To localize the content of a framework, create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list">
    <comment>List menu item name.</comment>
    <val lang="en_US">List</val>
    <val lang="de_DE">Liste</val>
    <val lang="fr_FR">Liste</val>
  </key>
  ......................
</translation>
```
Oxygen XML Editor matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the languagelist tag for the corresponding framework is used.

Add the directory where this file is located to the Classpath list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (on page 95), go to Author > Actions, and rename the bold action to ${i18n(translation_key)}. Actions with a name format other than ${i18n(translation_key)} are not localized. Translation_key corresponds to the key from the translation.xml file.

Now open the translation.xml file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:

```xml
<key value="translation_key">
    <comment>Bold action name.</comment>
    <val lang="en_US">Bold</val>
    <val lang="de_DE">Bold</val>
    <val lang="fr_FR">Bold</val>
</key>
```

To use a description from the translation.xml file in the Java code used by your custom framework, use the new ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle() API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
    content: "${i18n(title.key)} : ";
}
```
Note: You can enter any language you want in the `languagelist` tag and any number of keys.

The `translation.xml` file for the DocBook framework is located here: `{OXYGEN_INSTALL_DIR}/frameworks/docbook/i18n/translation.xml`. In the Classpath list corresponding to the DocBook document type the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association > Author > Actions. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the Oxygen SDK Maven archetype, you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

Creating New Document Templates for a Custom Framework

You can create your own custom document templates and attach them to a custom framework (on page 3282). You can then share the custom framework (on page 2371) so that all users will have access to the templates in the New document wizard (on page 676).

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

   Tip: You can use editor variables (on page 276) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (on page 685) for other template customization tips (for example, you could add placeholders or hints (on page 687) to assist authors).

2. Save the new template in a directory (for example, called `templates`) within your custom framework directory.

   Attention: The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as `My Custom Template1`). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (on page 686) section.

3. Open the Document Type configuration dialog box (on page 95) for that specific framework, go to the Templates tab (on page 118), and click the `+` button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). Binding to an absolute file (e.g., `C:\some_dir\templates`) makes the association difficult to share between users.

4. Click OK for all of the dialog boxes to save your changes.
5. To test the template, open the new document wizard (New toolbar button or File > New) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

Related Information:

- Customizing Document Templates (on page 685)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an XML Catalog (on page 3289) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (on page 3282) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

   **Example:**

   Create a new XML file called catalog.xml and save it in your custom framework directory (\OXYGEN_INSTALL_DIR\frameworks\CUSTOM_FRAMEWORK_DIR). The content of the file should look like this:

   ```xml
   <?xml version="1.0"?>
   <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
     <uri name="http://www.oxygenxml.com/SDF/abs.xsd" uri="schema/abs.xsd"/>
   </catalog>
   ```

2. Add catalog files to your custom framework using the Catalogs tab (on page 119) from the Document Type configuration dialog box (on page 95).

To test the catalog settings, restart Oxygen XML Editor and try to validate a new sample document for your custom framework. There should be no errors.

**Example:**

The schema that validates the document refers the other file abs.xsd through an import element:
The `schemaLocation` attribute references the `abs.xsd` file:

```xml
<xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
  http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```xml
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to `http://www.oxygenxml.com/SDF/abs.xsd` must be resolved to the `abs.xsd` file located in the `schema` directory (note that the `schema` directory needs to be in the same folder as the XML Catalog). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

Configuring Transformation Scenarios for a Framework

When distributing a framework (on page 3282) to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the framework configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your framework.

1. Create an `xsl` folder inside your custom framework directory
   ```
   \{OXYGEN_INSTALL_DIR\}/frameworks/\{CUSTOM_FRAMEWORK_DIR\}/xsl
   ```

2. Create an `xsl` file and save it in the `xsl` folder. To help you get started, you can use the sample `sdf.xsl` file found in the sample framework customization package.

3. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Associations. Select the particular framework, click the Edit button to open Document Type...
Configuration dialog box (on page 95), and choose the Transformation tab. Click the - New button and choose the appropriate type of transformation (for example, XML transformation with XSLT).

In the New scenario dialog box, fill in the following fields:

- Fill in the Name field with the name of your transformation scenario.
- Set the XSL URL field to path of your custom stylesheet (for example, ${framework}/xsl/mycustom.xsl).

Figure 708. Configuring a New XSLT Transformation Scenario

4. Change to the Output tab. Configure the fields as follows:

- Set the Save as field to ${cfd}/${cfn}.html. This means the transformation output file will have the name of the XML file and the html extension and will be stored in the same folder.
- Select the Open in Browser/System Application option.

  Note: To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.
- Select the Saved file option.

5. Click the OK button to save the new scenario.

Now the scenario is listed in the Transformation tab:
To test the transformation scenario that you just created, you can use the sample `sdf.xml` file found in the sample framework customization package. Click the `Apply Transformation Scenario(s)` button to display the Transform with dialog box. The scenario list contains the scenario you defined earlier. Select the SDF to HTML scenario that you just defined and click the Apply associated button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

Configuring Validation Scenarios for a Framework

You can distribute a framework (on page 3282) with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

Note: If a master file is associated with the current file, the validation scenarios defined in the master file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support (on page 726) or Working with Modular XML Files in the Master Files Context (on page 1126).

To associate a validation scenario with a specific framework, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.

2. Select the document type and click the Edit button to open the Document Type Configuration dialog box (on page 95), then choose the Validation tab. This tab displays a list of document types in which you can define validation scenarios. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the Default box for that specific document type.

3. To edit an existing scenario, select the scenario and click the Edit button. To add a new scenario, click the New button.

In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.
This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**Storage**

You can choose between storing the scenario in the Project Options (on page 3286) or Global Options (on page 3283).

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the ❘ **Insert Editor Variable** button to insert an editor variable (on page 276) or a custom editor variable (on page 284).
File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the URL of the file to validate field.

Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 200), XQuery preferences page (on page 208), XML Schema preferences page (on page 192)).

The DITA Validation engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA Maps Manager Validate and Check for Completeness action (on page 3036), but for a local file rather than an entire DITA map (on page 3281)).

The Table Layout Validation engine looks for table layout problems (for more information, see Report table layout problems (on page 3040)).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 1082). If the Automatic validation feature is disabled in the Document Checking preferences page (on page 180), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the File type to XML Document and allows you to specify the schema used for the validation unit.
**Specify Schema**

Opens the Specify Schema dialog box that allows you to set a schema to be used for validating XML documents.

Figure 712. Specify Schema Dialog Box

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document (on page 1113).

**Use custom schema**

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol (on page 2610). You can specify the URL by using the text field, the history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the URL field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.

- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**: Opens a dialog box that allows you to specify [Java extension JARs](on page 3283) to be used during the validation.
- **Public ID**: Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase**: If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

**Move Up**
Moves the selected scenario up one spot in the list.

**Move Down**
Moves the selected scenario down one spot in the list.

**Add**
Adds a new validation unit to the list.

**Remove**
Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

5. Press **Ok**.
   The newly created validation scenario is now included in the list of scenarios in the **Validation tab (on page 121)**. You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

Customizing Smart Paste Support

The **Smart Paste feature (on page 918)** preserves certain style and structure information when copying content from some of the most common applications and pasting into frameworks (document types) that support Smart Paste (on page 919) in Oxygen XML Editor. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (framework (on page 3282)). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.
How to Customize the Smart Paste Mapping

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular framework contains a folder named resources in the following path structure:

   /frameworks/[Document Type]/resources

2. Create an XSLT file named xhtml2content.xsl and save it in the resources folder for the particular framework.

   For example: /frameworks/[Document Type]/resources/xhtml2content.xsl

3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the Supported Parameters for the Custom Smart Paste XSLT (on page 2345) section below.

   Tip: The built-in DITA framework includes an xhtml2ditaDriver.xsl file (in [OXYGEN_INSTALL_DIR]/frameworks/dita/resources) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire contents of the built-in dita/resources folder and customize the stylesheets according to your needs.

4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Editor.

Result: When you paste content from external applications (such as a web browser or an Office document) to a document that is opened in Author mode, and that matches the particular framework, the styling from the xhtml2content.xsl stylesheet will be applied on the clipboard contents.

Customized Smart Paste Stylesheet Sample:

```xml
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xhtml="http://www.w3.org/1999/xhtml"
  xmlns="urn:hl7-org:v3"
  exclude-result-prefixes="xsl xhtml">

  <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

  <xsl:template match="xhtml:b | xhtml:strong">
    <content styleCode="bold">
      <xsl:apply-templates select="@* | node()"></xsl:apply-templates>
    </content>
  </xsl:template>

</xsl:stylesheet>
```
Supported Parameters for the Custom Smart Paste XSLT

The following parameters can be used in your XSLT stylesheet for customizing the Smart Paste mechanism:

**inTableContext**

The custom XSLT stylesheet receives this parameter with a value of `true` if the end user is pasting content inside a table.

**folderOfPasteTargetXml**

A URL pointing to the folder where the current edited XML document is located. This is used to save images relative to the current XML document.

**context.path.names**

A sequence of element names showing the current context in the XML document where the paste occurred.

**context.path.uris**

A sequence of namespaces, one for each context path name.

**context.path.separator**

The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called `externalPasteOptions.xml` in the `resources` folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:

```xml
<!-- Options that control external paste
```
Customizing Author Mode Using CSS Files Associated with a Framework

The easiest way to customize the main (on page 3284) CSS stylesheet of a framework (on page 3282) is to create a new stylesheet, save it as an alternate (on page 3279) CSS file that will be applied as an additional layer to the main CSS, and then select it from the Styles drop-down menu in Author mode.

For example, suppose that you want to customize the main CSS for DITA documents. To do this, follow these steps:

1. First, create a new CSS stylesheet and save it in the /frameworks/dita/css/edit folder (where the default main stylesheet named style-basic.css is located).

2. Edit the DITA framework and go to the CSS subtab (on page 101):
   a. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.
   b. Select the DITA document type and press the Edit button.

   **Tip:** If you do not have write permissions to modify the document type, use the Extend button to create an extension of the framework.

   a. Go to the CSS subtab of the Author tab.

Figure 713. CSS Subtab of the Document Type Association Author Tab
3. Add the new stylesheet as an *alternate* CSS stylesheet:
   a. Click the **Add** button to open a dialog box that allows you to specify the URI and Title for your newly created stylesheet.
   b. Select the **Alternate** option to define it as an *alternate* stylesheet that will be applied as an additional layer to the *main* CSS.

![Figure 714. Add CSS Dialog Box](image)

4. Press **OK** in all the dialog boxes to validate the changes.

5. Select your newly created CSS stylesheet from the **Styles** drop-down menu on the toolbar in **Author** mode.
   
   You can now edit DITA documents based on the new CSS stylesheet. You can also edit the new CSS stylesheet itself and see its effects on rendering DITA documents in the **Author** mode by using the **Refresh** action that is available on the **Author** toolbar and in the **DITA** menu.

   **Related Information:**
   ```
   • Configuring and Managing Multiple CSS Styles for a Framework (on page 2348)
   ```
Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Editor provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style and multiple alternate CSS styles. This makes it easy to change the look of the document as it appears in Author mode and the output without having to continually edit the CSS stylesheets.

An example of a common use case is when content authors want to use custom styling within a document. You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document.

Managing the CSS Styles

The main and alternate styles that are listed in the Styles drop-down menu can be controlled in the Document Type configuration dialog box. To access it, follow these steps:

1. Open the Preferences dialog box.
2. Go to Document Type Association.
3. Select the appropriate document type and press the Edit button.

Important: If you do not have access rights to the folder where the framework files are stored, you can either elevate read/write permissions on that framework folder or you can extend the framework and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework.

The CSS styles (CSS files) associated with the particular document type are listed in the CSS subtab of the Author tab.

Figure 715. Main and Alternate CSS Styles in the Document Type Configuration Dialog Box
You can **Add**, **Edit**, or **Delete** styles from this dialog box to manage the *main (on page 3284)* and *alternate (on page 3279)* styles associated to the particular document type. You can also change the order of the styles by using the **Move Up** and **Move Down** buttons. This will also change the order that they appear in the **Styles** drop-down menu. The *alternate* styles are combined with the *main* CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the rules that are defined in the last *alternate* style in this list will take precedence, since it is the last one to be combined (applied as a layer).

The **URI** column shows the path of each CSS file. The names listed in the **Styles** drop-down menu match the values in the **Title** column. The value in the **Alternate** column determines whether it is a *main* or *alternate* CSS. If the value is *no* it is a *main* CSS. If the value is *yes* it is an *alternate* CSS and the style can be combined with a *main* CSS or other *alternate* styles when using the **Styles** drop-down menu.

**Note:** To group alternate styles into categories (submenus), use a vertical bar character (|) in the **Title** column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the **Styles** drop-down menu, while the text after the final vertical bar will be rendered as the name of the style inside the submenu.
Example: Suppose that you want to add two alternate stylesheets in separate submenus, with the Title column set to My Styles|User Assistance|Hints and My Styles|User Actions|Inline Actions, respectively.

Oxygen XML Editor will add a My Styles submenu with two submenus (User Assistance that contains the Hints style, and User Actions that contains the Inline Actions style) in the Styles drop-down menu.

The Enable multiple selection of alternate CSSs checkbox (on page 101) at the bottom of the pane must be selected for the alternate CSS styles (on page 3279) to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the alternate styles are treated like main CSS styles (on page 3284) and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to ignore or merge them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

Using the Styles Drop-down Menu

You can use the Styles drop-down menu to select a main css style (on page 3284) that applies to the whole document and then select one or more alternate css styles (on page 3279) that behave like layers and are merged sequentially with the main style. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in Author mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Editor will remember them when subsequent documents are opened.

Main CSS Style

The main styles are listed in the top section and each of their corresponding CSS files are primarily used to render basic things such as the font and background of the document. You can only select one main style at a time.

Alternate CSS Styles
The alternate styles are listed in the bottom section and their corresponding CSS files are used to render numerous different types of things in the document as they are merged with the selected main styles. You can select as many alternate styles as you wish. If you are unsure about how each of the styles with change the look of your documents based solely upon their name, there is no harm in selecting them to see the difference. You can simply deselect them to revert to the previous look.

**Note:** If you deselect the Enable multiple selection of alternate CSSs option (on page 101) in the CSS subtab of the Document Type configuration dialog box (on page 95), the alternate styles are treated like main CSS styles and you can only select one at a time.

**EXAMPLE: CSS Styles in DITA**

Oxygen XML Editor comes with a set of built-in CSS layer stylesheets for DITA documents (as well as some that are specifically for DITA maps (on page 3281)). In the subsequent figure, a DITA document has the Century style selected for the main CSS style and the alternate styles Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.

**Tip:** The Hints style displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure. The Inline actions style displays possible elements that are allowed to be inserted at various locations throughout DITA documents.

Figure 716. Styles Drop-down Menu in a DITA Document
Customizing the Content Completion Assistant

Oxygen XML Editor gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant (on page 3280). Oxygen XML Editor also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Editor:

- You can add, modify, or remove actions that are proposed for each particular document type (framework (on page 3282)) by using the Content Completion subtab in the Document Type Association configuration dialog box (on page 116). To access this subtab, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 92), click on the Author tab, and then the Content Completion subtab.

- You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (li) accepts more than 60 child elements. Oxygen XML Editor includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (li) to only accept paragraph elements (p). In this case, the Content Completion Assistant (on page 3280) should not offer any element other than a paragraph (p) when a list item (li) is inserted into a document. It would also be helpful if the required child element (p) was automatically inserted whenever a list item (li) is inserted.
One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be quite complicated in some cases. Fortunately, Oxygen XML Editor offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 3280), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 99) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Configuration document template that is included in Oxygen XML Editor (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip: In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (cc_config.xml) uses elementProposals elements. This element allows you to customize or filter the child elements and attributes for an element.
Warning: Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

Elements:

To control the elements that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, `"title"` matches all the `title` elements in the document, while `"chapter/title"` matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `/elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`

Note: Using a namespace prefix requires that you declare it in the configuration file. For example:

```
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
    path="db5:listitem" insertElements="db5:para" />
```
- `//xs:documentation[@lang="en"]`
Note: If the path attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use possibleElements (on page 2355) or rejectElements (on page 2355) to specify or restrict particular elements for a framework (on page 3282).

For example, suppose that in your DITA documents, you want to restrict your users from using image and fig elements because you do not want images to be included in your output. The configuration file should look like this:

```
<elementProposals rejectElements="image fig" />
```

Since the path attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- insertElements - A space-separated sequence of child element names. Each time the element specified in the path attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, insertElements="b i" will insert exactly one b element, followed by an i element. An empty value ("") means that no child elements should be inserted.

  Note: If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- possibleElements - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the path attribute. For example, "b i codeph ph" means that the Content Completion Assistant will contain these four elements when invoked on the element specified in the path attribute. The following other possible values are also supported:

  - **NONE** - There will be no proposals in the content completion list.
  - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - **INSERTED** - The proposals will be the same list of elements that are defined in the insertElements attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```
<elementProposals possibleElements="b i codeph ph" />
```

- rejectElements - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the path attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the elements specified in this attribute.
This setting also influences copy/paste and insertion behaviors. For example, if you reject the insertions of images in paragraphs and you try to paste an image inside a paragraph, by default the application will take your choice into account and try to insert the image in a place where it is allowed.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```
<elementProposals rejectElements="image fig imagemap foreign" />
```

**Attributes:**

To control the attributes that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- **path** - A path within the document that matches the element that will have its attribute proposals changed. For example, "title" matches all the `title` elements in the document, while "chapter/title" matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences (on page 162).

  **Note:** If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleAttributes` (on page 2357) or `rejectAttributes` (on page 2357) to specify or restrict attributes for an entire framework.

For example, suppose that you only want to allow a limited set of attributes in a customized `framework`. The configuration file should look like this:

```
<elementProposals possibleAttributes=""
  id domains href scope format type conref
  props keyref class"/>
```

Since the `path` attribute is missing, this applies to the entire `framework` and only the specified attributes will be proposed.

- **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

```
<elementProposals path="ol/li" insertAttributes="product platform"/>
```

- **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

```
<elementProposals path="ol/li">
  <insertAttribute name="platform" value="test"/>
```

• possibleAttributes - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the path attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals possibleAttributes="scope format type" />
```

• rejectAttributes - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the path attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals rejectAttributes="importance platform product" />
```

### Other Important Notes About the Configuration File

⚠️ **Important:**

- By default, the element names that do not have a namespace prefix are considered from no-namespace. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the elementPath and model attributes.
- This configuration file only affects the content completion assistance. It has no effect on validation or operations invoked from other areas in the interface (such as the toolbar or menus).
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the **Refresh (F5)** action to test your customizations.
- When an XML element from the document is matched against a list of configured elementProposals, the first one in sequence takes precedence. Therefore, make sure you place the more specific elementProposals (those with a longer path) first in your configuration file.
- Regular expression patterns can be used in the following attributes: possibleElements, rejectElements, possibleAttributes, and rejectAttributes. For example, code*, *block, con*ref, _*.  
- Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex elementProposals patterns are defined, you should avoid infinite recursions.
Examples: Configuring the Element Proposals

• Example 1: Automatically Insert Elements

Suppose that you want to automatically insert a paragraph element (p) whenever a DITA ordered list item element (ol/li) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```xml
<elementProposals path="ol/li" insertElements="p"
    possibleElements="_INSERTED_"/>
```

Tip: This particular example modifies an action that inserts a list in a DITA document. There are several ways to invoke this action in the interface. For example, there is a toolbar button and an action in the DITA menu that inserts a list. However, since the configuration file only affects the Content Completion Assistant, this modification will have no effect on the behavior of the toolbar or menu action. Those actions would need to be configured separately if you want the result to be the same as the content completion proposal. For more information, see Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 2323).

• Example 2: Insert Complex Element Structure

For a more complex example, suppose that you want to insert a complex structure whenever a DITA prolog element is inserted.

For instance, if you need to insert the following structure inside prolog elements:

```xml
<prolog>
    <author/>
    <metadata>
        <keywords>
            <keyword/>
            <keyword/>
        </keywords>
    </metadata>
</prolog>
```

The configuration file should include the following:

```xml
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
<elementProposals path="prolog/metadata/keywords"
    insertElements="keyword, keyword"/>
```
Example 3: Limit Possible Elements

Suppose that you also want to limit the proposals for the `keywords` element to only allow the user to insert `audience` or `keyword` elements. The configuration file should include the following:

```xml
<elementProposals path="prolog/metadata" insertElements="keywords"
                  possibleElements="audience keywords"/>
```

Suppose that you want to simply restrict your users from inserting `image` elements inside DITA list item elements (`li`), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="li" rejectElements="image"/>
```

Examples: Configuring the Attributes Proposals

Example 1: Automatically Insert Attributes

Suppose that you want to insert an `id` attribute (with an empty value) whenever a DITA list item element (`li`) is inserted. The configuration file should include the following:

```xml
<elementProposals path="li" insertAttributes="id"/>
```

Example 2: Limit Possible Attributes

Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (`li`) is inserted. The configuration file should look like this:

```xml
<elementProposals path="li" insertAttributes="id"
                  possibleAttributes="id product platform audience"/>
```

Suppose that you want to simply restrict your users from inserting `conref` attributes inside DITA topics (`topic` element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="topic" rejectAttributes="conref"/>
```

Related Information:

- Configuring the Proposals for Attribute and Element Values (on page 2360)
Configuring the Proposals for Attribute and Element Values

Oxygen XML Editor includes support for configuring the proposed values that appear in the Content Completion Assistant (on page 3280). To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the Content Completion Assistant.

For an example of a specific use-case, suppose that you want the Content Completion Assistant to propose several possible values for the language code when you use an xml:lang attribute.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 3280), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 99) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip: In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.
**Configuring Proposed Values**

For the purposes of adding or replacing the values that are proposed, the configuration file (`cc_config.xml`) includes a series of `match` instructions that will match an element or attribute name. You also have the possibility of using an attribute called `editable` on the `match` element to specify the editable state of the attribute values, as reflected in the Attributes view (on page 426) and the In-place Attributes Editor (on page 429). The possible values for the `editable` attribute are:

- **true** - The attribute values can be edited by choosing from a combo box or manually providing a value.
- **false** - The attribute values cannot be edited.
- **onlyAllowedItems** - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

A new value is specified inside one or more `item` elements, which are grouped inside an `items` element. The behavior of the `items` element is specified with the help of the `action` attribute, which can have any of the following values:

- **append** - Adds new values to appear in the proposals list (default value).
- **addIfEmpty** - Adds new values to the proposals list only if no other values are contributed by the schema.
- **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source.

**Other Important Notes About the Configuration File**

⚠️ **Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application.

**Example: Specifying Values Directly**

If you want to specify the values directly, the configuration file should look like this:

```xml
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
    <!-- Replaces the values for an element with the local name "lg",
    from the given namespace -->
</match>
```
Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```xml
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

**Tip:** You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the Content Completion Assistant is invoked.

**Note:** A comprehensive XSLT sample is included in the Content Completion Configuration document template (in the Framework Templates > Oxygen Extensions section of the New document wizard (on page 676)).

