannot be used to insert Unicode characters in the **Grid editor (on page 392)**. Accordingly, the **Insert** button of the dialog box will be disabled if the current document is edited in **Grid** mode.

Related Information:

- Working with Special Characters and Encoding (on page 769)
Loading Large Documents

When you open a document with a file size larger than the limit configured in Open preferences (on page 155), Oxygen XML Editor prompts you to choose whether you want to optimize the loading of the document for large files or for huge files.

Figure 267. Large File Prompt Dialog Box

If your file has a size smaller than 300 MB, the recommended approach is Optimize loading for large files (on page 782). For documents that exceed 300 MB, the recommended approach is Optimize loading for huge files (on page 783).

Optimize Loading for Large Files

If you open a document that exceeds the limit configured in Open preferences (on page 155) (the default limit is 30 MB), a dialog box will be displayed (on page 781) prompting you to choose whether you want to optimize the loading of the document for large files or for huge files. If you choose the Optimize loading for large files option (typically recommended for files smaller than 300 MB), a special memory optimization is implemented so that the total memory allocated for the application is not exceeded. A temporary buffer file is created on disk and the available free disk space needs to be at least double the size of the file you want to open.

When opening a large file in this optimized editing environment, some editing features are disabled, including:

- The file can only be opened in Text mode.
- The automatic validation (on page 1082) is not available.
- The XPath filter is disabled in the Find/Replace dialog box (on page 740).
- The bidirectional Unicode support (right-to-left writing) is disabled.
• The **Format and indent the document on open** option ([on page 157](#)) is automatically deselected for non-XML documents. For XML documents, the formatting is done while optimizing the memory usage by ignoring the options set in the **Format preferences page** ([on page 157](#)).

• Localizations for the results of an **XPath expression** ([on page 2182](#)) will be less precise.

**Related Information:**

• [Optimize Loading for Huge Files](#) (on page 783)

---

**Optimize Loading for Huge Files**

If you open a document that exceeds the limit configured in **Open preferences** ([on page 155](#)) (the default limit is 30 MB), a dialog box will be displayed ([on page 781](#)) prompting you to choose whether you want to optimize the loading of the document for large files or for huge files. If you choose the **Optimize loading for huge files** option (typically recommended for files larger than 300 MB), the file is split in multiple pages (each approximately 1MB in size). Each page is individually loaded (and edited) in **Text** mode by using a special horizontal slider located at the top of the editing area.

![Figure 268. Huge File Editor Horizontal Slider](#)

When opening a file in this special huge file editor, some editing features are disabled, including:

• For XML files, the UTF-8, UTF-16, ASCII, Windows-1252, and ISO 8859-1 encodings are supported. No other encoding is supported.

• The file can only be opened in **Text** editing mode.

• The **automatic validation** ([on page 1082](#)) is disabled.

• The XPath filter is disabled in the **Find/Replace** dialog box ([on page 740](#)).

• The bidirectional Unicode support (right-to-left writing) is disabled.

• The **Format and indent the document on open** option ([on page 157](#)) is automatically deselected for non-XML documents. For XML documents, the formatting is done while optimizing the memory usage by ignoring the options set in the **Format preferences page** ([on page 157](#)).

• The **Outline view** ([on page 347](#)) is not supported.

• The file content is soft wrapped by default.

• The **Find/Replace** dialog box ([on page 740](#)) only supports the **Find** action.

• Saving changes is only possible if the **Safe save** option ([on page 156](#)) (in the **Save** preferences page) is enabled.

• The undo operation is not available if you go to other pages and come back to the modified page.
Documents with Long Lines

When working with documents that contain lines of text that exceed the boundaries of your monitor, you might want to see the text wrapped. To do so, use one of the following methods:

- Press **Ctrl + Shift + Y (Command + Shift + Y on OS X)** to toggle the line wrap feature for the current document only.
- Select the **Line wrap** (on page 128) option in the **Text** preferences page to apply the line wrap to all documents.

Features that Might be Affected by Wrapping Lines of Text

Documents that contain thousands of characters per line can affect the performance of Oxygen XML Editor Text mode. When a certain line length limit is reached (controlled from the **Optimize loading for documents with lines longer than (Characters)** (on page 156) option), Oxygen XML Editor prompts you to wrap the lines of text. By doing so, the following features may be affected to maintain a reasonable level of productivity:

- The editor uses the **Monospaced** font.
- You cannot set font styles.
- **Automatic validation** (on page 1082) is disabled.
- **Automatic spell checking** (on page 764) is disabled.
- When editing XML documents, the **XPath** field is disabled in the **Find/Replace** dialog box (on page 740).
- Less precise localization for executed XPath expressions in XML documents. The XPath executions use SAX sources for a smaller memory footprint. It is recommended to use XPath 2.0 instead of XPath 1.0 because it features an increased execution speed and uses a smaller memory footprint. Running an XPath expression requires additional memory of about 2 or 3 times the size of the document on disk.
Handling Read-Only Files

If a file marked as read-only is opened in Oxygen XML Editor you can by default perform modifications to it. This behavior is controlled by the Can edit read only files option (on page 126). When attempting to save such files you will be prompted to save them to another location.

You can check out the read-only state of the file by looking in the Properties view (on page 705). If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

The read-only state is marked with a lock decoration that appears in the editor tab and specified in the tooltip for a certain tab.

Scratch Buffer

The Scratch Buffer view can be used for storing fragments of arbitrary text during the editing process. It can be used to drop bits of paragraphs (including arbitrary XML markup fragments) while rearranging and editing the document and also to drag and drop fragments of text from the Scratch Buffer to the editor panel. The Scratch Buffer is basically a text area offering XML syntax highlight. The view’s contextual menu contains basic edit actions such as Cut, Copy, and Paste.

If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Compare Files or Directories

Oxygen XML Editor provides a simple means of performing file and folder comparisons. You can see the differences in your files and folders and merge the changes. You can also use the file comparison to compare fragments or files inside zip-based archives.

There are two types of comparison tools: Compare Directories or Compare Files. These utilities are available from the Tools menu or can be opened as stand-alone applications from the Oxygen XML Editor installation folder (diffDirs.exe and diffFiles.exe).

Starting the Tools from a Command Line

The comparison tools can also be started by using command-line arguments. In the installation folder there are two executable shells (diffFiles.bat and diffDirs.bat on Windows, diffFiles.sh and diffDirs.sh on OS X and Linux). To specify files or directories to compare, you can pass command-line arguments to each of these shells. The arguments can point to file or folder paths in directories or archives (supported formats: zip, docx, and xlsx).

Directory Comparison Example
To start a comparison between the two directories (on page 808), use the following construct:

```
diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2]
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

For example, to start a comparison between two Windows directories, the command line would look like this:

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

**File Comparison Example**

To start a comparison between 2 or 3 files (on page 2770), use the following construct:

```
diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to base file].
```

If three files are specified, the tool will start in the 3-way comparison mode (on page 2774). If only two files are specified, the tool will start in the 2-way comparison mode (on page 2771). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

For example, to do a 3-way comparison on Windows, the command line would look like this:

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

**Compare Files**

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (`diffFiles.exe`).

Figure 269. Compare Files Tool
Two-Way Comparisons

The Compare Files tool can be used to compare the differences between two files or XML fragments.

Compare Files

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the · Browse drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the Perform File Differencing button from the toolbar.

3. You can use the drop-down menu on the left side of the toolbar to change the algorithm (on page 2773) for the operation.

4. You can also use the Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the XML Fast or XML Accurate algorithms, you can enter an XPath 2.0 expression in the Ignore nodes by XPath text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

Figure 270. Two-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 242), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the Close (Ctrl + W (Command + W on OS X)) button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:
• Use the navigation buttons on the toolbar (or in the Compare menu).
• Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
• Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar (on page 2783) and in the various menus (on page 2787) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- Append left change to right and Append right change to left
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- Copy change from left to right and Copy change from right to left
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- Remove change
  Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in Author mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in Author mode.
• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.

• **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the *New* dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (*.xquery, .xq, .xqy, .xqm extensions), DTD file types (*.dtd, *.ent, *.mod extensions), TEXT file type (*.txt extension), or PHP file type (*.php extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The `<` character
  - The `/>` sequence of characters
  - The name of an attribute inside an XML tag
  - The `=` sign
  - The `"` character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)
- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Three-Way Comparisons

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- Visualize and merge content that was modified by you and another member of your team.
- Marks differences correctly even when the document structure is rearranged.
- Allows you to merge XML-relevant modifications.
To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the Three-Way Comparison button on the toolbar and select the base file in the Base field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

3. To highlight the differences, click the Perform File Differencing button on the toolbar.

4. You can use the drop-down menu on the left side of the toolbar to change the algorithm (on page 2773) for the operation.

5. You can also use the Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

![Three-Way Comparison Diagram](image)

**Highlighting Colors**
The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 242), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Navigate Differences**

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

**Editing Actions**

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar (on page 2783) and in the various menus (on page 2787) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right** and **Append right change to left**
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right** and **Copy change from right to left**
  
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
Rejects the change on the particular side and preserves the particular content on the other side.

**Three-Way Diff Algorithms**

Oxygen XML Editor offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Second-Level Comparisons**

For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second-level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second-level comparison is processed using a syntax-aware comparison (on page 2774), meaning that it looks for identical tokens. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

![Second-Level Diff Comparison](image)

**Note:** If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

![Word Level Comparison](image)
To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

Figure 275. Character Level Comparison

**Author Visual Mode**

The **Compare Files** tool includes an **Author** mode that displays the files in a visual mode similar to the **Author** editing mode in *Oxygen XML Editor/Author*. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's **Text** or **Author** mode, it detects the **Initial Edit Mode** in the **Document Type Association** configuration (on page 96) and the mode the files were last opened in *Oxygen XML Editor/Author*.

**Note:** This mode is not available if the **Enable file comparison in Author mode** option (on page 239) is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as a **Tags Display Mode** drop-down button (on page 2785) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).

Figure 276. File Comparison Tool - Author Mode
Author Mode Algorithms

The visual Author mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second-Level Comparisons

The visual Author mode automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Related Information:

- Files Comparison Preferences Page (on page 239)
Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (`diffFiles.bat` on Windows, `diffFiles.sh` on OS X and Linux). To specify the files to compare, you can pass command-line arguments using the following construct:
`diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file].`

If three files are specified, the tool will start in the **3-way comparison mode** (on page 2774). If only two files are specified, the tool will start in the **2-way comparison mode** (on page 2771). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the `-ext` argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type `diffFiles.bat --help` in the command line.

**Example:**

To do a 3-way comparison, the command line might look like this:

**Windows**

```
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

**Linux**

```
_diffFiles.sh home/file1 home/file2 home/basefile
```

**Mac OS X**

```
_diffFiles.sh documents/file1 documents/file2 documents/basefile
```

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your `.gitconfig` file and then you can simply start the tool from the command line.
To integrate the **Compare Files** tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the **Oxygen Compare Files** tool:
   - **Manual Configuration** - Locate your Git user-specific configuration file (.gitconfig) and edit it with a text editor (for example, in Windows, the .gitconfig file is most likely located in your user home directory). Add (or replace) the following lines:
     ```
     [diff]
     tool = oxygendiff
     [merge]
     tool = oxygendiff
     [difftool "oxygendiff"]
     cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL
     [mergetool "oxygendiff"]
     cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED
     trustExitCode = true
     [difftool]
     prompt = false
     ```
   - **Command Line Configuration** - To automatically configure the .gitconfig file, you can run the following commands from a command line:
     ```
     git config --global diff.tool oxygendiff
     git config --global difftool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL
     git config --global merge.tool oxygendiff
     git config --global mergetool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED
     git config --global mergetool.oxygendiff.trustExitCode true
     ```
   
   **Note:** For Mac OS X, the cmd lines would start with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, the cmd lines would start with something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the **Compare Files** tool and see a comparison of changes for a particular file, run the following command from a command line:
git difftool [PathToFile]

Tip: If the file you want to compare has conflicts, you can start the Compare Files tool as a merge conflict resolution tool by running the following command:

git mergetool [PathToFile]

For more information about the Git difftool syntax, see https://git-scm.com/docs/git-difftool.

For more information about the Git mergetool syntax, see https://git-scm.com/docs/git-mergetool.

How to Integrate the File Comparison Tool with SourceTree

The file comparison tool can be integrated with SourceTree so that you can use it to compare changes. The advantages of doing this include:

• The Oxygen Compare Files tool presents the files side-by-side and makes it much easier to determine real changes.
• The Oxygen Compare Files tool includes XML comparison algorithms.
• The Oxygen Compare Files tool includes various options for configuring the comparison.
• The Oxygen Compare Files tool allows you to navigate through changes.

To integrate the Compare Files tool with SourceTree, follow this procedure, depending on your operating system:

Windows

1. In SourceTree, go to Tools > Options.
2. Go to the Diff tab.
3. In the External Diff/Merge section, configure the settings as follows:
   • External Diff Tool - Select Custom.
   • Diff Command - Enter the path of the Oxygen diffFile.exe file (for example: c:\Programs\Oxygen XML Editor 19\diffFiles.exe).
   • Arguments - Enter -ext $REMOTE $LOCAL $LOCAL.
   • Merge Tool - Select Custom.
   • Diff Command - Enter the path of the Oxygen diffFile.exe file (for example: c:\Programs\Oxygen XML Editor 19\diffFiles.exe).
   • Arguments - Enter -ext $LOCAL $REMOTE $BASE $MERGED.
4. Click OK.

Result: In SourceTree, you can now compare file changes with the Oxygen Compare Files tool by simply selecting External Diff from the contextual menu, Actions menu, or Ctrl+D.
Mac OS X

1. In SourceTree, go to SourceTree > Preferences.
2. Go to the Diff tab.
3. In the External Diff/Merge section, configure the settings as follows:
   - **External Diff Tool** - Select Custom.
   - **Diff Command** - Enter a command-line argument to launch the Oxygen diffFiles.sh file (for example: sh "/Applications/Oxygen XML Editor/diffFiles.sh").
   - **Arguments** - Enter -ext $REMOTE $LOCAL $LOCAL.
   - **Merge Tool** - Select Custom.
   - **Diff Command** - Enter a command-line argument to launch the Oxygen diffFiles.sh file (for example: sh "/Applications/Oxygen XML Editor/diffFiles.sh").
   - **Arguments** - Enter -ext $LOCAL $REMOTE $BASE $MERGED.
4. Close the preferences dialog box.

**Result:** In SourceTree, you can now compare file changes with the Oxygen Compare Files tool by simply selecting External Diff from the contextual menu or Actions menu.

**Toolbar and Contextual Menu Actions of the Compare Files Tool**

The toolbar of the Compare Files tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

**Figure 277. Compare Toolbar**

The following actions are available:

**Algorithm**

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
• **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.

• **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.

• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.

• **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** mode.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

---

**Diff Options**

Opens the **Files Comparison** preferences page (on page 239) where you can configure various options.

**Three-Way Comparison**

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Synchronized scrolling**

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.

**Format and Indent Both Files** *(Ctrl + Shift + P (Command + Shift + P on OS X))*
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences. This option is not available when the file comparison is in Author mode.

Note: When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Tags Display Mode

Allows you to select the amount of markup to be displayed in the Author visual mode (on page 2778). You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Inline Tags, Partial Tags, or No Tags.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Copy All Changes from Left to Right
Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an XPath expression (on page 2182) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

Note: If an XPath expression is specified in the Ignore nodes by XPath option (on page 241) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Base

Available for three-way comparisons (on page 2774). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

Left-Side (Source) File

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

Save

Saves the changes made in the source (left-side) file.

Reload

Reloads the source (left-side) file.

Close

Closes the source (left-side) file.

Right-Side (Target) File
You can specify the path to the file to be compared on the right side (target) by using the
text field, its history drop-down, or the browsing actions in the 
Browse drop-down menu.

Save
Saves the target (right-side) file.

Reload
Reloads the target (right-side) file.

Close
Closes the target (right-side) file.

Compare Files Tool Menus

The menus in the Compare Files tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Source > Open
Browses for a file that will be displayed in the left panel.

Source > Open URL
Browses for a remote file that will be displayed in the left panel.

Source > Open File from Archive
Browses an archive for a file that will be displayed in the left panel.

Source > Reload
Reloads the file in the left panel.

Source > Save
Saves the changes made to the file in the left panel.

Source > Save As
Allows you to choose a destination to save the file in the left panel.

Source > Close
Closes the file in the left panel.

Target > Open
Browses for a file that will be displayed in the right panel.

**Target > Open URL**
Browses for a remote file that will be displayed in the right panel.

**Target > Open File from Archive**
Browses an archive for a file that will be displayed in the right panel.

**Target > Reload**
Reloads the file in the right panel.

**Target > Save**
Saves the changes made to the file in the right panel.

**Target > Save As**
Allows you to choose a destination to save the file in the right panel.

**Target > Close**
Closes the file in the right panel.

**Base > Open**
Browses for a file that will be compared with both files in a three-way comparison *(on page 2774).*

**Base > Open URL**
Browses for a remote file that will be compared with both files in a three-way comparison *(on page 2774).*

**Base > Open File from Archive**
Browses an archive for a file that will be compared with both files in a three-way comparison *(on page 2774).*

**Close (Ctrl + W (Command + W on OS X))**
Closes the application.

**Edit Menu**

**Cut**
Cut the selection from the currently focused editor panel to the clipboard.

**Copy**
Copy the selection from the currently focused editor panel to the clipboard.

**Paste**
Paste content from the clipboard into the currently focused editor panel.

Select all
Selects all content in the currently focused editor panel.

_undo
Undo changes in the currently focused editor panel.

Redo
Redo changes in the currently focused editor panel.

Find Menu

_find/replace
Perform find/replace operations in the currently focused editor panel.

Find Next
Go to the next match using the same options as the last find operation. This action runs in both editor panels.

Find Previous
Go to the previous match using the same options as the last find operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison
Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing
Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))
Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on OS X))

Jumps to the last change.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Show Word Level Details

Provides a word-level comparison of the selected change.

Show Character Level Details

Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Options Menu**

**Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**

**Help (F1)**

Opens a Help dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**
Opens the Oxygen XML Editor Support Center web page in a browser.

Compare Directories

The Compare Directories tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the Tools menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (diffDirs.exe).

Figure 278. Compare Directories Tool

Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (diffDirs.bat on Windows, diffDirs.sh on OS X and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct: diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2].

If you pass only one argument, you are prompted to manually choose the second directory or archive.

Example:

To do a comparison between two directories, the command line would look like this:

Windows
To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

   **Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the **Perform Directories Differencing** button from the toolbar.

3. You can also use the **Diff Options** button to access the **Directories Comparison preferences page** (on page 242) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the **Browse** drop-down menu to select the archives in the left and right panels.

2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, select the **Look in archives** option (on page 243) in the **Directories Comparison preferences page**.

3. To highlight the differences, click the **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An X symbol, when a file or a folder exists in only one of the compared directories.
A ≠ symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the **Directories Comparison / Appearance preferences page** (on page 244). You can double-click lines marked with the ≠ symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter** on a line with a pair of files, Oxygen XML Editor starts a **file comparison** (on page 2770) between the two files, using the **Compare Files** tool.

### Related Information:

- **Compare Files (on page 2770)**

### Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the **Compare Directories** tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

**Figure 279. Compare toolbar**

![Compare toolbar](Image)

**Toolbar Actions**

1. **Perform Directories Differencing**
   
   Looks for differences between the two directories displayed in the left and right side of the application window.

2. **Perform Files Differencing**
   
   Opens the **Compare Files tool** (on page 2770) that allows you to compare the currently selected files.

3. **Copy Change from Right to Left**
   
   Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

4. **Copy Change from Left to Right**
Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

**Binary Compare**

Performs a byte-level comparison on the selected files.

**Diff Options**

Opens the Directory Comparison preferences page (on page 242) where you can configure various options.

**Show Only Modifications**

Displays a more uncluttered file structure by hiding all identical files.

**File and folder filters**

Differences can be filtered using three combo boxes: Include files, Exclude files, and Exclude folders. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out all JPEG and GIF image files, edit the Exclude files filter box to read * .jpeg, *.png. Each filter includes a drop-down menu with the latest 15 filters applied.

**Contextual Menu Actions**

**Perform Files Differencing**

Opens the Compare Files tool (on page 2770) that allows you to compare the currently selected files.

**Binary Compare**

Performs a byte-level comparison on the selected files.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

**Open**

If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

**Open in System Application**
Opens the selected file in the system application that is associated with that type of file. The action is available when launching the **Compare Directories** tool from the **Tools** menu in Oxygen XML Editor.

**Show in Explorer**

Opens the default file browser for your particular operating system with the selected file highlighted.

### Compare Directories Tool Menus

The menus in the **Compare Directories** tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

**File Menu**

- **Close (Ctrl + W (Command + W on OS X))**
  
  Closes the application.

**Compare Menu**

- **Perform Directories Differencing**

  Looks for differences between the two directories displayed in the left and right side of the application window.

- **Perform Files Differencing**

  Opens the **Compare Files tool (on page 2770)** that allows you to compare the currently selected files.

- **Copy Change from Right to Left**

  Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

- **Copy Change from Left to Right**

  Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

**Options Menu**

- **Preferences**
Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**

**Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Editor Support Center web page in a browser.

**Compare Images**

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images
in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: GIF, JPG, JPEG, PNG, and BMP.

**Compare Directories Against a Base (3-Way)**

The **Compare Directories Against a Base (3-way)** tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

**How to Perform 3-Way Directory Comparisons**

To perform a 3-way directories comparison, follow these steps:

1. Select **Compare Directories Against a Base (3-way)** from the Tools menu.
   
   **Step Result:** This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

   Figure 280. Compare Directories Against a Base File Set Chooser

2. Select the file sets to be compared:
   
   - **Base directory** - This is the original (base) file set before any modifications were made by your or others.
   - **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
   - **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.
3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.
4. Use the features and actions described in the next section to identify and merge the changes.

### 3-Way Directory Comparison and Merge Tool

**Figure 281. Comparison and Merge Tool**

The 3-way directory comparison and merge tool includes the following information, features, and actions:

**Number of Changes and Conflicts**

The first thing you see in top-left corner of the tool is grand total of all the changes made by others, changes made by you, and the number of conflicts.

**Filter Buttons**

In the top-right corner you can use the toggle buttons to filter the list of modifications:

✈️ **Show all files**

Use this button to show all modified and unmodified files, as well as conflicts.

✈️ **Show only files modified by you and others**
Filters the list to show all files that have been modified, including conflicts.

**Show only files modified by others**
Filters the list to only show the files that were modified by others.

**Show only files modified by you**
Filters the list to only show the files that were modified by you.

**Show only conflicting files**
Filters the list to only show files that contain conflicts.

**List of Files Panel**
This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to **Automatically merge** the changes made by others with your changes. If there is a conflict, the default is **<Select action>** and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the file set with changes made by others is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

**File Comparison Panels**
If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

**Note:** If Oxygen XML Editor does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Editor to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:
File Path

The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

× Close

Closes the file comparison panel.

Algorithm Drop-Down Menu

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the Files Comparison preferences page (on page 239) where you can configure various options.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.
### Tags Display Mode

Allows you to select the amount of markup to be displayed in the Author visual mode. You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Inline Tags, Partial Tags, or No Tags.

### Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

### Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

### Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

### Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

### Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

### Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

### First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Left-Side File (Your changes)
Above the panel you can see the file path and the following two buttons:

**Save**

Saves changes made to the file.

**Reload**

Reloads the file.

**Right-Side File (Changes made by others)**

Above the panel you can see the file path and the following two buttons:

**Reload**

Reloads the file.

**Displaying Changes in the File Comparison Panels**

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 282. File Comparison Panels

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 242), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Direct Editing Actions in the File Comparison Panels**

In addition to selecting merge actions from the drop-down menus in the Merge Action column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed.
when you save the modified document (Save button or Ctrl+S) or when you click the Perform File Differencing button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append right change to left**
  
  Copies the content of the selected change from the right side and appends it on the left side.

- **Copy change from right to left**
  
  Replaces the content of a change in the left side with the content of the change in the right side.

- **Remove change**
  
  Removes the change from the left side.