Configuring Proposed Values in the Context Where the Content Completion was Invoked

**Web Author Customization Note:** This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element in which the content completion was invoked.
Suppose that you want to propose certain possible values for one property (for example, color) and other values for another property (for example, shape). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```xml
<sampleArticle>
    <!-- The possible values for @value should be "red" and "blue" -->
    <property name="color" value=""/>
    <!-- The possible values for @value should be "square" and "rectangle" -->
    <property name="shape" value=""/>
</sampleArticle>
```

The content completion configuration file:

```xml
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
    <match elementName="property" attributeName="value">
        <xslt href="get_values.xsl" useCache="false" action="replace"/>
    </match>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                 xmlns:xs="http://www.w3.org/2001/XMLSchema"
                 xmlns:saxon="http://saxon.sf.net/"
                 exclude-result-prefixes="xs"
                 version="2.0">

    <xsl:param name="documentSystemID" as="xs:string"/>
    <xsl:param name="contextElementXPathExpression" as="xs:string"/>

    <xsl:template name="start">
        <xsl:apply-templates select="doc($documentSystemID)/"/>
    </xsl:template>

    <xsl:template match="/">
        <xsl:variable name="propertyElement"
                      select="saxon:eval(saxon:expression($contextElementXPathExpression, ./*))"/>
    </xsl:template>
```
The **contextElementXPathExpression** parameter will be bound to an XPath expression that identifies the element in the context for which the content completion was invoked.

**Related Information:**

- Configuring the Proposals for Elements and Attributes *(on page 2352)*
- Customizing the Rendering of Elements *(on page 2364)*

**Customizing the Rendering of Elements**

In addition to the support for configuring the proposals that appear in the **Content Completion Assistant**(on page 3280), Oxygen XML Editor also includes support for customizing how the elements are rendered. You can do this by using the **XMLNodeRendererCustomizer** API extension *(on page 2431)*, but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`p`) to be rendered as **“Paragraph”** instead of **“p”** in the various components in **Author** mode (such as in the **Outline view** *(on page 347)*, **Elements view** *(on page 432)*, **Attributes view** *(on page 426)*, and the breadcrumb navigation bar). To achieve this, you can use the **elementRenderings** element in the configuration file.

**Setting up the Content Completion Configuration File**

To customize the configuration file for the **Content Completion Assistant** *(on page 3280)*, follow these steps:
1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).

2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 99) add a link to that resources folder (if it does not already exist).

3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor (File > New > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

   **Tip:** In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

### Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the render element inside a elementRenderings element to specify how element names, their annotations, and their icons are rendered.

The elementRenderings element supports the platform attribute, which can have one of the following values:

- **webapp**
  
  The element renderings are only applied to Oxygen XML Web Author.

- **standalone**
  
  The element renderings are only applied to standalone distributions of Oxygen.

- **eclipse**
  
  The element renderings are only applied to Eclipse plugin distributions of Oxygen.
Note: If the platform attribute is missing, the element renderings are applied to all types of distributions.

You can use the following attributes for the render element:

element

Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from noNamespace.

as

Provides the name (label) that will be displayed for the element in various components in Author mode (the Content Completion Assistant, the breadcrumb navigation bar, the Full Tags display mode (on page 441), and the Outline (on page 347), Elements (on page 432), and Attributes (on page 426) views). This attribute is optional. If it is missing, the name of the element is used.

If you want to translate this label into another language, use the $i18n(key_name) editor variable (on page 282). The following code snippet shows how the DITA paragraph elements (p) can be translated:

```xml
<elementRenderings>
  <render element="p" as="$i18n(cc_p)"/>
</elementRenderings>
```

Note: The cc_p id is a key that identifies the translations available for the paragraph element.

iconPath

Optional attribute that specifies the icon for the element. This is shown in the Content Completion Assistant and the Outline view (on page 347) in Author mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Editor to load "frameworks/$ {framework}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/", and the image file will be searched for in the Oxygen XML Editor classpath resources (for example, "/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Editor JAR file resources.

xml:lang (Deprecated)

It is recommended to use the $i18n(key_name) editor variable (on page 282) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple render elements for the same element attribute (element name) and the xml:lang attribute is missing on one of them, that one will
be considered the default fallback value to be used if none of the others match the language specified in the interface.

**Note:** The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (\texttt{p}) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```xml
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the \texttt{render} element also accepts the following element to change the tooltip annotations for an element (in both \textbf{Author} mode and \textbf{Text} mode):

```xml
annotation
```

This element can be used within the \texttt{render} element to customize the tooltip annotations that are displayed for the element in various components in \textbf{Author} mode (such as tooltips shown in the \textit{Content Completion Assistant} documentation window, the breadcrumb navigation bar, the \textbf{Full Tags} display mode \textit{(on page 441)}, and the \textbf{Outline} \textit{(on page 347)}, \textbf{Elements} \textit{(on page 432)}, \textbf{Attributes} \textit{(on page 426)} views), as well as the tooltips that are displayed when you hover over elements in \textbf{Text} mode. You can use HTML content to style the annotations (see the example below \textit{(on page 2368)}).

**Note:** If this element is missing, the styling for the annotations for that element is collected from the associated schema \textit{(on page 925)}.

**Tip:** The annotations can also be translated in the configuration file. For example:

```xml
<elementRenderings>
  <render element="p" as="${i18n(cc_p)}">
    <annotation>${i18n(cc_p)}</annotation>
  </render>
</elementRenderings>
```
Other Important Notes About the Configuration File for Rendering Elements

⚠️ Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the Refresh (F5) action to test your customizations.
- If the framework (on page 3282) has an associated style guide, then the annotations defined in the configuration file will take precedence over those defined in the style guide. To check to see if your framework uses a style guide, look for the following folder: ${oXygenInstallDir}frameworks/${framework}/styleguide/. If that folder exists, it is recommended that you make your annotation changes directly in the style guide, rather than in the configuration file.
- If an XMLNodeRendererCustomizer API extension (on page 2431) has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the XMLNodeRendererCustomizer implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
- The rendering customizations defined in the configuration file also apply to aspects of the Oxygen XML Web Author interface.

Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA title element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in Author mode. The configuration file should look like this:

```xml
<elementRenderings>
  <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A <i>heading</i> or <b>label</b> for the main parts of a topic</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```
Customizing Annotations in the Content Completion Assistant

Oxygen XML Editor gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the Content Completion Assistant (on page 3280) for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the Elements view (on page 432). If you hover over attributes in the Attributes view (on page 426) you also see information about each attribute, gathered from the same schema.

If you have a framework configuration (on page 95) set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the Content Completion Assistant, follow these steps:

1. Create a new folder in the configuration directory for the document type.  
   **Example:** OXYGEN_INSTALL_DIR/frameworks/dita/styleguide

2. Use the New document wizard to create a file using the Content Completion Styleguide document template (in the Framework Templates > Oxygen Extensions section).

3. Save the file in the folder created in step 1, using the fixed name: 
   contentCompletionElementsMap.xml.
4. Open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Editor will locate your mapping file by doing one of the following:
   - In the Classpath tab add a link to the newly created folder.
   - In the Catalogs tab add a new catalog file (on page 1123). The selected file needs to contain the following:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN" "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
   <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
     <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
   </catalog>
   ```

   where `{processed_dt_name}` is the name of the document type in lower case and with spaces replaced by underscores.

   **Note:** If Oxygen XML Editor finds a mapping file in both locations, the one in the Catalogs tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

   **Example:** You can look at how the DITA mapping file is configured: OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml

   The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.

   In the Content Completion Assistant (on page 3280), you should see the additional annotations for each element.

**Translating Annotations**

Annotations in the Content Completion Assistant can be displayed in various languages. Based on the language set for the interface, Oxygen XML Editor looks for several filename formats to determine the information to load for the content completion annotations. These files, that begin with the name `contentCompletionElementsMap`, are located in the styleguide folder for each built-in framework (for example, OXYGEN_INSTALL_DIR/frameworks/dita/styleguide).

For example, for English, the files are loaded in the following order (from specific to more general):
If you want the annotations to be displayed in another language, you need to create similar files for the particular language. For example, to show annotations in German, create a file with one of the following names (and store it in the styleguide folder for your framework):

• contentCompletionElementsMap_de_DE.xml
• contentCompletionElementsMap_de.xml

Related Information:

• Customizing the Rendering of Elements (on page 2364)

Sharing a Custom Framework

You can create a custom framework by extending a built-in document type (on page 2322) (such as DITA or DocBook) using the Document Type Association preferences page (on page 92), make modifications to it, and then share the extension with your team.

Sharing the Extended Framework

There are several ways that you can share the extended custom framework (on page 2322) with others:

• Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Project view (on page 333) and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one (on page 2322), if you haven't already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
  4. Go to Options > Preferences > Document Type Association > Locations (on page 94) and select Project Options (on page 3286) at the bottom of the page.
5. In the **Additional frameworks directories** list, add an entry using the `${pd}` editor variable (*on page 282*) like this: `${pd}/custom_frameworks`.

6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their **Project view (on page 333)**, the new framework becomes available in the list of document types.

- **Pack and deploy the extended framework as an add-on (on page 2372).**
- **Distribute the directory of the extended framework (on page 2322)** to the other members of your team. They will simply copy that directory to their `/frameworks` directory. The new framework will be available in their list of document types when Oxygen XML Editor starts.

To test the extended framework, the other members of your team can check the list of document types in the **Document Type Association preferences page (on page 92)** to see if the framework is present and if it appears before the built-in frameworks (meaning that it has higher priority).

### Packing and Deploying Frameworks as Add-ons

#### Packing a Framework as an Add-on

This procedure is suitable for developers who want a better control over the **add-on (on page 3285)** package or those who want to automate some of the steps:

1. Pack the **full custom framework (on page 2322)** (or an extension of a framework) as a **ZIP file** or a **Java Archive (on page 3283)**. Note that you should pack the entire root directory not just its contents.

2. Digitally sign the package. Note that you can perform this step only if you have created a **Java Archive** at the previous step. You will need a certificate signed by a trusted authority. To sign the **JAR** you can either use the `jarsigner` command-line tool inside Oracle's Java Development Kit. ([JDK_DIR]/bin/jarsigner.exe) or, if you are working with **Apache Ant (on page 3279)**, you can use the `signjar` task (a front for the `jarsigner` command-line tool).

   **Note:** The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the `keytool` command-line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.

3. Create a descriptor file. You can use a template that Oxygen XML Editor provides. To use this template, go to **File > New** and select the **Oxygen add-ons update site** template. Once deployed, this descriptor file is referenced as **update site**.

   Alternatively, you can use the **Add-ons Packager** plugin by following this procedure:
1. Install the **Add-ons Packager** plugin following the procedure described in Installing Add-ons (on page 75).
2. Restart Oxygen XML Editor. If the add-on is correctly installed, the **Add-ons packager** toolbar action is available.
3. Invoke the **Add-ons packager** toolbar action and input the required information in the displayed dialog box.
4. Press **OK** to complete the packaging process.

**Deploying an Add-on**

To deploy an add-on, copy the ZIP or Java Archive (on page 3283) file and the descriptor file to an HTTP server. The URL to this location serves as the Update Site URL.

**Framework Customization Tutorial**

This section contains topics meant to provide a general tutorial for customizing a framework (on page 3282). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

**Tip:** A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

**Framework Customization Overview**

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

**XML Grammar**

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor detects the schema, see Associating a Schema to XML Documents (on page 1112).

Consider a use-case in which several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, **test_report.xsd** defines a report with results of a testing
session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0" maxOccurs="unbounded">
              <xs:element name="important" type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="entry">
          <xs:complexType>
            <xs:sequence>
              <xs:element name="test_name" type="xs:string"/>
              <xs:element name="passed"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
```
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The table element must have children that have a table-row style. Similarly, the row elements must contain elements with a table-cell style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

report

This element is the root element of a report document. It should be rendered as a box that contains all other elements. To achieve this the display type is set to block. Additionally, some margins are set for it. The CSS rule that matches this element is:

```css
report{
    display:block;
    margin:1em;
}
```
title

The title of the report. Usually titles have a large font. The block display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```css
title {
    display:block;
    font-size:2em;
}
```

description

This element contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the block display. Also, the background color is changed to make it standout.

```css
description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}
```

line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be block style.

```css
line {
    display:block;
}
```

important

The important element defines important text from the description. Since it can be mixed with text, its display property must be set to inline. Also, the text is emphasized with bold to make it easier to spot.

```css
important {
    display:inline;
    font-weight:bold;
}
```

results
The `results` element displays the list of `test_names` and the results for each one. To make it easier to read, it is displayed as a `table`, with a green border and margins.

```css
results{
    display: table;
    margin: 2em;
    border: 1px solid green;
}
```

**entry**

An item in the `results` element. The results are displayed as a table so the entry is a row in the table. Thus, the display is `table-row`.

```css
entry {
    display: table-row;
}
```

**test_name, passed**

The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

```css
test_name, passed{
    display: table-cell;
    border: 1px solid green;
    padding: 20px;
}
passed{
    font-weight: bold;
}
```

The full content of the CSS file `test_report.css` is:

```css
report {
    display: block;
    margin: 1em;
}
description {
    display: block;
```
<table>
<thead>
<tr>
<th>test_name, passed</th>
</tr>
</thead>
<tbody>
<tr>
<td>display:table-cell;</td>
</tr>
<tr>
<td>border:1px solid green;</td>
</tr>
<tr>
<td>padding:20px;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>passed</th>
</tr>
</thead>
<tbody>
<tr>
<td>font-weight:bold;</td>
</tr>
</tbody>
</table>
Note: You can edit attributes in-place in the Author mode using form-based controls (on page 915).

XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Editor can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="test_report.xsd">
    <title>Automated test report</title>
    <description>
        <line>This is the report of the test automatically ran. Each test suite is ran at 20:00h each day. Please <important>check</important> the failed ones!</line>
    </description>
    <results>
        <entry>
            <test_name>Database connection test</test_name>
            <passed>true</passed>
        </entry>
        <entry>
            <test_name>XSLT Transformation test</test_name>
            <passed>true</passed>
        </entry>
        <entry>
            <test_name>DTD validation test</test_name>
            <passed>false</passed>
        </entry>
    </results>
</report>
```
<entry>
  <test_name>XSLT Transformation test</test_name>
  <passed>true</passed>
</entry>

<entry>
  <test_name>DTD validation test</test_name>
  <passed>false</passed>
</entry>

</results>

The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="http://www.mysite.com/reports/test_report.xsd">
  <title>Test report title</title>
  <description>
      ...
  </description>
</report>
```

If you want to share the files with other team members, you could create an archive containing the `test_report.xml`, `test_report.css`, and `test_report.xsd` and send it to the other users.

Basic Tutorial: Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type (`framework (on page 3282)`). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action. For more advanced and other types of customizations, see the Advanced Framework Customization (`on page 2322`) section.
Step 1: Organize Framework Files

First, create a new folder for your customized framework (on page 3282). This folder will be used to store all files related to the documentation framework. The folder structure will look something like this:

```
oxygen
  frameworks
    sdf
      schema
      css
```

The frameworks directory is the container where all the Oxygen XML Editor framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the frameworks directory of the newly installed application and start Oxygen XML Editor by running the provided start-up script files.

You should copy the created schema files abs.xsd and sdf.xsd, sdf.xsd being the master schema, to the schema directory and the CSS file sdf.css to the css directory.

Step 2: Extend an Existing Framework

The easiest way to create a custom framework (on page 3282) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association > Locations (on page 94). Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.
2. Go to the Document Type Association preferences page (on page 92) and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 95) where you can define the set of rules and settings for your custom framework.
3. Give the extension an appropriate name, select External for the Storage option, click the browsing button (_AUDIO) to specify the location of your custom framework directory.
4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.

**Results:** You now have a fully functional framework that you can continue to customize.

### Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 3282), suppose the documents are either articles or books, both composed of sections. The sections may contain titles, paragraphs, figures, tables, and other sections. To complete the picture, each section includes a def element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation"
    xmlns:doc="http://www.oxygenxml.com/sample/documentation"
    xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
    elementFormDefault="qualified">

    <xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
      schemaLocation="abs.xsd"/>

</xs:schema>
```

Next, the structure of the sections is defined. They all start with a title, then have the optional def element then either a sequence of other sections, or a mixture of paragraphs, images and tables.

```xml
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
    <xs:sequence>
        <xs:element name="title" type="xs:string"/>
        <xs:element ref="abs:def" minOccurs="0"/>
        <xs:choice>
            <xs:sequence>
```

---

4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.

**Results:** You now have a fully functional framework that you can continue to customize.

### Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 3282), suppose the documents are either articles or books, both composed of sections. The sections may contain titles, paragraphs, figures, tables, and other sections. To complete the picture, each section includes a def element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation"
    xmlns:doc="http://www.oxygenxml.com/sample/documentation"
    xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
    elementFormDefault="qualified">

    <xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
      schemaLocation="abs.xsd"/>

</xs:schema>
```

Next, the structure of the sections is defined. They all start with a title, then have the optional def element then either a sequence of other sections, or a mixture of paragraphs, images and tables.

```xml
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
    <xs:sequence>
        <xs:element name="title" type="xs:string"/>
        <xs:element ref="abs:def" minOccurs="0"/>
        <xs:choice>
            <xs:sequence>
```
The paragraph contains text and other styling markup, such as bold ( `<b>` ) and italic ( `<i>` ) elements.

```xml
<xs:choice minOccurs="0" maxOccurs="unbounded">
  <xs:element name="b"/>
  <xs:element name="i"/>
</xs:choice>
</xs:complexType>
```

The `image` element has an attribute with a reference to the file containing image data.

```xml
<xs:complexType name="paragraphType" mixed="true">
  <xs:choice minOccurs="0" maxOccurs="unbounded">
    <xs:element name="b"/>
    <xs:element name="i"/>
  </xs:choice>
</xs:complexType>
```

The `table` contains a header row and then a sequence of rows (`<tr>` elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```xml
<xs:complexType name="table">
  <xs:sequence>
    <xs:element name="header">
      <xs:complexType>
        <xs:sequence>
          <xs:element name="td" maxOccurs="unbounded" type="doc:paragraphType"/>
        </xs:sequence>
      </xs:complexType>
    </xs:element>
    <xs:element name="tr">
      <xs:complexType>
        <xs:sequence>
          <xs:element name="td" maxOccurs="unbounded" type="doc:paragraphType"/>
        </xs:sequence>
      </xs:complexType>
    </xs:element>
  </xs:sequence>
</xs:complexType>
```
The `def` element is defined as a text only element in the imported schema `abs.xsd`:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"

targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts">
  <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

Step 4: Associate the Schema to the Framework

In the bottom section of the **Document Type** configuration dialog box *(on page 95)*, there are a series of tabs. The **Schema** tab refers to the schema that is used for validation of the documents that match the defined association rules.
Important: If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this Schema tab will not be used for validation or content completion.

**Schema Type**

Select from the combo box the value XML Schema.

**Schema URI**

Enter the value of the schema location (for example, `${frameworks}/sdf/schema/sdf.xsd`). Use the `${frameworks}` editor variable (on page 282) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor installations.

Important: The `${frameworks}` variable is expanded at the time of validation into the absolute location of the directory containing the framework (on page 3282).

**Step 5: Create a Custom CSS**

If you read the Framework Customization Overview (on page 2373) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

**Defining the General Layout**

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```css
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
    display:block;
}

/* Horizontal flow */
b,i {
```
Important: Having block display children in an inline display parent results in Oxygen XML Editor changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```css
title{
    font-size: 2.4em;
    font-weight: bold;
}
* * title{
    font-size: 2.0em;
}
* * * title{
    font-size: 1.6em;
}
* * * * title{
    font-size: 1.2em;
}
```

It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo elements will be used, plus the CSS counters.

First declare a counter named sect for each book or article. The counter is set to zero at the beginning of each such element:

```css
book,
article{
    counter-reset: sect;
}
```

The sect counter is incremented with each section, that is a direct child of a book or an article element.
The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the sect counter and a dot.

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

Figure 718. A sample of nested sections and their titles.

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.
**Styling Inline Elements**

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```plaintext
b {
    font-weight: bold;
}

i {
    font-style: italic;
}
```

**Styling Images**

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor.

```plaintext
image{
    display: block;
    content: attr(href, url);
    margin-left: 2em;
}
```

The `image` element has the required attribute `href` of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```plaintext
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Editor handles both absolute and relative specified URLs. If the image has an `absolute` URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is `relative` specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.
An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:

```xml
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```xml
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the Author mode:

```css
imagedata[entityref] {
  content: url(unparsed-entity-uri(attr(entityref)));}
```

To take into account the value of the `width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```css
imagedata[width] {
  width: attr(width, length);}
```

Figure 719. Samples of images in Author
Step 6: Associate the Custom CSS to the Framework

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file.

Step 7: Testing the Framework Customization

To test the new framework (on page 3282) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an xsi:schemaLocation attribute. Instead, Oxygen XML Editor will detect its associated document type and use the specified schema.

```xml
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
  <title>My Technical Book</title>
  <section>
    <title>XML</title>
    <abs:def>Extensible Markup Language</abs:def>
    <para>In this section of the book I will explain different XML applications.</para>
  </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be as error.

```
Invalid content was found starting with element 'title2'. One of '{"http://www.oxygenxml.com/sample/documentation":title}' is expected.
```

Undo the tag name change, go to Author mode, and Oxygen XML Editor should load the CSS from the document type association (on page 3281) and create a layout similar to this:

Figure 720. Example: Testing a Framework Customization
Customizing Frameworks and Author Mode Using Extensions, Plugins, SDK

Advanced users can extend the functionality of custom frameworks and Author mode by using plugins (on page 3285), extensions, or the Oxygen SDK.

There is also an API Frequently Asked Questions section (on page 2633) that contains answers to common questions regarding API customizations.

---

**Related Information:**

- Extending Oxygen XML Editor with Plugins (on page 2580)
- Oxygen XML Author Component (on page 2618)
- SDK Common Use Cases (on page 2633)

---

Configuring Frameworks and Author Mode through Extensions

You can add extensions (on page 3285) to your custom framework (on page 3282) (document type) by using the Extensions tab from the Document Type configuration dialog box (on page 95).

**Note:** It is possible for a plugin to share the same classes with a framework. For further details, go to How to Share the Classloader Between a Framework and a Plugin (on page 2611).

---

Configuring an Extensions Bundle

All extensions (on page 3285) that are provided by Oxygen XML Editor are included in a single bundle.
Note: The individual extensions can still be set (open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the ro.sync.ecss.extensions.api.ExtensionsBundle class. The provided implementation of the ExtensionsBundle is instantiated when the Document Type Association (on page 3281) rules defined for the custom framework (on page 3282) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another ExtensionsBundle instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a lib folder in the Java project folder and copy in it the oxygen.jar file from the [OXYGEN_INSTALL_DIR]/lib folder.

2. Create the class (for example, simple.documentation.framework.SDFExtensionsBundle) to extend the abstract class ro.sync.ecss.extensions.api.ExtensionsBundle.
   For example:

   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ```

3. A Document Type ID and a short description should be defined first by implementing the methods getDocumentTypeID and getDescription. The Document Type ID is used to uniquely identify the current framework. Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.
   For example:

   ```java
   public String getDocumentTypeID() {
   }

   public String getDescription() {
       return "A custom extensions bundle used for the Simple Document Framework document type";
   }
   ```

4. To be notified about the activation of the custom Author Extension in relation with an opened document, ro.sync.ecss.extensions.api.AuthorExtensionStateListener should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as
ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener. The custom Author Extension state listener should be provided by implementing the createAuthorExtensionStateListener method. For example:

```java
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}
```

The AuthorExtensionStateListener is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of ro.sync.ecss.extensions.api.AuthorExtensionStateListener can be found in Implementing an Author Extension State Listener (on page 2406).

If Schema Aware mode (on page 137) is active in Oxygen XML Editor, all actions that can generate invalid content will be redirected toward the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an ro.sync.ecss.extensions.api.InvalidEditException. The actions that are forwarded to this handler include typing, delete, or paste.

See Handling Schema-Aware Editing Events (on page 2434) for more details about this handler.

5. Customizations of the content completion proposals are permitted by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is ro.sync.contentcompletion.xml.SchemaManagerFilter. The filter can be applied on elements, attributes, or on their values. The createSchemaManagerFilter method is responsible for creating the content completion filter. A new SchemaManagerFilter will be created each time a document matches the rules defined by the Document Type Association that contains the filter declaration.

For example:

```java
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (on page 2399) section.
6. The **Author** mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```java
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (on page 2425) section.

7. The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the **Author** editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in **Author** mode for both Oxygen XML Editor Eclipse plugin and standalone application. The **Text** mode corresponding listener is available only for Oxygen XML Editor Eclipse plugin. The methods corresponding to each implementation are: `createAuthorAWTDndListener`, `createTextSWTDndListener`, and `createAuthorSWTDndListener`.

```java
public AuthorDnDListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the **Author** mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (on page 2401) section.

8. Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the `ref` element and the attribute indicating the referenced resource is `location`. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements `ro.sync.ecss.extensions.api.AuthorReferenceResolver`. The method responsible for creating the custom references resolver is `createAuthorReferenceResolver`. The method is called each time a document opened in an **Author** editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated references resolver object is kept and used until
another extensions bundle corresponding to another document type is activated as result of the detection process.

For example:

```java
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the Configuring a References Resolver (on page 2402) section.

9. To be able to dynamically customize the default CSS styles for a certain `ro.sync.ecss.extensions.api.node.AuthorNode`, an implementation of `ro.sync.ecss.extensions.api.StylesFilter` can be provided. The extensions bundle method responsible for creating the `StylesFilter` is `createAuthorStylesFilter`. The method is called each time a document opened in an Author editing mode matches the Document Type Association where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

For example:

```java
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the Configuring CSS Styles Filter (on page 2424) section for more details about the styles filter extension.

10. To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided. The two methods from the ExtensionsBundle specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`.

For example:

```java
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}
```

```java
public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```
The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (on page 2416) and Configuring a Table Column Width Provider (on page 2410) sections.

If the functionality related to one of the previous extension point does not need to be modified, then the developed ro.sync.ecss.extensions.api.ExtensionsBundle should not override the corresponding method and leave the default base implementation to return null.

11. An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the ro.sync.ecss.extensions.api.link.LinkTextResolver interface should be returned by the createLinkTextResolver method. This implementation is used each time the oxy_link-text() function (on page 2532) is encountered in the CSS styles associated with an element.

For example:

```java
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

12. Pack the compiled class into a JAR (on page 3283) file.

13. Copy the JAR file into your custom framework directory (for example, frameworks/sdf).

14. Add the JAR file to the class path. To do this, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select the document type (for example, SDF), press the Edit button, select the Classpath tab, and press the + Add button. In the displayed dialog box, enter the location of the JAR file relative to the Oxygen XML Editor frameworks folder.

15. Register the Java class by going to the Extensions tab. Press the Choose button and select the name of the class (for example, SDFExtensionsBundle).

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.
Adding a Custom Image Decorator for Author Mode

The `AuthorImageDecorator` extension point allows you to add a custom decorator over images in Author mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

**How to Implement an `AuthorImageDecorator`**

To implement your own `AuthorImageDecorator`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorImageDecorator` interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 2391), you can return the `AuthorImageDecorator` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()` method.
   b. Specify the `AuthorImageDecorator` in the Author image decorator individual extension in the `Extensions tab (on page 122)` of the Document Type configuration dialog box (on page 95) for your particular document type.

**Example**

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
     * (ro.sync.exml.view.graphics.Graphics, int, int, int, int,
     * ro.sync.exml.view.graphics.Rectangle,
     * ro.sync.ecss.extensions.api.node.AuthorNode,
     */
```
Example result: In the top-left corner of the image, the following message will be displayed: [Double-click to edit image].

Adding Custom Persistent Highlights

The Author API includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

`<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>`

This functionality is available through the AuthorPersistentHighlighter class that is accessible through the AuthorEditorAccess#getPersistentHighlighter() method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

Configuring the Automatic ID Generation and Unique Attributes Recognizer

The ro.sync.ecss.extensions.api.UniqueAttributesRecognizer interface can be implemented if you want to provide for your framework (on page 3282) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (on page 3282). The following methods can be implemented to accomplish this: assignUniqueIDs(int startOffset, int endOffset), isAutoIDGenerationActive()
• **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element (on page 3280) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: `boolean copyAttributeOnSplit(String attrQName, AuthorElement element)`

**Tip:** The `ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer` class is an implementation of the interface that can be extended by your customization to provide easy assignment of IDs in your framework (on page 3282). You can also check out the DITA and DocBook implementations of `ro.sync.ecss.extensions.api.UniqueAttributesRecognizer` to see how they were implemented and connected to the extensions bundle.

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

### Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.

```java
import java.util.List;
import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {

    // You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the filterAttributes method and changing the default content completion list of ro.sync.contentcompletion.xml.CIAttribute for the element provided by the current ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext
```
context. For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```java
/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes, WhatAttributesCanGoHereContext context) {
    // If the element from the current context is the 'table' element add the
    // attribute named 'frame' to the list of default content completion proposals
    if (context != null) {
        ContextElement contextElement = context.getParentElement();
        if ("table".equals(contextElement.getQName())) {
            CIAttribute frameAttribute = new CIAttribute();
            frameAttribute.setName("frame");
            frameAttribute.setRequired(false);
            frameAttribute.setFixed(false);
            frameAttribute.setDefaultValue("void");
            if (attributes == null) {
                attributes = new ArrayList<CIAttribute>();
            }
            attributes.add(frameAttribute);
        }
    }
    return attributes;
}
```

The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements, WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the
    // 'td' element from the list of content completion proposals and add the
    // 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = context.getElementStack().peek();
            if ("header".equals(contextElement.getQName())) {
```

```java
```
```
if (elements != null) {
    for (Iterator<CIElement> iterator = elements.iterator(); iterator.hasNext();) {
        CIElement element = iterator.next();
        // Remove the 'td' element
        if ("td".equals(element.getQName())) {
            elements.remove(element);
            break;
        }
    }
} else {
    elements = new ArrayList<CIElement>();
}  
// Insert the 'th' element in the list of content completion proposals
CIElement thElement = new SDFElement();
thElement.setName("th");
elements.add(thElement);
}
else {
    // If the given context is null then the given list of content completion
    // elements contains global elements.
    return elements;
}

The elements or attributes values can be filtered using the \texttt{filterElementValues} or \texttt{filterAttributeValues} methods.

\begin{itemize}
\item \textbf{Note:} The complete source code for framework customization examples can be found in the \texttt{oxygen-sample-framework} module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.
\end{itemize}

Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the Text or Author modes.

\begin{itemize}
\item \textbf{Interfaces for the Drag and Drop Listener}
\end{itemize}
ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener

Receives callbacks from the standalone application for Drag And Drop in Author mode.

com.oxygenxml.editor.editors.author.AuthorDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in Author mode.

com.oxygenxml.editor.editors.TextDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in Text mode.

![Note:][1] The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

To configure how dropped URLs or XHTML fragments are handled in documents, see Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (on page 2437).

- Customizing Smart Paste Support (on page 2343)

Configuring a Reference Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is ref and the attribute indicating the referenced resource is location. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class simple.documentation.framework.ReferencesResolver. This class must implement the ro.sync.ecss.extensions.api.AuthorReferenceResolver interface.

```java
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver
        implements AuthorReferenceResolver {
```

2. The hasReferences method verifies if the handler considers the node to have references. It takes AuthorNode as an argument that represents the node that will be verified. The method will return

```java
```
true if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name *ref* and it must have an attribute named *location*.

```java
public boolean hasReferences(AuthorNode node) {
    boolean hasReferences = false;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            hasReferences = attrValue != null;
        }
    }
    return hasReferences;
}
```

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node for which the display name is needed. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the *location* attribute from the *ref* element.

```java
public String getDisplayName(AuthorNode node) {
    String displayName = "ref-fragment";
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                displayName = attrValue.getValue();
            }
        }
    }
    return displayName;
}
```

4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes `AuthorNode` as an argument that represents the node for which the reference needs resolving, the `systemID` of the node, the `AuthorAccess` with access methods to the `Author` mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the `XML Catalog (on page 3289)`. In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));

                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if (inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }
                }
                catch (MalformedURLException e) {
                    logger.error(e, e);
                }
                catch (SAXException e) {
                    logger.error(e, e);
                }
                catch (IOException e) {
                    logger.error(e, e);
                }
            }
        }
    }

    saxSource = new SAXSource(xmlReader, inputSource);
}

return saxSource;
5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}
```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the `Author` mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(node.getXMLBaseURL(),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));
                    systemID = absoluteUrl.toString();
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                }
            }
        }
    }
    return systemID;
}
```
In the listing below, the XML document contains the `ref` element:

```xml
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

Figure 721. Reference with no specified reference resolver

![Reference without a reference resolver](image)

When the above implementation is configured, the reference has the expected layout:

Figure 722. Reference with reference resolver

![Reference with a reference resolver](image)

Note: The complete source code for `framework` customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Configuring a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the `Author` mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
    private AuthorListener sdfAuthorDocumentListener;
    private AuthorMouseListener sdfMouseListener;
    private AuthorCaretListener sdfCaretListener;
```
private OptionListener sdfOptionListener;

When the association rules of the framework (on page 3282) (document type) configuration match that of a document opened in the Author editing mode, the activation event received by this listener should be used to perform custom initializations and to register listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener.

public void activated(AuthorAccess authorAccess) {
    // Get the value of the option.
    String option = authorAccess.getOptionsStorage().getOption("sdf.custom.option.key", ";");
    // Use the option for some initializations...

    // Add an OptionListener.
    authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

    // Add author DocumentListeners.
    sdfAuthorDocumentListener = new SDFAuthorListener();
    authorAccess.getDocumentController().addAuthorListener(sdfAuthorDocumentListener);

    // Add MouseListener.
    sdfMouseListener = new SDFAuthorMouseListener();
    authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

    // Add CaretListener.
    sdfCaretListener = new SDFAuthorCaretListener();
    authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

    // Other custom initializations...
}

The authorAccess parameter received by the activated method can be used to gain access to specific Author mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed Author Extension need to be stored or retrieved, a reference to the ro.sync.ecss.extensions.api.OptionsStorage can be obtained by calling the getOptionsStorage method from the authorAccess. The same object can be used to register
ro.sync.ecss.extensions.api.OptionListener listeners. An option listener is registered in relation with an option key and will be notified about the value changes of that option.

An AuthorListener can be used if events related to the Author mode document modifications are of interest. The listener can be added to the ro.sync.ecss.extensions.api.AuthorDocumentController. A reference to the document controller is returned by the getDocumentController method from the authorAccess. The document controller can also be used to perform operations involving document modifications.

To provide access to the Author mode component-related functionality and information, the authorAccess has a reference to the ro.sync.ecss.extensions.api.access.AuthorEditorAccess that can be obtained when calling the getEditorAccess method. At this level, AuthorMouseListener and AuthorCaretListener can be added to provide notification of mouse and cursor events that occur in the Author editor mode.

The deactivation event is received when another framework is activated for the same document, the user switches to another editor mode or the editor is closed. The deactivate method is typically used to unregister the listeners previously added on the activate method and to perform other actions. For example, options related to the deactivated Author Extension can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption("sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(sdfAuthorDocumentListener);

    // Remove MouseListener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.
    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

    // Other actions...
}
```
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```css
table{
    display: table;
    border: 1px solid navy;
    margin: 1em;
    max-width: 1000px;
    min-width: 150px;
}

table[width]{
    width: attr(width, length);
}

tr, header{
    display: table-row;
}

header{
    background-color: silver;
    color: inherit
}

td{
    display: table-cell;
    border: 1px solid navy;
    padding: 1em;
}
```
Suppose that in the schema, the \texttt{td} tag has the attributes \texttt{row_span} and \texttt{column_span} that are not automatically recognized by Oxygen XML Editor, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (on page 2416).

Suppose the column widths are specified by the \texttt{width} attribute of the \texttt{customcol} elements that are not automatically recognized by Oxygen XML Editor. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (on page 2410).

The table from the example does not make use of the attributes \texttt{colsep} and \texttt{rowsep} (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (on page 2419).

### Configuring a Table Column Width Provider

In a custom framework (on page 3282), the \texttt{table} element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (on page 2409), if you use the table element attribute \texttt{width} Oxygen XML Editor can determine the table width automatically. In this example the table has \texttt{col} elements with \texttt{width} attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class \texttt{simple.documentation.framework.TableColumnWidthProvider}. This class must implement the \texttt{ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider} interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.AuthorOperationException;
   import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
   import ro.sync.ecss.extensions.api.WidthRepresentation;
   import ro.sync.ecss.extensions.api.node.AuthorElement;

   public class TableColumnWidthProvider
   implements AuthorTableColumnWidthProvider {

   2. Method \texttt{init} is taking as argument an \texttt{ro.sync.ecss.extensions.api.node.AuthorElement} that represents the XML \texttt{table} element. In our case the column widths are specified in \texttt{col} elements from the \texttt{table} element. In such cases you must collect the span information by analyzing the \texttt{table} element.

   ```java
   public void init(AuthorElement tableElement) {
       this.tableElement = tableElement;
   ```
AuthorElement[] colChildren = tableElement.getElementsByLocalName("customcol");
   if (colChildren != null && colChildren.length > 0) {
      for (int i = 0; i < colChildren.length; i++) {
         AuthorElement colChild = colChildren[i];
         if (i == 0) {
            colsStartOffset = colChild.getStartOffset();
         }
         if (i == colChildren.length - 1) {
            colsEndOffset = colChild.getEndOffset();
         }
         // Determine the 'width' for this col.
         AttrValue colWidthAttribute = colChild.getAttribute("width");
         String colWidth = null;
         if (colWidthAttribute != null) {
            colWidth = colWidthAttribute.getValue();
            // Add WidthRepresentation objects for the columns this 'customcol'
            // specification spans over.
            colWidthSpecs.add(new WidthRepresentation(colWidth, true));
         }
      }
   }

3. The method isTableAcceptingWidth should check if the table cells are td.

   public boolean isTableAcceptingWidth(String tableCellsTagName) {
      return "td".equals(tableCellsTagName);
   }

4. The method isTableAndColumnsResizable should check if the table cells are td. This method determines if the table and its columns can be resized by dragging the edge of a column.

   public boolean isTableAndColumnsResizable(String tableCellsTagName) {
      return "td".equals(tableCellsTagName);
   }

5. Methods getTableWidth and getCellWidth are used to determine the table and column width. The table layout engine will ask this ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property display:table-cell. The implementation is simple and just parses the value of the width attribute. The methods must return null for the tables / cells that do not have a specified width.
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}

public List<WidthRepresentation> getCellWidth(AuthorElement cellElement, int colNumberStart, int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;
}

6. Methods `commitTableWidthModification` and `commitColumnWidthModifications` are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

public void commitTableWidthModification
(AuthorDocumentController authorDocumentController,
int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (newTableWidth > 0) {
            if (tableElement != null) {
                String newWidth = String.valueOf(newTableWidth);
            }
        }
    }
}
authorDocumentController.setAttribute(
    "width",
    new AttrValue(newWidth),
    tableElement);
} else {
    throw new AuthorOperationException("Cannot find the table element.");
}
}

public void commitColumnWidthModifications
    (AuthorDocumentController authorDocumentController,
     WidthRepresentation[] colWidths, String tableCellsTagName)
        throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (colWidths != null && tableElement != null) {
            if (colsStartOffset >= 0 && colsEndOffset >= 0
                && colsStartOffset < colsEndOffset) {
                authorDocumentController.delete(colsStartOffset,
                    colsEndOffset);
            }
            String xmlFragment = createXMLFragment(colWidths);
            int offset = -1;
            AuthorElement[] header = tableElement.getElementsByLocalName("header");
            if (header != null && header.length > 0) {
                // Insert the cols elements before the 'header' element
                offset = header[0].getStartOffset();
            }
            if (offset == -1) {
                throw new AuthorOperationException("No valid offset to insert column width");
            }
            authorDocumentController.insertXMLFragment(xmlFragment, offset);
        }
    }
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
WidthRepresentation width = widthRepresentations[i];
fragment.append("<customcol");
String strRepresentation = width.getWidthRepresentation();
if (strRepresentation != null) {
    fragment.append(" width=" + width.getWidthRepresentation() + "\"");
}
if (ns != null && ns.length() > 0) {
    fragment.append(" xmlns=" + ns + "\"");
}
fragment.append("\/>")
return fragment.toString();
}

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

```java
public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
    return true;
}
```

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

In the listing below, the XML document contains the table element:

```xml
<table width="300">
    <customcol width="50.0px"/>
    <customcol width="1*"/>
    <customcol width="2*"/>
    <customcol width="20%"/>
    <header>
```
When no table column width provider is specified, the table has the following layout:

**Figure 723.** Table layout when no column width provider is specified

![Table layout](image)

When the above implementation is configured, the table has the correct layout:

**Figure 724.** Columns with custom widths
Configuring a Table Cell Span Provider

In a custom framework (on page 3282), the table element can have cells that span over multiple columns and rows. As explained in Configuring Tables (on page 2409), you need to indicate Oxygen XML Editor a method to determine the cell spanning. If you use the cell element attributes `rowspan` and `colspan` or `rows` and `cols`, Oxygen XML Editor can determine the cell spanning automatically. In the following example, the td element uses the attributes `row_span` and `column_span` that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider
    implements AuthorTableCellSpanProvider {

```

2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML table element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the table element. In such cases, you must collect the span information by analyzing the table element.

```java
public void init(AuthorElement table) {
```

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.
3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return `null` for all the cells that do not change the span specification.

```java
public Integer getColSpan(AuthorElement cell) {
    Integer colSpan = null;

    AttrValue attrValue = cell.getAttribute("column_span");
    if (attrValue != null) {
        // The attribute was found.
        String cs = attrValue.getValue();
        if (cs != null) {
            try {
                colSpan = new Integer(cs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return colSpan;
}
```

4. The row span is determined in a similar manner:

```java
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;

    AttrValue attrValue = cell.getAttribute("row_span");
    if (attrValue != null) {
        // The attribute was found.
        String rs = attrValue.getValue();
        if (rs != null) {
            try {
                rowSpan = new Integer(rs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return rowSpan;
}
```
The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

```java
public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}
```

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

6. In the listing below, the XML document contains the table element:

```xml
<table>
   <header>
      <td>C1</td>
      <td>C2</td>
      <td>C3</td>
      <td>C4</td>
   </header>
   <tr>
      <td cs="1" rs="1">cs=1, rs=1</td>
      <td column_span="2" row_span="2" cs="2" rs="2">cs=2, rs=2</td>
      <td row_span="3" cs="1" rs="3">cs=1, rs=3</td>
   </tr>
   <tr>
      <td cs="1" rs="1">cs=1, rs=1</td>
   </tr>
   <tr>
      <td column_span="3" cs="3" rs="1">cs=3, rs=1</td>
   </tr>
</table>
```

When no table cell span provider is specified, the table has the following layout:

Figure 725. Table layout when no cell span provider is specified
When the above implementation is configured, the table has the correct layout:

Figure 726. Cells spanning multiple rows and columns.

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Configuring a Table Cell Row and Column Separator Provider

In a custom framework (on page 3282), the table element has separators between rows. As explained in Configuring Tables (on page 2409), you need to indicate a method to determine the way
rows and columns are separated. If you use the `rowsep` and `colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
   import ro.sync.ecss.extensions.api.node.AuthorElement;
   
   public class TableCellSepProvider implements AuthorTableCellSepProvider{
   
   2. The `init` method takes the `ro.sync.ecss.extensions.api.node.AuthorElement` interface that represents the XML `table` element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when the cell separators are specified in the `table` element. In such cases, you should initialize your provider based on the given argument.

   ```java
   public void init(AuthorElement table) {
   }
   
   3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

   ```java
   /**
   * @return false - No column separator at the right of the cell.
   */
   @Override
   public boolean getColSep(AuthorElement cellElement, int columnIndex) {
     return false;
   }
   
   4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.

   ```java
   /**
   * @return true - A row separator below each cell.
   */
   @Override
   public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
   ```
```java
return true;
}
```

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

5. In the example below, the XML document contains the table element:

```xml
<table>
  <header>
    <td>H1</td>
    <td>H2</td>
    <td>H3</td>
    <td>H4</td>
  </header>
  <tr>
    <td>C11</td>
    <td>C12</td>
    <td>C13</td>
    <td>C14</td>
  </tr>
  <tr>
    <td>C21</td>
    <td>C22</td>
    <td>C23</td>
    <td>C24</td>
  </tr>
  <tr>
    <td>C31</td>
    <td>C32</td>
    <td>C33</td>
    <td>C34</td>
  </tr>
</table>
```

When the borders for the `td` element are removed from the CSS, the row separators become visible:

Figure 727. Row separators provided by the Java implementation.
Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

Customizing Attribute Value Editors

The CustomAttributeValueEditor extension point allows you customize the attribute value editing mechanisms in Oxygen XML Editor. It changes the Browse button found in the attribute editors to an Edit button. When a user clicks that Edit button, your custom attribute value editor will be presented.

The Edit button can be accessed in the following attribute editors:

- The Attributes view in Author mode (on page 426) (when the Expand button is used to reveal an expanded panel).
- The Attributes view in Text mode (on page 351) (when the Expand button is used to reveal an expanded panel).
- The In-place Attributes Editor (on page 429) when invoked in Author mode.
- The In-place Attributes Editor invoked in the Outline view (on page 347).

How to Implement a CustomAttributeValueEditor

To implement your own CustomAttributeValueEditor, follow this procedure:

1. Extend the ro.sync.ecss.extensions.api.CustomAttributeValueEditor abstract class.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 2391), you can return the CustomAttributeValueEditor implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor() method.
b. Specify the CustomAttributeValueEditor in the **Author custom attribute value editor** individual extension in the **Extensions tab (on page 122)** of the **Document Type configuration dialog box (on page 95)** for your particular document type.

**Example**

The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

/**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
@Override
public String getDescription() {
    return "My custom attribute value editor";
}

/**
 * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
 * (ro.sync.ecss.extensions.api.EditedAttribute, java.lang.Object)
 */
@Override
public String getAttributeValue(EditedAttribute attribute, Object parentComponent)
    throws CancelledByUserException {
    // Show an input dialog for collecting the new value
    return JOptionPane.showInputDialog(
        "Set a new value for " + attribute.getAttributeQName() + ":");
}

/**
 * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
 * (ro.sync.ecss.extensions.api.EditedAttribute)
 */
@Override
public boolean shouldHandleAttribute(EditedAttribute attribute) {
    // Handle all attributes
    return true;
}
```
Example result: If a user were to click the `Edit` button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

Customizing the CSS Styles Filter

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the Author mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Editor or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in this simple document example, the filter can change the value of the `KEY_FONT` property for the `table` element:

```java
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType() && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
        }
        return styles;
    }
}
```
Customizing Elements that Wrap Profiled Content

For each framework (on page 3282) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider. This configuration is set by default for DITA and DocBook frameworks.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (on page 2426) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.

Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface. As an alternative, your class could extend ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, the default implementation.
ro.sync.ecss.extensions.commons.XPointerElementLocator can be found in the oxygen-sample-framework project.

Default Link Target Reference Finder

The DefaultElementLocatorProvider implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values (on page 2426).
- XPointer element() scheme (on page 2427).

The method `getElementLocator` determines what `ElementLocator` should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null `IDTypeVerifier` will always be provided if a schema is associated with the document type.