Any time you save manual changes (Save button or Ctrl+S), the selection in the Merge Action column in the top panel automatically changes to Use merged and a copy of the original file is kept so that you can revert to the original file if necessary. To discard your manual changes and revert to your original changes, select a different action in the Merge Action drop-down menu.

**Open Merged Files**

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

**Applying Changes**

When you click the Apply button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the Merge Action drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click Apply, your local changes will be preserved for the unresolved conflicts.

- **Overwrite your changes** - If you select this option and then click Apply, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.
• **Cancel** - You can click the **Cancel** button to go back to the merge tool to resolve the conflicts individually.

**Cancelling Changes**

If you click the **Cancel** button at the bottom of the merge tool, all the changes you made in the tool will be lost.

**Author Visual Mode**

The **Comparison and Merge** tool includes an **Author** mode that displays the files in a visual mode similar to the **Author** editing mode in *Oxygen XML Editor/Author*. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's **Text** or **Author** mode, it detects the Initial Edit Mode in the **Document Type Association** configuration (on page 96) and the mode the files were last opened in *Oxygen XML Editor/Author*.

**Note**: This mode is not available if the **Enable file comparison in Author mode** option (on page 239) is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as the **Tags Display Mode** drop-down button (on page 818) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).

Figure 283. File Comparison Tool - Author Mode
Author Mode Algorithms

The visual Author mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than XML Accurate.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second Level Comparisons

The visual Author mode automatically performs a second level comparison for the XML Fast and XML Accurate algorithms. After the first comparison is finished, the second level comparisons is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Related Information:

- Compare Directories (on page 808)
- Compare Files (on page 2770)

Viewing Status Information

Status information generated by operations such as schema detection, manual validation, automatic validation, and transformations are fed into the Information view, allowing you to monitor how the operation is being executed.

Figure 284. Information view messages
Messages contain a timestamp, the name of the thread that generated it and the actual status information. The number of displayed messages can be controlled with the Maximum number of lines option (on page 260) in the Views preference page.

To make the view visible, select Window > Show View > Information.

Editor Highlights

An editor highlight is a text fragment emphasized by a colored background.

Highlights are generated in both Text and Author mode when the following actions generate results:

- Find/Replace in Files (on page 745)
- Find/Replace (on page 740)
- Open/Find Resource (on page 733)
- Find All
- Find All Elements (on page 751)
- XPath in Files (on page 341)
- Search References (on page 884)
- Search Declarations (on page 884)

By default, Oxygen XML Editor uses a different color for each type of highlight (XPath in Files, Find/Replace, Search References, Search Declarations, etc.) You can customize these colors and the maximum number of highlights displayed in a document on the Editor preferences page (on page 125). The default maximum number of highlights is 10000.
You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the editor pane.
- Clicking the Next and Previous buttons (_whitespace) from the bottom of the range ruler, located at the right side of the editor pane.

  **Note:** When there are multiple types of highlights in the document, the Next and Previous buttons (_whitespace) navigate through highlights of the same type.

- Clicking the messages displayed in the Results view (on page 357) at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the ✖️ Remove all button from bottom of the range ruler, located at the right side of the editor pane.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the ✖️ Remove all button on the right side of the Results panel (on page 357) at the bottom of the editor.

  **Note:** Use the 📝 Highlight all results in editor button (on the right side of the Results panel) to either display all the highlights or hide them.

### Printing a Document

Printing is supported in Text, Author, and Grid modes.

The Print (Ctrl + P (Command + P on OS X)) action that is available from File menu displays a series of dialog boxes that allow you to configure print settings. After defining the settings in each dialog box, click OK to continue to the next one.

A Print Preview action is also available in the File menu. It first opens a Page Setup dialog box where you can define some paper, orientation, and margin settings. After you click OK, it displays the Print Preview dialog box where you can see a preview of how the document will look when it is printed.

Figure 285. Print Preview Dialog Box
The main window is split in three sections:

- **Preview area** - Displays the formatted document page as it will appear on printed paper.
- **Left stripe** - The left-side stripe that displays a list of thumbnail pages. Clicking any of them displays the page content in the main preview area.
- **Toolbar** - The toolbar area at the top that contains controls for printing, page settings, page navigation, print scaling, and zoom.

**Other Printing Features**

- If you are printing a document that is opened in the **Author** visual editing mode, you can use the **CSS print media type (on page 2481)** to change the styling in the printed output.
- If you are printing a document that is opened in **Author** mode and it contains **Tracked Changes (on page 941)**, you can print (or print preview) a copy of the document as if all changes have been accepted by switching the **Track Changes Visualization Mode (on page 946)** to **View Final**.
• If you are printing a document that is opened in **Text** mode and line numbers are displayed (the **Show line numbers** option (on page 128) is selected), the printed output will include the line numbers.

• If you are printing an XML document that is opened in **Text** mode and the **folding support** (on page 840) is activated (the **Enable folding** option (on page 128) is selected), the printed output will include the current **folded** state. Note that this applies to printing an entire document and not selections within the document.

• If you are printing an XML document that is opened in **Text** mode and a block of content is selected, you have the ability to print only the selection of text rather than the entire document. When you invoke the print action with a block of content selected in **Text** mode, a dialog box will be presented that offers you the choice to print the selection or the entire document.
Editing Documents

Oxygen XML Editor includes built-in frameworks for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) (on page 1537) with a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). In addition, Oxygen XML Editor provides support for editing numerous other types of documents (all XML document types and even some non-XML formats).

Each type of document has unique features and options and this chapter includes a large amount of information about editing numerous types of documents and various editing features that are provided in Oxygen XML Editor, including general information about editing XML documents in Text mode (on page 828), the visual Author mode (on page 893), and Grid mode (on page 886).

For extensive details about the DITA editing features included in Oxygen XML Editor, see the DITA Authoring chapter (on page 2981).

Related Information:

- Built-in XML Frameworks (Document Types) (on page 1537)

Editing XML Documents

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in the visual Author editing mode. For more information about schema association, see Associating a Schema to XML Documents (on page 1112).

Oxygen XML Editor includes fully supported built-in frameworks (on page 3282) for the most popular XML document types (DITA, DocBook, TEI, XHTML, JATS) (on page 1537) with a full set of features. These built-in frameworks are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. For extensive details about the DITA editing features included in Oxygen XML Editor, see the DITA Authoring chapter (on page 2981).

This section includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.
Related Information:

- Text Editing Mode (on page 303)
- Author Editing Mode (on page 402)
- Grid Editing Mode (on page 392)
- Built-in XML Frameworks (Document Types) (on page 1537)

Editing XML Documents in Text Mode

The Oxygen XML Editor Text editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor also includes specialized editing actions, a powerful Content Completion Assistant (on page 844), a helpful Outline view (on page 347), and many other unique features.

To switch to this mode, select Text at the bottom of the editing area.

Navigating the Document Content in Text Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents in Text mode.

Navigation Keyboard Shortcuts

- **Ctrl + CloseBracket (Command + CloseBracket on OS X)**
  
  Navigate to the next XML node.

- **Ctrl + OpenBracket (Command + OpenBracket on OS X)**
  
  Navigate to the previous XML node.

- **Ctrl + RightArrow (Command + RightArrow on OS X)**
  
  Navigate one word forward.

- **Ctrl + LeftArrow (Command + LeftArrow on OS X)**
  
  Navigate one word backward.

- **Ctrl + Home (Command + Home on OS X)**
  
  Position the cursor at the beginning of the document.
Ctrl + End (Command + End on OS X)
Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar (they can also be accessed from the Find menu):

← Last Modification
Navigates to the last modification in any opened tab.

← Back
Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links in Text or Author mode.

→ Forward
Available after you use the Back button at least once, and it navigates in the opposite direction as the Back button.

Navigating with the Outline View

Oxygen XML Editor includes an Outline view (on page 347) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

Figure 286. Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A breadcrumb on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.
Figure 287. Breadcrumb in Text Mode

The last element listed in the breadcrumb is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In Text mode, you can navigate precisely to a location in the document you are editing by using the Go to dialog box. To open this dialog box, press Ctrl+L (Command+L on OS X) or select Find > Go to.

Figure 288. Go to Dialog Box

The dialog box includes the following fields for specifying a specific navigation location:

- **Line**: Destination line in the current document.
- **Column**: Destination column in the current document.
- **Offset**: Destination offset relative to the beginning of document.

Navigating with Bookmarks

By using bookmarks, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents. You can place up to nine distinct bookmarks in any document. Shortcut keys are available to navigate to any of the marked positions (Ctrl+1 through Ctrl+9). There are also shortcuts for creating bookmarks (Ctrl+Shift+1 through Ctrl+Shift+9). You can also configure these shortcut keys in the Options > Menu Shortcut Keys (on page 248) menu.

Figure 289. Editor Bookmarks
To insert a *bookmark* in **Text** mode, do any of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Press *(F9)* on your keyboard or use any of the specific bookmark creation shortcuts ((**Ctrl**+**Shift** +1 through **Ctrl**+**Shift**+9).
- Select the ![Create Bookmark](image) action from the **Edit > Bookmarks** menu.

To remove *bookmark* in **Text** mode, do either of the following:

- Left-click its icon in the vertical stripe.
- Right-click its icon on the vertical stripe and select **Remove** or **Remove all** (**Ctrl**+**F7** *(Command** +**F7** on OS X)).

To navigate to a specific *bookmark*, do either of the following:

- Use any of the specific bookmark navigation shortcuts (**Ctrl**+1 through **Ctrl**+9).
- Use one of the actions available on the **Edit > Bookmarks > Go to** menu.

**Tip:** The navigation shortcuts work even if the document where the bookmark was inserted has been closed. In this case, using the shortcut will automatically re-open the document.

**Smart Editing in Text Mode**

Oxygen XML Editor includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag>` | `</tag>`).

- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor will mirror-edit the name of the matching end tag. This feature can be controlled from the **Content Completion** option page *(on page 166)*.

- **Auto-breaking the edited line** - The **Hard line wrap option** *(on page 159)* automatically breaks the edited line when its length exceeds the maximum line length defined for the format and indent operation *(on page 159)*.

- **Indent on Enter** - The **Indent on Enter** option *(on page 159)* indents the new line inserted when you press **Enter**.

- **Smart Enter** - The **Smart Enter** option *(on page 159)* inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
• **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
  ◦ If the click position is on a start tag or end tag, then the element name is selected.
  ◦ If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
  ◦ Otherwise, a double-click selects contiguous text.

• **Triple-click** - A triple-click selects entire regions of text, depending on the click position:
  ◦ If the click position is on a start or end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  ◦ If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
  ◦ If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
  ◦ If the click position is immediately before an attribute, then the entire attribute and its value is selected.
  ◦ If the click position is in between the opening and closing quotes of an attribute value, then the entire attribute value is selected.
  ◦ Otherwise, it selects the entire current line.

**Shortcut Actions in Text Mode**

Oxygen XML Editor includes numerous shortcut actions to help you edit content in the **Text** editing mode.

**Changing the Font Size (Zoom)**

The font size of the editor panel can be changed with the following actions that are available with shortcuts or in the **Document > Font size** menu:

**Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl + MouseWheelForward (Windows/Linux))**

Increases the font size (zooms in) with one point for each execution of the action.

**Note:** For Mac OS X, if you activate the **Enable mouse-wheel zooming option (on page 126)** in the **Editor** preferences page, you can use **Command + MouseWheelForward** to increase the font size (zoom in). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

**Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl + MouseWheelBackwards (Windows/Linux))**

Decreases the font size (zooms out) with one point for each execution of the action.
Note: For Mac OS X, if you activate the Enable mouse-wheel zooming option (on page 126) in the Editor preferences page, you can use Command + MouseWheelBackwards to decrease the font size (zoom out). It is disabled by default due to the way inertia affects the mouse wheel on Mac OS X.

Normal editor font (Ctrl + 0 (Command + 0 on OS X))

Resets the font size to the value of the editor font set in the Fonts preferences page (on page 88).

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the Edit menu:

Undo (Ctrl + Z (Command + Z on OS X))

Reverses a maximum of 200 editing actions (configurable with the Undo history size option (on page 126) in the Editor preferences page) to return to the preceding state.

Note: Complex operations such as Replace All or Indent selection count as single undo events.

Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the Undo function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the Edit menu):

Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on OS X))

Selects the entire content of the current document.
Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in Text mode:

- **Ctrl + Alt + UpArrow (Command + Alt + UpArrow on OS X)**
  
  Moves the node up one line.

- **Ctrl + Alt + DownArrow (Command + Alt + DownArrow on OS X)**
  
  Moves the node down one line.

**Note:** The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Editor also includes the following other miscellaneous shortcut actions in Text mode:

- **Ctrl + Delete (Command + Delete on OS X)**
  
  Deletes the next word.

- **Ctrl + Backspace (Command + Backspace on OS X)**
  
  Deletes the previous word.

- **Ctrl + W (Command + W on OS X)**
  
  Cuts the previous word.

- **Ctrl + K (Command + K on OS X)**
  
  Cuts to end of line.

- **Ctrl + Single-Click (Command + Single-Click on OS X)**
  
  Use this shortcut to open any of the following:

  - Any absolute URL (URLs that have a protocol), regardless of their location in the document.
  - URI attributes such as: `schemaLocation`, `noNamespaceSchemaLocation`, `href` and others.
• Processing instructions used for associating resources, xml-models, xml-stylesheets.

**Ctrl + Shift + Y (Command + Shift + Y on OS X) (Document > Edit > Toggle Line Wrap)**

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

**Related Information:**

• Frequently Used Shortcut Keys (on page 27)

---

**Editing XML Markup in Text Mode**

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu and in the **Document > Markup** menu, and many of the actions can also be done with simple keyboard shortcuts.

**Using the Breadcrumb**

A **breadcrumb** on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 290. Breadcrumb in Text Mode**

![Breadcrumb in Text Mode](image)

The last element listed in the **breadcrumb** is the element at the current cursor position. The current element is also highlighted by a thin light blue bar for easy identification. Clicking an element in the **breadcrumb** selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

**Append Child**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

**Insert Before**

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

**Insert After**
Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

**Edit Attributes**
Opens an editing window that allows you to edit the attributes of the currently selected element.

**Toggle Comment**
Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

**Cut**
Removes the selected element and copies it to the clipboard.

**Copy**
Copies the selected element to the clipboard.

**Delete**
Deletes the currently selected element.

### Move Nodes
You can easily move XML nodes in the current document by using the following shortcut keys:

**Alt + UpArrow**
Moves the current node or selected nodes in front of the previous node.

**Alt + DownArrow**
Moves the current node or selected nodes after the subsequent node.

### Rename Elements
You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

**Rename Element**
The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**
The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.
• If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing OK, the prefix is modified from `p1` to `p5` without inserting a new declaration.

• If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.

• To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

### Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):

- **Surround with submenu**
  
  Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

- **Surround with Tags (Ctrl + E (Command + E on OS X))**
  
  Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  • If the **Position cursor between tags** option (on page 167) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

  • If the **Position cursor between tags** option (on page 167) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

- **Surround with ‘[tag]’ (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

  Surround the selected content with the last tag used.

### Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu (or from the **Document > Markup** menu):
Delete element tags (`Alt + Shift + X (Command + Alt + X on OS X)`)  
Deletes the start and end tag of the current element.

Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Join elements (`Alt + Shift + J (Command + Alt + J on OS X)`)  
Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Split element (`Alt + Shift + D (Ctrl + Alt + D on OS X)`)  
Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the Refactoring submenu of the contextual menu:

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute  
Allows you to change the value of an attribute or insert a new one.

Convert attribute to element  
Allows you to change an attribute into an element.

Delete attribute  
Allows you to remove one or more attributes.

Rename attribute  
Allows you to rename an attribute.

Replace in attribute value  
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**
- Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
- Allows you to delete elements.

**Delete element content**
- Allows you to delete the content of elements.

**Insert element**
- Allows you to insert new elements.

**Rename element**
- Allows you to rename elements.

**Unwrap element**
- Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**
- Allows you to surround elements with element tags.

**Wrap element content**
- Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**
- Allows you to insert an XML fragment.

**Replace element content with XML fragment**
- Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**
- Allows you to replace elements with an XML fragment.
Folding XML Elements in Text Mode

When working with a large document, the folding (on page 3282) support in Oxygen XML Editor can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

By default, the folding (on page 3282) feature is enabled in Oxygen XML Editor, but it can be disabled in the Text preferences page with the Enable folding option (on page 128).

Figure 291. Folding of XML Elements in Text Mode

```xml
<xt:template match="article.description"> [28 lines]
  <xt:template match="article.descriptions"> ...
    <xt:apply-templates> ...
  </xt:template>
</xt:template>
<xt:template match="code"> ...
  <p class="textSmall"> ...
    <xt:for-each select="coderow"> [2 lines]
      <p> ...
    </xt:for-each>
  </p> ...
</xt:template>
```

The fact that the folds are persistent is a unique feature of Oxygen XML Editor. The next time you open the document the folds are restored to its last state.

Folding Actions in Text Mode

Element folds are marked with a small triangle (▲/▼) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available:

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.
**Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**

Folds the child elements that are indented one level inside the current element.

**Expand Child Folds**

Unfolds all child elements of the currently selected element.

**Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**

Unfolds all elements in the current document.

For more information about the folding support in Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to select content in Text mode. These include numerous standard continuous selection possibilities that are common to many text editors, as well as a selection feature that allows you to select a rectangular area within a document in Text mode.

**Standard Continuous Selection Shortcuts**

**Shift + Left/Right Arrow Keys**

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

**Shift + Up/Down Arrow Keys**

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

**Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.
**Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

**Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

**Ctrl + Shift + Home**

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

**Ctrl + Shift + End**

Begins a continuous selection at the cursor position and extends it to the end of the document.

**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects certain text, depending on the position of the click in the document. See Smart Editing: Double-Click (on page 832) for the specifics.

**Triple-Click**

Selects entire regions of text, depending on the position of the click in the document. See the Smart Editing: Triple-Click (on page 832) for the specifics.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Attributes**

Selects all the attributes of the element at the current cursor position.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.
Rectangular Selection Shortcuts

Oxygen XML Editor also includes some keyboard shortcuts that allow you to select a rectangular block of content in Text mode and you can then copy, cut, paste, delete, or edit the selection.

⚠️ **Attention:** The rectangular selection shortcuts will not work if the Line Wrap option (on page 128) is selected in the Text preferences page.

The following shortcuts can be used to create a rectangular selection:

- **Alt + Mouse Click + Mouse Movement** *(Alt + Meta + Mouse Click + Mouse Movement on Mac OS X)*

  Begins a rectangular selection at the mouse click position and extends it in the direction that you move the mouse. Release **Alt** *(Alt + Meta on Mac OS X)* to enter the in-place editing mode (on page 844).

- **Shift + Alt + Left/Right Arrow Keys** *(Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)*

  Begins a rectangular selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

- **Shift + Alt + Up/Down Arrow Keys** *(Shift + Alt + Meta + Up/Down Arrow Keys on Mac OS X)*

  Begins a rectangular selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys (you can also use the mouse to extend the selection).

- **Ctrl + Shift + Alt + Left/Right Arrow Keys** *(Ctrl + Shift + Alt + Meta + Left/Right Arrow Keys on Mac OS X)*

  Begins a rectangular selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

- **Shift + Alt + Home** *(Shift + Alt + Meta + Home on Mac OS X)*

  Begins a rectangular selection at the cursor position and extends it to the beginning of the current line.

- **Shift + Alt + End** *(Shift + Alt + Meta + End on Mac OS X)*

  Begins a rectangular selection at the cursor position and extends it to the end of the current line.

- **Shift + Alt + PageUp** *(Shift + Alt + Meta + PageUp on Mac OS X)*

  Begins a rectangular selection at the cursor position and extends it up one screen page.

- **Shift + Alt + PageDown** *(Shift + Alt + Meta + PageDown on Mac OS X)*
Begins a rectangular selection at the cursor position and extends it down one screen page.

You can then use standard editing actions to copy, cut, paste, or delete the entire selection.

**In-Place Editing Mode**

To edit the content of the rectangular selection, you can enter an in-place editing mode by releasing the Alt key (on Mac OS X, release both Alt & Meta). Once you are in the editing mode, you can simply use your keyboard to edit the entire selection of content, or click anywhere inside the selection to edit the content at the cursor position for all lines within the selection at once (as if the rectangular selection is a selection of columns). To exit the editing mode, press either Enter or Esc.

Content Completion Assistant in Text Mode

Oxygen XML Editor includes an intelligent *Content Completion Assistant (on page 3280)* that offers proposals for inserting structured language elements, attributes, and attribute values that are valid in the current editing context.

The *Content Completion Assistant* is enabled by default. To disable it, open the *Preferences* dialog box (Options > Preferences) (on page 79), go to Editor > Content Completion, and deselect the **Enable content completion** option (on page 167).

**Figure 292. Content Completion Assistant**

![Diagram of an XML element with content completion proposals](image)

Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the *Content Completion Assistant (on page 3280)* depend on the associated schemas (DTD, XML Schema, Relax NG, or NVDL schema). For information about the various ways to associate a schema and the order of their precedence, see the *Associating a Schema to XML Documents (on page 1112)* section.

Using the Content Completion Assistant in Text Mode

The feature is activated in **Text** mode in the following situations:
• After you press the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the Activation delay of the proposals window (ms) option (on page 168) from the Content Completion preferences page.

• After typing a partial element or attribute name, you can manually activate it by pressing Ctrl + Space (Command + Space on OS X) or Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X). If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in Text mode, do one of the following:

• Press Enter or Tab to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.

• Press Ctrl + Enter (Command + Enter on OS X) to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:** When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the Add Element Content option (on page 167) (in the Content Completion preferences page) is selected. The Content Completion Assistant can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the Add optional content (on page 167) and Add first Choice particle (on page 167) options in the Content Completion preferences page.

After inserting an element, the cursor is positioned:

• Before the `>` character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.

• After the `>` character of the start tag, if the element has no attributes.

### Where the Content Completion Assistant is Displayed

The Content Completion Assistant is displayed:
• Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
• Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
• Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

Element Structure Specified in DTD or Schema

The proposals that populate the Content Completion Assistant depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

Note: The Content Completion Assistant is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

Current Cursor Position

The number and type of elements displayed by the Content Completion Assistant is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

Unique ID Attribute Values

A schema may declare certain attributes as ID or IDREF/IDREFS. When the document is validated, Oxygen XML Editor checks the uniqueness and correctness of the ID attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

Values for xml:id Attributes

Values of all the xml:id attributes are handled as ID attributes. They are collected and displayed by the Content Completion Assistant as possible values for anyURI attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

Links/References in DITA
When entering values for the various types of links and references in DITA (for example, values for `href` or `conref` elements), the **Content Completion Assistant** will propose potential targets when you use the forward slash key (/).

### ID Values for DITA Key References

In DITA, when inserting key references (`keyref`) or content key references (`conkeyref`), the ID values that are defined in the key reference are presented as possible targets.

The **Content Completion Assistant** will only propose targets that are valid in the current context.

### Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the **Content Completion Assistant** offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the **Content Completion Assistant**.