The `link` string argument is the anchor (on page 3279) part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier, String link) {
    ElementLocator elementLocator = null;
    try {
        if (link.startsWith("element()")) {
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    } catch (ElementLocatorException e) {
        logger.warn("Exception when create element locator for link: " + link + ". Cause: " + e, e);
    }
    return elementLocator;
}
```

ID Element Locator

The IDEElementLocator is an implementation of the abstract class ro.sync.ecss.extensions.api.link.ElementLocator for links that use an ID.
The constructor only assigns field values and the method `endElement` is empty for this implementation.

The method `startElement` checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is `xml:id`.
- The attribute type is ID.

The attribute type is checked with the help of the method `IDTypeVerifier.hasIDType`.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if ("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName = ExtensionUtil.getLocalName(atts[i].getQName());
                String attrUri = atts[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }
    return elementFound;
}
```

**XPointer Element Locator**

`XPointerElementLocator` is an implementation of the abstract class `ro.sync.ecss.extensions.api.link.ElementLocator` for links that have one of the following XPointer element() scheme patterns:

**element (elementID)**

Locate the element with the specified ID.
element (/1/2/3)

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

element (elementID/3/4)

A child sequence appearing after a NCName identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```java
public XPointerElementLocator(IDTypeVerifier idVerifier, String link) throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element(".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;

        // Empty xpointer component is not supported
        if(xpointerPath[i].length() == 0){
            invalidFormat = true;
        }

        if(i > 0){
            try {
                Integer.parseInt(xpointerPath[i]);
            } catch (NumberFormatException e) {
                invalidFormat = true;
            }
        }
    }

    if(invalidFormat){
```
throw new ElementLocatorException(
    "Only the element() scheme is supported when locating XPointer links."
+ "Supported formats: element(elementID), element(/1/2/3),
 element(elemID/2/3/4).";
}
i++;
}

if(Character.isDigit(xpointerPath[0].charAt(0))){
    // This is the case when xpointer have the following pattern /1/5/7
    xpointerPathDepth = xpointerPath.length;
} else {
    // This is the case when xpointer starts with an element ID
    xpointerPathDepth = -1;
    startWithElementID = true;
}

The method startElement will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are

uri

The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

localName

Local name of the element.

qName

Qualified name of the element.

atts

Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns true if the processed element is found to be the one indicated by the link.

The XPointerElementLocator implementation of the startElement will update the depth of the current element and keep the index of the element in its parent. If the xpointerPath starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.
If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth ++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
        currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
    }

    if (startWithElementID) {
        // This the case when xpointer path starts with an element ID.
        String xpointerElement = xpointerPath[0];
        for (int i = 0; i < atts.length; i++) {
            if (xpointerElement.equals(atts[i].getValue())) {
                if (idVerifier.hasIDType(localName, uri, atts[i].getQName(), atts[i].getNamespace())){
                    xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                    break;
                }
            }
        }

        if (xpointerPathDepth == startElementDepth){
            // check if xpointer path matches with the current element path
            linkLocated = true;
            try {
                int xpointerIdx = xpointerPath.length - 1;
                int stackIdx = currentElementIndexStack.size() - 1;
                int stopIdx = startWithElementID ? 1 : 0;
                while (xpointerIdx >= stopIdx && stackIdx >= 0) {
                    int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
                }
            } catch (Exception e) {
                // handle exception
            }
        }
    }
}```
```
int currentElementIndex =
   ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
if(xpointerIndex != currentElementIndex) {
   linkLocated = false;
   break;
}
xpointerIdx--;
stackIdx--;
}
}
catch (NumberFormatException e) {
   logger.warn(e,e);
}
return linkLocated;
```

The method `endElement` will be invoked at the end of every element in the XML document (even when the element is empty).

The `XPointerElementLocator` implementation of the `endElement` updates the depth of the current element path and the index of the element in its parent.

```java
public void endElement(String uri, String localName, String name) {
   endElementDepth = startElementDepth;
   startElementDepth --;
   lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the Outline view (on page 347) in Author mode, breadcrumb navigation bar (on page 907) in Author mode, Outline view (on page 347) in Text mode, Content Completion Assistant (on page 3280) window, or DITA Maps Manager view (on page 2990).

There are two methods to provide an implementation of
ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer:

- As a part of a bundle, returning it from the createXMLNodeCustomizer() method of the
  ExtensionsBundle associated with your document type in the Document type configuration dialog
  box (on page 95) (Extensions bundle field in the Extensions tab).
- As an individual extension, associated with your document type in the Document type
  configuration dialog box (on page 95) (XML node renderer customizer field in the Individual
  extensions section of the Extensions tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the XMLNodeRendererCustomizer should
be backed up by a copy of larger size using the proper Retina/HiDPI naming convention (on page
1029).

For example, for the title element, if the XMLNodeRendererCustomizer returns the path
${framework}/images/myImg.png, then to support Retina images with a scaling factor of 2, an
extra file (myImg@2x.png) should be added to the same images directory (${framework}/images/
myImg@2x.png). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled
and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in
Author Mode (on page 1028) section.

Note: The complete source code for framework customization examples can be found in the
oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen
XML Editor website.

- Customizing the Rendering of Elements (on page 2364)

Handling Author Mode Action Events

The AuthorEventHandler extension point allows you to handle certain Author mode actions in a
special way. For example, a specific use-case would be if you want to insert new lines when you press
Enter instead of it opening the Content Completion Assistant (on page 3280).
How to Implement an *AuthorActionEventHandler*

To implement your own *AuthorActionEventHandler*, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle *(on page 2391)*, you can return the *AuthorActionEventHandler* implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
   b. Specify the *AuthorActionEventHandler* in the *Author action event handler* individual extension in the *Extensions* tab *(on page 122)* of the *Document Type* configuration dialog box *(on page 95)* for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses `Enter` in *Author* mode. It uses the `canHandleEvent` method to make sure the insertion will be performed in an element that will preserve the `new-line` character. Then the `handleEvent` method inserts the new line at the current cursor position.

```java
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
     *(AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess,
                                  AuthorActionEventType type) {
        boolean canHandle = false;

        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController =
                authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {

```
```java
AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
    canHandle = true;
}
}

} catch (BadLocationException ex) {
    if (logger.isDebugEnabled()) {
        logger.error(ex.getMessage(), ex);
    }
}

return canHandle;

/**
 * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent
 * (ro.sync.ecss.extensions.api.AuthorAccess,
 * ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
 */
@Override
public boolean handleEvent(AuthorAccess authorAccess,
AuthorActionEventType eventType) {
    int caretOffset = authorAccess.getEditorAccess().getcaretOffset();
    // Insert a new line
    authorAccess.getDocumentController().insertText(caretOffset, 
"
");
    return true;
}

/**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
@Override
public String getDescription() {
    return "Insert a new line";
}
```
Handling Schema-Aware Editing Events

The `AuthorSchemaAwareEditingHandlerAdapter` extension point allows you to handle certain Author mode actions in various ways. For example, implementing the `AuthorSchemaAwareEditingHandlerAdapter` makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor when pasting content (through the use of some specific methods (on page 2436)).

How to Implement an `AuthorSchemaAwareEditingHandlerAdapter`

For this handler to be called, the Schema Aware Editing option (on page 138) must be set to On or Custom in the Schema-Aware preferences page (on page 137). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `InvalidEditException`.

To implement your own `AuthorSchemaAwareEditingHandlerAdapter`, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter` extension.
2. To instruct Oxygen XML Editor to use this newly created implementation, configure an extensions bundle (on page 2391) and return the `AuthorSchemaAwareEditingHandlerAdapter` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter()` method.

Example

Typing events can be handled using the `handleTyping` method. For example, the `AuthorSchemaAwareEditingHandler` checks if the schema is not a learned one, was loaded successfully, and if the Smart paste and drag and drop option (on page 138) is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter
        extends AuthorSchemaAwareEditingHandler {

        /**
         * @see AuthorSchemaAwareEditingHandler#handleTyping
         * (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
         */

        public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
```
```java
void InvalidEditException {
    boolean handleTyping = false;
    AuthorSchemaManager authorSchemaManager =
    authorAccess.getDocumentController().getAuthorSchemaManager();
    if (!authorSchemaManager.isLearnSchema() &&
        !authorSchemaManager.hasLoadingErrors() &&
        authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
        try {
            AuthorDocumentFragment characterFragment =
        authorAccess.getDocumentController().createNewDocumentTextFragment
            (String.valueOf(ch));
            handleTyping = handleInsertionEvent
                (offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
        } catch (AuthorOperationException e) {
            throw new InvalidEditException
                (e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
        }
    }
    return handleTyping;
}
```

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

### Methods for Improving the Paste Mechanism

**getAncestorDetectionOptions**

When pasting content in **Author** mode, if the result causes the document to become invalid, Oxygen XML Editor will propose solutions to make it valid. As a possible solution, Oxygen XML Editor might surround the pasted content in a sequence of ancestor elements. This `getAncestorDetectionOptions` method allows you to choose which parent elements might be a possible solution.

**canBeReplaced**

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor. For example, when pasting an element inside an empty element with the same name, this `canBeReplaced` method allows Oxygen XML Editor to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.
Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode

The AuthorExternalObjectInsertionHandler extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in Author mode.

How to Implement an AuthorExternalObjectInsertionHandler

To implement your own AuthorExternalObjectInsertionHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the AuthorExternalObjectInsertionHandler in the Author external object insertion handler individual extension in the Extensions tab (on page 122) of the Document Type configuration dialog box (on page 95) for your particular document type.
   b. Otherwise, you can configured an extensions bundle (on page 2391), then return the AuthorExternalObjectInsertionHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler() method.
3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

   ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)

   and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the Classpath tab (on page 99) in the Document Type configuration dialog box (on page 95) for your particular document type.

Example

The following example illustrates an implementation for the DITA framework:

```java
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle
 */
```
createExternalObjectInsertionHandler()
 */
@override
public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler() {
    return new DITAExternalObjectInsertionHandler();
}

/**
 * @see ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler#
getImporterStylesheetFileName(ro.sync.ecss.extensions.api.AuthorAccess)
 */
@override
protected String getImporterStylesheetFileName(AuthorAccess authorAccess) {
    return "xhtml2ditaDriver.xsl";
}

Tip: For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (on page 2343).

Presenting an Edit Properties Dialog Box for Actions in Author Mode

The EditPropertiesHandler extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an EditPropertiesHandler

To implement your own EditPropertiesHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.EditPropertiesHandler interface.
2. To instruct Oxygen XML Editor to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 2391), you can return the EditPropertiesHandler implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler() method.
   b. Specify the EditPropertiesHandler in the Author edit properties handler individual extension in the Extensions tab (on page 122) of the Document Type configuration dialog box (on page 95) for your particular document type.
Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `image` tag in Author mode (with tags displayed from the Tags drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

    /*
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "Sample implementation that handles properties for a table element.";
    }

    /*
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties
     * (ro.sync.ecss.extensions.api.node.AuthorNode)
     */
    @Override
    public boolean canEditProperties(AuthorNode authorNode) {
        // If this node is an image element we can edit its properties.
        return "image".equals(authorNode.getDisplayName());
    }

    /*
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties
     * (ro.sync.ecss.extensions.api.node.AuthorNode,
     *  ro.sync.ecss.extensions.api.AuthorAccess)
     */
    @Override
    public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
        // If we receive this call then it surely an image.
        AuthorElement imageElement = (AuthorElement) authorNode;
        String currentValue = "";
        AttrValue altValue = imageElement.getAttribute("alt");
        if (altValue != null) {
            currentValue = altValue.getValue();
        }
    }
}
```
Example result: If a user were to double-click an image tag icon in Author mode, the following dialog box would be displayed that allows the user to edit the alternate text property for the image:

Java API - Extending Author Functionality through Java

Oxygen XML Editor Author mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations (on page 2451)) and the execution of XPath expressions on the current document edited in Author mode. However, there are situations in which you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Editor Author mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Editor website. It includes the source code of the Author mode
operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for Author mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

⚠️ **Attention:** Make sure the Java classes of your custom Author mode operations are compiled with the same Java version used by Oxygen XML Editor. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Editor with a Java 1.8 virtual machine but the Java classes of your custom Author mode operations are compiled with a Java 9 or later virtual machine then the custom operations cannot be loaded and used by the Java 1.8 virtual machine.

### Related Information:

- [https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorOperation.html](https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorOperation.html)

### Example 1- Simple Use of a Dialog Box from an Author Mode Operation

In this example, functionality is added for inserting images in a custom framework (on page 3282). The images are represented by the `image` element. The location of the image file is represented by the value of the `href` attribute. In the Java implementation, a dialog box will be displayed with a text field, in which the user can enter a full URL or browse for a local file.

1. Set up a sample project following this set of instructions. The framework project is `oxygen-sample-framework`.

2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`.

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
  - An object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map.
  - Argument names and values.
- The `getArguments` method is used by Oxygen XML Editor when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
• The `getDescription` method is used by Oxygen XML Editor when the operation is configured. It returns a description of the operation.

**Example:**

Here is the implementation of these three methods:

```java
/**
 * Performs the operation.
 */
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
    AuthorOperationException {

    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();
    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment = "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='"
                           + href + "'/>";

        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCareOffset();
        authorAccess.getDocumentController().insertXMLFragment(imageFragment, caretPosition);
    }
}

/**
 * Has no arguments.
 *
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}
```
* @return A description of the operation.
 */

```java
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}
```

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

**Important:**

Make sure you always specify the namespace of the inserted fragments.

```xml
<image xmlns="http://www.oxygenxml.com/sample/documentation"
       href="path/to/image.png"/>
```

3. Package the compiled class into a JAR (on page 3283) file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
  <target name="dist">
    <jar destfile="sdf.jar" basedir="classes">
      <files dir="classes">
        <include name="**/*"/>
      </files>
    </jar>
  </target>
</project>
```

4. Copy the sdf.jar file into your custom framework directory

('{OXYGEN_INSTALL_DIR}\frameworks\{CUSTOM_FRAMEWORK_DIR}\').

5. Add the sdf.jar to the class path. To do this, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select SDF, and press the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 95) and press the + Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor frameworks folder.
7. Next, create the action that will use the defined operation. Go to the Actions subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory\((\text{OXYGEN}_{\text{INSTALL\_DIR}/}\text{frameworks/\{CUSTOM\_FRAMEWORK\_DIR\}})\).

8. Define the action's properties:
   - Set ID to \text{insert\_image}.
   - Set Name to \text{Insert image}.
   - Set Menu access key to letter i.
   - Set Toolbar action to $\{\text{framework}/\text{toolbarImage.png}\}$.
   - Set Menu icon to $\{\text{framework}/\text{menuImage.png}\}$.
   - Set Shortcut key to Ctrl (Meta on Mac OS)+Shift+i.

9. Next, set up the operation. You want to add images only if the current element is a section, book or article.
   - Set the value of XPath expression to
     \[
     \text{local-name()='section'} \text{ or local-name()='book'} \text{ or local-name()='article'}
     \]
   - Set the Invoke operation field to \text{simple.documentation.framework.InsertImageOperation}.

Figure 728. Selecting the Operation

10. Add the action to the toolbar, using the Toolbar panel.
To test the action, open or create an xml file and place the cursor at a valid location. Then press the button associated with the action from the toolbar. In the dialog box, select an image URL and press OK. The image is inserted into the document.

Example 2- Operations with Arguments. Report from Database Operation

In this example you will create an operation that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the database connection string, the user name, the password and the SQL expression.

1. Set up a sample project following this set of instructions. The framework project is oxygen-sample-framework.

2. Create the class simple.documentation.framework.QueryDatabaseOperation. This class must implement the ro.sync.ecss.extensions.api.AuthorOperation interface.

   ```java
   import ro.sync.ecss.extensions.api.ArgumentDescriptor;
   import ro.sync.ecss.extensions.api.ArgumentsMap;
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.AuthorOperation;
   import ro.sync.ecss.extensions.api.AuthorOperationException;

   public class QueryDatabaseOperation implements AuthorOperation {

   3. Now define the operation's arguments. For each of them you will use a String constant representing the argument name:

   ```java
   private static final String ARG_JDBC_DRIVER = "jdbc_driver";
   private static final String ARG_USER = "user";
   private static final String ARG_PASSWORD = "password";
   private static final String ARG_SQL = "sql";
   private static final String ARG_CONNECTION = "connection";
   ```

   4. You must describe each of the argument name and type. To do this, implement the getArguments method that will return an array of argument descriptors:

   ```java
   public ArgumentDescriptor[] getArguments() {
       ArgumentDescriptor args[] = new ArgumentDescriptor[] {
           new ArgumentDescriptor( 
               ARG_JDBC_DRIVER,
   ```
These names, types and descriptions will be listed in the Arguments table when the operation is configured.

5. When the operation is invoked, the implementation of the doOperation method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
    throws IllegalArgumentException, AuthorOperationException {
    // Collects the arguments.
    String jdbcDriver =
        (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection =
        (String)map.getArgumentValue(ARG_CONNECTION);
    String user =
        (String)map.getArgumentValue(ARG_USER);
    String password =
        (String)map.getArgumentValue(ARG_PASSWORD);
```
String sql = (String)map.getArgumentValue(ARG_SQL);

int caretPosition = authorAccess.getCaretOffset();

try {
    authorAccess.getDocumentController().insertXMLFragment(  
        getFragment(jdbcDriver, connection, user, password, sql),  
        caretPosition);
} catch (SQLException e) {  
    throw new AuthorOperationException(  
            "The operation failed due to the following database error: "  
            + e.getMessage(), e);
} catch (ClassNotFoundException e) {  
    throw new AuthorOperationException(  
            "The JDBC database driver was not found. Tried to load ' "  
            + jdbcDriver + "', e);
}

6. The getFragment method loads the JDBC driver, connects to the database and extracts the data. The result is a table element from the http://www.oxygenxml.com/sample/documentation namespace. The header element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '<' and '&' characters are replaced with the '&lt;' and '&amp;' character entities to ensure the fragment is well-formed.

private String getFragment(  
    String jdbcDriver,  
    String connectionURL,  
    String user,  
    String password,  
    String sql) throws  
    SQLException,  
    ClassNotFoundException {

    Properties pr = new Properties();
    pr.put("characterEncoding", "UTF8");
    pr.put("useUnicode", "TRUE");
    pr.put("user", user);
    pr.put("password", password);

    // Loads the database driver.
Class.forName(jdbcDriver);
// Opens the connection
Connection connection =
    DriverManager.getConnection(connectionURL, pr);
java.sql.Statement statement =
    connection.createStatement();
ResultSet resultSet =
    statement.executeQuery(sql);

StringBuffer fragmentBuffer = new StringBuffer();
fragmentBuffer.append("<table xmlns=" +
    "http://www.oxygenxml.com/sample/documentation'">

    /*
    // Creates the table header.
    */
    fragmentBuffer.append("<header>");
    ResultSetMetaData metaData = resultSet.getMetaData();
    int columnCount = metaData.getColumnCount();
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</header>");

    /*
    // Creates the table content.
    */
    while (resultSet.next()) {
        fragmentBuffer.append("<tr>");
        for (int i = 1; i <= columnCount; i++) {
            fragmentBuffer.append("<td>");
            fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
            fragmentBuffer.append("</td>");
        }
        fragmentBuffer.append("</tr>");
    }
fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();
return fragmentBuffer.toString();
}

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor website.

7. Package the compiled class into a JAR (on page 3283) file.

8. Copy the JAR file and the JDBC driver files into your custom framework directory (\OXYGEN_INSTALL_DIR\frameworks\CUSTOM_FRAMEWORK_DIR).

9. Add the JARS to the class path. To do this, open the Document Type Association preferences page (on page 92), select SDF and press the Edit button. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 95) and press the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor frameworks folder.

10. Go to the Actions subtab. The action properties are:
    • Set ID to clients_report.
    • Set Name to Clients Report.
    • Set Menu access key to letter r.
    • Set Description to Connects to the database and collects the list of clients.
    • Set Toolbar icon to ${framework}/TableDB20.png (image TableDB20.png is already stored in the frameworks/ sdf folder).
    • Leave empty the Menu icon.
    • Set shortcut key to Ctrl + Shift + C (Command + Shift + C on OS X).

11. The action will work only if the current element is a section. Set up the operation as follows:
    • Set XPath expression to:
      
      \local-name() = 'section'
      
    • Use the Java operation defined earlier to set the Invoke operation field. Press the Choose button, then select simple.documentation.framework.QueryDatabaseOperation. Once
selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: `jdbc://<database_host>:<database_port>/<database_name>.

The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

Figure 729. Java Operation Arguments Setup

To test the action, open or create an **xml** file and place the cursor at a valid location. Then press the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

Figure 730. Table Content Extracted from the Database
Author Mode Operations

This topic lists the default operations for the **Author** mode.

**ChangeAttributeOperation**

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom **Author** mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

* **name**
  The attribute local name.

* **namespace**
  The attribute namespace.

* **elementLocation**
  The XPath location that identifies the element.

* **value**
  The new value for the attribute. If empty or null the attribute will be removed.

* **editAttribute**
  If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

* **removeIfEmpty**
The possible values are true and false. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

**ChangeAttributesOperation**

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom **Author** mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

- **elementLocations**
  The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

- **attributeNames**
  The names of the attributes to add, modify, or remove. The values can be local names or Clark notations.

- **values**
  The new attributes values, each on a new line. An empty value will remove the attribute if `removeIfEmpty` is set to true.

- **removeIfEmpty**
  The possible values are true (default) and false. True means that the attribute will be removed if an empty value is provided.

**ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- **setLocations**
  An XPath expression indicating a list of nodes for which the specified list of pseudo-classes will be set. If it is not defined, then the element at the cursor position will be used.

- **setPseudoClassNames**
  A space-separated list of pseudo-class names that will be set on the matched nodes.

- **removeLocations**
  An XPath expression indicating a list of nodes from which the specified list of pseudo-classes will be removed. If it is not defined, then the element at the cursor position will be used.
removePseudoClassNames

A space-separated list of pseudo-class names that will be removed from the matched nodes.

includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

DeleteElementOperation

Deletes the node indicated by the elementLocation parameter XPath expression. If missing, the operation will delete the node at the cursor location.

DeleteElementsOperation

Deletes the nodes indicated by the elementLocations parameter XPath expression. If missing, the operation will delete the node at the cursor location.

ExecuteCommandLineOperation

This operation allows you to start a process executing a given command line. It has the following arguments:

name

The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

workingDirectory

The path to the directory where the command line is executed. The default value is "." (current directory).

cmdLine

The command line to be executed (accepts editor variables (on page 2468)).

showConsole

If set to true, the console panel will be displayed in Oxygen XML Editor. The default value is false.
ExecuteMultipleActionsOperation

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Editor.

actionIDs

The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

ExecuteMultipleWebappCompatibleActionsOperation

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

ExecuteTransformationScenariosOperation

This operation allows running one or more transformation scenarios defined in the current document type association (on page 3281). It is useful to add to the toolbar buttons that trigger publishing to various output formats. The argument of the operation is:

scenarioNames

The list of scenario names that will be executed, separated by new lines.

InsertEquationOperation

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

fragment

The XML fragment containing the MathML content that should be inserted.

InsertFragmentOperation

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation (on page 2472).
InsertOrReplaceFragmentOperation

Similar to InsertFragmentOperation (on page 2454), except it removes the selected content before inserting the fragment. Also, the insertPosition parameter has another possible value: Replace. If this value is used, the operation deletes the node selected by the XPath expression denoted by the insertLocation parameter. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation (on page 2472).

InsertOrReplaceTextOperation

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

- text
  
  The text section to insert.

InsertXIncludeOperation

Insert an XInclude element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

JSOperation

Allows you to call the Java API from custom JavaScript content. For some sample JSOperation implementations, see https://github.com/oxygenxml/javascript-sample-operations.

Note: For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API.

This operation accepts the following parameter:

- script
  
  The JavaScript content to execute. It must have a function called doOperation(), which can use the predefined authorAccess variable. The authorAccess variable has access to the entire ro.sync.ecss.extensions.api.AuthorAccess Java API.

The following example is a script that retrieves the current value of the type attribute on the current element, allows the end user to edit its new value and sets the new value in the document:

```javascript
function doOperation(){
  //...
The current node is either entirely selected...

```
currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
if(currentNode != null){
    // or the cursor is placed in it
    caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    currentNode = authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
}
```

Get current value of the @type attribute

```
currentTypeValue = "";
currentTypeValueAttr = currentNode.getAttribute("type");
if(currentTypeValueAttr != null){
    currentTypeValue = currentTypeValueAttr.getValue();
}
```

Ask user for new value for attribute.

```
newTypeValue = javax.swing.JOptionPane.showInputDialog("Input @type value", currentTypeValue);
if(newTypeValue != null){
    // Create and set the new attribute value for the @type attribute.
    attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue(newTypeValue);
    authorAccess.getDocumentController().setAttribute("type", attrValue, currentNode);
}
```

Tip: You can call functions defined inside a script called commons.js from your custom script content so that you can use that external script file as a library of functions. Note that this commons.js file must be placed in the root of the framework directory (for example, \[OXYGEN_INSTALL_DIR\]/frameworks/dita/commons.js) because that is the only location where Oxygen XML Editor will look for it.

**MoveCaretOperation**

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

**xpathLocation**

An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.
position

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- Before - Places the cursor at the beginning of the selection.
- Inside, at the beginning - Places the cursor at the beginning of the selection.
- After - Places the cursor at the end of the selection.
- Inside, at the end - Places the cursor at the end of the selection.

selection

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: None, Element, and Content.

MoveElementOperation

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

sourceLocation

XPath expression that identifies the content to be moved.

deleteLocation

XPath expression that identifies the node to be removed. This parameter is optional. If missing, the sourceLocation parameter will also identify the node to be deleted.

surroundFragment

A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

targetLocation

XPath expression that identifies the location where the node must be moved to.

insertPosition

Argument that indicates the insert position.

moveOnlySourceContentNodes

When true, only the content of the source element is moved.

processTrackedChangesForXPathLocations
When nodes are located via an XPath expression and the nodes are deleted with Change Tracking (on page 3288) enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to true and change tracking is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).

**OpenInSystemAppOperation**

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

- **resourcePath**
  
  An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables (on page 276) are expanded in the value of this parameter, before the expression is executed.

- **isUnparsedEntity**
  
  Possible values are true or false. If the value is true, the value of the resourcePath argument is treated as the name of an unparsed entity.

**ReloadContentOperation**

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

- **markAsNotModified**
  
  The possible values are true and false. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to true to prevent the editor from showing the content as modified.

**RemovePseudoClassOperation**

An operation that removes a pseudo-class from an element. Accepts the following parameters:

- **name**
  
  Name of the pseudo-class to be removed.

- **includeAllNodes**
  
  The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.
The XPath location that identifies the element. Leave it empty for the current element. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

**Example:**

Suppose that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

```xml
paragraph:myClass{
   font-size:2em;
   color:red;
}
paragraph{
   color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue.

**RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- **elementName**
  - The new element name.

- **elementLocation**
  - The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

**SetPseudoClassOperation**

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- **elementLocation**
  - An XPath expression indicating the element for which the pseudo-class will be set. If it is not defined, then the element at cursor position will be used.

- **name**
  - The pseudo-class local name.
includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

ShowElementDocumentationOperation

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

SurroundWithFragmentOperation

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: Arguments of SurroundWithFragmentOperation (on page 2475).

SurroundWithTextOperation

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

header

The text that is placed before the selection.

footer

The text that is placed after the selection.

TogglePseudoClassOperation

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

name

Name of the pseudo-class to be toggled on/off.

includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

elementLocation
The XPath location that identifies one or more elements for which the pseudo class will be toggled. Leave it empty for the current element.

**Example:**

```xml
paragraph:myClass{
  color:red;
}
paragraph{
  color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that you have a `TogglePseudoClassOperation` configured for the `myClass` pseudo-class. Invoking it the first time will set the `myClass` pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered paragraph element.

**ToggleSurroundWithElementOperation**

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

- **element**
  The element to wrap or unwrap content.
- **schemaAware**
  This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

**UnwrapTagsOperation**

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is:

- **unwrapElementLocation**
An XPath expression indicating the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.

**XQueryUpdateOperation**

Allows you to execute an XQuery Update script directly over content in Author mode.

**Note:** This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

**script**

The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the `${framework}` (on page 282) or `${frameworkDir}` (on page 282) editor variables to refer the scripts from the framework directory.

The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

```xml
declare variable $oxyxq:selection external;
```

In the example below (on page 2463), you can see how this argument is used.

**externalParams**

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```xml
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the `externalParams` to `param1=value1,param2=value2`.

**expandXincludeReferences**

Makes all Xinclude elements transparent to the XQuery transformer. When the Xinclude references are transparent, the `XQueryUpdateOperation` can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the Xinclude elements are not transparent.
An example of an XQuery Update Script that converts paragraphs to list items:

```xquery
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";

(: This variable will be linked to the selected nodes assuming that there are actually fully selected nodes. For example this selection will return null:
 <p>{SEL_START}text{SEL_END} in para</p>
 but this will give two "p" elements:
 {SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.
:)

declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :)
let $toProcess := if (empty($oxyxq:selection)) then
    (.)
else
    ($oxyxq:selection)
return if (not(empty($toProcess))) then
    {
        (: Create the list :) 
        let $ul :=
        <ul>
            {
                for $sel in $toProcess
                return
                <li>{$sel}</li>
            }
        </ul>

        return
        {
            (: Delete the processed nodes :) 
            for $sel in $toProcess
            return
            delete node $sel,
            (: Inserts the constructed list :) 
            insert node $ul
            before $toProcess[1]
        } 
    }
```
XSLTOperation and XQueryOperation

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

**Note:** For the Oxygen XML Web Author, these operations cannot be invoked using the JavaScript API.

These operations accept the following parameters:

**sourceLocation**

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations in which you want to look at an ancestor of the current element and take decisions in the script based on this. To do this, you can set the sourceLocation to point to an ancestor node then use the oxy:current-element() function to access the current element, as in the following example:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/
Transform" version="2.0"
    xpath-default-namespace="http://docbook.org/ns/docbook"
    xmlns:oxygen="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    exclude-result-prefixes="oxy">

    <xsl:template match="/">
        <xsl:apply-templates select="oxy:current-element()"/>
    </xsl:template>

    <xsl:template match="para">
        <!-- And the context is again inside the current element, 
        but we can use information from the entire XML -->
        <xsl:variable name="keyImage" select="//imagedata[@fileref='images/lake.jpeg']/ancestor::inlinemediaobject/@xml:id[string()]"/>
        <xref linkend="{$keyImage}" role="key_include"
             xmlns="http://docbook.org/ns/docbook">
        </xref>
    </xsl:template>
</xsl:stylesheet>
```
targetLocation

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

script

The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported xslt_operation.xsl needs to be located in the current framework directory.

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="1.0">
    <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>
```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The $[framework] editor variable (on page 282) can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, http://www.oxygenxml.com/fr/testy.xsl) and map it in the catalog.xml file from the framework directory to a resource from the framework.

action

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

caretPosition

The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the $[caret] editor variable (on page 280) in the inserted content.
expandEditorVariables

Parameter controlling the expansion of editor variables (on page 276) returned by the script processing. Expansion is enabled by default.

suspendTrackChanges

It has 2 possible values (true and false). The default value is false. When set to true, the Track Changes (on page 3288) feature is deactivated. When using this argument, after the action is finished, the state of the Track Changes feature is restored to its initial value.

externalParams

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```xml
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the externalParams to param1=value1,param2=value2.

XSLTOperation Example: Sort a list with respect to the language declared on the root element:

Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```xml
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```

The XSLTOperation needs to be configured as follows:

- **sourceLocation** is set to /* so that the script has access to the root element and its children.
- **targetLocation** is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
```
<?xml version="2.0"?>
           xmlns:xs="http://www.w3.org/2001/XMLSchema"
           exclude-result-prefixes="xs oxy" version="2.0">

<xsl:template match="/">
  <!-- sourceLocation parameter was set to /* to have a larger context. 
       We can pinpoint the element that contained the caret 
       using the oxy:current-element() function. -->
  <xsl:apply-templates select="oxy:current-element()"/>
</xsl:template>

<xsl:template match="ul">
  <!-- Because the sourceLocation parameter was set to /* we now have access to 
       the root element and its attributes. -->
  <xsl:variable name="lang" select="//@xml:lang"/>
  <xsl:variable name="collationURI">
    <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=',
                              $lang)"/>
  </xsl:variable>

  <xsl:copy>
    <xsl:copy-of select="@*"/>

    <!-- Copy the list items, but sorted. -->
    <xsl:apply-templates select="li">
      <xsl:sort collation="$collationURI" select="text()"/>
      <xsl:apply-templates/>
    </xsl:apply-templates>
  </xsl:copy>
</xsl:template>

<xsl:template match="@* | node()">
  <xsl:copy>
    <xsl:apply-templates select="@* | node()"/>
  </xsl:copy>
</xsl:template>

<!-- This copy template will handle the contents of the list items. -->
<xsl:template match="@* | node()">
  <xsl:copy>
    <xsl:apply-templates select="@* | node()"/>
  </xsl:copy>
</xsl:template>
</xsl:stylesheet>
Using Entities and Xincludes with the XSLTOperation

- **Entities** will be resolved in the result.
- **Xincludes** are also resolved in the result, and you can alter the XML obtained after the resolving using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.

Editor Variables in Author Mode Operations

**Author** mode operations can include parameters that contain the following editor variables (on page 276):

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.
  
  **Note:** The `${caret}` editor variable is available only for parameters that take XML content as values. It is replaced with the `$UNIQUE_CARET_MARKER_FOR_AUTHOR` macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a selection plugin.

- **${ask('message', type, ('real_value1':rendered_value1'; 'real_value2':rendered_value2'; ...), 'default-value', @id)}** - To prompt for values at runtime, use the `ask('message', type, ('real_value1':rendered_value1'; 'real_value2':rendered_value2'; ...), 'default_value')` editor variable. You can set the following parameters:
  - **message** - The displayed message. Note the quotes that enclose the message.
  - **default-value** - Optional parameter. Provides a default value.
  - **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the `${answer(@id)}` editor variable.
  - **type** - Optional parameter, with one of the following values:

    **Note:** The title of the dialog box will be determined by the type of parameter and as follows:

    - For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the 'message'.
    - For the other parameters listed below, the title will be the name of that respective parameter.
    - If no parameter is used, the title will be "Input".

| Parameter | Format: ${ask('message', url, 'default_value')}
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>url</strong></td>
<td><strong>Description:</strong> Input is considered a URL. Oxygen XML Editor checks that the provided URL is valid.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>password</td>
<td>Format: <code>$\{\text{ask('message', password, 'default')}\}</code></td>
</tr>
<tr>
<td></td>
<td>Description: The input is hidden with bullet characters.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>${\text{ask('Input password', password)}}$ - The displayed dialog box</td>
</tr>
<tr>
<td></td>
<td>has the name 'Input password' and the input is hidden with bullet symbols.</td>
</tr>
<tr>
<td></td>
<td>${\text{ask('Input password', password, 'abcd')}}$ - The displayed dialog</td>
</tr>
<tr>
<td></td>
<td>box has the name 'Input password' and the input hidden with bullet symbols.</td>
</tr>
<tr>
<td></td>
<td>The input field already contains the default <code>abcd</code> value.</td>
</tr>
<tr>
<td>generic</td>
<td>Format: <code>$\{\text{ask('message', generic, 'default')}\}$</code></td>
</tr>
<tr>
<td></td>
<td>Description: The input is considered to be generic text that requires no</td>
</tr>
<tr>
<td></td>
<td>special handling.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>${\text{ask('Hello world!')}}$ - The dialog box has a <code>Hello world!</code></td>
</tr>
<tr>
<td></td>
<td>message displayed.</td>
</tr>
<tr>
<td></td>
<td>${\text{ask('Hello world!', generic, 'Hello again!')}}$ - The dialog box</td>
</tr>
<tr>
<td></td>
<td>has a <code>Hello world!</code> message displayed and the value displayed in the input</td>
</tr>
<tr>
<td></td>
<td>box is <code>Hello again!</code>.</td>
</tr>
<tr>
<td>relative_url</td>
<td>Format: <code>$\{\text{ask('message', relative_url, 'default')}\}$</code></td>
</tr>
<tr>
<td></td>
<td>Description: Input is considered a URL. Oxygen XML Editor tries to make the</td>
</tr>
<tr>
<td></td>
<td>URL relative to that of the document you are editing.</td>
</tr>
<tr>
<td></td>
<td>Note: If the <code>$\text{ask}$</code> editor variable is expanded in content that is</td>
</tr>
<tr>
<td></td>
<td>not yet saved (such as an <code>untitled</code> file, whose path cannot be determined),</td>
</tr>
<tr>
<td></td>
<td>then Oxygen XML Editor will transform it into an absolute URL.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>${\text{ask('File location', relative_url, 'C:/example.txt')}}$ - The</td>
</tr>
<tr>
<td></td>
<td>dialog box has the name 'File location'. The URL inserted in the input box</td>
</tr>
<tr>
<td></td>
<td>is made relative to the current edited document location.</td>
</tr>
<tr>
<td>combobox</td>
<td>Format: <code>$\{\text{ask('message', combobox, ('real_value1':rendered_value1';...;'real_valueN':rendered_valueN'), 'default'})\}$</code></td>
</tr>
</tbody>
</table>
| Parameter | Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).  

Note: The 'default' parameter specifies the default selected value and can match either a key or a value.  

Example: |
| --- | --- |
| ${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.  

Note: In this example, the default value is indicated by the osx key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example: ${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}  

- ${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')} |
| editable_combobox Format: | ${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')} |
| Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.  

Note: The 'default' parameter specifies the default selected value and can match either a key or a value.  

Example: |
| --- | --- |
| ${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.  

Note: |
Parameter | Format: \$\{ask('message', radio, \\
\hspace{5mm} ('real_value1': 'rendered_value1'; ... ; 'real_valueN': 'rendered_valueN'), \\
\hspace{5mm} 'default')\}
---
radio

**Description:** Displays a dialog box that offers a series of radio buttons. Each radio button displays a 'rendered_value' and will return an associated 'real_value'.

**Note:** The 'default' parameter specifies the default selected value and can match either a key or a value.

**Example:**

\$\{ask('Operating System', radio, ('win': 'Microsoft Windows'; 'osx': 'Mac OS X'; 'inx': 'Linux/UNIX'), 'osx')\} - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.

**Note:** In this example, Mac OS X is the default selected value and if selected, it would return osx for the output.

- \$\{timeStamp\} - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- \$\{uuid\} - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- \$\{id\} - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- \$\{cfm\} - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- \$\{cfne\} - Current file name with extension. The current file is the one currently opened and selected.
- \$\{cf\} - Current file as file path, that is the absolute file path of the current edited document.
- \$\{cfd\} - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- \$\{frameworksDir\} - The path (as file path) of the frameworks directory.
- \$\{pd\} - The file path to the folder that contains the current project file (.xpr).
- \$\{oxygenInstallDir\} - Oxygen XML Editor installation folder as file path.
- \$\{homeDir\} - The path (as file path) of the user home folder.
- \$\{pn\} - Current project name.
- \$\{env(VAR_NAME)\} - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the \$\{system(var.name)\} editor variable.
• \${system(var.name)} - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the \${env(VAR_NAME)} editor variable instead.

• \${date(pattern)} - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

Note: This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: http://www.w3.org/TR/xmlschema-2/#date. For details about xs:datetime, go to: http://www.w3.org/TR/xmlschema-2/#dateTime.

How to Find More Information About the Arguments of an Operation

If you need to find more information about the arguments of an operation, there are several places where this information is available:

• In the API documentation for the particular operation.

• By invoking the getArguments() method on the operation.

• In the source code of the operation.

• In Oxygen XML Editor:
  1. Go to Options > Preferences > Document Type Association, select a document type and click the New, Edit, Duplicate, or Extend button (on page 92).
  2. Go to the Author tab and then the Actions subtab. At the bottom of this subtab, click New to open the Action dialog box (on page 102).
  3. Locate the Operation field and click the Choose button on the right side. This will open a dialog box that displays the default operations.
  4. Double-click the operation (or select it and click OK).

The arguments for the operation will now be displayed in the Action dialog box (on page 102).

Arguments of InsertFragmentOperation Operation

fragment

This argument has a textual value. This value is parsed by Oxygen XML Editor as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!
If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

1. **Prefixes that are not bound explicitly**

   For instance, the fragment:

   ```xml
   <x:item id="dty2"/>
   &ent;
   <x:item id="dty3"/>
   ```

   Can be correctly inserted in the document: ('|' marks the insertion point):

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE x:root [ 
   <!ENTITY ent "entity">
   ]>
   <x:root xmlns:x="nsp">
   |
   </x:root>
   ```

   Result:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE x:root [ 
   <!ENTITY ent "entity">
   ]>
   <x:root xmlns:x="nsp">
   <x:item id="dty2"/>
   &ent;
   <x:item id="dty3"/>
   </x:root>
   ```

2. **Default namespaces**

   If there is a default namespace declared in the document and the document fragment does not declare a namespace, the elements from the fragment are considered to be in **no namespace**.

   For instance, the fragment:

   ```xml
   <x:root xmlns:x="nsp">
   <x:item id="dty2"/>
   &ent;
   <x:item id="dty3"/>
   </x:root>
   ```
Inserted in the document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
    <item xmlns="" id="dty2"/>
    <item xmlns="" id="dty3"/>
</root>
```

Gives the result document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
    <item xmlns="" id="dty2"/>
    <item xmlns="" id="dty3"/>
</root>
```

**insertLocation**

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

**insertPosition**

Specifies where the insertion is made relative to the reference node selected by the `insertLocation`. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

**goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the `$\text{caret}$` editor variable (on page 280). The possible values of this action are `true` and `false`.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid,
then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a paragraph element with a bold element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Arguments of SurroundWithFragmentOperation

**fragment**

The XML fragment that will surround the selection. For example, consider the fragment:

```xml
<F>
  <A></A>
  <B>
    <C></C>
  </B>
</F>
```

and the document:

```xml
<doc>
  <X></X>
  <Y></Y>
  <Z></Z>
</doc>
```

Considering the selected content to be surrounded is the sequence of elements \( \text{x} \) and \( \text{y} \), then the result is:

```xml
<doc>
  <F>
    <A>
      <X></X>
      <Y></Y>
    </A>
    <B>
      <C></C>
    </B>
  </F>
  <Z></Z>
</doc>
```
Since the element $A$ was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

**schemaAware**

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a `paragraph` element with a `bold` element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Adding a Custom Operation to an Existing Framework

This task explains how to add a custom Author mode operation to an existing framework (on page 3282) (document type).

1. Setup a sample project by following the instructions for installing the SDK.
   
   **Tip:** The SDK contains a sample framework project called oxygen-sample-framework.

2. A variety of classes in the `simple.documentation.framework.operations` package implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.

3. Pack the operation class inside a Java JAR library.

4. Copy the JAR library to your framework directory (for example, `{OXYGEN_INSTALL_DIR}/frameworks/{FRAMEWORK_DIR}`).

5. Open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, and edit the document type (you need write access to the `{OXYGEN_INSTALL_DIR}`) to open the Document Type configuration dialog box (on page 95). 
   a. In the Classpath tab, add a reference to your JAR library (for example, `$\{framework\}/customAction.jar`).
   b. Go to the Author tab, then go to the Actions subtab.
   c. Click the + New button and use the Action dialog box (on page 102) to create a new action that uses your custom operation.
   d. Mount the action to the toolbars or menus. You can also define a shortcut key.

6. Share the modifications (on page 2371) with your colleagues. The files that should be shared are your customAction.jar library and the .framework configuration file from the `{OXYGEN_INSTALL_DIR}/frameworks/{FRAMEWORK_DIR}` directory.
Customizing Author Mode Through CSS

The visual Author editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language. Also, Oxygen XML Editor has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize Author mode through custom frameworks (on page 2322).

Associating a CSS with an XML Document

**Associating a Stylesheet with an XML Document**

The rendering of an XML document in the Author mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported. Oxygen XML Editor also supports stylesheets coded with the LESS dynamic stylesheet language.

There are several methods for associating a stylesheet (CSS or LESS) with an XML document:

1. Insert the `xml-stylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, you should create a new document type (framework) (on page 2322).

   **CSS example:**
   ```xml
   <?xml-stylesheet type="text/css" href="test.css"?>
   ```

   **LESS example:**
   ```xml
   <?xml-stylesheet type="text/css" href="test.less"?>
   ```

   **Note:** XHTML documents need a link element, with the `href` and `type` attributes in the head child element, as specified in the W3C stylesheet specification. XHTML example:
Tip: You can also insert the `xml-stylesheet` processing instruction by using the Associate XSLT/CSS Stylesheet action that is available on the toolbar or in the Document > XML Document menu.

2. Add a new CSS or LESS file to a framework (on page 3282) (document type). To do so, open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Edit the appropriate framework, open the Author tab, then the CSS subtab. Press the New button to add a new CSS or LESS file.

Note: The built-in frameworks are read-only, so you need to Extend (on page 93) or Duplicate (on page 93) them to configure them as custom frameworks.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

Figure 731. Document with no CSS association default rendering

For information about associating a CSS to a framework (document type), see Customizing Author Mode Using CSS Files Associated with a Framework (on page 2346).

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog (on page 3289) URI mappings to determine an indirect CSS referenced location.
Example: CSS Import

For example, if you can have a CSS import, such as:

```
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog (on page 3289) file that maps the location to a custom CSS in the XML Catalog preferences page (on page 189):

```
<uri name="http://host/path/to/location/custom.css"
    uri="path/to/custom.css"/>
```

Adding a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog (on page 3289) file that looks like this:

```
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
    uri="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual Author editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various editor variables (on page 276) in CSS imports. When editing an XML document with an associated CSS in Author mode, the editor variables will be expanded and resolved.

Example: Editor Variable in a CSS Import

For example, the following editor variable:

```
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA framework (on page 3282) folder where the custom.css is placed. In the Document Type Association preferences page (on page 92), you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the framework() function.

Note: If you use editor variables like ${cfdu} (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.
Displaying Processing Instructions from Other XML Editors

By default, external processing instructions are hidden (for example, processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be associated with the current document using a CSS (on page 2477) like this:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction[Pub],
oxy|processing-instruction[PubTbl],
oxy|processing-instruction[xm-replace_text],
oxy|processing-instruction[xm-deletion_mark],
oxy|processing-instruction[xm-insertion_mark_start],
oxy|processing-instruction[xm-insertion_mark_end]
{
  display:block !important;
}
```

Specifying Media Types in the CSS

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Editor Author mode and ignored in other media types. This can be accomplished by using the oxygen media type.

**Example: oxygen Media Type**

```css
ang
b{
  font-weight:bold;
  display:inline;
}

@media oxygen{
  b{
    text-decoration:underline;
  }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize @media oxygen, while the text is bold and underlined when opened in Oxygen XML Editor Author mode.
You can also use the oxygen media type to specify CSS selectors to be applied in certain operating systems or platforms by using the os and platform properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor in Windows, and another set of style rules for Mac OS. The supported properties are as follows:

- **os** - The possible values are: win, linux, or mac.
- **platform** - The possible values are: standalone, eclipse, or webapp.