**Related Information:**

- Customizing the Content Completion Assistant *(on page 2352)*

**Schema Annotations in Text Mode**

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The **Content Completion Assistant** *(on page 3280)*.
- A small tooltip window shown when the mouse hovers over an element or attribute. The tooltip window can be invoked at any time by using the F2 shortcut.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** *(on page 171)* option in the **Annotations** preferences page.
Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `div`, `body`, `p`, `br`, `table`, `ul`, or `ol`).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (on page 172) option in the Annotations preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`p`, `br`, `ul`, `li`), they are rendered as an HTML document loaded in a web browser. For example, `p` begins a new paragraph, `br` breaks the current line, `ul` encloses a list of items, and `li` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```xml
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```xml
<define name="person">
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person.
    </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```
However, any element outside the Relax NG namespace (http://relaxng.org/ns/structure/1.0) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the Use all Relax NG annotations as documentation (on page 172) option in the Annotations preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```xml
## Information about a person.
element person { name, email*}
```

Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled by the Prefer DTD comments that start with "doc:" as annotations (on page 171) option in the Annotations preferences page. The following is an example of a DTD annotation:

```xml
<!--doc:Description of the element. -->
```

Content Completion Helper Views

Information about the current element being edited is also available in various dockable (on page 3281) views, such as the Model view (on page 353), Attributes view (on page 351), Elements view (on page 355), and Entities view (on page 356). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view (on page 347), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 293. Model View
The Model view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 295. Annotation panel

Attributes View in Text Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use the Attributes view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the Attribute column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 296. Attributes View
Expand/Collapse Button

There is an Expand/Collapse (↑ / ↓) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.

You can use the Remove button to delete an attribute and its value from the selected element.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have entered or selected a value, use the Update button (or press Enter) to add the value to the attribute.

Note: For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the Attributes view when editing in Text mode:
Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the Allow only insertion of valid elements and attributes (on page 137) schema-aware option is selected.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the (Delete) or (Backspace) keys.

Copy

Copies the attrName="attrValue" pair to the clipboard. The attrValue can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the Attributes view. The attribute is selected and its value is changed if they exist in the Attributes view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the Attributes view and you can start editing it. The attribute is selected and you can start editing it if it exists in the Attributes view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Elements View in Text Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing F2 with an element selected will display information about that particular element.
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt;`, `&gt;`, `&amp;`, `&apos;`, `&quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the `?` and `*` wildcards. Also, you can enter multiple filters by separating them with a comma.

**Code Templates**

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a `+` symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

**How to Create Code Templates**

To create a code template, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.
Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking Duplicate.

Figure 299. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the Content Completion Assistant (on page 3280). HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
   - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the Shortcut key field and press the desired key combination on your keyboard. Use the Clear button if you make a mistake. If the Enable platform-independent shortcut keys checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
     - M1 represents the Command key on MacOS X, and the Ctrl key on other platforms.
     - M2 represents the Shift key.
     - M3 represents the Option key on MacOS X, and the Alt key on other platforms.
     - M4 represents the Ctrl key on MacOS X, and is undefined on other platforms.
   - **Content** - Text box where you define the content that is used when the code template is inserted. An editor variable (on page 276) can be inserted in the text box using the Insert Editor Variables button.

4. Click OK to save your new code template.

Result: Your code template can now be selected using the Content Completion Assistant (on page 3280) (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). The code templates are displayed with a symbol.
How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Select Project Options at the bottom of the dialog box. This stores the preferences in the project file (.xpr).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their Project view (on page 333), the code templates will be available in their content completion list.

Tip: It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (on page 2352) for a particular framework. You could then share the whole framework (on page 2371) with other members of your team.

Syntax Highlighting in XML Documents

Oxygen XML Editor supports syntax highlighting in Text mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79).
2. Go to Editor > Syntax Highlight (on page 178).
3. Select and expand the XML section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the XML tab in the Preview pane to see the effects of your changes.

**Tip:** Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page (on page 179).

---

Outline View for XML Documents

The Outline view displays a general tag overview of the currently edited XML Document. When you edit a document, the Outline view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

**Outline View Features**

The Outline view allows you to:

- Quickly navigate through the document by selecting nodes in the Outline tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the Outline view, and vice versa.
- View document errors, as they are highlighted in the Outline view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

**Outline View Interface**

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are
presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

It also includes a Settings menu in the top-right corner that presents a variety of options to help you filter the view even further.

**Drop and Drop Actions in the Outline View**

Entire XML elements can be moved or copied in the edited document using only the mouse in the Outline view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the Outline view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the (Ctrl (Command on OS X)) key after dragging, a copy operation will be performed instead of a move.

Figure 300. Outline View

Outline View Filters

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are
presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view:

**Filter returns exact matches**

The text filter of the Outline view returns only exact matches.

**Selection update on cursor move (Available in Text mode)**

Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

**Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

**Show comments and processing instructions**

Show/hide comments and processing instructions in the Outline view.

**Show element name**

Show/hide element name.

**Show text**

Show text additional text content for the displayed elements.

**Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (on page 259).

**Configure displayed attributes**

Displays the XML Structured Outline preferences page (on page 259).

**Outline View Contextual Menu Actions**

The contextual menu of the Outline view contains the following actions:

**Edit Attributes**

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

**Edit Profiling Attributes (Available in Author mode)**

Allows you to change the profiling attributes (on page 969) defined on all selected elements.
Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand More

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.
Inserting or Opening a File at Cursor Location

When editing content in **Text** mode, the following actions (with regard to inserting, opening, or comparing files) are available in the **Document > File** menu:

**Insert File**

Inserts the content of the file with the specified file path into the current document, at the current position of the cursor.

**Open File at Cursor**

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

**Open File at Cursor in System Application**

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

**Compare**

Opens the current file in the **Compare Files** tool (**on page 2770**).

Adjusting the Transparency of XML Markup

Most of the time you want the content of a document displayed on screen with zero transparency. However, if you want to focus your attention only on editing text content inside XML markup, Oxygen XML Editor offers the option of reducing the visibility of the markup by increasing their transparency when displayed in **Text** mode. To change the level of transparency, use the **Tags Transparency Selector** drop-down menu that is available from the **Source** toolbar. By default, this drop-down menu is not visible. You can add it to the toolbar by using the **Configure Toolbars action** (**on page 273**). There are several levels of transparency that can be adjusted to make the content more or less visible:

- **Normal Contrast** - Resets the transparency level back to normal.
- **Semi-transparent Text** - Slightly reduces the visibility of text to place greater emphasis on the visibility of the XML markup.
- **Transparent Text** - Greatly reduces the visibility of text to place even greater emphasis on the visibility of the XML markup.
- **Semi-transparent Markup** - Slightly reduces the visibility of the XML markup to place greater emphasis on the visibility of the text.
- **Transparent Markup** - Greatly reduces the visibility of the XML markup to place even greater emphasis on the visibility of the text.

Locking and Unlocking XML Markup

For documents with fixed markup, such as forms in which the XML tags are not allowed to be modified (only their text content), the possibility to edit the XML tag names can be toggled on or off with the Lock / Unlock the XML tags action available in Text editing mode from the Source submenu from the contextual menu (or Document > Source menu).

You can set the default lock state for all opened editors using the Lock the XML tags option in the Text preferences page (on page 129).

Formatting and Indenting XML Documents

Oxygen XML Editor creates XML documents using several edit modes (on page 303). In Text mode (on page 303), you as the author decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Editor must decide how to format and indent the XML. Oxygen XML Editor will also format and indent your XML for you in Text mode if you use one of the Format and Indent options:

- **Document > Source > ➕ Format and Indent** - Formats and indents the whole document.
- **Document > Source > ➕ Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the Source submenu of the contextual menu.
- **Document > Source > ➕ Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the Source submenu of the contextual menu.

A number of settings affect how Oxygen XML Editor formats and indents XML. Many of these settings have to do with how whitespace is handled.
Significant and insignificant whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called insignificant whitespace. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called significant whitespace.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```xml
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom, or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise destroyed; nor will we not pass upon him, nor condemn him, but by lawful judgment of his Peers, or by the <xref href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html" scope="external">Law of the land</xref>. We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called normalizing space.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```xml
<codeblock>
class HelloWorld
{
    public static void main(String args[]) {
        System.out.println("Hello World");
    }
}
</codeblock>
```

Here every whitespace character between the codeblock tags should be treated as significant.
How Oxygen XML Editor determines when whitespace is significant

When Oxygen XML Editor formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor assigns each element in the document to one of four categories:

Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant. However,

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```xml
<p>The file is located in <i>HOME</i>/USER/hello.
This is a <strong>big</strong> deal.</p>
```
In this example, whitespace should not be introduced around the \textit{\texttt{i}} tags as it would introduce extra significant whitespace into the document. The space between the end \textit{\texttt{<strong>}} tag and the beginning \textit{\texttt{<emphasis>}} tag should be normalized to a single space, not zero spaces.

**Preserve space**

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor consults several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an \textit{\texttt{xml:space="preserve"}} attribute in the source file, it will be assigned to the preserve space category. If an element has the \textit{\texttt{xml:space="default"}} attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor consults information from the following sources:

\texttt{xml:space}

If the XML element contains the \texttt{xml:space} attribute, the element is promoted to the appropriate category based on the value of the attribute.

**CSS whitespace property**

If the CSS stylesheet controlling the **Author mode** editor applies the \texttt{white-space: pre} setting to an element, it is promoted to the preserve space category.

**CSS display property**

If a text node contains only white-spaces:

- If the node has a parent element with the CSS \texttt{display} property set to \texttt{inline} then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS \texttt{display} property set to \texttt{inline} then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS \texttt{display} property set to \texttt{table} then the node is assigned to the ignore space category.

**Schema aware formatting**
If a schema is available for the XML document, Oxygen XML Editor can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema aware formatting can be turned on and off.

- To turn it on or off for Author mode, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Edit modes > Author > Schema aware, and select/deselect the Schema aware normalization, format and indent option (on page 137).
- To turn it on or off for the Text editing mode, open the Preferences editing mode (Options > Preferences) (on page 79), go to Editor > Format > XML, and select/deselect the Schema aware format and indent option (on page 163).

**Preserve space elements list**

If an element is listed in the Preserve space tab of the Element Spacing list (on page 162) in the XML formatting preferences (on page 160), it is promoted to the preserve space category.

**Default space elements list**

If an element is listed in the Default space tab of the Element Spacing list (on page 162) in the XML formatting preferences (on page 160), it is promoted to the default space category.

**Mixed content elements list**

If an element is listed in the Mixed content tab of the Element Spacing list (on page 162) in the XML formatting preferences (on page 160), it is promoted to the mixed content category.

**Element content**

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.
Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, a element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In Author mode, if an element is marked as mixed content in the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as blocks by the associated CSS (that is, they have a CSS property of display: block). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only block elements (on page 3280). In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the Schema Aware Editing option (on page 138) in the Schema-Aware preferences page.

How Oxygen XML Editor formats and indents XML

You can control how Oxygen XML Editor formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- Format preferences page (on page 157)
- XML Formatting preferences page (on page 160)
- Whitespaces preferences page (on page 164)

When Oxygen XML Editor formats and indents XML

Oxygen XML Editor formats and indents a document, or part of it, on the following occasions:

- In Text mode when you select one of the format and indent actions (Document > Source > Format and Indent, Document > Source > Indent Selection, or Document > Source > Format and Indent Element).
- When saving documents in Author mode.
- When switching from Author mode to another mode.
- When saving documents in Design mode.
- When switching from Design mode to another mode.
- When saving or switching to Text mode from Grid mode, if the Format and Indent when passing from grid to text or on save option (on page 130) is selected in the Grid preferences page.
Setting an Indent Size to Zero

Oxygen XML Editor will automatically format and indent (on page 863) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

**Note:** Changing the indent size does not override the rules that Oxygen XML Editor uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

**Maintaining zero indent in documents with zero indent**

If you have existing documents with zero indent and you want Oxygen XML Editor to maintain a zero indent when editing or formatting those documents:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format (on page 157).
2. Select Detect indent on open.
3. Select Use zero-indent if detected.

Oxygen XML Editor will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor will use the indent closest to what it detects in the document.

**Enforcing zero indent for all documents**

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Format (on page 157).
2. Deselect Detect indent on open.
3. Set Indent size to 0.

All documents will be formatted and indented with an indent of zero.

**Warning:** Setting the indent size to zero can change the meaning of some file types, such as Python source files.
Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (pretty-print (on page 3286)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the Format and Indent Files action that is available in the contextual menu of the Project view (on page 333) or from the Tools menu. This opens the Format and Indent Files dialog box that allows you to configure options for the action.

Figure 302. Format and Indent Files Dialog Box

The Scope section allows you choose from the following scopes:

- **All opened files** - The pretty-print (on page 3286) is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - The pretty-print (on page 3286) is performed in the files located at a specified path.

The Options section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the pretty-print (on page 3286) is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
- **Include hidden files** - When selected, the pretty-print (on page 3286) is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Editor makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

Managing Highlighted Content

While working with XML documents you often have frequent changes to the structure and content. You are often faced with a situation where you need to make a slight change in multiple places in the same document. Oxygen XML Editor includes a feature, *Manage Highlighted Content*, that is designed to help you achieve this.

When you are in Text mode and you perform a search operation or apply an XPath that highlights multiple results, you can access the *Manage Highlighted Content* submenu by right-clicking any of the highlights in the editing pane. If the results are displayed only in the Results panel at the bottom of the screen, you can use the ✉ Highlight all results in editor button (on the right side of the Results panel) to display all the highlights in the editor (then you can access the *Manage Highlighted Content* submenu from the contextual menu of any highlight.

The following options are available in the *Manage Highlighted Content* submenu:

- **Modify All**
  
  Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

  **Note:** If you select a very large number of highlights that you want to modify using this feature, a dialog box informs you that you may experience performance issues. You have the option to either use the Find/Replace operation (on page 740), or continue the operation.

- **Surround All**
  
  Use this option to surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.

- **Remove All**
  
  Removes all the highlighted content.

If you right-click content in another part of the document, other than a highlight, you have the option to select the following option:

- **Modify All Matches**
Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment in which the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Quick Assist Support for IDs and IDREFS

The Quick Assist support (on page 3286) is activated automatically when you place the cursor inside an ID or IDREF in Text mode. To access it, click the yellow bulb help marker placed on the current line, in the line number stripe of the editor. You can also invoke the Quick Assist menu from the contextual menu or by pressing Alt+1 (Command+Alt+1 on Mac OS X) on your keyboard.

The following actions are available:

- Rename in
  Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (on page 1129). For a preview of the changes you are about to make, click Preview. This opens the Preview dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- Search Declarations
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

- Search References
  Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

- Change scope
  Opens the Select the scope for the Search and Refactor operations (on page 1129) dialog box.

- Rename in File
  Renames the ID you are editing and all its occurrences from the current file.

- Search Occurrences
  Searches for the declaration an references of the ID located at the cursor position in the current document.
Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the Text mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

Note: Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Mark Occurrences (on page 179).

Contextual Menu Actions in Text Mode

When editing XML documents in Text mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu):

Add File to Review Task

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Cut, Copy, Paste

Executes the typical editing actions on the currently selected content.

Copy XPath

Copies the XPath expression of the current element or attribute (or property for JSON documents) from the current editor to the clipboard.
Toggle Comment (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment the current line is commented. If the cursor is positioned inside a comment then the commented text is uncommented.

Go to submenu

This submenu includes the following actions:

- Go to Matching Tag (Ctrl + Shift + G)
  Moves the cursor to the end tag that matches the start tag, or vice versa.
- Go after Next Tag (Ctrl + CloseBracket (Command + CloseBracket on OS X))
  Moves the cursor to the end of the next tag.
- Go after Previous Tag (Ctrl + OpenBracket (Command + OpenBracket on OS X))
  Moves the cursor to the end of the previous tag.

Select submenu

This submenu allows you to select the following:

- Element
  Selects the entire element at the current cursor position.
- Content
  Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.
- Attributes
  Selects all the attributes of the element at the current cursor position.
- Parent
  Selects the parent element at the current cursor position.

Source submenu

This submenu includes the following actions:

- Shift Right (Tab)
  Shifts the currently selected block to the right.
- Shift Left (Shift + Tab)
Shifts the currently selected block to the left.

럴 Indent selection (Ctrl + I (Command + I on OS X)) اخبار
Corrects the indentation of the selected block of lines if it does not follow the current indenting preferences (on page 157).

الة Escape Selection اريخ
Escapes a range of characters by replacing them with the corresponding character entities.

الة Unescape Selection اريخ
Replaces the character entities with the corresponding characters.

عال Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on OS X)) اريخ
Pretty-prints (on page 3286) the element that surrounds the current cursor position.

عال To Upper Case اريخ
Converts the selected content to upper case characters. This works with contiguous and multiple selections.

عال To Lower Case اريخ
Converts the content selection to lower case characters. This works with contiguous and multiple selections.

عال Capitalize Lines اريخ
It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

عال Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X)) اريخ
Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 770). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

• 0x0045 will be converted to E
• 0x0125 to #
• 265 to #
• 2190 to #

**Note:** For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent *(on page 779).*

**Base64 Encode/Decode submenu**

This submenu include the following actions for encoding or decoding base 64 schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page *(on page 125)* will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page *(on page 261).*

**Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page *(on page 125)* will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page *(on page 261).*
Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding base32 schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 125) will be used. Likewise, the same is true if the Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions option is not selected in the Messages preference page (on page 261).

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the Encoding for Base64, Base32, Hex conversions option in the Encoding preferences page (on page 125) will be used. Likewise, the same is true
if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page.

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Hex Encode/Decode submenu**

This submenu include the following actions for encoding or decoding hex schemes:

**Import File to Encode and Insert**

Encodes a file and then inserts the encoded content into the current document at the cursor position.

**Decode Selection and Export to File**

Decodes a selection of text from the current document and then exports (saves) the result to another file.

**Encode Selection**

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding preferences page** will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page.

**Decode Selection**

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to
choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the Encoding preferences page (on page 125) will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the Messages preference page (on page 261).

**Modify All Matches**

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Join and Normalize Lines** (**Ctrl + J (Command + J on OS X)**)

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

**Insert new line after** (**Ctrl + Alt + Enter (Command + Alt + Enter on OS X)**)

This action has the same result as moving the cursor to the end of the current line and pressing the **ENTER** key.

**Insert XInclude**

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

**Note:** In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

**Import entities list**

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:
Lock / Unlock the XML Tags

Disables or enables the ability to edit XML tags.

Canonicalize

Opens the Canonicalize dialog box that allows you to select a canonicalization (on page 3280) algorithm to standardize the format of the document.

Sign

Opens the Sign dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result. The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the Tag dialog box. The Specify the tag drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with
different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

**Go to Definition (Ctrl + Shift + Enter)**

Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a "type" belonging to the `http://www.w3.org/2001/XMLSchema-instance` namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

**Refactoring submenu**

This submenu includes the following actions:

- **Rename Element**

  The element from the cursor position, and any elements with the same name, can be renamed according with the options from the *Rename* dialog box.

- **Rename Prefix (Alt + Shift + P (Command + Shift + P on OS X))**

  The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the *Rename* dialog box.

  - If you select the *Rename current element prefix* option, the application will recursively traverse the current element and all its children. For example, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.

  - If you select the *Rename current prefix in all document* option, the application will apply the change on the entire document.

  - To also apply the action inside attribute values, select the *Rename also attribute values that start with the same prefix* checkbox.

- **Surround with submenu**
Presents a drop-down menu that allows you to choose a tag to surround a selected portion of content.

**Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 167) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 167) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with [tag] (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

**Delete element tags (Alt + Shift + X (Command + Alt + X on OS X))**

Deletes the start and end tag of the current element.

**Split element (Alt + Shift + D (Ctrl + Alt + D on OS X))**

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

**Join elements (Alt + Shift + J (Command + Alt + J on OS X))**

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

### Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**

Allows you to remove one or more attributes.
**Rename attribute**
Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
Allows you to delete elements.

**Delete element content**
Allows you to delete the content of elements.

**Insert element**
Allows you to insert new elements.

**Rename element**
Allows you to rename elements.

**Unwrap element**
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**
Allows you to surround elements with element tags.

**Wrap element content**
Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**
Allows you to insert an XML fragment.

**Replace element content with XML fragment**
Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**
Allows you to replace elements with an XML fragment.

**Manage IDs submenu**
This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

- **Rename in**
  Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation (on page 1129). For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- **Rename in File**
  Renames the ID you are editing and all its occurrences from the current file.

- **Search References**
  Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** (on page 1129) dialog box, this scope will be used instead.

- **Search References in**
  Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** (on page 1129).

- **Search Declarations**
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select...**
the scope for the Search and Refactor operations (on page 1129) dialog box, this scope will be used instead.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 1129).

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Quick Assist (Alt + 1 (Command + Alt + 1 on OS X))

Available when the cursor is inside an ID or IDREF, this action opens the Quick Assist (on page 3286) window that allows you to select some search and refactoring actions for the selected ID or IDREF.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a Create new file button that starts the New document wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the Compare Files tool (on page 2770).

Resource Hierarchy

Opens the Resource Hierarchy/Dependencies view (on page 1130) that allows you to see the resource hierarchy for an XML document.

Resource Dependencies

Opens the Resource Hierarchy/Dependencies view (on page 1130) that allows you to see the resource dependencies for an XML document.
Editing XML Documents in Grid Mode

The Grid mode in Oxygen XML Editor displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple contextual menu actions, drag/drop, or copy/paste operations. The text content can be modified simply by editing the value of cells that contain the text and a useful Content Completion Assistant (on page 3280) is also available to help you edit or insert XML elements.

To switch to this mode, select Grid at the bottom of the editing area.

For more information about some of the features available in the Grid editor, watch our video demonstration:

https://www.youtube.com/embed/PoYm2VqisWk

Editing Actions in Grid Mode

Since Grid mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the Content Completion Assistant (on page 891) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Editor provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

Tip: There are two different types of layouts available in Grid mode. Most people prefer to leave it on the default Grid mode layout, but there is also a Tree mode layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for your particular situation from the Document > Grid Layout menu.

Expanding/Collapsing Nodes

An arrow sign (стрелка) displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (стрелка). The expand/collapse actions can also be invoked with the NumPad+ and NumPad- keys, or from the Expand/Collapse submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select Expand All from the Expand/Collapse submenu. To collapse all node, right-click any cell and select Collapse All from the Expand/Collapse submenu.
Editing Elements or Attributes

To edit elements or attributes in Grid mode, simply double-click the cell that contains the element or attribute (or select the cell and press Enter) to invoke the Content Completion Assistant (on page 891). This opens a pop-up window that offers a list of proposals that are valid for that particular node.

Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press Enter (or double-click the cell), and start editing.

To stop editing a cell value, press Enter again.

To cancel the editing without saving the current changes in the document, press the Esc key.

Editing the Structure of the Nested Tables

To edit the structure of the nested tables in Grid mode, Oxygen XML Editor provides the following actions in the contextual menu (many of them also appear in the submenus of the Document menu, or the toolbar):

- Cut, Copy, Paste, X Delete common editing actions
  - Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

Paste as Child
  - Pastes the copied content as the last child of the current selection.

Duplicate
  - Creates a new node by duplicating the currently selected one.

Insert Before
  - Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

Insert After
  - Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

Append Child
  - Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.
Sort Ascending, Sort Descending

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between numerical and alphabetical.

Insert Row

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press Enter.

Insert Column

Inserts a column after the current selection.

Clear Content

Removes all content from the current cell.

Expand/Collapse > Expand All

Expands the selection and all its children.

Expand/Collapse > Collapse All

Collapses the selection and all its children.

Expand/Collapse > Expand Children

Expands all the children of the selection but not the selection.

Expand/Collapse > Collapse Children

Collapses all the children of the selection but not the selection.

Expand/Collapse > Collapse Others

Collapses all the siblings of the current selection but not the selection.

Refresh Selected

Forces the layout to be recomputed.

Related Information:

- Grid Mode Navigation (on page 393)
- Copy and Paste in the Grid Editing Mode (on page 889)
Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the Grid mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use Ctrl + Single-Click (Command + Single-Click on OS X).

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the Grid editor and text from other applications into the Grid.

Tip: When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together. To force the layout to be recomputed, you can use the Refresh Selected action that is available in the contextual menu and in the Document > Grid Edit menu.

Copy and Paste in the Grid Editing Mode

Selecting content in the Grid mode is similar to working with any table with a little more complexity. Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use Ctrl + Single-Click (Command + Single-Click on OS X).
Pasting Content Within Grid Mode

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

- **Paste (Ctrl + V (Command + V on OS X))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the Grid editor can also be pasted into Text mode or other external applications. When pasting copied content from Grid mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

![Figure 303. Copying from Grid to Other Editors](image)

Pasting Content from Other Editors into Grid Mode

You can also paste well-formed XML content or tab-separated values from other editors into the Grid editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.
If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the Grid editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the Grid editor.

Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the Grid editing mode offers a **Content Completion Assistant (on page 3280)** for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).
Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Editor and switch to **Grid** mode.
2. **Expand the nodes** *(on page 886)* to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export *(Copy from the contextual menu or Ctrl+C)*.
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Editor also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in **Grid** mode). For more information, see **Import from MS Excel Files – Grid Mode Method** *(on page 2278)*.

For more information about exchanging data between Oxygen XML Editor and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

**Related Information:**

Editing XML Documents in Author Mode

The Author editing mode in Oxygen XML Editor allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. This makes structured authoring easier for people who are not familiar with XML and it also provides easier access to the XML structure for XML experts. Oxygen XML Editor provides support for visually editing the most commonly used XML vocabularies in Author mode, including DITA, DocBook, TEI, and XHTML.

Adding text content in Author mode is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output. You can even play audio and video objects directly in Author mode and it includes an intuitive Image Map Editor (on page 1029). You can easily change the rendering by selecting one of the preset main styles (on page 3284) from the Styles drop-down menu (on page 2350) (available on the toolbar) and combine multiple alternate styles (on page 3279) that behave like layers. You can also use the options in the Tags Display Mode drop-down menu (on page 441) to control how much XML markup is displayed in Author mode and there are various features and views that provide information about the XML structure based upon your current location within the document.

Author mode provides numerous helpful editing actions, many of which are specific to the type of document you are editing and it includes a variety of other powerful editing features, such as keyboard shortcuts, drag and drop support (on page 918), a Smart Paste mechanism (on page 918), and an intelligent Content Completion Assistant (on page 921). Author mode also allows you to visualize and manage profiled content (on page 969), you can collaborate with others with various review features (on page 941) (such as the ability to add comments, track changes, or highlight content), and includes many other unique features.

To switch to this mode, click the Author button at the bottom of the editing area.

For more information about some of the features available in the visual Author editing mode, watch our video demonstration:

https://www.youtube.com/embed/bnQwJZD58wY

Author Mode User Roles

There are two main types of users for the Author mode: framework developers and content authors.
Framework Developers

A framework developer is a technical person with advanced XML knowledge who defines the framework (on page 3282) for authoring XML documents in the visual editor. Once the framework is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The framework (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in Author mode.

The framework details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of XML Catalogs (on page 3289).
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor includes some ready-to-use built-in document types for XML frameworks, such as DocBook, DITA, TEI, JATS, and XHTML.

Content Authors

A content author does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the framework set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

Styling XML Documents in Author Mode

The Author mode renders the content of the XML documents visually, based on CSS stylesheets associated with the document.

Selecting and Combining Multiple CSS Styles

Oxygen XML Editor provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (on page 3284) and multiple alternate CSS styles (on page 3279). This makes it easy to change the look of the document as it appears in Author mode and the output without having to continually edit the CSS stylesheets.
Tip: For information about configuring the Styles drop-down menu, see Configuring and Managing Multiple CSS Styles for a Framework (on page 2348).

You can select a main CSS style that applies to the whole document and then alternate styles that are applied as layers to specific parts of the document. For example, in the subsequent figure, a DITA document has the Century style selected for the main CSS and the alternate styles Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.

The selections from the Styles drop-down menu are persistent, meaning that Oxygen XML Editor will remember the selections when subsequent documents are opened.

Figure 307. Styles Drop-down Menu in a DITA Document

Related Information:

- Associating a Schema to XML Documents (on page 1112)
- Configuring and Managing Multiple CSS Styles for a Framework (on page 2348)
- Customizing Author Mode Using CSS Files Associated with a Framework (on page 2346)
Navigating the Document Content in Author Mode

Oxygen XML Editor includes some useful features to help you navigate XML documents.

**Navigation Keyboard Shortcuts**

**Tab**

Navigate to the next XML node.

**Tip:** If you encounter a *space-preserved element (on page 3287)* when you navigate through a document and you do not press another key, pressing the *Tab* key will continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the *Tab* key can be used to arrange the text.

**Shift + Tab**

Navigate to the previous XML node.

**Ctrl + RightArrow (Command + RightArrow on OS X)**

Navigate one word forward.

**Ctrl + LeftArrow (Command + LeftArrow on OS X)**

Navigate one word backward.

**Ctrl + Home (Command + Home on OS X)**

Position the cursor at the beginning of the document.

**Ctrl + End (Command + End on OS X)**

Position the cursor at the end of the document.

**Navigating to a Modification**

Oxygen XML Editor includes some actions that help you to quickly navigate to a particular modification. These navigation buttons are available in the main toolbar (they can also be accessed from the *Find* menu):

**Navigate to Last Modification**

Navigates to the last modification in any opened tab.

**Navigate to Last Tab**

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links in *Text* or *Author* mode.
Forward

Available after you use the Back button at least once, and it navigates in the opposite direction as the Back button.

Navigating with the Outline View

Oxygen XML Editor includes an Outline view (on page 347) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the Outline view, the corresponding nodes are highlighted in the editor area.

Figure 308. Outline View Navigation in Author Mode

Using the Breadcrumb to Navigate

A breadcrumb on the stripe at the top of the document indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 309. Breadcrumb in Author Mode

The last element listed in the breadcrumb is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the breadcrumb selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc.), the linking support is useful for navigating between the documents. In the built-in frameworks that are bundled with Oxygen XML Editor, links are marked with an icon representing a chain link (🔗). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained
by using the **Document > File > Open file at cursor (Ctrl + Enter (Command + Enter on OS X))** action when the cursor is inside a link element.

**Note:** Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor or in the default system application. If the target file does not exist, Oxygen XML Editor prompts you to create it.

### Navigating with Bookmarks

A position in a document can be marked with a **bookmark**. You can then quickly go to the marked position with a keyboard shortcut or a menu action. This is useful when navigating large documents or working on multiple documents where the cursor needs to move between several marked positions. The **bookmarks** are displayed with a small icon on the vertical strip to the left of the editor. You can place up to nine distinct **bookmarks** in any document. Shortcut keys are available to navigate to any of the marked positions (**Ctrl+1** through **Ctrl+9**). There are also shortcuts for creating bookmarks (**Ctrl+Shift+1** through **Ctrl+Shift+9**). You can also configure these shortcut keys in the **Options > Menu Shortcut Keys** (on page 248) menu.

Figure 310. Editor Bookmarks

![Editor Bookmarks](image)

To insert a **bookmark** in **Author** mode, do any of the following:

- Click in the vertical stripe on the left side of the editor (to the left of the line number).
- Press **(F9)** on your keyboard or use any of the specific bookmark creation shortcuts (**Ctrl+Shift+1** through **Ctrl+Shift+9**).
- Select the 📞 **Create Bookmark** action from the **Edit > Bookmarks** menu.

To remove **bookmark** in **Author** mode, do either of the following:

- Left-click its icon in the vertical stripe.
- Right-click its icon on the vertical stripe and select **Remove** or **Remove all** (**Ctrl+F7** (Command +F7 on OS X)).

To navigate to a specific **bookmark**, do either of the following:

- Use any of the specific bookmark navigation shortcuts (**Ctrl+1** through **Ctrl+9**).
- Use one of the actions available on the **Edit > Bookmarks > Go to** menu.
Tip: The navigation shortcuts work even if the document where the bookmark was inserted has been closed. In this case, using the shortcut will automatically re-open the document.

Displaying the Markup

You can control the amount of markup that is displayed in the Author mode with various levels of tag modes for both block and in-line elements.

The following dedicated tag modes are available from the Tags Display Mode drop-down menu (available on the toolbar):

- Full Tags with Attributes
  Displays full tag names with attributes for both block and in-line elements.

- Full Tags
  Displays full tag names without attributes for both block and in-line elements.

- Block Tags
  Displays full tag names for block elements and simple tags without names for in-line elements.

- Inline Tags
  Displays full tag names for in-line elements, while block elements are not displayed.

- Partial Tags
  Displays simple tags without names for in-line elements, while block elements are not displayed.

- No Tags
  No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Opens the Author preferences page (on page 131) where you can configure options regarding tags, such as the default Tags Display Mode, Tags Background Color, Tags Foreground Color, Tags Font, and whether or not Oxygen XML Editor will use a Compact Tag Layout for displaying the tags (this option tries to group consecutive block tags on the same line).

Note: The associated CSS information is used to determine whether a tag should be considered in-line or block. If the current document does not have an associated CSS stylesheet, then the Full Tags mode will be used.
Displaying Referenced Content

The references to entities, XInclude, DITA conrefs, and constructs in other vocabularies with displayable referenced content (on page 2402) are expanded by default in Author mode and the referenced content is displayed. You can control this behavior from the Author preferences page (on page 131). The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in current document.

![XInclude reference](image1)

**Figure 311. XInclude reference**

![External entity reference](image2)

**Figure 312. External entity reference**

When the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the ⚙ icon) that is displayed before the referenced content or by using the Edit Reference action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the XML Catalog (on page 3289) set in the XML Catalog preferences page (on page 189).

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Editor.
- On demand, by using the 🔄 Refresh references action (on page 1060). This is useful when the referenced content is modified outside the Oxygen XML Editor scope.

Related Information:
Visual Hints for the Cursor Position

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

• Before first block - The cursor is positioned before the first block (on page 3280) child of the current node.

• Between two block elements - The cursor is positioned between two block elements (on page 3280).

• After last block - The cursor is positioned after the last block element (on page 3280) child of the current node.

• Inside a node - The cursor is positioned inside a node.

• Before an inline element - The cursor is positioned inside an element, before a child inline element (on page 3283).

• Between two inline elements - The cursor is positioned between two inline elements (on page 3283).
- **After an inline element** - The cursor is positioned inside an element, after an child *inline element* (on page 3283).

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, open the *Preferences* dialog box (*Options > Preferences*) (on page 79), go to *Author > Cursor Navigation*, and deselect the *Show cursor position tooltip* option (on page 136). Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.

**Note:** The position information tooltip is not displayed if *Full Tags with Attributes* or *Full Tags* is selected in the *Tags display mode* drop-down menu (on page 441).

---

**Location Tooltip**

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor displays a transparent preview of the position information, called the *Location Tooltip*:

Oxygen XML Editor displays a *Location Tooltip* when the following conditions are met:

- You are editing the document in one of the following *tags display modes* (on page 441): *Inline Tags*, *Partial Tags*, *No Tags*.
- The mouse pointer is moved between *block elements* (on page 3280).

To activate or deactivate this feature, use the *Show location tooltip on mouse move* option (on page 136) in the *Cursor Navigation* preferences page (on page 136).

---

**Whitespace Handling in Author Mode**

When you edit a document in *Author* mode, Oxygen XML Editor must serialize the resulting document as XML. Oxygen XML Editor serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor *formats and indents the XML document* (on page 863) according to the current *format and indent settings* (on page 157).
Minimizing Whitespace Differences Between Versions

When serializing a document to XML, Author mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

Entering Whitespace in Author Mode

Oxygen XML Editor controls the entry of whitespace characters in Author mode according the XML whitespace rules (on page 863), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its built-in document types (on page 1537), Oxygen XML Editor is correctly configured to recognize preserve space elements (on page 160) and to allow you to enter additional spaces in them.

If you are using a built-in document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is configured correctly (on page 2322) so that Oxygen XML Editor recognizes that the current element is a preserve-space element.

Serialization Options for Author Mode

The Author preferences page (on page 131) (open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author) includes a Serialization section (on page 134) that contains some options that control how the formatting and indenting is applied when a document is saved in Author mode or when switching from Author to Text mode. It also includes a Compatibility with other tools option (on page 135) that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.
Editing Content in Author Mode

The **Author** mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

**Undo/Redo Actions**

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

- **Undo (Ctrl + Z (Command + Z on OS X))**
  
  Reverses a maximum of 200 editing actions (configurable with the **Undo history size option** (on page 126) in the **Editor** preferences page) to return to the preceding state.

  - **Note:** Complex operations such as **Replace All** or **Indent selection** count as single undo events.

- **Redo (Ctrl + Y (Command + Shift + Z on OS X, Ctrl + Shift + Z on Linux/Unix))**
  
  Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

**Copy and Paste Actions**

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

- **Cut (Ctrl + X (Command + X on OS X))**
  
  Removes the current selected content from the document and places it in the clipboard.

- **Copy (Ctrl + C (Command + C on OS X))**
  
  Places a copy of the current selected content in the clipboard.

- **Paste (Ctrl + V (Command + V on OS X))**
  
  Inserts the current clipboard content into the document at the cursor position.

- **Select All (Ctrl + A (Command + A on OS X))**
  
  Selects the entire content of the current document.

**Entering Text in Elements**

By default, you can only enter text in elements that accept text content. If the element is declared as **empty** or **element only** in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.
To allow text to be inserted in these instances, go to the Schema-Aware preferences page and
deselect the Reject action when its result is invalid option in the Typing actions section (on page 139).

Editing Text Content Without Modifying the XML Markup

You can use the options in the Tags Display Mode drop-down menu (on page 441) (available
on the toolbar) to control how tags are displayed in Author mode. This can help you to clearly see
where the current cursor position is within the tag structure so that you can avoid making unintended
modifications to the XML markup. You can also switch to the Grid editing mode (on page 886) to
modify text content without affecting the XML tags.

Changing the Font Size (Zoom)

The font size of the editor panel can be changed with the following actions that are available with
shortcuts or in the Document > Font size menu:

Increase editor font (Ctrl + NumPad+ (Command + NumPad+ on OS X) or Ctrl +
MouseWheelForward (Windows/Linux)

Increases the font size (zooms in) with one point for each execution of the action.

Note: For Mac OS X, if you activate the Enable mouse-wheel zooming
option (on page 126) in the Editor preferences page, you can use Command +
MouseWheelForward to increase the font size (zoom in). It is disabled by default due to
the way inertia affects the mouse wheel on Mac OS X.

Decrease editor font (Ctrl + NumPad- (Command + NumPad- on OS X) or Ctrl +
MouseWheelBackwards (Windows/Linux)

Decreases the font size (zooms out) with one point for each execution of the action.

Note: For Mac OS X, if you activate the Enable mouse-wheel zooming
option (on page 126) in the Editor preferences page, you can use Command +
MouseWheelBackwards to decrease the font size (zoom out). It is disabled by default
due to the way inertia affects the mouse wheel on Mac OS X.

Normal editor font (Ctrl + 0 (Command + 0 on OS X))
Resets the font size to the value of the editor font set in the Fonts preferences page (on page 88).

- Frequently Used Shortcut Keys (on page 27)

Editing XML Markup in Author Mode

Oxygen XML Editor includes some useful actions that allow you to easily edit XML markup in Author mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Editor is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the breadcrumb (on page 907) displayed at the top of the editing window.
- **Outline View** - Click the element name in the Outline view (on page 347).
- **Full Tags Mode** - While editing in Full Tags mode (on page 441), click the start or end tag of the element in the editor.
- **Mouse Selection** - While editing in Full Tags mode (on page 441), click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
- **Shift + Arrow Keys** - While editing in Full Tags mode (on page 441), place the cursor before the start tag of the element, press and hold Shift, and use the arrow keys to make the selection (including the end tag).
**Note:** If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in well-formed XML (on page 1079).

### Using the Breadcrumb in Author Mode

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

**Figure 315. Breadcrumb in Author Mode**

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

#### Edit Attributes

Opens the *in-place attributes editor (on page 429)* that allows you to easily edit the attributes of an element.

#### Edit Profiling Attributes

Allows you to select the *profiling attributes (on page 969)* that apply to a certain element.

#### Append child

Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

#### Insert before

Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

#### Insert after

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

#### Cut

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

#### Copy
Copies the selected element to the clipboard, while preserving the styles of the copied content.

**Paste**

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

**Paste before**

Insert a well-formed element (from the clipboard) before the currently selected element.

**Paste after**

Insert a well-formed element (from the clipboard) after the currently selected element.

**Paste as XML**

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

**Delete**

Deletes the currently selected element.

**Toggle Comment**

Encloses the currently selected element in an XML comment, if the element is not commented, or removes the comment if it is commented.

**Rename Element**

Opens the *Rename* dialog box that allows you to rename the currently selected element and other elements with the same name.

**Tip:** The tag names displayed in the breadcrumb can be customized with an Author mode extension class that implements the AuthorBreadCrumbCustomizer API. See the Oxygen SDK for more details.

**Move Nodes**

You can move XML nodes in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

**Move Up** *(Alt + UpArrow)*

Moves the current node or selected nodes in front of the previous node.

**Move Down** *(Alt + DownArrow)*

Moves the current node or selected nodes after the subsequent node.
Tip: The easiest way to move nodes is to use the Alt + UpArrow and Alt + DownArrow shortcut keys.

Promote/Demote List Item Nodes

You can easily promote or demote selected list item nodes within ordered lists or unordered lists by using the following keyboard shortcuts:

Promote (Shift + Tab)

Promotes an entirely selected list item node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Demote (Tab)

Demotes an entirely selected list item node (the list item is moved to the right). It also works for selections of multiple list item nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Join or Split Elements

You can join or split elements in the current document by using the following actions in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Join Elements

Joins two adjacent block elements (on page 3280) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

Tip: Specifically, the Delete or Backspace keys can be used to join block elements in the following situations:

- The cursor is located before the end position of the first element and (Delete) key is pressed.
- The cursor is located after the end position of the first element and (Backspace) key is pressed.
- The cursor is located before the start position of the second element and (Delete) key is pressed.
- The cursor is located after the start position of the second element and (Backspace) key is pressed.

If the element has no sibling or the sibling element has a different name, an Unwrap operation will be performed.
Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Rename Elements

You can rename elements by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Renew Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (wrap the content) by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Surround with Tags (Ctrl + E (Command + E on OS X))

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

• If the Position cursor between tags option (on page 167) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (on page 167) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

Delete Element Tags
Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Tip: Specifically, the Delete or Backspace keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and (Delete) key is pressed.
- The cursor is located after the start position of the element and (Backspace) key is pressed.
- The cursor is located before the end position of the element and (Delete) key is pressed.
- The cursor is located after the end position of the element and (Backspace) key is pressed.

If the element has no sibling or the sibling element has a different name, an Unwrap operation will be performed.

Remove Markup from Blocks of Content

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Tip: You can use the (Delete) or (Backspace) keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

Remove Text from Selected Markup

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the Refactoring submenu of the contextual menu (or from the Document > Markup menu):

- Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.
Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the Refactoring submenu of the contextual menu:

DITA Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert conref attributes to conkeyref attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task
Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

- **Add/Change attribute**
  - Allows you to change the value of an attribute or insert a new one.

- **Convert attribute to element**
  - Allows you to change an attribute into an element.

- **Delete attribute**
  - Allows you to remove one or more attributes.

- **Rename attribute**
  - Allows you to rename an attribute.

- **Replace in attribute value**
  - Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

- **Delete comments**
  - Allows you to delete comments found inside one or more elements.
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

- [Displaying the Markup](on page 441)
Editing Attributes in Author Mode

You can easily edit attributes in Author mode by using the Attributes View (on page 426) and Oxygen XML Editor also allows you to edit attribute and element values in-place, directly in the Author mode, using an in-place attribute editor.

In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

• Select an element or place the cursor inside it and then press the Alt + Enter keyboard shortcut.
• Double-click any named start tag when the document is edited in one of the following display modes. (on page 441): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.

This opens an in-place attributes editor that contains the same content as the Attributes view. By default, this editor presents the Name and Value fields, with the list of all the possible attributes collapsed.

Figure 316. In-place Attributes Editor

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the Attributes view.
Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the Browse button to select a URL for the value of an attribute. You can also press Ctrl + Space to open a content completion window that offers a list of possible choices and allows you to select multiple values.

Note: For built-in frameworks, if the selected attribute in the Name field is an @id attribute, the Browse button is replaced by a Generate Unique ID Value button. Clicking this button will automatically generate a unique ID for the selected element.

If you click More while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 317. In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

Note: If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

Related Information:

- Attributes View in Author Mode (on page 426)

Folding XML Elements in Author Mode

When working with a large document, the folding (on page 3282) support in Oxygen XML Editor can be used to collapse some element content leaving only the parts that you need to edit in focus.
Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 318. Folding of XML Elements in Author Mode

The fact that the folds are persistent is a unique feature of Oxygen XML Editor, meaning the next time you open the document the folds are restored to its last state.

Folding Actions in Author Mode

Foldable elements (on page 3282) are marked with a small triangle (✓ / ▼) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the foldable area. To toggle the fold, simply click the icon. Also, the following actions are available in the Folding sub-menu of the contextual menu or from the Document > Folding menu:

- **Toggle Fold** (or you can simply click on the ✓ / ▼ arrow)
  Toggles the state of the current fold.

- **Collapse Other Folds** (**Ctrl + NumPad/ (Command + NumPad/ on OS X)**)
  Folds all the elements except the current element.

- **Collapse Child Folds** (**Ctrl + NumPad. (Command + NumPad. on OS X)**)
  Folds the child elements that are indented one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All** (**Ctrl + NumPad* (Command + NumPad* on OS X)**)
  Unfolds all elements in the current document.

For more information about the folding support in Oxygen XML Editor, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Related Information:
Drag and Drop in Author Mode

The Oxygen XML Editor Author mode includes support for dragging and dropping content in XML documents.

When editing content in Author mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the Author mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the Author mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the Author mode editor is inserted without changes.

Related Information:

- Smart Paste Mechanism (on page 918)

Smart Paste Mechanism

The Author editing mode includes a Smart Paste feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), or other document types within Oxygen XML Editor, and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in Author mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.
Tip: When pasting text fragments formatted with the *Courier New* font, the *Smart Paste* mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a `codeph` element).

**Smart Paste Options**

By default, the *Smart Paste* feature is enabled in Oxygen XML Editor. There are several options in the *Schema Aware* preferences page that control the *Smart Paste* mechanism:

- **Smart paste and drag and drop** - This option determines whether or not Oxygen XML Editor will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.

- **Reject action when its result is invalid** - If you select this option, Oxygen XML Editor will not let you paste content into a position where it would be invalid. This option is deselected by default.

- **Convert external content on paste** - This option determines whether or not Oxygen XML Editor will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.

- **Convert even when pasting inside space-preserve elements** - If you select this option, the *Smart Paste* feature will also work when pasting external content into a space-preserve element (such as a `codeblock`). This option is deselected by default.

**Smart Paste Supported Document Types**

The *Smart Paste* feature is supported for the following document types:

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

For more information about the *Smart Paste* support, watch our video demonstration:

https://www.youtube.com/embed/bpiXZQwzBfA

**Related Information:**

- Customizing Smart Paste Support (on page 2343)
Selecting Content in Author Mode

Oxygen XML Editor includes a variety of keyboard shortcuts that allow you to easily select content in Author mode.

**Selection Shortcuts in Author Mode**

- **Ctrl + A (Meta + A on Mac OS X)**
  Selects all content in the document.

- **Shift + Left/Right Arrow Keys**
  Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

- **Shift + Up/Down Arrow Keys**
  Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

- **Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on Mac OS X)**
  Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

- **Shift + Home**
  Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on Mac OS X, it extends to the beginning of the document).

- **Shift + End**
  Begins a continuous selection at the cursor position and extends it to the end of the current line (on Mac OS X, it extends to the end of the document).

- **Ctrl + Shift + Home**
  Begins a continuous selection at the cursor position and extends it to the beginning of the document.

- **Ctrl + Shift + End**
  Begins a continuous selection at the cursor position and extends it to the end of the document.
**Shift + PageUp**

Begins a continuous selection at the cursor position and extends it up one screen page.

**Shift + PageDown**

Begins a continuous selection at the cursor position and extends it down one screen page.

**Double-Click**

Selects the word at the cursor position.

**Triple-Click**

Selects the node at the cursor position.

**Right-Click > Select > Element**

Selects the entire element at the current cursor position.

**Right-Click > Select > Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Right-Click > Select > Parent**

Selects the entire parent element at the current cursor position.

Content Completion Assistant in Author Mode

One of the most useful features in Author mode is the *Content Completion Assistant* (on page 3280). It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

Figure 319. Content Completion Assistant in Author Mode

The *Content Completion Assistant* is enabled by default. To disable it, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Content Completion, and deselect the Enable content completion option (on page 167).
Using the Content Completion Assistant in Author Mode

To activate the feature in Author mode, use any of the following shortcut keys:

- Enter
- Ctrl + Space (Command + Space on OS X)
- Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)

You can navigate through the list of proposals by using the Up and Down keys on your keyboard. In some cases, the Content Completion Assistant displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can use Tab and Shift + Tab to navigate to those links and Space to trigger them. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in Author mode, simply press Enter.

Types of Proposals Listed in the Content Completion Assistant

The Content Completion Assistant offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert code templates (on page 855).
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in Full Tags mode (on page 441)), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the Show all possible elements in the content completion list option from the Schema-Aware preferences page (on page 139) is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.
Note: By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the Allow only insertion of valid elements and attributes check box from the Schema-Aware preferences page (on page 139).

Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the Content Completion Assistant in certain contexts:

• If the cursor is positioned at the beginning or at the end of the element, the first item offered in the Content Completion Assistant is a New <Element> item. Selecting this item will insert an empty element.

Figure 320. Example (New [Element Name])

• If the cursor is positioned somewhere inside the element, the first entry in the Content Completion Assistant is a Split <Element> item. In most cases, you can only split the closest block element (on page 3280) to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting Split <Element> splits the content of the specified element around the cursor position.

Figure 321. Example (Split [Element Name])

• If the cursor is positioned inside a space-preserved element (on page 3287) (for example, a codeblock), the first choice in the Content Completion Assistant is Enter, which will insert a new line in the content of the element, followed by New <Element>.

Figure 322. Example (‘ENTER’ New Line)
• If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in "Full Tags mode (on page 441)"), it will allow you to rename the element.

Figure 323. Example (Rename)

• If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

Figure 324. Example (Surround)

Related Information:

• Customizing the Content Completion Assistant (on page 2352)

Set the Schema to be Used for Content Completion

The proposals that are presented in the Content Completion Assistant (on page 3280) depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the Content Completion Assistant is specified in the following methods, in the order of their precedence:
• The schema specified explicitly in the document (on page 1120). In this case, Oxygen XML Editor reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
• The default schema declared (on page 1121) in the Schema tab of the Document Type configuration dialog box (on page 99) for the particular document type.

Schema Annotations in Author Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the Content Completion Assistant (on page 3280).

Figure 325. Schema Annotation in the Content Completion Assistant

The schema annotations support is available if the schema type is one of the following:

• XML Schema
• Relax NG
• NVDL schema
• DTD

This feature is enabled by default, but you can disable it by deselecting the Show annotations in Content Completion Assistant (on page 171) option in the Annotations preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as div, body, p, br, table, ul, or ol).

The HTML rendering is controlled by the Show annotations using HTML format, if possible (on page 172) option in the Annotations preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (p, br, ul, li), they are rendered as an HTML document loaded in a web browser. For example, p begins
a new paragraph, \textit{br} breaks the current line, \textit{ul} encloses a list of items, and \textit{li} encloses an item of the list.

**Collecting Annotations from XML Schemas**

In an XML Schema, the annotations are specified in an \textit{<xs:annotation>} element like this:

```xml
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor looks for an annotation in the type definition of that element or attribute.