**Example: os and platform Properties**

```css
@media oxygen AND (os:"win") AND (platform:"standalone") {
    p{
        content:"PPP"
    }
}
```

**Related Information:**

- [@media Rule (on page 2481)]

### CSS At-Rules

Oxygen XML Editor supports some of the standard at-rules specified by CSS Level 2.1 and 3. The @media rule also include support for some style rules that are specific to Oxygen XML Editor.

**@font-face At-Rule**

Oxygen XML Editor allows you to use custom fonts in the Author mode by specifying them in the CSS using the @font-face media type. Only the src and font-family CSS properties can be used for this media type.

**Example: @font-face Rule**

```css
@font-face{
    font-family:"Baroque Script";
    /*The location of the loaded TTF font must be relative to the CSS*/
    src:url("BaroqueScript.ttf");
}
```
@media Rule

The @media rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Editor supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Author mode. For more information, see Specifying Media Types in the CSS (on page 2480).
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Author mode when a dark theme is used (for example, Graphite).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Author mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Author mode on a Windows High Contrast Theme with a white background.

Example: @media Rule

```xml
@media oxygen{
  b{
    text-decoration:underline;
  }
}
@media oxygen-high-contrast-white{
  b{
    font-weight:bold;
  }
}
```
Supported Properties

Oxygen XML Editor also supports a few properties to set specific style rules that depend upon the size of the visible area in Author mode. These supported properties are as follows:

- \textit{min-width} - The styles selected in this property are applied if the visible area in Author mode is equal to or greater than the specified value.
- \textit{max-width} - The styles selected in this property are applied if the visible area in Author mode is less than or equal to the specified value.

\textbf{Example: min-width and max-width Properties}

```css
@media (min-width: 500px) {
  p{
    content: 'XXX';
  }
}

@media (max-width: 700px) {
  p:after{
    content: 'yyy';
  }
}
```

Related Information:

- Specifying Media Types in the CSS (on page 2480)

Standard W3C CSS Supported Features

Oxygen XML Editor supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

Supported CSS Selectors

The following table lists the CSS selectors that are supported in Oxygen XML Editor:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>$</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any $ element (i.e. an element with the local name $)</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------</td>
<td>-----------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a descendant of an E element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any F element that is a child of an element E.</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type E if it is in (human) language c (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any F element immediately preceded by a sibling element E.</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any F element preceded by a sibling element E.</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with the &quot;foo&quot; attribute set (whatever the value).</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector with value</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;foo&quot; attribute value is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector containing value</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;foo&quot; attribute value is a list of space-separated values, one of which is exactly equal to &quot;warning&quot;.</td>
</tr>
<tr>
<td>E[lang=&quot;en&quot;]</td>
<td>Attribute selector containing hyphen separated values</td>
<td>CSS Level 2</td>
<td>Matches any E element whose &quot;lang&quot; attribute has a hyphen-separated list of values beginning (from the left) with &quot;en&quot;.</td>
</tr>
<tr>
<td>E:before and E:after</td>
<td>Pseudo elements</td>
<td>CSS Level 2</td>
<td>The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.</td>
</tr>
<tr>
<td>E:before(n) and E:after(n)</td>
<td>Pseudo elements</td>
<td>CSS Level 3</td>
<td>Multiple ':before(n)' and ':after(n)' pseudo-elements can be used to insert content before or after the content of an element (or other pseudo-element).</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>------</td>
<td>-----------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>E:first-child</td>
<td>The first-child pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element E when E is the first child of its parent.</td>
</tr>
<tr>
<td>E:not(s)</td>
<td>Negation pseudo-class</td>
<td>CSS Level 2</td>
<td>An E element that does not match simple selector s.</td>
</tr>
<tr>
<td>E:has</td>
<td>Relational pseudo-class</td>
<td>CSS Level 4</td>
<td>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see :has Relational Pseudo-Class (on page 2489).</td>
</tr>
<tr>
<td>E:hover</td>
<td>The hover pseudo-class</td>
<td>CSS Level 2</td>
<td>The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.</td>
</tr>
<tr>
<td>E:focus</td>
<td>The focus pseudo-class</td>
<td>CSS Level 2</td>
<td>The :focus pseudo-class applies while an element has the focus (accepts keyboard input).</td>
</tr>
<tr>
<td>E:focus-within</td>
<td>The generalized input focus pseudo-class</td>
<td>CSS Level 4</td>
<td>The :focus-within pseudo-class applies to elements for which the :focus pseudo-class applies. Additionally, the ancestors of an element that matches :focus-within also match.</td>
</tr>
<tr>
<td>E#$myid</td>
<td>The ID selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with ID equal to &quot;myid&quot;. <strong>Important:</strong> Limitation: In Oxygen XML Editor the match is performed only taking into account the attributes with the exact name: &quot;id&quot;.</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E[att^=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose <code>att</code> attribute value begins exactly with the string <code>val</code>.</td>
</tr>
<tr>
<td>E[att$=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose <code>att</code> attribute value ends exactly with the string <code>val</code>.</td>
</tr>
<tr>
<td>E[att=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose <code>att</code> attribute value contains the substring <code>val</code>.</td>
</tr>
<tr>
<td>E:root</td>
<td>Root pseudo-class</td>
<td>CSS Level 3</td>
<td>Matches the root element of the document. In HTML, the root element is always the HTML element.</td>
</tr>
<tr>
<td>E:empty</td>
<td>Empty pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element that has no text or child elements.</td>
</tr>
<tr>
<td>E:nth-child(n)</td>
<td>The nth-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent.</td>
</tr>
<tr>
<td>E:nth-last-child(n)</td>
<td>The nth-last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent, counting from the last one.</td>
</tr>
<tr>
<td>E:nth-of-type(n)</td>
<td>The nth-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type.</td>
</tr>
<tr>
<td>E:nth-last-of-type(n)</td>
<td>The nth-last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type, counting from the last one.</td>
</tr>
<tr>
<td>E:last-child</td>
<td>The last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last child of its parent.</td>
</tr>
<tr>
<td>E:first-of-type</td>
<td>The first-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, first sibling of its type.</td>
</tr>
<tr>
<td>E:last-of-type</td>
<td>The last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last sibling of its type.</td>
</tr>
<tr>
<td>E:only-child</td>
<td>The only-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, only child of its parent.</td>
</tr>
<tr>
<td>E:only-of-type</td>
<td>The only-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, only sibling of its type.</td>
</tr>
<tr>
<td>ns</td>
<td>E</td>
<td>Element namespace selector</td>
<td>CSS Level 3</td>
</tr>
</tbody>
</table>
### Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```
b {font-weight:bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

**Example: Defining prefixed and default namespaces**

Given the namespace declarations:

```
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

Then:

```
sync|A
```

Represents the name A in the [http://sync.example.org](http://sync.example.org) namespace.

```
*B
```
Represents the name B in ANY namespace, including NO NAMESPACE.

C

Represents the name C in ANY namespace, including NO NAMESPACE.

**Example: Defining prefixed namespaces combined with pseudo-elements**

To match the `def` element its namespace declares, bind it to the `abs` prefix and then write a CSS rule:

```css
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

```
abs|def
```

Represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

```
abs|def:before
```

Represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

**Subject Selector**

Oxygen XML Editor supports the subject selector described in CSS Level 4 (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

*The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.*

**Example:**

```css
table! > caption {
  border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```css
table > caption {
  border: 1px solid red;
}
```
This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (\texttt{PI}) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

**Descendant Selectors Limitation**

\textbf{Important:} The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
a:has(b c)
```

and:

```css
a:has(b>c)
```

**Related Information:**

- :has Relational Pseudo-Class \textit{(on page 2489)}
Oxygen XML Editor supports the CSS Level 4 subject selector (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]), as described in Subject Selector (on page 2488). Oxygen XML Editor also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see [https://drafts.csswg.org/selectors-4/#relational](https://drafts.csswg.org/selectors-4/#relational).

You can create conditions that take into account the structure of the matching element.

**Example: has Pseudo Class**

```css
table:has( tbody > thead){
  border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `thead` element in the `tbody` element.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```
Descendant Selectors Limitation

⚠️ **Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
a:has(b c)
```

and:

```css
a:has(b>c)
```

Supported CSS Properties

Oxygen XML Editor validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in **Author** mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Editor-specific (extension) CSS properties, see [Oxygen CSS Extensions](on page 2501).

<table>

`<length>` - Refers to distance measurements and is expressed in units such as mm, cm, in, em, rem, ex, pc, pt, px. For more information, see the W3 CSS Level 3 length type specifications.

Related Information:
Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

**Example: RGBA Color**

```css
personnel:before {
    display:block;
    padding: 1em;
    font-size: 1.8em;
    content: "Employees";
    font-weight: bold;
    color:#EEEEEE;
    background-color: rgba(50, 50, 50, 0.6);
}
```

**attr() Function: Properties Values Collected from the Edited Document**

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```css
title:before{
    content: "[Audience Level: " attr(audience) "]";
}
```

If the `title` element from the XML document is:

```xml
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Editor, the use of `attr()` function is available not only for the `content` property, but also for any other property. This is similar to the CSS Level 3 working draft: `http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional`. The arguments of the function are:
`attr (attribute_name, attribute_type, default_value)`

**attribute_name**

The attribute name. This argument is required.

**attribute_type**

The attribute type. This argument is optional. If it is missing, argument's type is considered `string`. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor accepts one of the following types:

**color**

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor supports colors specified either by name (`red`, `blue`, `green`, etc.) or as an RGB hexadecimal value `#FFEEFF`.

**url**

The value is a URL pointing to a media object. Oxygen XML Editor supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

**integer**

The value must be interpreted as an integer.

**number**

The value must be interpreted as a float number.

**length**

The value must be interpreted as an integer.

**percentage**

The value must be interpreted relative to another value (length, size) expressed in percents.

**em**

The value must be interpreted as a size. 1 em is equal to the `font-size` of the relevant font.

**ex**
The value must be interpreted as a size. 1 ex is equal to the *height* of the x character of the relevant font.

**px**

The value must be interpreted as a size expressed in pixels relative to the viewing device.

**mm**

The value must be interpreted as a size expressed in millimeters.

**cm**

The value must be interpreted as a size expressed in centimeters.

**in**

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

**pt**

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

**pc**

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

**default_value**

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

**Example: attr Function**

Consider the following XML instance:

```xml
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```
The `para` elements have `bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```css
background-color: attr(bg_color, color);
```

The attribute `font_size` represents the font size in `em` units. You can use this value to change the style of the element:

```css
font-size: attr(font_size, em);
```

The complete CSS rule is:

```css
para{
  display: block;
  background-color: attr(bg_color, color);
  font-size: attr(font_size, em);
  margin: attr(space, em);
}
```

The document is rendered as:

![CSS Level 3 target-counter() and target-counters() Functions](image)

The CSS Level 3 functions `target-counter` and `target-counters` can be used as values for the `content` property to retrieve counter values and display information obtained from a target at the end of a link.
**target-counter Function**

This function retrieves the value of the innermost counter with a given name.

\[
\text{target-counter ( } \text{url} \text{, } \text{custom-ident} [\text{, } \text{counter-style} ] ? \text{)}
\]

**url**

The URL of the target. This argument is required.

**custom-ident**

The name of the counter. This argument is required.

**counter-style**

This argument can be used to format the result. This argument is optional.

**Example:**

**HTML:**

```html
<nav>
  <ol>
    <li class="frontmatter"><a href="#pref_01">Preface</a></li>
    <li class="frontmatter"><a href="#intr_01">Introduction</a></li>
    <li class="bodymatter"><a href="#chap_01">Chapter One</a></li>
  </ol>
</nav>
```

**CSS:**

```css
.frontmatter a::after { content: leader(\'.\') target-counter(attr(href url), page, lower-roman) }
.bodymatter a::after { content: leader(\'.\') target-counter(attr(href url), page, decimal) }
```

**Result:**

```
Preface..........v11
Introduction........xi
Chapter One........1
```
**target-counters Function**

This function fetches the value of all counters of a given name from the end of a link, and formats them by inserting a given string between the value of each nested counter.

```
target-counter ( <url> , <custom-ident> , <string> [ , <counter-style> ] ? )
```

**url**

The URL of the target. This argument is required.

**custom-ident**

The name of the counter. This argument is required.

**string**

The string to be inserted between the value of each nested counter. This argument is required.

**counter-style**

This argument can be used to format the result. This argument is optional.

**Oxygen CSS Extensions**

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor CSS extensions are useful.

Examples of how they can be used:

- Property for marking foldable elements (on page 3282) in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
- Constructing a URL from a relative path location.
- String processing functions.
Built-in CSS Selectors

When Oxygen XML Editor renders content in the Author mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

List of CSS Selector Contributed by Oxygen XML Editor

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
@namespace xi "http://www.w3.org/2001/XInclude";

}

/*
  * EXM-40349
  *
  * In DIFF these place holder PIs are not handled so we treat them as normal PIs with a
  * bit of styling.
  *
  */
Example:

To show all entities in the Author mode as transparent, without a gray background, first define in your CSS after all imports the namespace:
@namespace oxy "http://www.oxygenxml.com/extensions/author";

and then add the following selector:

```
oxy|entity {
  background-color: inherit !important;
}
```

**Additional CSS Selectors**

Oxygen XML Editor provides support for selecting additional types of nodes. These custom selectors apply to: `document`, `doctype`, `processing-instruction`, `comment`, `CDATA sections`, `entities`, and `reference sections`. `Processing-instructions` are not displayed by default. To display them, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Author, and select Show processing instructions.

**Note:** The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with an `!important` flag. For this reason, you have to set the `!important` flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the Author mode extensions namespace at the beginning of the stylesheet documents:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- **oxy|document** - The `oxy|document` selector matches the entire document:

```
oxy|document {
  display:block !important;
}
```

- **oxy|doctype** - The following example changes the rendering of doctype sections:

```
oxy|doctype {
  display:block !important;
  color:blue !important;
  background-color:transparent !important;
}
```

- **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

```
oxy|processing-instruction {
  display:block !important;
  color:purple !important;
```
A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"/>
```

You can match a processing instruction with a particular target from the CSS using the construct:

```css
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```css
oxy|processing-instruction[target_name][data="b"]
```

- **oxy|comment** - The XML comments display in **Author** mode can be changed using the `oxy|comment` selector:

  ```css
  oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
  }
  ```

- **oxy|cdata** - The `oxy|cdata` selector matches CDATA sections:

  ```css
  oxy|cdata {
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
  }
  ```

- **oxy|entity** - The `oxy|entity` selector matches the entities content:

  ```css
  oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
    background-color:transparent !important;
  }
  ```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```css
oxy|entity[name='amp'],
oxy|entity[name='lt'],
oxy|entity[name='gt'],
oxy|entity[name='quot'],
```
The references to entities, XInclude, and DITA conrefs and conkeyrefs are expanded by default in Author mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that refers to them.

You can use the `reference` property to customize the way these references are rendered in Author mode:

```xml
oxy|reference {
    border: 1px solid gray !important;
}
```

In the Author mode, content is highlighted when text contains comments (on page 941) and changes (if Track Changes (on page 941) was active when the content was modified).

If this content is referenced, the Author mode does not display the highlighted areas in the new context. If you want to mark the existence of this comments and changes you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

**Note:** Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and tracked changes in the content.

The following example represents the customization of the reference fragments that contain comments:

```xml
oxy|reference[comments]:before {
    content: "Comments: " attr(comments) !important;
}
```

To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector.

```xml
oxy|reference[changeTracking]:before {
    content: "Change tracking: " attr(changeTracking) !important;
}
```

Here is an example of how you can set a custom color to the reference containing both tracked changes and comments:

```xml
oxy|reference[changeTracking][comments]:before {
    content: "Change tracking: " attr(changeTracking)
```
Additional CSS Properties

Oxygen XML Editor provides various additional CSS properties to extend the standard CSS properties.

Append Content Properties: -oxy-append-content / -oxy-prepend-content

Used to append specified content.

oxy-append-content Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the content property, where only the value from the rule with the greatest specificity is taken into account, the oxy-append-content property adds content to that generated by the lesser specificity rules into a new compound content.

Example:
The content shown before the `element` will be `Hello World`.

**-oxy-prepend-content Property**

 Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

**Example:**

```
.element:before{
    content: "Hello!";
}
.element:before{
    -oxy-prepend-content: "said: ";
}
.element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the `element` will be `I said: Hello!`.

**Collapse Text: -oxy-collapse-text Property Value**

Used to collapse the content of an element.

Oxygen XML Editor allows you to set the value of the `visibility` property to `-oxy-collapse-text`, meaning that the content of that element is not rendered. If an element is marked as `-oxy-collapse-text`, you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

**Example: visibility Property**

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the **Author** visual editing mode:
Cyrillic Counters: -oxy-lower-cyrillic Property Values

Used to style lists with Cyrillic counters.

Oxygen XML Editor allows you to set the value of the list-style-type property to Cyrillic counters. For example, -oxy-lower-cyrillic-ru, -oxy-lower-cyrillic-uk, -oxy-upper-cyrillic-ru or -oxy-upper-cyrillic-uk, meaning that you can have Russian and Ukrainian counters.

Example: Cyrillic Counters

Counting list items with Cyrillic symbols:

```html
li{
  display:list-item;
  list-style-type:-oxy-lower-cyrillic-ru;
}
```

Display Tag Markers: -oxy-display-tags Property

Used to specify whether or not tag markers are displayed.

Oxygen XML Editor allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with :before and :after pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named -oxy-display-tags, with the following possible values:

- **none** - Tags markers will not be presented regardless of the current display mode. (on page 441).
- **default** - The tag markers will be created depending on the current display mode. (on page 441).
- **inherit** - The value of the property is inherited from an ancestor element.

-oxy-display-tags
  Value: none | default | inherit
  Initial: default
  Applies to: all nodes (comments, elements, CDATA, etc.)
  Inherited: false
  Media: all
Example: -oxy-display-tags Property

In this example, the para element from DocBook uses a :before and :after element and its tag markers will not be visible.

```xml
para:before{
    content: "{";
}
para:after{
    content: "}";
}
para{
    -oxy-display-tags: none;
    display: block;
    margin: 0.5em 0;
}
```

Editable: -oxy-editable Property

Used to inhibit the content of a particular element.

If you want to inhibit editing a certain element's content, you can set the -oxy-editable CSS property (deprecated property editable is also supported) to false.

Folding Elements: -oxy-foldable Property

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Editor allows you to declare some elements to be foldable (on page 3282). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the Folding submenu of the contextual menu:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

To define the element whose content can be folded by the user, you must use the property: -oxy-foldable:true; . To define the elements that are folded by default, use the -oxy-folded:true property.

Note: The -oxy-folded property works in conjunction with the -oxy-foldable property. Thus, the folded property is ignored if the -oxy-foldable property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The property -oxy-not-foldable-child is used to identify the child element that is kept visible. It accepts as value an element name or a list of comma-separated element names. The first child element from the XML document that appears in the list of element names will be identified as the not foldable child and displayed. If the element is marked as foldable (-oxy-foldable:true; ) but it doesn't have the property -oxy-not-foldable-child or none of the specified non-foldable children exists, then the element is still foldable. In this case the element kept visible when folded will be the before pseudo-element.

Note: Deprecated properties foldable, not-foldable-child, and folded are also supported.

Example: Folding DocBook Elements

All the elements below can have a title child element and are considered to be logical sections. You mark them as being foldable leaving the title element visible.

```
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
```
Links: -oxy-link Property

Used to specify that a particular element should be considered a link.

Oxygen XML Editor allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the link property on the before or after pseudo element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to attr(href)

**Example: DocBook Link Elements**

The following elements are defined to be links on the before pseudo element and their values are defined by the value of an attribute.

```
*[href]:before{
    -oxy-link:attr(href);
    content: "Click " attr(href) " for opening" ;
}

ulink[url]:before{
    -oxy-link:attr(url);
    content: "Click to open: " attr(url);
}

olink[targetdoc]:before{
    -oxy-link: attr(targetdoc);
    content: "Click to open: " attr(targetdoc);
}
```

**Morph Elements: -oxy-morph Property Value**

Used to specify that an element should be displayed inline.
Oxygen XML Editor allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is inline (on page 3283) if all its children are inline.

**Example: -oxy-morph Property Value**

Suppose you have a `wrapper` XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline (on page 3283) or block (on page 3280) behavior, depending on the behavior of its child elements:

```xml
wrapper{
  display:-oxy-morph;
}
```

**Placeholders for Empty Elements: -oxy-placeholder-content Property**

Used to configure placeholders for empty elements.

Oxygen XML Editor displays the element name as pseudo-content for empty elements if the Show placeholders for empty elements option (on page 132) is selected in the Author preferences page and there is no before or after content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (`-oxy-placeholder-content` and `-oxy-show-placeholder`).

**-oxy-placeholder-content CSS Property**

To control the displayed pseudo-content for empty elements, you can use the `-oxy-placeholder-content` CSS property.

The following example would change the `keyword` element to be displayed as `key`:

```css
keyword{
  -oxy-placeholder-content:"key";
}
```

**Note:** This CSS property accepts the `$(i18n(key))` (on page 282) localization editor variable, as in the following example:

```css
-oxy-placeholder-content:"$(i18n(id))";
```

**-oxy-show-placeholder CSS Property**

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:
- always - Always display placeholders.
- default - Always display placeholders if before or after content is not set in the CSS.
- inherit - The placeholders are displayed according to the Show placeholders for empty elements option (on page 132) (if before and after content is not declared).
- no - Never display placeholders.

**Note:** Deprecated properties show-placeholder and placeholder-content are also supported.

Related Information:

- Using Placeholders in Document Templates (on page 685)

**Style Elements:** -oxy-style Property

Used to configure the style of particular elements.

Oxygen XML Editor allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

**Example: -oxy-style Property**

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```css
*{
    -oxy-style:attr(style);
}
```

Suppose you want to display the title elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

**Tip:** The style attribute is supported by default in HTML5 documents.

**Tags Color:** -oxy-tags-color Property

Used to configure the background or foreground colors of tags.
By default, Oxygen XML Editor does not display element tags. You can use the Partial Tags button from the Author toolbar to control the amount of displayed markup. (on page 441)

To configure the default background and foreground colors of the tags, open the Preferences dialog box (Options > Preferences) (on page 79), go to Editor > Edit modes > Author, and set the desired colors in the Tags background color (on page 134) and Tags foreground color (on page 134) options.

If you want to be more specific and configure the colors using a CSS, the -oxy-tags-background-color and -oxy-tags-color properties allow you to control the background and foreground colors for any particular XML element.

Example:

```css
para {
  -oxy-tags-color:white;
  -oxy-tags-background-color:green;
}

.title {
  -oxy-tags-color:yellow;
  -oxy-tags-background-color:black;
}
```

Custom CSS Functions

Oxygen XML Editor provides a wide range of custom CSS extension functions that can be used to customize the visual Author editing mode.

**Arithmetic Functions**

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the java.lang.Math class (http://download.oracle.com/javase/6/docs/api/java/lang/Math.html).

In addition, the following functions are available:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>oxy_add (param1, ..., paramN, returnType)</td>
<td>Adds the values of all parameters from param1 to paramN.</td>
</tr>
<tr>
<td>oxy_subtract (param1, param2, ..., paramN, returnType)</td>
<td>Subtracts the values of parameters param2 to paramN from param1.</td>
</tr>
<tr>
<td>oxy_multiply (param1, ..., paramN, returnType)</td>
<td>Multiplies the values of parameters from param1 to paramN.</td>
</tr>
<tr>
<td>oxy_divide (param1, param2, returnType)</td>
<td>Performs the division of param1 to param2.</td>
</tr>
</tbody>
</table>
### Syntax

**oxy_modulo (param1, param2, returnType)** Returns the reminder of the division of `param1` to `param2`.

#### Note:
The `returnType` can be 'integer', 'number', or any of the supported CSS measuring types.

### Example: oxy_multiply Function

If you have an image with **width** and **height** specified on it, this will compute the number of pixels on it:

```css
element:before{
  content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

### Actions: oxy_action() Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the `oxy_button()` function (on page 2547) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (framework configuration) but the `oxy_action()` function allows you to define it directly in the CSS instead of the framework configuration.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an editor variable (on page 276).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (on page 2451) that can be used.