**Collecting Annotations from Relax NG Schemas**

For Relax NG schema, element and attribute annotations are made using the \textit{<documentation>} element from the \textit{http://relaxng.org/ns/compatibility/annotations/1.0} namespace like this:

```xml
<define name="person">
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person.
    </a:documentation>
    <ref name="name"/>
    <zeroOrMore>
      <ref name="email"/>
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (\textit{http://relaxng.org/ns/structure/1.0}) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the \textbf{Use all Relax NG annotations as documentation} (on page 172) option in the \textbf{Annotations} preferences page.

**Collecting Annotations from Relax NG Compact Syntax Schemas**

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```xml
## Information about a person.
element person { name, email*}
```
Collecting Annotation from DTDs

For DTD, Oxygen XML Editor defines a custom mechanism for annotations using comments enabled by the Prefer DTD comments that start with "doc:" as annotations (on page 171) option in the Annotations preferences page. The following is an example of a DTD annotation:

\[
<!--doc:Description of the element. -->
\]

Related Information:

- Customizing the Rendering of Elements (on page 2364)
- Customizing Annotations in the Content Completion Assistant (on page 2369)

Content Completion Helper Views

Information about the current element being edited is also available in various dockable (on page 3281) views, such as the Model view (on page 353), Attributes view (on page 351), Elements view (on page 355), and Entities view (on page 356). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful Outline view (on page 347), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Model View

The Model view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 326. Model View
The Model view is comprised of two sections, an element structure panel and an annotations panel.

**Element Structure Panel**

The element structure panel displays the structure of the currently edited or selected tag in a treelike format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 327. Element Structure Panel
Annotation Panel

The Annotation panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 328. Annotation panel

Attributes View in Author Mode

The Attributes view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the Window > Show View menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a `false` value for the `oxy-editable` property associated with the element.
- The element is entirely included in a deleted Track Changes marker.
- The element is part of a content fragment that is referenced in Author mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text “[empty]”, painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the Value column. If the possible values of the attribute are specified as list in the schema of the edited document, the Value column acts as a combo box that allows you to either select the value from a list or manually enter it.

**Note:** If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.
You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

**Figure 329. Attributes View**

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

**Expand/Collapse Button**

There is an **Expand/Collapse** (_expand/collapse_) button at the top-right of the view. When expanded, this presents the following additional combo boxes:

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

You can use the **Remove** button to delete an attribute and its value from the selected element.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values. After you have
entered or selected a value, use the \(\text{Update}\) button (or press \text{Enter}\) to add the value to the attribute.

\[\text{Note:}\] For built-in frameworks, if the selected attribute in the \text{Name}\ field is an \text{@id}\ attribute, the \text{Browse}\ button is replaced by a \text{Generate Unique ID Value}\ button. Clicking this button will automatically generate a unique ID for the selected element.

**Contextual Menu Actions in the Attributes View**

The following actions are available in the contextual menu of the \text{Attributes}\ view when editing in \text{Author}\ mode:

- **Set empty value**
  
  Specifies the current attribute value as empty.

- **Remove**
  
  Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the \text{Delete}\ or \text{Backspace}\ keys.

- **Copy**
  
  Copies the \text{attrName}="attrValue"\ pair to the clipboard. The \text{attrValue}\ can be:
  
  - The value of the attribute.
  - The value of the default attribute, if the attribute does not appear in the edited document.
  - Empty, if the attribute does not appear in the edited document and has no default value set.

- **Paste**
  
  Depending on the content of the clipboard, the following cases are possible:
  
  - If the clipboard contains an attribute and its value, both of them are introduced in the \text{Attributes}\ view. The attribute is selected and its value is changed if they exist in the \text{Attributes}\ view.
  - If the clipboard contains an attribute name with an empty value, the attribute is introduced in the \text{Attributes}\ view and you can start editing it. The attribute is selected and you can start editing it if it exists in the \text{Attributes}\ view.
  - If the clipboard only contains text, the value of the selected attribute is modified.
In-place Attributes Editor

Oxygen XML Editor includes an in-place attributes editor in Author mode. To edit the attributes of an XML element in-place, do one of the following:

• Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.

• Double-click any named start tag when the document is edited in one of the following display modes. *(on page 441): Full Tags with Attributes, Full Tags, Block Tags, or Inline Tags.*

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

![In-place Attributes Editor](image)

**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

**Value Combo Box**

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:** For built-in frameworks, if the selected attribute in the **Name** field is an @id attribute, the **Browse** button is replaced by a **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

![In-place Attributes Editor (Full Version)](image)
The full version includes a table grid, similar to the Attributes view, that presents all the attributes for the selected element.

Elements View in Author Mode

The Elements view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the Show only items allowed at cursor position option (on page 260) is not selected in the Views preferences page (on page 259), two additional tabs (Before and After) will be displayed at the bottom of the view and they list elements that are allowed before or after the element at the current cursor position.

Double-clicking any of the listed elements inserts that element into the edited document and its position depends on the tab.

- **Cursor** tab - Double-clicking an element inserts it at the current cursor position.
- **Before** tab - Double-clicking an element inserts it before the element at the cursor position.
- **After** tab - Double-clicking an element inserts it after the element at the cursor position.

Pressing F2 with an element selected will display information about that particular element.

Figure 332. Elements View in Author Mode
Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An entity is defined using the ENTITY statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`&lt;, &gt;, &amp;, &apos;, &quot;`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

**Note:** If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The Entities view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 333. Entities View
The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:** When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

### Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor includes a set of built-in code templates for CSS, LESS, Schematron, XSL, XQuery, JSON, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a `.%` symbol in the content completion list (Enter in Author mode or Ctrl + Space (Command + Space on OS X) in Text mode). Also, in Text mode you can press Ctrl + Shift + Space to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press Enter. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

### How to Create Code Templates

To create a code template, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Click New to open a code template configuration dialog box.
Tip: You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

Figure 334. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:

   - **Name** - The name of the code template.
   - **Description** - [Optional] The description of the code template that will appear in the Code Templates preferences page and in the tooltip message when selecting it from the **Content Completion Assistant (on page 3280)**. HTML markup can be used for better rendering.
   - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
   - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
     - M1 represents the **Command** key on MacOS X, and the **Ctrl** key on other platforms.
     - M2 represents the **Shift** key.
     - M3 represents the **Option** key on MacOS X, and the **Alt** key on other platforms.
     - M4 represents the **Ctrl** key on MacOS X, and is undefined on other platforms.
   - **Content** - Text box where you define the content that is used when the code template is inserted. An **editor variable (on page 276)** can be inserted in the text box using the **Insert Editor Variables** button.

4. Click **OK** to save your new code template.

**Result:** Your code template can now be selected using the **Content Completion Assistant (on page 3280)** (**Enter** in Author mode or **Ctrl + Space** (Command + Space on OS X) in Text mode). The code templates are displayed with a ✂️ symbol.
How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Click the Export button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Templates > Code Templates, click the Import button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Templates > Code Templates.
2. Select Project Options at the bottom of the dialog box. This stores the preferences in the project file (.xpr).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their Project view (on page 333), the code templates will be available in their content completion list.

Tip: It is also possible to configure certain actions that function similar to code templates and add them to the content completion list (on page 2352) for a particular framework. You could then share the whole framework (on page 2371) with other members of your team.

Outline View for XML Documents

The Outline view displays a general tag overview of the currently edited XML Document. When you edit a document, the Outline view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.
Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*`, `?`) and separate multiple patterns with commas.

It also includes a **Settings** menu in the top-right corner that presents a variety of options to help you filter the view even further.

Drop and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **(Ctrl (Command on OS X))** key after dragging, a copy operation will be performed instead of a move.
Outline View Filters

The upper part of the Outline view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as *, ?) and separate multiple patterns with commas.

The following actions are available in the Settings menu of the Outline view:

- **Filter returns exact matches**
  The text filter of the Outline view returns only exact matches.

- **Selection update on cursor move (Available in Text mode)**
  Controls the synchronization between Outline view and source document. The selection in the Outline view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the Outline view also selects the corresponding item in the source document.

- **Flat presentation mode of the filtered results**
  When active, the application flattens the filtered result elements to a single level.

- **Show comments and processing instructions**
  Show/hide comments and processing instructions in the Outline view.

- **Show element name**
  Show/hide element name.
Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel (on page 259).

Configure displayed attributes

Displays the XML Structured Outline preferences page (on page 259).

Outline View Contextual Menu Actions

The contextual menu of the Outline view contains the following actions:

Edit Attributes

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Edit Profiling Attributes (Available in Author mode)

Allows you to change the profiling attributes (on page 969) defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, Copy, Paste, Delete common editing actions

Executes the typical editing actions on the currently selected elements. The Cut and Copy operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)
Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in an XML comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a Rename dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand More

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip: You can copy, cut or delete multiple nodes in the Outline by using the contextual menu after selecting multiple nodes in the tree.

Finding and Replacing Text

You can search for a specific word or string of characters using the following features:

- Find/Replace dialog box (on page 740)
- Find/Replace in Files dialog box (on page 745)
- Quick Find toolbar (on page 752)
- Find all Elements dialog box (on page 751)

Complex search operations may take some time to complete. If a search operation takes more than 5 seconds, you are prompted to decide whether you want to continue the operation or stop it.

Reviewing Documents

Oxygen XML Editor includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.
Tracking Document Changes

The *Track Changes feature (on page 3288)* is a way to keep track of the changes you make in a document. The *Track Changes* feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the *Track Changes feature is activated (on page 944)*, insertions are rendered in Author mode with an underline while deletions are rendered with a strike through.

The *tracked changes* are also displayed in the *Review view (on page 964)* and you can also choose to present the changes in *callouts (on page 958)* by selecting the *Track Changes Deletions (on page 144)* and *Track Changes Insertions (on page 144)* options in the *Callouts preferences page (on page 143)*.

Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of read-only text. The difference between using comments and change tracking is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in *callouts (on page 958)* with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the *Review preferences page (on page 140)*.

Highlighting Content

Oxygen XML Editor includes a highlighting feature that allows you to create digital markers to emphasize important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

Using the Review View

Oxygen XML Editor includes a *Review view (on page 964)* that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The *Review* view is also useful for managing *tracked changes* and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.
You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

**Printing Review Information**

When you print a document from **Author** mode, whatever review information is shown in the main editing area will be included in the printed output. For example, **tracked changes** will be included and as long as the **Comments option (on page 143)** is selected in the **Callouts preferences page (on page 143)**, comment callouts will also be included (same with **tracked change** callouts if their corresponding options are selected in the **Callouts preferences page (on page 143)**).

**Managing Tracked Changes**

Oxygen XML Editor includes a **Track Changes feature (on page 3288)** that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view (on page 964)**.

The **Track Changes** feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the **Review view (on page 964)** and **Attributes view (on page 426)**.

**Types of Tracked Changes**

The types of **tracked changes** include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a **Split** operation
- Performing a **Surround with** operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)
**Important:** If you copy content in **Author** mode that contains tracked changes, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

### Activating the Change Tracking Feature

To activate the **Track Changes** feature for the current document, use any of the following methods:

- Click the **Track Changes** button on the toolbar.
- Select **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.
- Select **Track Changes** from the **Edit > Review** menu.

To activate the **Track Changes** feature globally for all documents that you open in Oxygen XML Editor, change the **Initial State** option to **Always On** (on page 141) in the **Review** preferences page (on page 140).

### Rendering Tracked Changes in Author Mode

When **Track Changes** (on page 3288) is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the **Review** preferences page (on page 140), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

![Change Tracking in Author Mode](image)

When hovering over a change a tooltip displays information about the author and modification time.
**Change Tracking Contextual Menu Actions**

You can right-click any change in **Author** mode to access the following contextual menu actions:

✅ **Accept Change(s)**

Accepts the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion or insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

❌ **Reject Change(s)**

Rejects the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion or insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

💬 **Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 3288)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Change Tracking Toolbar Actions**

By default, the toolbar includes the following actions and options for reviewing or tracking changes (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

💬 **Track Changes**

Enables or disables the *Track Changes (on page 3288)* support for the current document.

✅ **Accept Change(s) combo box**

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- ✅ **Accept Change(s) and Move to Next** - Accepts the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection and then
moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- ✓ Accept Change(s) - Accepts the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection.
- ✓✓ Accept All Changes - Accepts all Tracked Changes (on page 3288) in the current document.

Tip: You can assign shortcut keys (on page 248) for these actions to make it easier to access them.

✗ Reject Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

- ✗ Reject Change(s) and Move to Next - Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.
- ✗ Reject Change(s) - Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection.
- ✗✓Reject All Changes - Rejects all Tracked Changes (on page 3288) in the current document.

Tip: You can assign shortcut keys (on page 248) for these actions to make it easier to access them.

📝 Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

🔍 Track Changes Visualization Modes Drop-Down Menu

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

- ★ View All Changes/Comments - This mode is active by default. When you use this mode, all tracked changes are represented in the Author mode.
• **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.

• **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.

• **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to **View All Changes/Comments**.

**Note:** If you use **View Final** mode and **View Original** mode, callouts (on page 3280) are not displayed for comments or changes. To display callouts, use the **View All Changes/Comments** mode.

**Highlight**

Enables or disables the **Highlight** tool (on page 956). Use the **Highlight** dropdown menu to select a new color.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Manage Reviews**

Opens the **Review view** (on page 964).

**Tracked Change Callouts**

You can also choose to display insertion and deletion changes in callouts (on page 3280) in **Author** mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the **Track Changes Deletions** (on page 144) and **Track Changes Insertions** (on page 144) options in the **Callouts preferences page** (on page 143). You can also choose to display the actual content of the deletion or insertion.
By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see Author Callouts (on page 958).

### Tracked Changes in the Review View

The Review view (on page 964) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see Review View (on page 964).

### Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validation or transformations. For each change, the author name and the modification time are preserved.

**Example - Insertion Change:** The following processing instruction is an example of how an insertion change is stored in a document:

```xml
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

**Example - Deletion Change:** The following processing instruction is an example of how a deletion change is stored in a document:

```xml
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

For more information about the Track Changes support, watch our video demonstration:

- Author Callouts (on page 958)
- Review View (on page 964)
Tracked Changes Behavior

The behavior of the *Track Changes feature (on page 3288)* depends on the context, the type of change, and whether or not it is activated.

Inserting Content

If the *Track Changes* feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a *Delete* change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an *Insert* change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the *Track Changes* feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a *Delete* change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an *Insert* change results in the following:
  - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
  - If the original *Insert* change was made by the same user, the change is just expanded to contain the inserted content. The creation timestamp of the previous insert is preserved.
- If inserted in regular content, the current inserted content appears marked as an *Insert* change.

Surrounding Content

If the *Track Changes* feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a *Delete* change results in nothing happening.
- Making a surround in an *Insert* change results in the following:
  - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
  - If the original *Insert* change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.
Deleting Characters

If the Track Changes feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing Delete change results in nothing happening.
- Deleting content in an existing Insert change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the Track Changes feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing Delete change results in the following:
  - If the same author created the Delete change, the previous change is marked as deleted by the current author.
  - If another author created the Delete change, nothing happens.
- Deleting content in an existing Insert change results in the following:
  - If the same author created the Insert change, the content is deleted and the Insert change shrinks accordingly.
  - If another author created the Insert change, the Insert change is split in two and the deleted content appears marked as a Delete change by the current author.
- Deleting in regular content results in the content being marked as a Delete change by the current author.

Deleting Selections of Content

If the Track Changes feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire Delete change, the change disappears and the content is deleted.
- If the selection intersects with a Delete change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire Insert change, the change disappears and the content is deleted.
- If the selection intersects with an Insert change (starts or ends in one), the Insert change is shrunk and the content is deleted.

If the Track Changes feature is enabled and you delete a selection of content, the following behavior is possible:
• If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
• If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
• If the selection contains an entire **Insert** change, the following is possible:
  ◦ If the **Insert** is made by the same author, the change disappears and the content is deleted.
  ◦ If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
• If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

**Deleting Tags**

Assuming you are using any of the **Tag Display Modes (on page 441)** other than **No Tags** and the **Track Changes** feature is disabled, if you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the **Tag Display Modes (on page 441)** other than **No Tags** and the **Track Changes** feature is enabled, if you delete a start tag of an **inline element (on page 3283)**, both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.

**Copying Content**

If the **Track Changes** feature is disabled and you copy content, if the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the **Track Changes** feature is enabled and you copy content, if the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

**Pasting Content**

If the **Track Changes** feature is disabled and you paste content, if the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the **Track Changes** feature is enabled and you paste content, if the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.
Tracked Changes Limitations

There are some inherent limitations to the Change Tracking (on page 3288) feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.
- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.
- **Limitations to using certain actions** - Some actions cannot be implemented with the Track Changes feature (on page 3288) enabled. For example, some of the table-related actions (Delete Row(s), Delete Column(s), Join Cells, Split Cell) ignore the Track Changes feature when executing the action.

Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the Track Changes feature (on page 3288):

<table>
<thead>
<tr>
<th>Edit Type</th>
<th>Processing Instruction Start Marker</th>
<th>Processing Instruction End Marker</th>
<th>Attributes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Split</td>
<td>&lt;?oxy_insert_start?&gt;</td>
<td>&lt;?oxy_insert_end?&gt;</td>
<td>author, timestamp, type=&quot;split&quot;</td>
</tr>
<tr>
<td>Surround</td>
<td>&lt;?oxy_insert_start?&gt;</td>
<td>&lt;?oxy_insert_end?&gt;</td>
<td>author, timestamp, type=&quot;surround&quot;</td>
</tr>
<tr>
<td>Deletion</td>
<td>&lt;?oxy_delete?&gt;</td>
<td>_</td>
<td>author, timestamp, content</td>
</tr>
<tr>
<td>Comment</td>
<td>&lt;?oxy_comment_start?&gt;</td>
<td>&lt;?oxy_comment_end?&gt;</td>
<td>author, timestamp, comment, mid</td>
</tr>
<tr>
<td>Attribute Change</td>
<td>&lt;?oxy_attributes?&gt;</td>
<td>_</td>
<td>id, type, oldValue, author, timestamp</td>
</tr>
</tbody>
</table>
Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of read-only content. The difference between using comments and tracked changes (on page 3288) is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the Author mode as callouts (on page 3280) (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the Comments option (on page 143) in the Callouts preferences page (on page 143). Comments are also displayed in the Review view (on page 964).

Figure 337. Comments in Author Mode

Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in Author mode.

Add Comment

To insert a comment at the cursor position or on a specific selection of content, select the Add Comment action from the toolbar (or in the Review submenu of the contextual menu).

Tip: When adding or editing a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

Show/Edit Comments

To edit an existing comment that you have added in the main editing area in Author mode, select the Show/Edit Comments action from the toolbar (or in the Review submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments
To remove a comment at the cursor position or multiple comments in a selection, select Remove Comment(s) from the toolbar (or in the Review submenu of the contextual menu).

**Copy/Paste**

If you copy content that includes comments, they will be preserved when you paste it.

**Managing Comments in Callouts**

As long as the Comments option (on page 143) is selected in the Callouts preferences page (on page 143), comments are also displayed in callouts (on page 958). By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Callouts Options**
Select this option to open the Callouts preference page (on page 143) where you can configure various callout options.

**Tip:** When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

**Managing Comments in the Review View**

The Review view (on page 964) is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the Review view, the contextual menu includes the following actions.

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Show only reviews by ‘<author name>’**

Filters the comments to only show comments for the particular author.
Remove all Comments

Removes all comments from the document.

Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```xml
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300" comment="Do not change this content"?>
  Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `parentID` attribute and its value is the same as the `id` value of the parent comment.

```xml
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200" comment="We should not forget about recycling the oil and oil filter!"
  parentID="vws_x4l_1v" mid="4"?>
```

- Author Callouts *(on page 958)*
- Review View *(on page 964)*

Managing Highlights

Use the Highlight tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that needs additional editing or to draw the attention of others to particular content.

Using the Highlight Tool

You can find the Highlight action on the main toolbar, in the **Edit > Review** menu, or in the **Review** submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to **Stop highlighting** from the same menus.

To highlight content, follow these steps:
1. Click the Highlight icon on the toolbar.

   **Step Result:** The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the Highlight icon and select the color that you want to use for the highlighting.

3. Select the content you want to highlight. To mark multiple parts of a document, press and hold Ctrl (Meta on Mac OS) and select the parts you want to highlight.

4. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press Ctrl + A (Command + A on OS X) if you want to select all of the text.

2. Click the small arrow next to the Highlight icon and select **No color (erase)**, or right-click the highlighted content and select **Remove highlight(s)**.

3. To exit the highlighting mode, press Esc, click the Highlight icon, or start editing the document.

**Note:** Oxygen XML Editor preserves the highlighting of a document between working sessions. Also, if you copy content that includes highlights, the highlighting will be preserved when you paste it.

**Review View**

The **Review view (on page 964)** is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with tracked changes (on page 3288) and comments. The following actions are available in the contextual menu of each highlight in the **Review view**:

**Change Color**

Allows you to change the color of an existing highlight by selecting the new color from this menu.

**Remove Highlight**

Removes the selected highlight.

**Remove Highlights with the Same Color**

Removes the selected highlight and all others that have the same color.

**Remove All Highlights**

Removes all highlights from the document.
Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```xml
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
The highlights are stored<?oxy_custom_end?>
```

For more information about using the Highlight tool, watch our video demonstration:

- Review View (on page 964)

Author Callouts

Oxygen XML Editor uses callouts (on page 3280) to present comments and tracked change (on page 3288) modifications that you or other members of your team have added to the document.

Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in Author mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the Review preferences page (on page 140). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the Fixed option for the particular type of change and choose a color from the color box. If the Automatic option is selected, Oxygen XML Editor automatically assigns a color based upon the Colors for automatic assignment list (on page 143).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the Show all connecting lines option (on page 144) in the Callouts preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

Figure 338. Multiple Author Callouts
Note: Oxygen XML Editor displays callouts only if View All Changes/Comments or View Only Changes/Comments by is selected in the Track Changes Visualization Modes drop-down menu. Oxygen XML Editor does not display callouts in View Final and View Original modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or space-preserved elements (on page 3287) that contain long fragments (such as a DITA codeblock element or programlisting in DocBook). To help you view the text under the covered area, Oxygen XML Editor applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

Figure 339. Transparent Callout

Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the Initial Width option (on page 144) in the Callouts preferences page.
You can also adjust the maximum number of lines to be shown in the callouts using the **Text Lines Count Limit** option (on page 144). Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

**Type of Callouts in Oxygen XML Editor**

Oxygen XML Editor uses callouts to display comments and Tracked Changes (on page 3288) that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the **Callouts preferences page** (on page 143). You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the **Comments** option (on page 143) is selected in the **Callouts preferences page** (on page 143), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the **Show review time** option (on page 144) to include timestamp information in the comment callouts.

![Figure 340. Comment Callouts](image)

There are several types of comments that can be added in **Author** mode:

- **Author Review Comments** - Comments that you associate with specific content. To insert this type of comment, select the content and use the **Add Comment** action that is available on the toolbar (or in the **Review** submenu of the contextual menu).
- **Comments Added to Tracked Changes** - Comments that you add to an already existing tracked change insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select **Comment Change**.
- **Replies to Comments** - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in its callout and select **Reply**. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

![Figure 341. Callout for a Comment with Replies](image)
Tip: When adding, editing, or replying to a comment, you can use Enter to insert line breaks and Oxygen XML Editor will take the line breaks into account when presenting the callout. You can also use Ctrl + Enter to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the Track Changes Deletions option (on page 144) is selected in the Callouts preferences page (on page 143), deletions that are made while the Track Changes feature is enabled are displayed in callouts. A deletion callout contains the type of callout (Deleted) and the name of the author that made the deletion. You can also select the Show deleted content in callout option (on page 144) to display the actual deleted content in the callout. Additionally, you can select the Show review time option (on page 144) to include timestamp information in the deletion callouts.

Figure 342. Deletion Callouts

- **Tracked Change Insertion Callouts** - As long as the Track Changes Insertions option (on page 144) is selected in the Callouts preferences page (on page 143), insertions that are done while the Track Changes feature is enabled are displayed in callouts. An insertion callout contains the type of callout (Inserted) and the name of the author that inserted the content. You can also select the Show inserted content in callout option (on page 144) to display the actual deleted content in the callout. Additionally, you can select the Show review time option (on page 144) to include timestamp information in the deletion callouts.

Figure 343. Insertion Callouts
Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu of an insertion or deletion callout:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

** ✓ Accept Change**

Accepts the tracked change, removes the callout, and moves to the next change. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

** ✗ Reject Change**

Rejects the tracked change, removes the callout, and moves to the next change. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

** 📣 Comment Change**

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on
an existing commented change, the dialog box will allow you to edit the comment.

**Edit Reference**

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

**Callouts Options**

Select this option to open the Callouts preference page (on page 143) where you can configure various callout options.

**Comment Callout Actions**

The following options are available in the contextual menu of a comment callout:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

**Edit Reference**
If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

- **Callouts Options**
  Select this option to open the **Callouts preference page** (on page 143) where you can configure various callout options.

### Printing Callouts

When you print a document from **Author** mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

### Review View

The **Review view** (on page 964) is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see **Review View** (on page 964).

To watch our video demonstration about the Callouts support, see our video demonstration:

[https://www.youtube.com/embed/kCCWyFqBaUM](https://www.youtube.com/embed/kCCWyFqBaUM)

**Related Information:**

- Managing Tracked Changes (on page 943)
- Managing Comments (on page 952)
- Review View (on page 964)

### Review View

The **Review view** is an independent panel, available both for built-in and custom XML document frameworks (on page 3282). It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and tracked changes (on page 3288) using a single view.
The **Review** view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the **Review** view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true. For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

![Review View](image)

**Figure 344. Review View**

### Activating the Review View

To activate the **Review** view, do one of the following:

- Click the ![Manage reviews](image) button on the toolbar.
- Right-click anywhere in a document and select **Review > Manage reviews**.
- Open it from the **Window > Show View** menu.

### Review View Toolbar Actions and Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. The filter field also includes a search history drop-down list. The toolbar also includes ![Previous](image) and ![Next](image) navigation buttons and a ![Settings](image) menu button.
Use this button to navigate to the previous review item. By default, if you reach the first review item in the document, clicking this button will open a dialog box asking if you want to open the previous document (from the current DITA map hierarchy) that contains review items. This default behavior can be changed by choosing one of the options in the When navigating items in the Review view and you reach the last/first item section of the DITA preferences page (on page 226).

Next

Use this button to navigate to the next review item. By default, if you reach the last review item in the document, clicking this button will open a dialog box asking if you want to open the next document (from the current DITA map hierarchy) that contains review items. This default behavior can be changed by choosing one of the options in the When navigating items in the Review view and you reach the last/first item section of the DITA preferences page (on page 226).

Settings

The Settings menu includes the following options:

Show highlights

Controls whether or not the Review view displays the highlighting in your document.

Show comments

Controls whether or not the Review view displays the comments in the document you are editing.

Show track changes

Controls whether or not the Review view displays the inserted and deleted content in your document.

Show reviews in read-only content

Controls whether or not the Review view displays review items from content referenced with a @conref or @conkeyref attribute.

Show review time

Displays the time when the edits from the Review view were made.

Sort by date

Expands to offer the following sorting options: Oldest to newest, Newest to oldest, and No sorting.

Configure review options
Opens the Review preferences page (on page 140) where you can configure various options for review information.

Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the Review view:

Remove
Available for highlights and comments presented in the Review view and it removes the particular highlight or comment from your document and moves to the next change.

Accept
Available for inserted and deleted content presented in the Review view and it accepts the particular change in your document and moves to the next change.

Reject
Available for inserted and deleted content presented in the Review view and it rejects the particular change in your document and moves to the next change.

Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the Review view:

Reply
Opens the Reply dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

Mark as Done
Toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

Show Comment
Available for comments added by other users and you can use this option to view it in a Show comment dialog box.

Edit Comment
Available for comments you have added and you can use this action to edit a comment.

Remove Comment
Use this action to remove the selected comment.

**Show only Reviews by `<author name>`**

Use this action to filter the edits to only show them for a certain author.

**Remove All Comments**

Use this action to remove all the comments that appear in the edited document.

**Change Color**

Available for highlights and it opens a palette where you can choose a new color for the highlighted content.

**Remove Highlight**

Available for highlights and you can use this action to remove the selected highlight.

**Remove Highlights with the Same Color**

Available for highlights and you can use this action to remove all the highlights with the same color from the entire document.

**Remove All Highlights**

Available for highlights and you can use this action to remove all the highlights in your document.

✔ **Accept Change**

Accepts the selected change and moves to the next change.

❌ **Reject change**

Rejects the selected change and moves to the next change.

➡️ **Comment change**

Available for insertions or deletions and you can use this option to add a comment for the particular change.

✔️ **Accept all changes**

Accepts all the changes in the current document.

❌ ✔️ **Reject all changes**

Rejects all the changes in the current document.

For more information about the Review view, watch our video demonstration:

[https://www.youtube.com/embed/W22jkbwlh60](https://www.youtube.com/embed/W22jkbwlh60)

Related Information:
Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appears in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for expert users and another section for novice users, while unmarked sections are included in all renditions.

Profiling Attributes and Condition Sets

Oxygen XML Editor allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in Author mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

Figure 345. Example: Profiling Content
Oxygen XML Editor includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the Profiling/Conditional Text preferences page (on page 144). You can also define your own profiling attributes and condition sets for each document type (framework (on page 3282)) and your profiling configuration can be shared among content authors through the project file.

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes (on page 970) (for information about sharing them, see Sharing Profiling Attribute Configurations (on page 973)/Sharing Profiling Attribute Configurations (on page 3229)).

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets (on page 975) (for information about sharing them, see Sharing Condition Set Configurations (on page 978)).

Related Information:

- Customizing Elements that Wrap Profiled Content (on page 2425)

Creating and Editing Profiling Attributes

Oxygen XML Editor includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type (framework (on page 3282)). You can then apply the profiling attributes to content in Author mode to see how the profiling will affect the output.

Create or Editing Profiling Attributes

To create or edit profiling attributes for a specific document type, follow these steps:

1. Make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text.
Information: The Profiling Attributes section (on page 145) is used to define the attributes and their values for each document type.

3. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

Step Result: In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.

Figure 346. Profiling Attribute Dialog Box

The following options are available in this dialog box:

**Document type**

Select the document type (framework (on page 3282)).

Tip: You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**
This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).

The columns are as follows:

- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (Edit Profiling Attributes dialog box (on page 973), Condition Set dialog box (on page 975), and other UI components where the profiling is shown (on page 980)). If the Label is not specified, the Value will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click OK to confirm your selections and close the Profiling Attributes configuration dialog box.
5. Click Apply to save the changes.

### Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (on page 915) in Author mode, the Attributes view (on page 426), or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Profiling / Conditional Text preferences page (on page 144) where you can edit the profiling configuration.

Note: If the Allow contributing extra profiling attribute values (on page 146) option is not selected in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.
Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select Project Options (on page 3286) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 723).

Related Information:

- Applying Profiling Attributes (on page 973)
- Creating and Editing Profiling Condition Sets (on page 975)
- Applying Profiling Condition Sets (on page 978)
- Showing and Filtering Profiled Content in Author Mode (on page 980)

Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple
elements at the same time. If there is no selection in your document, the profiling attributes are
applied on the element at the cursor position.

To apply a profiling attribute to content in Author mode, follow these steps:

1. To apply a profiling attribute to content in Author mode, highlight the content and select Edit
   Profiling Attributes from the contextual menu. To profile an entire element, position the cursor
   inside the element, right-click, and select Edit Profiling Attributes (you can also right-click the
   element in the breadcrumb (on page 907) or Outline (on page 347) view).

   Step Result: The Edit Profiling Attributes dialog box is displayed and shows all the profiling
   attributes and their values, as defined for the particular document type (framework). If you have
   a large list of profiling attributes, you can use the text filter field to search for attributes or values,
   and you can expand or collapse attributes by using the Expand All / Collapse All buttons to
   the right of the text filter or the arrow button to the left of the profiling attribute name.

   The attributes and values that appear in the dialog box are determined as follows:
   • If you have defined profiling attribute values (on page 970) for the DITA document type
     in the Profiling/Conditional Text preferences page (on page 144) and you store them at
     project-level (on page 3286), those values are displayed in the dialog box.
   • If you have defined profiling attribute values (on page 970) for the DITA document type in
     the Profiling/Conditional Text preferences page (on page 144) and you store them at global-
     level (on page 3283), those values are displayed in the dialog box.
   • Otherwise, a generic default set of profiling attributes and values are available.

Figure 348. Edit Profiling Attributes Dialog Box
2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the *document fragment (on page 3281)*.

3. Click **OK** to finish the profiling configuration.

**Result:** The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the **Show Profiling Attributes** option *(on page 981)* (available in the **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 349. Profiling Attribute Value Form Control Pop Up**

- Showing and Filtering Profiled Content in Author Mode *(on page 980)*
- Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 3240)*
Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A Profiling Condition Set is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

   Information: The Profiling Condition Sets section (on page 146) is used to define condition sets.

2. To add new condition set, click the New button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the Edit button.

   Step Result: In either case, this opens a Condition Set configuration dialog box where you can define attributes that exist in your schema.

Figure 350. Condition Set Configuration Dialog Box
The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type ([framework](on page 3282)) for which you have defined profiling attributes.

**Use DITAVAL file**

For DITA projects, select this option if you want the Profiling Condition Set to reference a DITAVAL file ([on page 3248](on page 3248)). You can specify the path by using the text field, its history drop-down, the Insert Editor Variables ([on page 276](on page 276)) button, or the browsing actions in the Browse drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

**Shortcut key**
You can click the Choose button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

3. After defining or configuring the condition sets according to your needs, click OK to confirm your selections and close the Condition Set configuration dialog box.

4. Click Apply to save the condition set.

Result: All saved profiling condition sets are available in the Profiling / Conditional Text toolbar drop-down menu (on page 980).

Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select Project Options (on page 3286) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 723).

- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 3240)

Applying Profiling Condition Sets

All defined Profiling Condition Sets (on page 975) are available as shortcuts in the Profiling / Conditional Text toolbar menu (on page 980). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode and Outline view (on page 347). An element is
filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

**EXAMPLE:**

Suppose that you have the following document:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.
Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.
This is how the document looks in Author mode after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.
Context:

The garage is a good place to spray paint.

1. Move the car out of the garage to avoid getting paint on it. [Audience: novice]
2. Place newspaper, cardboard, or a drop-cloth on the garage floor. [Audience: expert]
3. Place the object to be painted on the covered area. [Audience: expert] Other [prop?]
4. Follow the directions on the paint can to paint the object. [Audience: expert] Other [prop?]
5. Let the paint dry thoroughly before you move the object. [Audience: novice] Other [prop?]
```

- Creating and Editing Profiling Attributes (on page 970)
- Applying Profiling Attributes (on page 973)
- Showing and Filtering Profiled Content in Author Mode (on page 980)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 983)

Showing and Filtering Profiled Content in Author Mode

You can visualize the effects of profiled content in Author mode by using the options in the Profiling/Conditional Text drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page (on page 147).
Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode. You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page (on page 148).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode and the Outline (on page 347) view. When this option is selected and a condition set is selected in this drop-down menu (on page 981), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 981), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 146).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 981) to access a dialog box that presents all of them.

♀ Profiling Settings

Opens the Profiling/Conditional Text preferences page (on page 144) where you can add and edit profiling attributes and condition sets.

Figure 351. Example: Profiling Controls in Author Mode
If the Show Profiling Attributes option is selected, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 352. Profiling Attribute Value Form Control Pop Up

Related Information:

- Applying Profiling Attributes (on page 973)
- Creating and Editing Profiling Condition Sets (on page 975)
- Applying Profiling Condition Sets (on page 978)
Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in Author mode so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in Author mode, allowing you to easily recognize the differences.

Figure 353. Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:
1. Select the Show Profiling Colors and Styles option (on page 980) from the Profiling / Conditional Text toolbar drop-down menu.

2. Select Profiling Settings (on page 981) from the Profiling / Conditional Text toolbar drop-down menu. This is a shortcut to the Profiling/Conditional Text preferences page (on page 144).

3. Go to the Colors and Styles preferences page (on page 146) to configure the colors and styling for the profiling attributes.

4. Go to the Attributes Rendering preferences page (on page 148) to configure how you want the profiling attributes to appear in Oxygen XML Editor.

**Result:** The styling is now applied in the Author editing mode and the Outline view (on page 347). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the Edit Profiling Attributes dialog box (on page 970) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Adding Tables in Author Mode

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in various frameworks (on page 3282) (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each framework has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

**Editing Tables in Author Mode**

Oxygen XML Editor provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

### Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a `colspecs` section that appears above the table in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The built-in DITA, DocBook, and XHTML frameworks (on page 3282) support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

**Figure 355. Resizing a Table Column in Author Mode**

![Table Column Resizing](image)

### Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the cursor changes to ▶️ for row selection and to ▼️ for column selection and that specific row or column is highlighted.
You can use the Ctrl and Shift keys to select multiple rows.

**Selecting Cells**

To select a cell in a table, press and hold the Ctrl key and click anywhere inside the cell. You can also use the Ctrl and Shift keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing a RTL document (on page 621)) to select it. The cursor changes to when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

**Drag and Drop**

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

**Copy/Cut and Paste**

In Oxygen XML Editor, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a CALS table, Oxygen XML Editor preserves column width information. This information is then used when you paste the column into another CALS table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.
Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the **Delete Row(s)** or **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the **Delete Row(s)** or **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the **Quick navigation in tables** option (on page 137) is not selected in the **Cursor Navigation** preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Related Information:

- Adding Tables in DocBook (on page 987)
- Adding Tables in DITA Topics (on page 999)
- Adding Tables in XHTML Documents (on page 1013)

Adding Tables in DocBook

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.
Inserting a CALS Table Model in DocBook

To insert a CALS table model in DocBook documents, select the Insert Table action on the toolbar or from the contextual menu. The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure a few more properties than the HTML model.

Figure 356. Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:
**proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is 1*.

**dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspecs` (column specifications) section above the table or in Text mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row separator**

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Column separator**

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.
Note: The `justify` value cannot be rendered in `Author` mode, so you will only see it in the output.

- `char` - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

Note: The options in the `Insert Table` dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click `Insert`, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the `Author mode (on page 402)`, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 357. CALS Table in DocBook

Inserting an HTML Table Model

To insert an `HTML` table model in DocBook documents, select the `Insert Table` action on the toolbar or from the contextual menu. The `Insert Table` dialog box appears. Select `HTML` for the table `Model`.

Figure 358. Insert Table Dialog Box - Simple Model
The dialog box allows you to configure the following options when you select the HTML table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of *Rows* and *Columns* for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (*width* attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a *width* attribute (in a *col* element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the *width* attribute
are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `width` attribute is 1\*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0\*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the **DocBook HTML table specifications**.

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author mode** (on page 402), it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 426) (Window > Show View > Attributes).

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (on page 1010) action from the toolbar or contextual menu to modify many of the properties of the table (on page 995).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 303).

DocBook Table Layouts

The DocBook framework (on page 3282) supports the following two table model layouts:

- CALS table model (on page 993)
- HTML table model (on page 994)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (colwidth attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 359. CALS Table in DocBook
HTML Table Model Layout

Choosing an **HTML** table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an **HTML** table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**width** attribute) or the text alignment (**align** attribute). Although these properties appear as part of the **Author mode** (on page 402), they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 360. HTML Table in DocBook

Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the **CALS** model. If you want to overwrite this behavior and instruct Oxygen XML Editor to convert them to **HTML** tables, set the **docbook.html.table** parameter to **1**. You can find this parameter in the following stylesheet:

- **[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml2db5Driver.xsl** for DocBook 5
Table Validation in DocBook

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

**HTML Tables**

- A row has fewer cells than the number of table columns.
- The value of the `colspan`, `rowspan`, or `span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 426) (Window > Show View > Attributes).

You can use the Table Properties (Ctrl + T (Command + T on OS X)) action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.
Note: Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the Table properties dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a Preview pane that shows a representation of the modification.

Figure 361. Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)

The options in the four tabs include the following:

**Horizontal alignment** (Available in the Table, Column, and Cell tabs)
Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook CALS table specifications.

**Row type (Available in the Row tab only)**

Allows you change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).
Edit Table Properties for an HTML Table Model

For an HTML table model, the Table properties dialog box includes four tabs of options (Table, Row, Column, and Cell) and the options include a Preview pane that shows a representation of the modification.

The options in the four tabs include the following:

Frame (Available only in the Table tab)

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the DocBook HTML table specifications.

Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a thead, tbody, or tfoot attribute).

Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (align attribute). The allowed values are:

- left - Aligns the text to a left position.
- right - Aligns the text to a right position.
- center - Aligns the text to a centered position.
- justify - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- char - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (valign attribute). The allowed values are:

- top - Aligns the text at the top of the cell.
- middle - Aligns the text in a vertically centered position.
- bottom - Aligns the text at the bottom of the cell.
- baseline - Sets the row so that all the table data share the same baseline. This often has the same effect as the bottom value. However, if the fonts are different sizes, the baseline value often makes the table look better.
Adding Tables in DITA Topics

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model** *(on page 999)* - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model)** *(on page 1001)* - This is used for more advanced functionality.
- **DITA Choice table model** *(on page 1004)* - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model** *(on page 1005)* - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a Simple DITA table, select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select Simple for the table Model.

Figure 362. Insert Table Dialog Box - Simple Model
The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**
Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the **Simple** model.

Figure 363. Insert Table Dialog Box - CALS Model
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, colwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the pt unit is inserted, but you can change the units in the colspecs (column specifications) section above the table or in Text mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

### Row separator
Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Column separator
Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

### Alignment
Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although
they appear as part of the **Author mode** (on page 402), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 364. CALS Table in DITA

![Sample CALS Table with Fixed Width](image)

**Inserting a Choice Table Model**

To insert a **Choice** table within a `step` element in a DITA Task document, select the **Insert Table** action on the toolbar or in the `Insert` submenu from the contextual menu (or the `Table` submenu from the **DITA** menu), or select `choicetable` from the **Content Completion Assistant** (on page 3280). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 365. Insert Table Dialog Box - Choice Model

![Insert Choice Table](image)

The dialog box allows you to configure the following options when you insert a **Choice** table model within a DITA Task:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.
**Column widths**

Allow you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click Insert, a Choice table is inserted into your DITA Task document at the current cursor position (within a step element).

**Inserting a Properties Table Model**

To insert a Properties table within a refbody element in a DITA Reference document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table
submenu from the DITA menu), or select properties(wizard) from the Content Completion Assistant (on page 3280). The Insert Table dialog box appears. Select Properties for the table Model.

Figure 366. Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more
When you click Insert, a Properties table is inserted into your DITA Reference document at the current cursor position (within a refbody element).

**Editing an Existing Table**

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 426) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (on page 1010) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 1010).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 303).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor includes a Smart Paste feature (on page 918) that preserves certain style and structure information when pasting content.

**Tip:** When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

**Related Information:**

- Editing Tables in Author Mode (on page 985)

**DITA Table Layouts**

Depending on the context, DITA accepts the following table layouts:

- CALS table model (on page 1008)
- Simple table model (on page 1008)
- Choice table model (on page 1008)
- Properties table model (on page 1009)
CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a CALS table includes a *colspecs* section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (*colwidth* attribute) or the text alignment (*align* attribute). Although they appear as part of the **Author mode (on page 402)**, the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 367. CALS Table in DITA

---

Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Figure 368. DITA Simple Table

---

Choice Table Model Layout

A **Choice** table model is used within a **step** element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The *choicetable* element is a useful
device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (on page 3280) (within a step element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

Figure 369. DITA Choice Table

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>

Properties Table Model Layout

A Properties table model is used within a refbody element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting properties(wizard) from the Content Completion Assistant (on page 3280) (within a refbody element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 370. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (on page 3281) with the Validate and Check for Completeness action, if the Report table layout problems option is selected in the DITA Map Completeness Check dialog box (on page 3040), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table cols attribute.
- A row has more cells than the number of columns detected from the table cols attribute.
• A cell has a vertical span greater than the available rows count.
• The number of cols specs is different than the number of columns detected from the table cols attribute.
• The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
• The value of the cols, rowsep, or colsep attributes are not numeric.
• The namest, nameend, or colname attributes point to an incorrect column name.

Simple or Choice Tables

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (Ctrl + T (Command + T on OS X)) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

Note: Some properties allow the following special values, depending on the context and the current properties or values:

• <not set> - Use this value if you want to remove a property.
• <preserve> - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the Table properties dialog box includes four tabs of options:

• Table tab - The options in this tab apply to the entire table.
• Row tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
• Column tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
• Cell tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a Preview pane that shows a representation of the modification.
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Vertical alignment (Available in the Row and Cell tabs)**
Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the colsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the rowsep attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame (Available only in the Table tab)**

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Edit Table Properties for a Simple, Choice, or Properties Table Model**

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.
Table tab

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row tab (not available for Properties tables)

Row type

Allows you to change the row to a body or header type of row.

Related Information:

- Adding Tables in DITA Topics (on page 999)
- Editing Tables in Author Mode (on page 985)

Adding Tables in XHTML Documents

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the Insert Table dialog box.