#### Note:
If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- **arg-string** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
• **ID** - (optional) - The ID of the action from the *framework*. If this is specified, all others parameters are disregarded.

**Example: oxy_action function inside an oxy_button form control (on page 2547):**

```xml
oxy_button{
  action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation,
    'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'),
  showIcon, true)
```

**Example: oxy_action Function**

You can also create a button form control directly from an *oxy_action* function:

```xml
oxy_action{
  name, 'Insert',
  description, 'Insert an element after the current one',
  operation, 'InsertFragmentOperation',
  arg-fragment, '<element>${caret}</element>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After')
```

**Tip:** A code template is available to make it easy to add the *oxy_action* function with the *Content Completion Assistant (on page 3280)* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.! oxy_action` code template.

**Related Information:**

- **Button Form Control (on page 2547)**

**Action Lists: oxy_action_list() Function**

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.
The `oxy_action_list()` function is used from the `oxy_buttonGroup()` function (on page 2550) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the `oxy_action_list()` function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the `oxy_action_list()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 2521). The following properties are supported in the `oxy_action()` function:

- **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an editor variable (on page 276).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (on page 2451) that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.

- **arg-*string*** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action_list Function**

```css
p:after {
  content: oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list(
      oxy_action{
        name, 'Insert a new paragraph',
        description, 'Insert an element after the current one',
      }
    )
  )
}
```
Tip: A code template is available to make it easy to add the `oxy_action_list` function with the *Content Completion Assistant (on page 3280)* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.! oxy_action_list` code template.

Related Information:

- Actions: `oxy_action()` Function *(on page 2521)*
- Button Group Form Control *(on page 2550)*

Attributes Concatenation: `oxy_attributes()` Function

This function concatenates the attributes for an element and returns the serialization.

**Syntax:**

```
oxy_attributes ()
```

**Example: `oxy_attributes` Function**

```
element{
    content: oxy_attributes();
}
```

For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x="&quot;"/>`, the CSS function will display:

```
att1="x" xmlns:a="2" x=""
```
**Base URL:** `oxy_base-uri()` Function

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the [XML Base specification](#) for more details.

**Example: `oxy_base-uri` Function**

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in **Author** mode):

```xml
image[href]{
    content: oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

**Capitalization:** `oxy_capitalize()` Function

This function capitalizes the first letter of the text received as argument.

**Syntax:**

```xml
oxy_capitalize ( text )
```

- **text**
  - The text in which the first letter will be capitalized.

**Example: `oxy_capitalize` Function**

```xml
*:before{
    content: oxy_capitalize(oxy_name()) " : ";
}
```

This would insert the capitalized qualified name as static text content before the element.

**Compound Actions:** `oxy_compound_action()` Function

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function (on page 2547) or the `oxy_buttonGroup()` form control function (on page 2550).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 2521).
You can use three optional properties (name, description, icon) in the oxy_compound_action() function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first oxy_action function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the oxy_getActionName function.

- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the oxy_getActionDescription function.

- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor (oxygen.jar) by starting its value with / (for example, /images/Remove16.png). It can also be expressed as an editor variable (on page 276). If you want to reuse the icon of an action already defined in your framework, you can use the oxy_getActionIcon function.

The oxy_getActionName, oxy_getActionDescription, and oxy_getActionIcon functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.

- **fallback** (optional) - A fallback value in case the ID value provided in the framework.defined.action.id parameter is not found.

**Example: oxy_compound_action Function**

```xml
oxy_button{
  action,
    oxy_compound_action{
      name, oxy_getActionName('framework.id', 'Fallback'),
      description, 'Inserts a paragraph and uses form controls to edit its audience attribute',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
      oxy_action{
        name, 'Insert',
        description, 'Insert an element after the current one',
        operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
        icon, url('insert.png'),
        arg-fragment, "<p audience=''></p>'
    }},
}
arg-insertLocation, '.',
arg-insertPosition, 'After'
),
oxy_action(
    name, 'Activate edit mode',
    description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
    operation, 'SetPseudoClassOperation',
    arg-name, 'edit-mode-on',
    arg-elementLocation, '
)
,
showIcon, true)

Tip: A code template is available to make it easy to add the oxy_compound_action function with the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the .! oxy_action_list code template.

Related Information:

- Actions: oxy_action() Function (on page 2521)
- Button Form Control (on page 2547)

Concatenation: oxy_concat() Function

This function concatenates the received string arguments.

Syntax:

oxy_concat ( str_1, str_2 )

    str_1 ... str_n

    The string arguments to be concatenated.

Example: oxy_concat Function

If an XML element has an attribute called padding-left:

<p padding-left="20">...
and you want to add a padding before it with that specific amount specified in the attribute value:

```css
*{padding-left} {
    padding-left: oxy_concat(attr(padding-left), "px");
}
```

**Get Text: oxy_getSomeText(text, length) Function**

This function allows you to truncate a long string and to set a maximum number of displayed characters.

**Syntax:**

```javascript
oxy_getSomeText ( text, length, endsWithPoints )
```

- `text`
  Displays the actual text.

- `length`
  Sets the maximum number of characters that are displayed.

- `endsWithPoints`
  Specifies if the truncated text ends with ellipsis.

**Example: oxy_getSomeText Function**

If an attribute value is very large, you can trim its content before it is displayed as static content:

```css
*{longdesc}:before{
    content: oxy_getSomeText(attr(longdesc), 200);
}
```

**Indexing: oxy_indexof() Function**

This function is used to define searches.

The `oxy_indexof()` function has two signatures:

**Syntax 1:**

```javascript
oxy_indexof ( text, toFind )
```

Returns the index within `text` string of the first occurrence of the `toFind` substring.

- `text`
  Text to search in.
toFind

The searched substring.

Syntax 2:

```
oxy_indexof ( text , toFind , fromOffset )
```

Returns the index within `text` string of the first occurrence of the `toFind` substring. The search starts from `fromOffset` index.

- **text**
  Text to search in.

- **toFind**
  The searched substring.

- **fromOffset**
  The index to start the search from.

**Example: oxy_indexof Function**

```
oxy_indexof('abcd', 'bc') returns 1.
oxy_indexof('abcdbc', 'bc', 2) returns 4.
```

If you only want to display part of an attribute value, for instance the part that comes before an `Appendix` string:

```
image[longdesc]({
  content: oxy_substring(attr(longdesc), 0,
    oxy_indexof(attr(longdesc), "Appendix"));
})
```

**Label: oxy_label() Function**

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are `property name - property value` pairs. The following properties are supported:

- **text** - This property specifies the built-in form control you are using.
- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
• color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.

• background-color - Specifies the background color of the form control. If the value of the background-color property is inherit, the form control has the same color as the element in which it is inserted.

• styles - Specifies styles for the form control. The values of this property are a set of CSS properties:
  ◦ font-weight, font-size, font-style, font
  ◦ text-align, text-decoration
  ◦ width
  ◦ color, background-color
  ◦ link - For more information about this property, see the link property section (on page 2517).

```xml
element{
  content: oxy_label(text, "Label Text", styles,
    "font-size:2em;color:red;link:attr(href);" );
}
```

Instead of using the values of the styles property individually, you can define them in a CSS file as in the following example:

```css
* {
  width: 40%;
  text-align: center;
}
```

Then refer that file with an @import directive, as follows:

```xml
elem {
  content: oxy_label(text, 'my_label', styles, '@import 'labels.css';")
}
```

⚠️ CAUTION: Extensive use of the styles property may lead to performance issues.

If the text from an oxy_label() function contains new lines, for example oxy_label(text, 'LINE1\A LINE2', width, 100px), the text is split in two. Each of the two new lines has the specified width of 100 pixels.

⚠️ Note: The text is split after \A, which represents a new line character.

You can use the oxy_label() function together with a built-in form control (on page 2541) function to create a form control based layouts.
Example: *oxy_label* Function

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```css
person:before {  
  content: "Name:*" oxy_textfield(edit, '@name', columns, 20)  
  "\A Address:" oxy_textfield(edit, '@address', columns, 20)  
}
```

Suppose you only want the **Name** label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```css
person:before {  
  content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")  
  oxy_textfield(edit, '@name', columns, 20) "\A  
  oxy_label(text, "Address:", styles, "width:200px")  
  oxy_textfield(edit, '@address', columns, 20)  
}
```

**Tip:** A code template is available to make it easy to add the `oxy_label` function with the [Content Completion Assistant](on page 3280) by pressing **Ctrl + Space (Command + Space on OS X)** and select the `. oxy_label` code template.

Last Occurrence: *oxy_lastindexof()* Function

This function is used to define last occurrence searches.

The `oxy_lastindexof()` function has two signatures:

**Syntax 1:**

```javascript
oxy_lastindexof (text, toFind )
```

Returns the index within `text` string of the rightmost occurrence of the `toFind` substring.

- **text**
  - Text to search in.

- **toFind**
  - The searched substring.

**Syntax 2:**

```javascript
oxy_lastindexof (text, toFind, fromOffset )
```
The search starts from \texttt{fromOffset} index. Returns the index within \texttt{text} string of the last occurrence of the \texttt{toFind} substring, searching backwards starting from the \texttt{fromOffset} index.

\begin{description}
\item [text] Text to search in.
\item [toFind] The searched substring.
\item [fromOffset] The index to start the search backwards from.
\end{description}

\textbf{Example: \texttt{oxy_lastindexOf} Function}

\begin{verbatim}
oxy_lastindexOf('abcdbc', 'bc') returns 4.
oxy_lastindexOf('abcdbccdbc', 'bc', 2) returns 1.
\end{verbatim}

If you only want to display part of an attribute value, for instance the part that comes before an \texttt{Appendix} string:

\begin{verbatim}
image[longdesc] {
    content: oxy_substring(attr(longdesc), 0, 
                 oxy_lastindexOf(attr(longdesc), "Appendix"));
}
\end{verbatim}

\textit{Link Text: \texttt{oxy_link-text()} Function}

You can use this function on the CSS \texttt{content} property to obtain a text description from the source of a reference.

By default, the \texttt{oxy_link-text()} function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks (on page 3282), go to Configuring an Extensions Bundle (on page 2391).

\textbf{DITA Support}

For DITA, the \texttt{oxy_link-text()} function resolves the \texttt{xref} element and the elements that have a \texttt{keyref} attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a \texttt{topicref} element that has the \texttt{navtitle} and \texttt{locktitle} attributes set, the function returns the value of the \texttt{navtitle} attribute.
DocBook Support

For DocBook, the oxy_link-text() function resolves the xref element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

**Example: oxy_link-text Function**

For the following XML and associated CSS fragments the oxy_link-text() function is resolved to the value of the xreflabel attribute.

```xml
<para>
  <code id="para.id" xreflabel="The reference label">my code</code>
</para>

<para><xref linkend="para.id"/></para>

xref {
  content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the href is not valid), you can use an optional argument to display fallback text.

```css
*[class~="map/topicref"]:before{
  content: oxy_link-text("Cannot find the topic reference");
  link:attr(href);
}
```

**Local Name: oxy_local-name() Function**

This function evaluates the local name of the current node.

It does not have any arguments.

**Example: oxy_local-name Function**

To insert the local name as static text content before the element, use this CSS selector:

```css
*:before{
  content: oxy_local-name() ": ";
}
```

**Lowercase: oxy_lowercase() Function**

This function transforms the text received as argument to lower case.
Syntax:

```xml
oxy_lowercase ( text )
```

text

The text to be lower cased.

**Example: oxy_lowercase Function**

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_lowercase(oxy_name()) "": ";
}
```

**Name: oxy_name() Function**

This function evaluates the qualified name of the current node.

It does not have any arguments.

**Example: oxy_name Function**

To insert a qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_name() "": ";
}
```

**Parent URL: oxy_parent-url() Function**

This function evaluates the parent URL of a URL received as string.

**Syntax:**

```xml
oxy_parent-url ( URL )
```

URL

The URL as string.

**Replace: oxy_replace() Function**

This function is used to replace a string of text.

The *oxy_replace()* function has two signatures:
Syntax 1:

\texttt{oxy\_replace(\texttt{text}, \texttt{target}, \texttt{replacement})}

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

\textbf{text}

The text in which the replace will occur.

\textbf{target}

The target string to be replaced.

\textbf{replacement}

The string replacement.

**Example:** Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual Author editing mode:

```plaintext
image[href] {
    content: oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

Syntax 2:

\texttt{oxy\_replace(\texttt{text}, \texttt{target}, \texttt{replacement}, \texttt{isRegExp})}

This function replaces each substring of the text that matches the target string with the specified replacement string.

\textbf{text}

The text in which the replace will occur.

\textbf{target}

The target string to be replaced.

\textbf{replacement}

The string replacement.

\textbf{isRegExp}

If \texttt{true} the target and replacement arguments are considered regular expressions, if \texttt{false} they are considered literal strings.

**Example:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:
Substring of Text: oxy_substring() Function

This function is used to return a string of text.

The `oxy_substring()` function has two signatures:

**Syntax 1:**

```plaintext
oxy_substring ( text, startOffset )
```

Returns a new string that is a substring of the original `text` string. It begins with the character at the specified index and extends to the end of `text` string.

- **text**
  - The original string.
- **startOffset**
  - The beginning index, inclusive.

**Syntax 2:**

```plaintext
substring ( text, startOffset, endOffset )
```

Returns a new string that is a substring of the original `text` string. The substring begins at the specified `startOffset` and extends to the character at index `endOffset` - 1.

- **text**
  - The original string.
- **startOffset**
  - The beginning index, inclusive.
- **endOffset**
  - The ending index, exclusive.

**Example: oxy_substring Function**

- `oxy_substring('abcd', 1)` returns the string `bcd`.
- `oxy_substring('abcd', 4)` returns an empty string.
- `oxy_substring('abcd', 1, 3)` returns the string `bc`. 
If you only want to display part of an attribute value, for instance the part that comes before an 
Appendix string:

```xml
image[longdesc]{
    content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Unescape URL Value: oxy_unescapeURLValue(string) Function**

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

**Example: oxy_unescapeURLValue Function**

```xml
oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html") returns the following value:
```

| http://www.example.com/a simple example.html |

**Unparsed Entity URI: oxy_unparsed-entity-uri() Function**

This function returns the URI value of an unparsed entity name.

**Syntax:**

```xml
oxy_unparsed-entity-uri ( unparsedEntityName )
```

```
unparsedEntityName
```

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

**Example: oxy_unparsed-entity-uri Function**

CSS for displaying the image in Author for an `imagedata` with `entityref` to an unparsed entity:

```xml
imagedata[entityref]{
    content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

**Uppercase: oxy_uppercase() Function**

This function transforms the text received as argument to upper case.
Syntax:

oxy_uppercase ( text )

text

The text to be capitalized.

Example: oxy_uppercase Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_uppercase(oxy_name()) ": ";
}
```

URL: oxy_url() Function

This function extends the standard CSS url() function by allowing you to specify additional relative path components (parameters loc_1 to loc_n).

Oxygen XML Editor uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (on page 276) (built-in or custom).

Syntax:

oxy_url ( base_location , loc_1 , loc_2 )

base_location

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

loc_1 ... loc_n (optional)

Strings representing relative location path components.

Examples: oxy_url Function

The following function receives String objects as input parameters:

```html
```

and returns:

'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```xml
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), '.jpeg', 'Thumbnail.jpeg'));
}
```

The following function uses an editor variable (on page 276) as the first parameter to point to the Oxygen XML Editor installation location:

```xml
image[href] {
  content: oxy_url('${oxygenHome}', 'logo.png');
}
```

Related Information:
- Editor Variables (on page 276)

**XPath: oxy_xpath() Function**

This function is used to evaluate XPath expressions.

**Syntax:**

```xml
oxy_xpath ( XPathExpression [, processChangeMarkers , value ] [, evaluate , value ] )
```

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced `xi:include` section or inside artificially referenced content (for example, DITA `conref` or `topicref` references).

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (delete changes are removed and insert changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
- **dynamic** - Evaluates the XPath each time there are changes in the document.
- **dynamic-once** - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
- **static** - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

**Note:** When XPath expressions are evaluated, the entities and `xi:include` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```xml
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```xml
<section>
  <p>Referenced content</p>
</section>
```

The latter will be the actual content in which the XPath expression is executed.

**Example: oxy_xpath Function**

The following example counts the number of words from a paragraph (including tracked changes (on page 3288)) and displays the result in front of it:

```xml
para:before{  
  content:    
    concat("|Number of words:"  
          oxy_xpath({    
            "count(tokenize(normalize-space(string-join(text(), '')), ' '))",    
            processChangeMarkers,    
            true),$| "});
}
Note: The `oxy_xpath()` function supports editor variables (on page 276), as in the following example:

```xml
* {
    content: oxy_concat("Result: ", oxy_xpath('count(collection($cfdu/?select=*.xml))'))
}
```

Form Controls

Oxygen XML Editor provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Editor also supports custom form controls in Java (on page 2573).

How to Add a Built-in Form Control in Author Mode

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a date picker form control (on page 2558), its dedicated function is `oxy_datePicker`.
3. Associate the CSS file with the XML document in one of the following ways:
   - If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and associate the CSS with the framework (on page 2346). This approach is recommended if you intend on sharing the customization with others.
   - If you do not have a framework, you can associate the CSS to the XML document through a Processing Instruction (on page 2477).

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzKMSLM

Related Information:

- Custom CSS Functions (on page 2520)
- Label: `oxy_label()` Function (on page 2529)
Audio File Player Form Control

The oxy_audio built-in form control is used for providing a mechanism to play audio clips.

The oxy_audio form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```xml
  oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3')), width, 400px)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_audio Form Control**

```xml
object {
  content:
    oxy_audio(
      href, '/resources/audio.mp3',
      width, 200px),
  }
```

**Tip:** To insert a sample of the oxy_audio form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_audio code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Related Information:**

- Custom CSS Functions (on page 2520)
Browser Form Control

The oxygen_browser built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Editor workspace.

The oxygen_browser form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```javascript
  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg'), width, 50%, height, 50%)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxygen_browser Form Control**

```javascript
object {
  content:
    oxygen_browser{
      href, 'http://example.page',
      width, 600px,
      height, 400px,
    }
}
```

**Tip:** To insert a sample of the oxygen_browser form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxygen_browser code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

**Interacting with the Oxygen XML Editor Workspace**

The oxygen_browser form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the oxygen_browser form control to load HTML that
executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Editor Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

⚠️ **Important:** This will only work if the loaded HTML is located inside a framework or plugin directory (on page 94), such as: `[OXYGEN_INSTALL_DIR]/frameworks/` or `[OXYGEN_INSTALL_DIR]/plugins/`.

The following global variables can be used:

- **authorAccess** - This object is an instance of `ro.sync.ecss.extensions.api.AuthorAccess`.
- **contextElement** - An instance of `ro.sync.ecss.extensions.api.node.AuthorNode`. The form control is added over this node.
- **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
  "ro.sync.ecss.extensions.api.node.AttrValue",
  ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
  "counter", newAttrValue, contextElement);
```

You can also specify the constructor signature:

```javascript
var newAttrValue = apiHelper.newInstance(
  "ro.sync.ecss.extensions.api.node.AttrValue",
  (java.lang.String, java.lang.String, boolean),
  ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
  "counter", newAttrValue, contextElement);
```

For more information, open the `form-controls.xml` file in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` directory and go to section 11.1 - Interacting with the Oxygen Workspace.
Warning: On Mac OS X, you need to use asynchronous calls to the API, due to the following JDK bug: https://bugs.openjdk.java.net/browse/JDK-8087465. By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: `sync()` and `async()`.

---

// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
  // On Mac, methods that change the document must be executed asynchronously.
  ctrl.async();
  ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
  ctrl.sync();
}

---

### Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

```javascript
function bridgeReady () {
  // We declare a member function for each method of the
  // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
  var handler = {
    attributeChanged : function(event) {
      var node = event.getOwnerAuthorNode();
      var attrName = event.getAttributeName();
      if (node.equals(contextElement) && attrName === "counter") {
        init();
      }
    },
    contentDeleted : function(event) {},
    contentInserted : function(event) {}
  };

  // We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that
```
// delegate its methods to the JS object's functions.
// We assign the listener to a global variable so that we can remove it later
on,
// on the dispose() method.
authorDocumentListener = apiHelper.createProxyListener(
    "ro.sync.ecss.extensions.api.AuthorListener", handler);

var ctrl = authorAccess.getDocumentController();

// Add the proxy listener.
ctrl.addAuthorListener(authorDocumentListener);
}

2. Since a listener was added on the document, it is important to remove it once the form control is
not used anymore. When a form control is discarded, you can call the dispose() method from
the JavaScript. This is where the previously created listener can be removed:

```javascript
/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
    // Dispose all added listeners.
    var ctrl = authorAccess.getDocumentController();
    ctrl.removeAuthorListener(authorDocumentListener);
}
```

**Debugging JavaScript Used for Custom Form Controls**

If you encounter unexpected results when using the method described above (on page 2543), you
can debug the script by using the following guidelines:

- **Calls to** `alert("message.to.present")` or `console.log("message.to.present")` will be
  presented in the Results panel (on page 357).
- **You can install the Firebug extension** by executing the following script:

```javascript
{code:javascript}
function installFB() {
    if (!document.getElementById('FirebugLite')) {
        E = document.createElementNS('NS') && document.documentElement.namespaceURI;
        E = E ? document.createElementNS('NS')('script')
                  : document.createElement('script');
        E['setAttribute']('id', 'FirebugLite');
```
E['setAttribute']('src',
    'https://getfirebug.com/' + 'firebug-lite.js'
+ '#startOpened');
E['setAttribute']('FirebugLite', '4');
(document['getElementsByTagName']('head')[0]
    || document['getElementsByTagName']('body')[0]).appendChild(E);
E = new Image;
E['setAttribute']('src', 'https://getfirebug.com/' + '#startOpened');
}
}
{code}

Note: To force the Browser Form Control to reload after making changes to the JavaScript file, you need to use the Reload page action from the form control's contextual menu.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

- Custom CSS Functions (on page 2520)
- URL: oxy_url() Function (on page 2538)

Button Form Control

The oxy_button built-in form control is used for graphical user interface objects that invoke a custom Author mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_button form control supports the following properties:

- fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
- visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
• **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be **true** or **false** (default value).

• **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be **true** or **false**.

```xml
element {
    content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

• **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be **true** or **false**.

```xml
element {
    content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

• **enableInReadOnlyContext** - To enable button form controls (on page 2547) or groups of buttons form controls (on page 2550) this property needs to be set to **true**. This property can be used to specify areas as read-only (by setting the -oxy-editable property to **false**). This is useful when you want to use an action that does not modify the context.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
    content: oxy_button(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

• **actionContext** - Specifies the context in which the action associated with the form control is executed. Its possible values are **element** (default value) and **caret**. If you select the **element** value, the context is the element that holds the form control. If you select the **caret** value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the **element** value is selected automatically.

• **actionID** - The ID of the action, specified in the document type association (on page 102), that is invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is invoked.
• **action** - Defines an action directly, rather than using the `actionID` parameter to reference an action from the *document type association (on page 102)*. This property is defined using the `oxy_action` function (on page 2521).

**Tip:** You can also create a button form control directly from an `oxy_action` function (on page 2522).