Figure 372. Insert Table Dialog Box in XHTML
The dialog box allows you to configure the following options:

**Caption**

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Generate table footer**

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

**Column widths**

Allows you to specify the type of properties for column widths (width attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a width attribute (in a col element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, width="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the width attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the width attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If
you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the \texttt{pt} unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

**Frame**

Allows you to specify a value for the \texttt{frame} attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

**Alignment**

Specifies the alignment of the text within the table (\texttt{align} attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The \texttt{justify} value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the \texttt{char} attribute for alignment.

**Note:** The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the \texttt{colspecs} (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode (on page 402)**, the \texttt{colspecs} link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (Window > Show View > Attributes). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 303).

XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an XHTML table includes a colspecs section that allows you to easily configure some properties. For example, you can change the value of column widths (width attribute) or the text alignment (align attribute). Although they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 373. Table Layout in XHTML Documents

Table Validation in XHTML

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the colspan, rowspan, or span attributes are not numeric.
- A cell has a vertical span greater than the available rows count.
Adding Tables in TEI Documents

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

**Figure 374. Insert Table Dialog Box in TEI**

The dialog box allows you to configure the following options:

**Head**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

![Insert Table Dialog Box in TEI](image)

**Note:** The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (on page 426) ([Window > Show View > Attributes](#)). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 303).

Sorting Content in Tables and List Items

Oxygen XML Editor offers support for sorting the content of tables and list items of ordered and unordered lists.
**Sorting a Table**

To sort rows in a table, select the entire table (or specific rows) and use the `Sort` action from the main toolbar or the contextual menu. This opens the `Sort` dialog box.

![Sort Dialog Box](image)

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

**Note:** When you invoke the sorting operation over an entire table, the `Selected rows` option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - **Text** - Alphanumeric characters.
  - **Numeric** - Regular integer or floating point numbers are accepted.
  - **Date** - Default date and time formats from the local OS are accepted (such as `short`, `medium`, `long`, `full`, `xs:date`, and `xs:dateTime`).
- The sorting direction (either `ascending` or `descending`).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the `Sort` dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press `Ctrl + Z (Command + Z on OS X)` on your keyboard.

**Note:** The sorting support takes the value of the `xml:lang` attribute into account and sorts the content in a natural order.
Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose \texttt{Sort}, or click \texttt{Sort} on the main toolbar. This opens the \texttt{Sort} dialog box.

Figure 376. Sort Selected Rows

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The \texttt{Sort} dialog box also allows you to apply the sorting operation to the entire table, using the \texttt{All rows} option.

The \texttt{Criteria} section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
  - \texttt{Text} - Alphanumeric characters.
  - \texttt{Numeric} - Regular integer or floating point numbers are accepted.
  - \texttt{Date} - Default date and time formats from the local OS are accepted (such as \texttt{short}, \texttt{medium}, \texttt{long}, \texttt{full}, \texttt{xs:date}, and \texttt{xs:dateTime}).
- The sorting direction (either \texttt{ascending} or \texttt{descending}).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the \texttt{Sort} dialog box, click \texttt{OK} to complete the sorting operation. If you want to revert to the initial order of your content, press \texttt{Ctrl + Z (Command + Z on OS X)} on your keyboard.

\textbf{Note:} The sorting support takes the value of the \texttt{xml:lang} attribute into account and sorts the content in a natural order.
Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the Criteria section of the Sort dialog box, configure the applicable items, and click OK to complete the sorting operation.

Figure 377. Sorting Based on Multiple Criteria

Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain rowspans.

Note: For this type of table, the Sort dialog box keeps the All rows option disabled even if you perform the sorting operation over a selection of rows.

Sorting List Items

A sorting operation can be performed on various types of lists and list items. The types of lists that can be sorted in Oxygen XML Editor depend on the framework (document type), but examples of the types that can be sorted include:

- Ordered list (DITA, DocBook, XHTML, TEI)
- Unordered list (DITA, DocBook, XHTML, TEI)
- Definition list (DITA)
- Variable list (DocBook)
- Parameter list (DITA)
- Simple list (DITA)
- Required conditions (DITA Machinery Task)
- Supplies list (DITA Machinery Task)
The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the $\text{Sort}$ action from the main toolbar or the contextual menu. This opens the \text{Sort} dialog box.

![Sorting List Items](image)

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

**Note:** When you invoke the sorting operation over an entire list, the \text{Selected rows} option is disabled.

The \text{Criteria} section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
  - \text{Text} - Alphanumeric characters.
  - \text{Numeric} - Regular integer or floating point numbers are accepted.
  - \text{Date} - Default date and time formats from the local OS are accepted (such as \text{short}, \text{medium}, \text{long}, \text{full}, \text{xs:dateTime}, and \text{xs:dateTime}).
- The sorting direction (either \text{ascending} or \text{descending}).

After you finish configuring the options in the \text{Sort} dialog box, click \text{OK} to complete the sorting operation. If you want to revert to the initial order of your content, press \text{Ctrl + Z (Command + Z on OS X)} on your keyboard.

**Note:** The sorting support takes the value of the \text{xml:lang} attribute into account and sorts the content in a natural order.

**Inserting Images**

To insert an image in a document while editing in \text{Author} mode, use one of the following methods:
• Click the **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Editor tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the file:/C:/project/xml/dir/img1.jpg image into the file:/C:/project/xml/doc1.xml document, Oxygen XML Editor inserts a reference to dir/img1.jpg. This is useful when multiple users work on a common project and they have it stored in multiple locations.

**Note:** The **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

• Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `href` attribute in an `image` element:

```
<image href="../images/image_file.png"/>
```

**Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

• Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Editor will insert it as a reference to the image file the same as the drag/drop method.

• Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Editor will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

**Related Information:**

• [Image Map Editor (on page 1029)]

• [Image Rendering in Author Mode (on page 1022)]

• [Adding Video, Audio, and Embedded HTML Resources in DITA Topics (on page 3066)]

**Image Rendering in Author Mode**

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.
Table 36. Supported Image Formats

<table>
<thead>
<tr>
<th>Image Type</th>
<th>Support</th>
<th>Additional Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>GIF</td>
<td>built-in</td>
<td>Animations not yet supported.</td>
</tr>
<tr>
<td>JPG, JPEG</td>
<td>built-in</td>
<td>JPEG images with CMYK color profiles <em>(on page 2968)</em> are properly rendered only if color profile is inside the image.</td>
</tr>
<tr>
<td>PNG</td>
<td>built-in</td>
<td></td>
</tr>
<tr>
<td>SVG, SVGZ, WMF</td>
<td>built-in</td>
<td>Rendered using the open-source Apache Batik library that supports SVG 1.1.</td>
</tr>
<tr>
<td>BMP</td>
<td>built-in</td>

<td>JPEG 2000, WBMP</td>
<td>plugin</td>
<td>Renders by installing the Java Advanced Imaging (JAI) Image I/O Tools plug-in <em>(on page 1027)</em>.</td>
</tr>
</tbody>
</table>

When an image cannot be rendered, Oxygen XML Editor **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the **Show very large images** option *(on page 133)*.
- The image format is not supported by default. It is recommended to install the Java Advanced Imaging (JAI) Image I/O Tools plug-in *(on page 1027)*.

**Tip:** If you are using a custom XML format and you want images to be displayed in **Author** mode, you could use a custom CSS to define the rendering.

For example, if your XML has something like this:

```xml
<image href="blue.png"/>
```

You can add a selector in your custom CSS like this:

```css
image[href]{
    content: attr(href, url);
}
```

**Scaling Images**

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:
• If you specify only the width attribute of an image, the height of the image is proportionally applied.
• If you specify only the height attribute of an image, the width of the image is proportionally applied.
• If you specify width and height attributes of an image, both of them control the rendered image.
• If you want to scale both the width and height of an image proportionally, use the `scale` attribute.

**Note:** As a Java application, Oxygen XML Editor uses the Java Advanced Imaging API that provides a pluggable support for new image types. If you have an `ImageIO` library that supports additional image formats, just copy this library to the `[OXYGEN_INSTALL_DIR]/lib` directory.

**Rendering CGM Images (Experimental Support)**

Oxygen XML Editor offers a few add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, follow this procedure:

1. Go to `Help > Install new add-ons` to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the `Show add-ons from` field or select it from the drop-down menu.
3. Select the **Oxygen CGM support** add-on and click `Next`.
4. Select the `I accept all terms of the end user license agreement` option and click `Finish`.
5. Restart the application.

**Result:** You should be able to see CGM images in **Author** mode.

**Note:** If you want to render CGM images in your PDF output, make sure you add support for this image format in the transformation scenario (on page 2179).

**Alternate Method for ISOView Active X Component**

**Restriction:** This support will only work on 32 bit versions of Oxygen XML Editor.

If you already have the **ISOView Active X** component for Internet Explorer installed, you may want to use it to render CGM images instead of the components provided in the plugin described above.

To use your existing **ISOView Active X** component to render CCM images, follow these steps:

1. Go to `Help > Install new add-ons` to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the `Show add-ons from` field or select it from the drop-down menu.
3. Select **CGM Form control (Active X-based)** plugin and click `Next`.
4. Select the `I accept all terms of the end user license agreement` option and click `Finish`. 
5. Restart the application.

6. The **CGM Form Control** plugin automatically renders CGM files in DITA, DocBook, and XHTML, so for those frameworks, this step is not necessary. For other frameworks ([on page 3282](#)), modify your CSS according to your particular framework.

If you have an XML:

```xml
<image href="MyCGMFile.cgm"/>
```

You need a CSS rule like this:

```css
image[href$=".cgm"],
image[href$=".CGM"]{
    content: oxy_editor(
        saHeavyFormControlClassName , "com.oxygenxmlactivex.fctrl.ActiveXFormControl",
        href, oxy_url(oxy_base-uri() , attr(href)));
}
```

You should be able to see CGM images in **Author** mode.

### Rendering PDF Images

Starting with version 20.0, Oxygen XML Editor provides built-in support for rendering PDF images in **Author** mode and PDF output. For previous versions, they are not rendered by default and you need to add the *Apache PDFBox* library by using one of the following procedures:

#### Installing the PDF Image Rendering Add-on

Oxygen XML Editor offers an add-on that contributes the *Apache PDFBox* library for you. To install this add-on, follow these steps:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **PDF Image Rendering** add-on and click **Next**.
4. Select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** The Apache PDFBox libraries are now contributed to the **Oxygen** installation directory and you should be able to see PDF images in **Author** mode.

For more information, see the details about this **PDF Image Rendering** add-on in GitHub.
Manually Adding the ApachePDFBox Libraries

To manually add the Apache PDFBox library so that PDF images are rendered in Author mode, follow this procedure:

1. Go to [http://pdfbox.apache.org/downloads.html](http://pdfbox.apache.org/downloads.html) and download the pre-built PDFBox standalone binary JAR files: `pdfbox-2.0.3.jar`, `fontbox-2.0.3.jar`, and `xmpbox-2.0.3.jar`. Alternatively, you can use the 1.8.12 version of these files, as they have been tested and work properly.

   **Note:** It is not recommended to use `pdfbox-app-2.0.3.jar` file instead of the three specified files because it contains additional classes that may cause conflicts elsewhere in Oxygen XML Editor.

2. Create a subfolder called `pdfImageJars` in the `\[OXYGEN_INSTALL_DIR\]\lib` directory.

3. Copy the downloaded JAR libraries to that newly created subfolder.

4. Restart the application.

Rendering PSD Images

Oxygen XML Editor provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in Author mode, follow this procedure:

1. Download the following JAR files:
   
   - [http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar](http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar)

2. Copy the downloaded JAR libraries to the `\[OXYGEN_INSTALL_DIR]\lib` directory.

3. Restart the application.
Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor cannot render the image.
- The EPS image includes a TIFF preview picture.

**Note:** Some newer versions of the TIFF picture preview are rendered in gray-scale.
- The AI image contains a JPEG preview picture. Oxygen XML Editor renders the image correctly.

Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Editor by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

**How to Install JAI Image I/O Tools Plugin**

To install this plug, follow this procedure:

1. Start Oxygen XML Editor and open the Help > About dialog box. Go to the System properties tab and look for the `java.runtime.name` and `java.home` properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the `java.runtime.name` property). A list of archived JAI distributions can be found at: http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html.

**Note:** The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.
3. Run the installer. When the installation wizard displays the Choose Destination Location page, fill-in the Destination Folder field with the value of the `java.home` property. Continue with the installation procedure and follow the on-screen instructions.

**OS X Workaround**

There is no native implementation of the JAI Image I/O Tools plugin for OS X 10.5 and later. However, it has a Java implementation fallback that also works on OS X. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this OS X workaround:

2. In the \[OXYGEN_INSTALL_DIR\]/lib directory, create a directory named endorsed (\[OXYGEN_INSTALL_DIR\]/lib/endorsed).

3. Unpack the tar.gz. Copy the clibwrapper_jiio.jar and jai_imageio.jar files from its lib directory and paste them in the \[OXYGEN_INSTALL_DIR\]/lib/endorsed directory.

4. Restart the application and the JAI Image I/O support will be up and running.

Retina/HiDPI Images in Author Mode

Oxygen XML Editor provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include @2x in the name (for example, myImage@2x.png). Oxygen XML Editor displays the larger set of icons starting with 150% (1.5x) scaling.

You can reference an image to style an element in a CSS by using the url function in the content property, as in the following example:

```css
listItem:before{
    content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the myImage.png file just before the listItem element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a normal DPI image and a high DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Editor interprets the argument of the url function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor would first try to find myImage@2x.png. If this file is not found, it defaults back to the normal resolution image file (myImage.png).

Oxygen XML Editor also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the normal image is used.
Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor:

<table>
<thead>
<tr>
<th>Color Theme</th>
<th>Referred Image File</th>
<th>Double Density Image File</th>
<th>Triple Density Image File</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>../img/myImage.png</td>
<td>../img/myImage@2x.png</td>
<td>../img/myImage@3x.png</td>
</tr>
<tr>
<td>dark</td>
<td>../img/myImage_dark.png</td>
<td>../img/myImage_dark@2x.png</td>
<td>../img/myImage_dark@3x.png</td>
</tr>
</tbody>
</table>

Related Information:

- Adding Retina/HiDPI Icons in a Framework (on page 2332)

Image Map Editor

Oxygen XML Editor includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an image map is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor is available for images in DITA, DocBook, TEI, and XHTML document types (frameworks (on page 3282)). To create an image map on an existing image and open the Image Map Editor, right-click the image and select Image Map Editor.

Figure 379. Image Map Rendered in Author Mode
Image Maps in DITA

Oxygen XML Editor includes support for image maps in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 380. Image Map Editor in DITA
Image Map Editor Interface in DITA

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**

Use this button to send the currently selected shape back one layer.

**Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

**Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.
Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Add Point**
  Adds a point to Polygon or Free Form shapes.

- **Remove Point**
  Removes the current point from Polygon or Free Form shapes.

- **Duplicate**
  Create a duplicate of the currently selected shape.
**Delete**

Delete the currently selected shape.

**New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

**New Circle**

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

**New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**Undo**

Use this action to undo the last action.

**Redo**

Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

**Type**

Displays information about the selected coordinate.

**Target**

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: *Cross Reference*, *File Reference*, or *Web Link*. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in
DiT A (on page 3164) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an xref element will be inserted with either an href attribute or a keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor (on page 3164).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (on page 1036) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.

   **Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ New Rectangle, ☐ New Circle, or ☐ New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1031) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1033). For example, the easiest way to remove a point is to right-click the point and select X Remove Point.

4. With the shape selected, use one of the linking options (on page 1034) in the Link drop-down menu to select a target resource (or enter its path in the Target (on page 1034) text field).

5. (Optional) Enter a Description (on page 1035) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.

   **Result:** The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image
includes an alt element, its value will be displayed under the image. The following two buttons will also now be available under the image in Author mode:

• **Image Map Editor** - Click this button to open the Image Map Editor.
• **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Figure 381. Image Map Details**

| Gear Pump |
|---|---|---|
| 1 | orfe | 172, 265, 14 | Bushings |
| 2 | orfe | 171, 331, 15 | Bushings |
| 3 | orfe | 327, 198, 14 | Bushings |

**How to Edit an Existing Image Map in DITA**

To edit an existing image map, use any of the following methods:

• Simply double-click the image.
• Right-click the image and select **Image Map Editor**.
• Click the **Image Map Editor** button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor toolbar (on page 1031)**). To change the
layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1031) (`,` `, `, `).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Image Maps in DocBook

Oxygen XML Editor includes support for image maps in DocBook documents through the use of the areaspec element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 382. Image Map Editor in DocBook
Image Map Editor Interface in DocBook

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Duplicate**
  
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  
  Use this button to delete the currently selected shape.

- **Undo**
  
  Use this button to undo the last action.

- **Redo**
  
  Use this button to redo the last action that was undone.
Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
• You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down `Shift` while using the arrow keys to move the shape further or `Alt` to move it 1 pixel at a time.

• To zoom in or out, you can use the `NumPad +` or `NumPad -` keys respectively. Use `Ctrl + NumPad 0` to reset the zoom level to its default value.

• You can use `Ctrl + Z` to undo an action or `Ctrl + Y` to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

- **Duplicate**
  Create a duplicate of the currently selected shape.

- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the `Image Pane` is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the `Image Pane`.

**Properties**

- **Type**
  Displays information about the selected coordinate.

- **ID**
The identifier for the selected area. This will become the value of the \texttt{xml:id} attribute for the particular \texttt{area} element.

\textbf{Target}

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference or Web Link. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an \texttt{xlink:href} attribute.

\textbf{Description}

You can enter an optional description for the selected area that will be displayed in the Image Map Details section (on page 1042) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

\section*{How to Create an Image Map in DocBook}

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select \textbf{Image Map Editor}.

   \textbf{Result:} This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting the \textbf{New Rectangle} button.

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1038) to adjust its layer and color, or to perform other editing actions.

   \textbf{Tip:} You can right-click any of the shapes or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1040).

4. With the shape selected, enter an \textbf{ID} (on page 1040) and use one of the linking options (on page 1041) in the Link drop-down menu to select a target resource (or enter its path in the Target (on page 1041) text field).

5. (Optional) Enter a \textbf{Description} (on page 1041) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select \textbf{New Rectangle} button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.
Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image includes an alt element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in Author mode:

- Image Map Editor - Click this button to open the Image Map Editor.
- Image Map Details - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

Note: If you want to link a set of related area elements, you can use areaset elements. To add areaset elements, and area elements to the areaset, switch to Text mode and insert them manually.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar (on page 1038)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1038) (↑, ↓, ←, →). If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Image Maps in TEI

Oxygen XML Editor includes support for image maps in TEI documents through the use of the facsimile element. In TEI documents, this feature provides an easy way to create areas (using zone elements) in an image where the end user can hover or click to retrieve more information about that particular area of the image. The visual Author editing mode includes an Image Map Editor that helps you to easily create the areas in the image.

Figure 383. Image Map Editor in TEI

Image Map Editor Interface in TEI

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- New Rectangle
Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Polygon**
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
  Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

- **Duplicate**
  Use this button to create a duplicate of the currently selected shape.

- **Delete**
  Use this button to delete the currently selected shape.

- **Undo**
  Use this button to undo the last action.

- **Redo**
  Use this button to redo the last action that was undone.

- **Show/Hide Numbers**
  Use this button to toggle between showing or hiding the numbers for the shapes.

- **Bring Shape to Front**
  Use this button to bring the currently selected shape forward to the top layer.

- **Bring Shape Forward**
  Use this button to bring the currently selected shape forward one layer.
Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions
You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

**Add Point**
Adds a point to *Polygon* or *Free Form* shapes.

**Remove Point**
Removes the current point from *Polygon* or *Free Form* shapes.

**Duplicate**
Create a duplicate of the currently selected shape.

**Delete**
Delete the currently selected shape.

**New Rectangle**
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

**New Polygon**
Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**Undo**
Use this action to undo the last action.

**Redo**
Use this action to redo the last action that was undone.

**Shape Table**
The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

**Type**
Displays information about the selected coordinate.
ID

The identifier for the selected area. This will become the value of the xml:id attribute for the particular zone element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (graphic) must be inside a facsimile element to support the Image Map Editor feature.
2. Right-click the image and select Image Map Editor.

   Result: This action will apply an image map to the current image and open the Image Map Editor dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons (New Rectangle or New Polygon).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1043) to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1045). For example, the easiest way to remove a point is to right-click the point and select Remove Point.
5. With the shape selected, enter an ID (on page 1047).
6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click OK to process your changes.

   Result: The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

   - Image Map Editor - Click this button to open the Image Map Editor.
   - Image Map Details - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:
• Simply double-click the image.
• Right-click the image and select **Image Map Editor**.
• Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

**Restriction:** Currently, if `zone` elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the `zone` elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor toolbar**). To change the layer order for a shape, use the layer buttons on the **Image Map Editor toolbar** (``, ```).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:** PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

**Related Information:**

• TEI 'facsimile' Element Specifications
Image Maps in XHTML

Oxygen XML Editor includes support for image maps in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an img element) may be associated with an image map (in the form of a map element) by specifying a usemap attribute on the img element.

The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

Figure 384. Image Map Editor in XHTML

Image Map Editor Interface in XHTML

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

**New Polygon**

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**
Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:
+ **Add Point**

  Adds a point to *Polygon* or *Free Form* shapes.

× **Remove Point**

  Removes the current point from *Polygon* or *Free Form* shapes.

☐ **Duplicate**

  Create a duplicate of the currently selected shape.

× **Delete**

  Delete the currently selected shape.

d | **New Rectangle**

  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

d | **New Circle**

  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

d | **New Polygon**

  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

← **Undo**

  Use this action to undo the last action.

→ **Redo**

  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the *Alternative* property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**
Type

Displays information about the selected coordinate.

Href

Specifies the hyperlink target for the selected area. This will become the value of the href attribute for the particular area element. The possible values are:

- **An Absolute URL** - A URL of another website (for example, http://www.example.com/index.htm).
- **A Relative URL** - A link to a file within your website (for example, index.htm).
- **An Element** - A link to the ID of an element within the page (for example, #top).
- **Other Protocols** - A specified path using other protocols (such as https://, ftp://, mailto:, file:).
- **A Script** - A link to a script (for example, javascript:alert('Hello');)

Alternate

The description for the selected area. The value is inserted in an alt attribute in the particular area element. This is a required attribute to present a text alternative for browsers that do not display images.

Target

Specifies where to open the linked resource. The allowed values are:

- **_blank** - Opens the linked resource in a new window or tab.
- **_self** - Opens the linked resource in the same frame as it was clicked.
- **_parent** - Opens the linked resource in the full body of the window.
- **framename** - Opens the linked resource in the named frame.

How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   **Result:** This action will apply an image map to the current image and open the **Image Map Editor** dialog box.
2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1049) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1051). For example, the easiest way to remove a point is to right-click the point and select Remove Point.

4. With the shape selected, specify the hyperlink target in the Href field (on page 1053) and enter a description for the selected area in the Alternate field (on page 1053).

5. (Optional) Specify where the hyperlink resource will be opened in the Target field (on page 1053).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.

**Result:** The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

### How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

In Author mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

### Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the
Show/Hide Numbers button on the Image Map Editor toolbar (on page 1049). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1049) (Widgets, Rooms, Rooms).

If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

⚠️ Warning: PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Adding Video, Audio, and Embedded HTML Resources

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project view (on page 333) and drop them into your documents (or copy and paste them).

**Table 37. Supported Media Types**

<table>
<thead>
<tr>
<th>Media</th>
<th>Description</th>
<th>Type</th>
<th>Supported Size Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td>mp3</td>
<td>Moving Picture Experts Group Layer-3 Audio</td>

<td>Flash Video</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
<tr>
<td>m4v</td>
<td>iTunes Video File</td>
<td>video</td>
<td>Width &amp; Height</td>
</tr>
</tbody>
</table>
### Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the **Insert Media Resource** action from the toolbar. A **Chose Media** dialog box appears.

   **Note:** You can also drag media files from your system explorer or the **Project view** (on page 333) and drop them into your documents (or copy and paste them).
3. Select the URL for the media resource and click **Ok**.

**Result in Author Mode:** A reference to the specified media object is inserted and rendered in **Author** mode so that it can be played directly from there.

**Attention:**

- On Ubuntu 17.10, if you receive an error when trying to play videos in **Author** mode, you need to install the **libavformat57** library.

**Result in Output:** In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

#### Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Editor includes a pre-installed plugin (on page 3285) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```xml
....
<foreign outputclass="html-embed"><![CDATA[
  <iframe width="420" height="315"
    src="https://www.youtube.com/embed/qepRkQxhTX"
    frameborder="0" allowfullscreen="true">
  </iframe>
</foreign>
```
The converted HTML output would look like this:

```html
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
```

The plugin is also available on the oxygenxml GitHub projects page.

- How to Add Video and Audio Objects in DITA WebHelp Output (on page 1964)

Editing MathML Notations

The Author editor includes a built-in editor for MathML notations. To start the MathML editor, double-click a MathML notation (for embedded notations, you can also select the Edit Equation action from its contextual menu). In the MathML editor you can edit the mathematical symbols of a MathML notation. You can open a MathML file of your current project directly in the MathML editor. To do this, select Open with > MathML editor from the contextual menu in the Project view (on page 333).

Figure 385. Default MathML Editor
The font size and font family that is used for the equations is based upon the context in which the MathML equation appears. To configure the minimum font size of the equation, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > MathML.

Configure the MathFlow Editor

The MathFlow Components product can replace the default MathML editor with a specialized MathML editor. You have to purchase a MathFlow Component from Design Science and configure it in Oxygen XML Editor with the following procedure:

1. Install MathFlow by using the Universal installer (for versions prior to 2.1, use the MathFlow SDK).

2. Set the path to the MathFlow install folder in the MathML preferences page (on page 149).

3. Set the path to the MathFlow license file in the MathML preferences page (on page 149).
MathML Equations in HTML Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook or DITA content that has embedded MathML equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"
src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

For DITA documents, you can also use the following procedure:

1. Edit the DITA Map WebHelp transformation scenario (on page 1758) and open the Parameters tab.
2. Set the following parameter to point to an XML resource file that contains your script, depending on your type of WebHelp system.
   - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your resource file.
   - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your resource file.
3. Run the transformation scenario.

**Result:** The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the **Reload** action.

To refresh the content of the referenced resources you can use the **Refresh references** action that is available in the current framework menu (for example, the DITA or DocBook5 menu). However, this action will not refresh the expanded external entities, for which you will need to use the **Reload** action.

Generating IDs for Elements in Author Mode

Oxygen XML Editor allows you to manually assign or edit values of `id` attributes in Author mode by using the Attributes View (on page 426) or an in-place attribute editor (on page 915). Oxygen XML Editor also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

**Generate IDs On-Request**

You can generate ID values for specific elements on-request. To do so, select the element for which you want to generate an ID (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu. This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the ID Options dialog box (on page 1061). To open this dialog box, select ID Options from the DITA, DocBook, or TEI menu (depending on your document type).

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

**Automatically Generate IDs**

Oxygen XML Editor includes an option to automatically add unique ID values to certain elements when they are created in Author mode. The **Auto generate IDs for elements** option can be found in the ID Options dialog box (on page 1061) that is displayed when you select the **ID Options** action from the framework (on page 3282)-specific menu (DITA, DocBook, or TEI). If this **Auto generate IDs for elements** option is selected, Oxygen XML Editor automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the
ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

**ID Options Dialog Box**

To configure options for generating IDs, select **ID Options** from the **DITA, DocBook**, or **TEI** menu (depending on your document type).

Figure 387. ID Options Dialog Box

The **ID Options** dialog box allows you to configure the following options with regard to generating ID values:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor **Editor Variables (on page 276)**.

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

**Remove IDs when copying content in the same document (DITA or TEI)**
When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is cut and pasted.

### Remove IDs when copying content (DocBook)

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

## Duplicating Elements with Existing IDs

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the **Auto generate IDs for elements** option is selected and you duplicate elements with existing IDs, Oxygen XML Editor assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements** option is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the **Remove IDs when copying content in the same document** option is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no effect on elements that are duplicated in other documents.
- For DocBook, if the **Remove IDs when copying content** option is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.
**Controlling the Default ID Generation Options**

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the `frameworks` folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the `resources` folder within the particular `framework` (on page 3282). For example, the configuration file for the DITA `framework` is located in: `{OXYGEN_INSTALL_DIR}/frameworks/dita/resources/idGenerationDefaultOptions.xml.`

**Sharing Default ID Generation Options**

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your `framework` according to your needs.
2. Bundle a modified version of the entire `framework` folder (for example, `{OXYGEN_INSTALL_DIR}/frameworks/dita`). To do this:
   a. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.
   b. Select your document type and click the Extend button.
   c. In the Document type configuration dialog box (on page 95) that is now displayed, select External for the Storage option. By default, this will save the extension in a new folder in the `frameworks` folder (for example, `{OXYGEN_INSTALL_DIR}/frameworks/dita-extension (1)`), but you can also use the Browse button to specify a specific name and folder.
   d. In this new extension folder, create a new folder called resources and add your modified `idGenerationDefaultOptions.xml` file to this new resources folder.
   e. Go back to the Document Type Association preferences page, select the extended `framework`, and click Edit.
   f. Go to the Classpath tab (on page 99), add a reference to your new resources folder, and move this reference up (using the Move Up button) so that it is the first one that appears in the list.
   g. Click OK and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in Sharing a Custom Framework (on page 2371).
Using Form Controls in Author Mode

Form controls make it easier to capture, organize, and edit content. They are especially helpful for less technical users because form controls provide a way to interact with the content of a document in a graphical manner without intimidating the user with the XML structure.

Oxygen XML Editor includes a variety of built-in form controls (on page 2541) that can be defined in CSS stylesheets that are used to render Author mode (on page 2541). You can also implement custom form controls (on page 2573) for more specific needs. The types of built-in form controls that are available include:

- **Audio (on page 2542)** - A media object that plays audio clips.
- **Browser (on page 2543)** - A media object that renders HTML frames or interact with SVG documents
- **Button (on page 2547)** - A graphical user interface object that performs a specific action.
- **Button Group (on page 2550)** - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- **Checkbox (on page 2553)** - A graphical user interface box that you can click to select or deselect a value.
- **Combo Box (on page 2556)** - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- **Date Picker (on page 2558)** - A form control object that allows you to select a date in a specified format.
- **HTML Content (on page 2560)** - A graphical user interface box that is used for rendering HTML content.
- **Pop-up (on page 2562)** - A contextual menu that provides quick access to various actions.
- **Text Area (on page 2565)** - A box that allows you to enter multiple lines of text.
- **Text Field (on page 2568)** - A graphical user interface box that allows you to enter a single line of text.
- **URL Chooser (on page 2570)** - A dialog box that allows you to select the location of local or remote resources.
- **Video (on page 2572)** - A media object that plays videos.

The following image is an example of several form controls rendered in Author mode. The first (Direct manager) is a combo box with both a drop-down menu and an editable text field. This is followed by a simple text field (Homepage), and the [+ ] and [- ] icons also represent button form controls that are assigned specific actions to add or delete records from the document.

Figure 388. Example of Form Controls in Author Mode
You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled samples project (located in the samples folder inside the Oxygen XML Editor installation directory) contains a file called personal.xml that contains form controls. You can use this file, along with its corresponding personal.css file to experiment with an example of how form controls can be implemented in Author mode.

Related Information:

- Form Controls (on page 2541)

Contextual Menu Actions in Author Mode

Oxygen XML Editor includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in Author mode, the contextual menu includes general actions that are available for all of the recognized document types and framework (on page 3282)-specific actions that are configured for each document type.

**General Contextual Menu Actions in Author Mode**

The general actions that are available in the contextual menu (some of them are also available in the submenus of the Document menu) for all built-in document types include the following:

1. **Add File to Review Task**
   
   This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your
organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Quick Fix (Alt + 1 (Command + Alt + 1 on OS X))

Available when the contextual menu is invoked on an error where Oxygen XML Editor can provide a Quick Fix (on page 1109).

Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in the Oxygen XML Editor Image Viewer (on page 721) or in a default system application associated with the current image type.

Track Changes Actions

Available when the Track Changes feature (on page 3288) is enabled and the contextual menu is invoked on a change. The following options are available:

✓ Accept Change(s)

Accepts the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

✗ Reject Change(s)

Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

✍ Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Author Callout Actions

Available when the contextual menu is invoked on a callout (on page 3280). If the corresponding options in the Show review callouts section (on page 143) are selected in
the Callouts preferences page (on page 143), the callouts are displayed in Author mode for comments, tracked insertion changes, or tracked deletion changes.

**Insertion or Deletion Callout Actions**

The following actions are available in the contextual menu when invoked on an insertion or deletion callout box:

**Reply**

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

**Mark as Done**

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✔ **Accept Change(s)**

Accepts the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an insertion change, it keeps the inserted text and for a deletion change, it removes the content from the document.

✗ **Reject Change(s)**

Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection. If you select a part of a deletion or insertion change, only the
selected content is rejected. If you select multiple changes, all of them are rejected. For an insertion change, it removes the inserted text and for a deletion change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the Callouts preference page (on page 143) where you can configure various callout options.

Comment Callout Actions

The following actions are available in the contextual menu when invoked on a comment callout box:

Reply

Opens a dialog box that allows you to add a reply to a comment or Tracked Changes (on page 3288). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and Review view (on page 964).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for Tracked Changes (on page 3288) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This
is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

- **Show/Edit Comment**
  Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

- **Remove Comment**
  Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

- **Callouts Options**
  Select this option to open the Callouts preference page (on page 143) where you can configure various callout options.

- **Edit Attributes**
  Displays an in-place attributes editor (on page 429) that allows you to manage the attributes of an element.

**Edit Profiling Attributes**
Allows you to change the profiling attributes (on page 969) defined on all selected elements.

- **Insert submenu**
  This submenu includes insert actions that are specific to each framework (on page 3282), along with the following general action:

- **Insert Entity**
  Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

  - #<decimal value> - e. g. #65
  - &#<decimal value>; - e. g. &#65
  - #x<hexadecimal value> - e. g. #x41
  - &#x<hexadecimal value>; - e. g. &#x41

- **Cut (Ctrl + X (Command + X on OS X))**
  Removes the current selected content from the document and places it in the clipboard.
Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes special paste actions that are specific to each framework (on page 3282), as well as the following general paste actions:

- **Paste As XML**
  Pastes clipboard content that is considered to be XML, preserving its XML structure.

- **Paste As Text**
  Pastes clipboard content, ignoring any structure or styling markup.

Select submenu

This submenu allows you to select the following:

- **Element**
  Selects the entire element at the current cursor position.

- **Content**
  Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

- **Parent**
  Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

- **To Lower Case**
  Converts the selected content to lower case characters.

- **To Upper Case**
  Converts the selected content to upper case characters.

- **Capitalize Sentences**
  Converts to upper case the first character of every selected sentence.
Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note: The content marked as deleted with change tracking (on page 3288) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 770). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to #

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 779).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

†† Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Join Elements**

Joins two adjacent block elements that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Ctrl + E (Command + E on OS X))**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 167) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 167) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with ‘[tag]’ (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according to the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**
Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).
Convert to Task
Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic
Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting
Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key
Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute
Allows you to change the value of an attribute or insert a new one.

Convert attribute to element
Allows you to change an attribute into an element.

Delete attribute
Allows you to remove one or more attributes.

Rename attribute
Allows you to rename an attribute.

Replace in attribute value
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.
Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

**JATSKit Refactoring Actions**

Available for JATS documents. Contains built-in XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

**Review submenu**

This submenu includes the following actions:

- ✔ **Track Changes**
  
  Enables or disables the *Track Changes (on page 3288)* support for the current document.

- ✔ **Accept Change(s) and Move to Next**
  
  Accepts the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- ✔ **Accept All Changes**
  
  Accepts all *Tracked Changes (on page 3288)* in the current document.

- ❌ **Reject Change(s) and Move to Next**
  
  Rejects the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

- ❌ **Reject All Changes**
  
  Rejects all *Tracked Changes (on page 3288)* in the current document.

- 💬 **Comment Change**
Opens a dialog box that allows you to add a comment to an existing 
_Tracked Change (on page 3288)_ . The comment will appear in a callout 
and a tooltip when hovering over the change. If the action is selected on 
an existing commented change, the dialog box will allow you to edit the 
comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your 
document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a 
callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the 
current user to edit comments that do not have replies. If you are not the 
author who inserted the original comment, the dialog box just displays the 
comment without the possibility of editing it.

**Remove Comment**

Removes a selected comment. If you remove a comment that contains 
replies, all of the replies will also be removed.

**Manage Reviews**

Opens the _Review view (on page 964)_ .

**Manage IDs submenu**

This submenu is available for XML documents that have an associated DTD, XML 
Schema, or Relax NG schema (not available for DITA documents). It includes the 
following actions:

**Rename in**
Renames the ID and all its occurrences. Selecting this action opens the 
**Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** (on page 1129) dialog box, this scope will be used instead.

**Search References in**

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** (on page 1129).

**Search Occurrences in file**

Searches for the occurrences of the ID in the current document.

**Folding submenu**

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

**Inspect Styles**

Opens the **CSS Inspector view** (on page 439) that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the **Author mode options page** (on page 131).
Document Type-Specific Contextual Menu Actions in Author Mode

Other document type-specific actions are available in the contextual menu of Author mode for the following document types (click the links to see the default actions that are available for each specific document types):

- DocBook4 Author Actions (on page 1539)
- DocBook5 Author Actions (on page 1555)
- DITA Author Actions (on page 1575)
- DITA Map Author Actions (on page 1598)
- XHTML Author Actions (on page 1605)
- TEI ODD Author Actions (on page 1623)
- TEI P5 Author Actions (on page 1613)
- JATS Author Actions (on page 1632)

Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Editor provides validation functions that allow you to easily identify errors and their location.

Related Information:

- Working with Modular XML Files in the Master Files Context (on page 1126)

Checking XML Well-Formedness

A Well-formed XML document is a document that conforms to the XML syntax rules. A Namespace Well-Formed XML document is a document that is Well-formed XML and is also Namespace-wellformed and Namespace-valid.
Well-Formedness Rules

The XML Syntax rules for Well-formed XML include:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The Namespace-wellformed rules include:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The Namespace-valid rules include:

- The xml prefix is by definition bound to the namespace name: http://www.w3.org/XML/1998/namespace. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The xmlns prefix is used only to declare namespace bindings and is by definition bound to the namespace name: http://www.w3.org/2000/xmlns/. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence x, m, l, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is xml or xmlns) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

Check for Well-Formedness

To check if a document is Namespace Well-Formed XML and Namespace-valid:

- Select the Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on OS X)) action from the Validation drop-down menu on the toolbar (or the Document > Validate menu).
- A selection of files can be checked for well-formedness by selecting the Check Well-Formedness action from the Validate submenu when invoking the contextual menu in the Project view (on page 333).
Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non Well-formed XML Document

```
<root><tag></root>
```

When Check Well-Formedness is performed the following error is raised:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert </tag>.

Example: A non Namespace-wellformed Document

```
<prefix:elem></prefix:elem>
```

When Check document form is performed the following error is raised:

```
The prefix "prefix" for element "prefix:elem" is not bound.
```

Example: A non Namespace-valid Document

```
<x:y></x:y>
```

When Check document form is performed the following error is raised:

```
The prefix "x" for element "x:y" is not bound.
```

Validating XML Documents Against a Schema

A Valid XML document is a Well-Formed XML document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Editor, how validation errors are presented, and information about built-in and custom validation scenarios.
For information about how to associate a schema for the purposes of validation (and content completion), see the `Associating a Schema to XML Documents (on page 1112)` section.

**Automatic Validation**

By default, Oxygen XML Editor automatically checks for validation errors in the document as you are editing. The `Enable automatic validation option (on page 181)` in the `Document Checking preferences page (on page 180)` controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a configurable delay (on page 181) from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. You can use the arrow buttons in this dialog box to navigate through the errors issued by the Automatic Validation feature.

**Related Information:**
- Manual Validation Actions (on page 1082)
- Presenting Validation Errors in Text Mode (on page 364)
- Presenting Validation Errors in Author Mode (on page 445)

**Manual Validation Actions**

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Editor.

**Manual Validation Actions**

To manually validate the currently edited document, use one of the following actions:

- ✔️ **Validate (Ctrl + Shift + V (Command + Shift + V on OS X))**
  
  Available from the ✔️ Validation drop-down menu on the toolbar, the **Document > Validate** menu, or from the Validate submenu when invoking the contextual menu in the Project view (on page 333).
An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules. This action also re-parses the XML Catalogs (on page 3289) and resets the schema used for content completion.

☑ Validate (cached)

Available from the ☐ Validation drop-down menu on the toolbar or the Document > Validate menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note: Automatic validation also caches the associated schema.

Validate with

Available from the ☐ Validation drop-down menu on the toolbar, (or Document > Validate menu).

This action opens a dialog box that allows you to specify a schema for validating the current document (on page 1116).

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

Note: The Validate with action does not work for files loaded through an Oxygen XML Editor custom protocol plugin (on page 2595) developed independently and added to Oxygen XML Editor after installation.

Validate with Schema

Available from the Validate submenu when invoking contextual menu in the Project view (on page 333).

This action opens a dialog box that allows you to specify a schema for validating all selected files (on page 1117).

Other Validation Options

To quickly open the schema used for validating the current document, select the ☐ Open Associated Schema action from the toolbar (or Document > Schema menu).
The **Validation options** button, available in the **Document > Validate** menu, allows you to quickly access to the validation options *(on page 191)* for the built-in validator in the Oxygen XML Editor preferences page.

**Tip:** If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the **Document Checking** preferences page *(on page 180)*.

### Related Information:

- Presenting Validation Errors in Author Mode *(on page 445)*

### Presenting Validation Errors in Text Mode

By default, Oxygen XML Editor automatically validates documents *(on page 1082)* while editing in the **Text** mode, and actions are also available to manually validate documents *(on page 1082)* on-request.

#### Figure 389. Presenting Validation Errors in Text Mode

![Image of validation errors in Text mode]

### Validation Marker Locations

In **Text** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
In the right-side vertical stripe, with a marker that is colored according to the type of issue.

For attributes with detected issues, in the Attributes view (on page 351), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in red.

- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in yellow.

- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in blue.

You can configure the color for each type in the **Document Checking** preferences page (on page 180).

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Document checking, and specify the desired limit in the **Maximum number of validation highlights** option (on page 180).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the Document checking options button opens the **Document Checking** preferences page (on page 180).

**Bottom Part of the Stripe**
Two navigation arrows (➡️) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)). Also, the ✗ Remove All button can be used to clear all the validation markers.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (on page 1109) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (on page 180) where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the Information view (on page 822).
- If you want to see all the validation messages grouped in the Results panel (on page 357), you should use the Validate action from the toolbar or Document > Validate menu..

Presenting Validation Errors in Author Mode

By default, Oxygen XML Editor automatically validates documents (on page 1082) while editing in the Author mode, and actions are also available to manually validate documents (on page 1082) on-request.

Figure 390. Presenting Validation Errors in Author Mode
Validation Marker Locations

In Author mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the Attributes view (on page 426), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the Attributes view are colored in blue.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

**Upper Part of the Stripe**

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation
warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

**Middle Part of the Stripe**

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Document checking, and specify the desired limit in the Maximum number of validation highlights option (on page 180).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (on page 180).

**Bottom Part of the Stripe**

Two navigation arrows (←) allow you to jump to the next or previous issue. The same actions can be triggered from Document > Automatic validation > Next error (Ctrl + Period (Command + Period on OS X)) and Document > Automatic validation > Previous error (Ctrl + Comma (Command + Comma on OS X)). Also, the Remove All button can be used to clear all the validation markers.

You can configure the color for each type in the Document Checking preferences page (on page 180).

**Hovering Over Validation Issues**

Hovering over a validation issue presents a tooltip message with more details about the problem and possible quick fixes (on page 1109) (if available for that issue). Also, when hovering over an issue, pressing F2 will change the focus to the tooltip where you can use Tab and Shift + Tab to navigate between quick fixes and Space to trigger them.

**Details About Validation Issues**

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the Document checking options button opens the Document Checking preferences page (on page 180) where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the Information view (on page 822).
• If you want to see all the validation messages grouped in the Results panel (on page 357), you should use the Validate action from the toolbar or Document > Validate menu.

Related Information:

• Validating XML Documents Against a Schema (on page 1081)

• Presenting Schematron Validation Issues (on page 1464)

Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the assert and assertion elements, set the message attribute on these elements.

  • For Xerces, the message attribute has to belong to the http://xerces.apache.org namespace.
  • For Saxon, the message attribute has to belong to the http://saxon.sourceforge.net/ namespace.

The value of the message attribute is the error message displayed if the assertion fails.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the Custom Validation Engines preferences page (on page 181). After a custom validation engine is properly configured (on page 181), it can be applied on the current document by selecting it from the list of custom validation engines in the Validation toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the output message format (on page 1091) of Oxygen XML Editor for linked messages:

  • Saxon-EE - Included in Oxygen XML Editor. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 192).
  • MSXML 4.0 - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
  • MSXML.NET - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
• **LIBXML** - Not included in Oxygen XML Editor and, depending on your operating system, the libraries need to be downloaded and installed separately from [http://xmlsoft.org/downloads.html](http://xmlsoft.org/downloads.html). Afterwards, the **PATH** environment variable needs to be updated to contain the parent folder of the `xmllint` executable. Alternatively, you can go to Options > Preferences > Editor > Custom Validation Engines, edit the LIBXML validation engine and set a custom path to the `xmllint` executable.

The LIBXML validator is associated with the XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for **XML Catalogs** (on page 3289) (the **--catalogs** parameter) and XInclude processing (**--xinclude**) are enabled by default in the preconfigured LIBXML validator. The **--postvalid** parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the **--dtdvalid** `${ds}` parameter manually to the DTD validation command line. `${ds}` represents the detected DTD declaration in the XML document.

⚠️ **CAUTION:** File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in **XML Catalog** (on page 3289) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Editor is installed in the default location on Windows (`C:\Program Files`) because the built-in **XML catalog** files are stored in the **frameworks** subfolder of the installation folder and in this case, the file path contains at least one space character.

⚠️ **Attention:** On OS X, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xsmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

• **XSV** - Not included in Oxygen XML Editor. Windows and Linux distributions of XSV can be downloaded from [http://www.cogsci.ed.ac.uk/~ht/xsv-status.html](http://www.cogsci.ed.ac.uk/~ht/xsv-status.html). The executable path is already configured in Oxygen XML Editor (on page 181) for the `[OXYGEN_INSTALL_DIR]/xsv` installation folder. If it is installed in a different folder, the predefined executable path must be corrected in Preferences. (on page 181) It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.

• **SQC (Schema Quality Checker from IBM)** - Not included in Oxygen XML Editor. It can be downloaded from here (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory `[OXYGEN_INSTALL_DIR]/sqa`. If it is installed in a different folder, the
predefined executable path and working directory must be corrected in the Preferences page. (on page 181) It is associated to XSD Editor.

A custom validator cannot be applied on files loaded through an Oxygen XML Editor custom protocol plugin (on page 2595) developed independently and added to Oxygen XML Editor after installation.

Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Editor window. If such an output message (warning, error, fatal error, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type**: [F|E|W] (the string Type: followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
- **SystemID**: A system ID of a file (the string SystemID: followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line**: A line number (the string Line: followed by the number of the line that will be highlighted).
- **Column**: A column number (the string Column: followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.
- **EndLine**: A line number (the string EndLine: followed by the number of the line where the highlight ends). This property is optional in a linked message.
- **EndColumn**: A column number (the string EndColumn: followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.

**Note:** The Line/Column pair works in conjunction with the EndLine/EndColumn pair. Thus, if both pairs are specified, then the highlight starts at Line/Column and ends at EndLine/EndColumn. If the EndLine/EndColumn pair is missing, the highlight starts from the beginning of the line identified by the Line parameter and ends at the column identified by the Column parameter.

- **AdditionalInfoURL**: The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description**: Message content (the string Description: followed by the content of the message that will be displayed in the output view).

**Example:**

Example of how a custom validation engine can report an error using the format specified above:
Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends net.sf.saxon.lib.ExtensionFunctionDefinition. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[]{SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public SequenceType getReturnType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }
```
```java