```xml
oxy_button(action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'InsertFragmentOperation',
    arg-fragment, '{@element>${caret}</element>'
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
))
```

**Tip:** To execute multiple actions sequentially, you can use the `oxy_compound_action` function (on page 2525).

**Example: oxy_button Form Control**

```css
button:before {
    content: "Label:" 
    oxy_button{
        /* This action is declared in the document type 
        associated with the XML document. */
        actionID, "insert.popupWithMultipleSelection";
    }
}
```

**Tip:** To insert a sample of the `oxy_button` form control in a CSS file (or LESS file), invoke the *Content Completion Assistant (on page 3280)* by pressing `Ctrl + Space (Command + Space on OS X)` and select the `.oxy_button` code template. Also, an `.oxy_button_in_place_action` code template is available that inserts an `oxy_button` function that includes an `action` parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `OXYGEN_INSTALL_DIR/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM
Button Group Form Control

The oxy_buttonGroup built-in form control is used for a graphical user interface group of buttons that invokes one of several custom Author mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_buttonGroup form control supports the following properties:

- label - Specifies the label to be displayed on the button. This label can be translated using the $i18n() editor variable (on page 282).
- icon - The path to the icon to be displayed on the button.
- visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- tooltip - Specifies a tooltip to be displayed when you hover over the form control.
- transparent - Makes the button transparent without any borders or background colors. The values of this property can be true or false.
- fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- enableInReadOnlyContext - To enable button form controls (on page 2547) or groups of buttons form controls (on page 2550) this property needs to be set to true. This property can be used to specify areas as read-only (by setting the oxy-editable property to false). This is useful when you want to use an action that does not modify the context.
- hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

- actionIDs - The IDs of the actions that will be presented in the group of buttons.
• **actionID** - The ID of the action, specified in the *document type association (on page 102)*, that is invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is invoked.

• **actions** - Defines a sequential list of actions directly, rather than using the **actionID** parameter to reference actions from the *document type association (on page 102)*. This property is defined using the **oxy_action_list** function (on page 2522).

```xml
oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list(
       oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'InsertFragmentOperation',
            arg-fragment, '<element></element>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Delete',
            description, 'Deletes the current element',
            operation, 'DeleteElementOperation'
        )
    )
)
```

**Tip:** To execute multiple actions sequentially, you can use the **oxy_compound_action** function (on page 2525) in the **oxy_action_list** function (on page 2522).

```xml
p:before {
    content:
        oxy_buttonGroup(
            label, 'A group of actions',
            icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
            actions,
            oxy_action_list(
                oxy_compound_action(
                    oxy_action(
                        name, 'Insert',
                        description, 'Insert an element after the current one',
                        operation, 'InsertFragmentOperation',
                        arg-fragment, '<element></element>',
                        arg-insertLocation, '.',
                        arg-insertPosition, 'After'
                    ),
                    oxy_action(
                        name, 'Delete',
                        description, 'Deletes the current element',
                        operation, 'DeleteElementOperation'
                    )
                )
            )
        )
    )
}
```
name, oxy_getActionName('framework.id', 'Fallback'),
description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
    icon, url('insert.png'),
    arg-fragment, '<p audience=""></p>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
),
oxy_action(
    name, 'Activate edit mode',
    description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
    operation, 'SetPseudoClassOperation',
    arg-name, 'edit-mode-on',
    arg-elementLocation , '.'
)
}
}
oxy_action(
    name, 'Delete',
    description, 'Deletes the current element',
    operation, 'DeleteElementOperation'
)}

**actionContext** - Specifies the context in which the action associated with the form control is executed. Its possible values are **element** (default value) and **caret**. If you select the **element** value, the context is the element that holds the form control. If you select the **caret** value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the **element** value is selected automatically.

**actionStyle** - Specifies what to display for an action in the form control. The values of this property can be **text** (default value), **icon**, or **both**.

**Example: oxy_buttonGroup Form Control**
buttongroup:before {
  
  content:
  oxy_label(text, "Button Group:", width, 150px, text-align, left)
  oxy_buttonGroup{
    label, 'A group of actions',
    /* The action IDs are declared in the document type
       associated with the XML document. */
    actionIDs,
    "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
    actionStyle, "both";
  }
}

Tip: To insert a sample of the oxy_buttonGroup form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_buttonGroup code template. Also, an oxy_buttonGroup_in_place_action code template is available that inserts an oxy_buttonGroup function that includes an oxy_action_list function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Checkbox Form Control

The `oxy_checkbox` built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The `oxy_checkbox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3286) and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2513) to render the text only in the form control that the `oxy_editor` function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `{$comma}` variable (on page 281).

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **values** - Specifies the values that are committed when check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  **Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `{values, '1\, 2\, 3, 4, edit, false}` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.

- **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `{$i18n()}` editor variable (on page 282). If this property is not specified, the `values` property is used as the label.

- **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.
• **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: Single oxy_checkbox Form Control**

```css
checkBox[attribute]:before {
  content: "A check box editor that edits a two valued attribute (On/Off)
  The values are specified in the CSS:"
  oxy_checkbox{
    edit, "@attribute",
    values, "On",
    uncheckedValues, "Off",
    labels, "On/Off";
  }
}
```

**Example: Multiple oxy_checkbox Form Controls**

```css
multipleCheckBox[attribute]:before {
  content: "Multiple checkboxes editor that edits an attribute value.
  Depending whether the check-box is selected,
  a different value is committed:"
  oxy_checkbox{
    edit, "@attribute",
    values, "true, yes, on",
    uncheckedValues, "false, no, off",
    resultSeparator, ",",
    labels, "Present, Working, Started";
  }
}
```

**Tip:** To insert a sample of the `oxy_checkbox` form control in a CSS file (or LESS file), invoke the *Content Completion Assistant (on page 3280)* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.i` `oxy_checkbox` code template.
To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

### Combo Box Form Control

The `oxy_combobox` built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The `oxy_combobox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName *(on page 3286)* and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element. **Note:** You can set the value of the visibility property to -oxy-collapse-text *(on page 2513)* to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.

- **width** - Specifies the width of the content area using relative `{em, ex}`, absolute `{in, cm, mm, pt, pc, px}`, and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- **editable** - This property accepts the `true` and `false` values. In addition to a drop-down menu, the `true` value also generates an editable text field box that allows you to insert other values than the proposed ones. The `false` value generates a drop-down menu that only accepts the proposed values.
• tooltips - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 281).

• values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\, 2\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

• fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

• labels - This property must have the same number of items as the values property. Each item provides a literal description of the items listed in the values property. These labels can be translated using the $\{i18n()\} editor variable (on page 282).

  Note: This property is only available for read-only combo boxes (the editable property is set to false).

• color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.

• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

• canRemoveValue - If the value is set to true and the combo box is not editable, then a new <Empty> value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

• onChange - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the oxy_action() function (on page 2521) or referenced from the framework (on page 3282) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

Example: oxy_combobox Form Control

```css
comboBox:before {
```

**content:** "A combo box that edits an attribute value. The possible values are provided from CSS:"

```javascript
oxy_combobox(
    edit, "@attribute",
    editable, false,
    values, "value1, value2, value3",
    labels, "Value no1, Value no2, Value no3",
    onChange, oxy_action(
        name, 'Insert',
        operation, 'XQueryUpdateOperation',
        arg-script, '
            insert node <product>{xs:string(@attribute)}</product>
            as last into .');
    );
```

**Tip:** To insert a sample of the `oxy_combobox` form control in a CSS file (or LESS file), invoke the *Content Completion Assistant* ([on page 3280](#)) by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.oxy_combobox` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

- Collapse Text: `-oxy-collapse-text Property Value ([on page 2513](#))

**Date Picker Form Control**

The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The `oxy_datePicker` form control supports the following properties:
• **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3286) and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the visibility property to -oxy-collapse-text (on page 2513) to render the text only in the form control that the oxy_editor function specifies.

• **columns** - Controls the width of the form control. The unit size is the width of the w character.

• **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

• **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

• **format** - This property specifies the format of the inserted date. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

• **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the datePicker form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to false.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example:** oxy_datePicker Form Control

```xml
date {
```
content:
    oxy_label(text, "Date time attribute with format defined in CSS: ", width, 300px)
    oxy_datePicker(
        columns, 16,
        edit, "@attribute",
        format, "yyyy-MM-dd");
}

Tip: To insert a sample of the oxy_datePicker form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_datePicker code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

- Custom CSS Functions (on page 2520)
- Label: oxy_label() Function (on page 2529)

**HTML Content Form Control**

The oxy_htmlContent built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The oxy_htmlContent form control supports the following properties:

- href - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- id - The unique identifier of an item. This is a div element that has a unique id and is a child of the body element. The div element is the container of the HTML content to be rendered by the form control.
- content - An alternative to the href and id pair of elements. It provides the HTML content that will be displayed in the form control.
• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```html
p:before {
  content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the href property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the p_description div element found in the descriptions.html file. The box is 400 pixels wide and is displayed before a paragraph identified by the intro_id attribute value.

```html
p#intro_id:before {
  content: oxy_htmlContent{
    href, "descriptions.html",
    id, "p_description",
    width, 400px);
}
```

An alternative example, using the content property:

```html
p#intro_id:before {
  content: oxy_htmlContent{
    content, "<div style='font-weight:bold;'>My content</div>",
    width, 400px);
}
```
Tip: To insert a sample of the oxy_htmlContent form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_htmlContent code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

• Custom CSS Functions (on page 2520)

Pop-up Form Control

The oxy_popup built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The oxy_popup form control supports the following properties:

• edit - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  • @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3286) and the CSS must have a namespace declaration for the prefix.
  • #text - Specifies that the presented/edited value is the simple text value of an element.

  Note: You can set the value of the visibility property to -oxy-collapse-text (on page 2513) to render the text only in the form control that the oxy_editor function specifies.

• rows - This property specifies the number of rows that the form control presents.

  Note: If the value of the rows property is not specified, the default value of 12 is used.

• color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.

  Note: This property is used for rendering in the Author mode.

• visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
• **tooltips** - Associates tooltips to each value in the **values** property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the **${comma}** variable [on page 281].

**Example:**

```css
link:before{
  content: oxy_popup{
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
    Chrysanthemum${comma}Salvia, Gerbera",
    selectionMode, single);
}
```

• **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

• **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the **space** character is used.

**Note:** The value of the **resultSeparator** property cannot exceed one character.

• **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are **single** (default value) and **multiple**.

• **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the **values** property is used instead.

• **columns** - Controls the width of the form control. The unit size is the width of the **w** character. This property is used for the visual representation of the form control.

• **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The **width** property takes precedence over the **columns** property (if the two are used together).

• **rendererSort** - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are **ascending** and **descending**.

• **editorSort** - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are **ascending** and **descending**.

• **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the **resultSeparator** property is used.
sort - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the editorSort and rendererSort properties have a higher priority. The possible values of this property are ascending and descending.

fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: oxy_popup Form Control**

```css
popupWithMultipleSelection:before {
    content: "This editor edits an attribute value. The possible values are specified inside the CSS:"
    oxy_popup(
        edit, "@attribute",
        values, "value1, value2, value3, value4, value5",
        labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
        resultSeparator, "|",
        columns, 10,
        selectionMode, "multiple",
        color, "blue",
        fontInherit, true);
    font-size:30px;
}
```

**Tip:** To insert a sample of the oxy_popup form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the `oxy_popup` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.
Text Area Form Control

The `oxy_textArea` built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The `oxy_textArea` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - `@attribute_name` - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a `QName (on page 3286)` and the CSS must have a namespace declaration for the prefix.
  - `#text` - Specifies that the presented/edited value is the simple text value of an element.
  - `#content` - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

  **Note:** You can set the value of the `visibility property to oxy-collapse-text (on page 2513)` to render the text only in the form control that the `oxy_editor` function specifies.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph>
<apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```css
codeblock:before{
  content:oxy_textArea{
    edit, '#content',
    contentType, 'text/xml'};
```
then the text area form control will edit the following fragment:

```
<codeblock outputclass="language-xml">
<co:output><co:code><co:codeblock>
</co:output><co:codeblock></co:codeblock></co:output></co:output>
```

Note: When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">
<co:output><co:code><co:codeblock>
</co:output><co:codeblock></co:codeblock></co:output></co:output>
```

and your CSS includes the following snippet:

```
codeblock:before {
  content: {
    oxy_textArea{
      edit, '#content',
      contentType, 'text/xml'
    }
  }
}
```

then the text area form control will edit the following fragment:

```
<codeblock outputclass="language-xml">
<co:output><co:code><co:codeblock>
</co:output><co:codeblock></co:codeblock></co:output></co:output>
```

Note: When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- **contentType** - Specifies the type of content for which the form control offers syntax highlighting. The following values are supported: `text/css`, `text/shell`, `text/cc`, `text/xquery`, `text/xml`,...
• **indentOnTab** - Specifies the behavior of the **Tab** key. If the value of this property is set to *true* (default value), the **Tab** key inserts characters. If it is set to *false*, **Tab** is used for navigation, jumping to the next editable position in the document.

• **white-space** CSS property influences the value that you edit, as well as the form control size:
  - *pre* - The whitespaces and new lines of the value are preserved and edited. If the **rows** and **columns** properties are not specified, the form control calculates its size on its own so that all the text is visible.
  - *pre-wrap* - The long lines are wrapped to avoid horizontal scrolling.

  ![Note:](image) The **rows** and **columns** properties must be specified. If these are not specified, the form control considers the value to be **pre**.

  - *normal* - The white spaces and new lines are normalized.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```javascript
p:before {
  content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_textArea Form Control**

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```javascript
textArea {
  visibility: -oxy-collapse-text;
  white-space: pre;
}
textArea[language="CSS"]:before {
  content: oxy_textArea(
    edit, '#text',
    contentType, 'text/css');
}
```
Text Field Form Control

The oxy_textfield built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The oxy_textfield form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - [@attribute_name] - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3286) and the CSS must have a namespace declaration for the prefix.
  - [#text] - Specifies that the presented/edited value is the simple text value of an element.
Note: You can set the value of the visibility property to -oxy-collapse-text (on page 2513) to render the text only in the form control that the oxy_editor function specifies.

- columns - Controls the width of the form control. The unit size is the width of the w character.
- width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
- fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
- visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
- values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
- tooltips - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 281).
- tooltip - Specifies a tooltip to be displayed when you hover over the form control.
- color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
- hasMultipleValues - Specifies if the text field allows multiple values separated by spaces or just a single value.

Note: If the value is false, the Content Completion Assistant (on page 3280) considers the entire text as the prefix for its proposals. If the value is true (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: value a, value b, and other values. If the hasMultipleValues property is set to true and the user enters "value " (notice the space character after 'value') in the text field, the Content Completion Assistant will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the hasMultipleValues property was set to false, the Content Completion Assistant would only suggest value a and value b because the space is considered part of the prefix.

• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
Example: oxy_textfield Form Control

element {
  content: "Label: "
  oxy_textfield{
    edit, "@my_attr",
    values, "value1, value2",
    color, "red",
    columns, 40);
}

Tip: To insert a sample of the oxy_textfield form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_textfield code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: \[OXYGEN_INSTALL_DIR\]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

• Collapse Text: -oxy-collapse-text Property Value (on page 2513)

URL Chooser Form Control

The oxy_urlChooser built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently opened editor.

The oxy_urlChooser editor supports the following properties:
• edit - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  ◦ @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 3286) and the CSS must have a namespace declaration for the prefix.
  ◦ #text - Specifies that the presented/edited value is the simple text value of an element.

  Note: You can set the value of the visibility property to oxy-collapse-text (on page 2513) to render the text only in the form control that the oxy_editor function specifies.

• columns - Controls the width of the form control. The unit size is the width of the w character.
• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
• color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element in which it is inserted.
• visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.
• fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.
• fileFilter - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "jpg,png,gif" is mapped to a single filter that will display all jpg, png, and gif files.
• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: oxy_urlChooser Form Control

```
urlChooser[file]:before {
  content: "A URL chooser editor that allows browsing for a URL.

  The selected URL is made relative to the currently edited file:"
  oxy_urlChooser{
    edit, '@file',
  }
```

Tip: To insert a sample of the oxy_urlChooser form control in a CSS file (or LESS file), invoke the Content Completion Assistant (on page 3280) by pressing Ctrl + Space (Command + Space on OS X) and select the .: oxy_urlChooser code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:

• Custom CSS Functions (on page 2520)

• Collapse Text: -oxy-collapse-text Property Value (on page 2513)

Video Player Form Control

The oxy_video built-in form control is used for providing a mechanism to play videos.

The oxy_video form control supports the following properties:

• href - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4')), width, 400px, height, 300px)

• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

• height - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: oxy_video Form Control

object {
  content:
    oxy_video(
      href, 'resources/video.mp4',
    ),
  }
Implementing Custom Form Controls

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

**Custom Form Controls Implementation**

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of `ro.sync.ecss.extensions.api.editor.InplaceRenderer`. The renderer has to be a SWING implementation and can be used both in the standalone and Eclipse distributions.
- **swingEditorClassName** - You can use this property for the standalone (Swing-based) distribution to specify the name of the class used for editing. It is a Swing implementation of `ro.sync.ecss.extensions.api.editor.InplaceEditor`.
- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a SWT implementation of the `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

Tip: To insert a sample of the `oxy_video` form control in a CSS file (or LESS file), invoke the **Content Completion Assistant (on page 3280)** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `.oxy_video` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Related Information:**

- Custom CSS Functions *(on page 2520)*
- URL: `oxy_url()` Function *(on page 2538)*
Note: If the custom form control is intended to work in the Oxygen XML Editor standalone distribution, the declaration of `swtEditorClassName` is not required. The `renderer` (the class that draws the value) has different properties from the `editor` (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the `classpath` property is an enumeration of URLs separated by comma.

- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.

- **saHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas). It is also helpful if you want to use JavaFX, since JavaFX-based form controls are not compatible with the classic form control architecture.

The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (on page 3283) that contains this implementation can either be added in the Classpath tab in the Document Type Configuration dialog box (on page 99) for your particular framework (on page 3282) or specified with the `classpath` property (on page 2574).

Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {
   /**
    * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
    */
   @Override
   public void stopEditing() {
      Runnable customCommit = new Runnable() {
         @Override
         public void run() {
            AuthorDocumentController documentController = context.getAuthorAccess().getDocumentController();
            documentController.insertXMLFragment("<custom/>", offset);
         }
      }
```
The custom form controls can use any of the predefined properties of the built-in form controls (on page 2541), as well as specified custom properties.

**Example: CSS**

The following is an example of how to specify a custom form control in the CSS:

```css
myElement {

  content: oxy_editor(
    rendererClassName, "com.custom.editors.CustomRenderer",
    swingEditorClassName, "com.custom.editors.SwingCustomEditor",
    swtEditorClassName, "com.custom.editors.SwtCustomEditor",
    edit, "@my_attr",
    customProperty1, "customValue1",
    customProperty2, "customValue2"
  )
}
```

**How to Implement Custom Form Controls**

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Editor SDK at: https://www.oxygenxml.com/oxygen_sdk.html
2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR (on page 3283) library.
4. Copy the JAR library to the `OXYGEN_INSTALL_DIR/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Editor, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, edit the appropriate framework, and add the JAR library in the Classpath tab.
6. Specify the custom form control in your CSS, as described above.
Tip: To see more detailed examples and more information about how form controls work in Oxygen XML Editor, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Editing Processing Instructions Using a Form Control**

Oxygen XML Editor allows you to edit processing instructions, comments, and CDATA by using CSS extensions.

**Note:** You can edit both the content and the attribute value from a processing instruction.

**Example: Editing an Attribute from a Processing Instruction**

PI content:

```xml
<?pi_target attr="val"?>
```

CSS:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction:before {
  display:inline;
  content:
    "EDIT attribute: " oxytextfield(edit, '@attr', columns, 15);
  visibility:visible;
}
oxy|processing-instruction{
  visibility:-oxy-collapse-text;
}
```

**Related Information:**

- Text Field Form Control *(on page 2568)*

- Collapse Text: -oxy-collapse-text Property Value *(on page 2513)*

- Displaying Processing Instructions from Other XML Editors *(on page 2480)*
Custom CSS Pseudo-classes

You can set your custom CSS pseudo-classes on the nodes from the AuthorDocument model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified). You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Editor they are used to hide/show the colspec elements from CALS tables. To take a look at the implementation, see:

1. \([OXYGEN_INSTALL_DIR]/frameworks/docbook/css/cals_table.css\) (Search for -oxy-visible-colspecs)
2. The definition of action table.toggle.colspec from the DocBook framework (on page 3282) makes use of the pre-defined TogglePseudoClassOperation Author mode operation.

Here are some examples:

**Example: Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class access-control-user, like the one below:

```css
section {
    display:none;
}

section:access-control-user {
    display:block;
}
```

By setting the pseudo-class access-control-user, the element section will become visible by matching the second CSS selector.

**Example: Coloring the elements at the current cursor location**

You could create an AuthorCaretListener that sets the caret-visited pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```css
*:caret-visited {
    color:red;
}
```

The API that you can use from the CaretListener:
### Predefined Pseudo-Class Author Mode Operations

Pre-defined **Author mode operations** can be used directly in your framework to work with custom pseudo-classes:

1. *TogglePseudoClassOperation*
2. *SetPseudoClassOperation*
3. *RemovePseudoClassOperation*

### Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the **Author** mode includes a [CSS Inspector view](on page 439) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

**Figure 733. CSS Inspector View**

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

**Related Information:**
• CSS Inspector View (on page 439)
17.

Using the Oxygen XML SDK

Oxygen XML Editor has an SDK that can be used as a base to develop frameworks (on page 3282) and plugins (on page 3285). It can be also used to create projects that use the Oxygen XML Author Component or Oxygen XML Web Author. The SDK is a Java library available under the Oxygen XML SDK licensing terms and is delivered with a set of examples that demonstrate how to extend Oxygen XML functionality through API calls. The SDK is available at https://www.oxygenxml.com/oxygen_sdk.html.

Extending Oxygen XML Editor with Plugins

A plugin (on page 3285) is a software component that adds extra functionality to the standalone version of the application using a series of application-provided extension points.

This chapter explains how to write and install a plugin for the standalone version of Oxygen XML Editor. The Plugins Development Kit contains sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

If you want to customize the Oxygen XML Editor Eclipse plugin you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the Oxygen XML Editor APIs.

General Configuration of an Oxygen XML Editor Plugin

The Oxygen XML Editor functionality can be extended with plugins (on page 3285) that implement a clearly specified API. On the Oxygen XML Editor website, there is an SDK with sample plugins (source and compiled Java code) and the Javadoc API necessary for developing custom plugins.

The minimal implementation of a plugin must provide:

- A Java class that extends the ro.sync.exml.plugin.Plugin class.
- A Java class that implements the ro.sync.exml.plugin.PluginExtension interface.
- A plugin descriptor file called plugin.xml.

A ro.sync.exml.plugin.PluginDescriptor object is passed to the constructor of the subclass of the ro.sync.exml.plugin.Plugin class. It contains the following data items about the plugin:

- basedir (File object) - The base directory of the plugin.
- description (String object) - The description of the plugin.
Oxygen XML Editor 21.1 User Guide | 17 - Using the Oxygen XML SDK | 2581

- **name** *(String object)* - The name of the plugin.
- **vendor** *(String object)* - The vendor name of the plugin.
- **version** *(String object)* - The plugin version.
- **id** *(String object)* - A unique identifier.
- **classLoaderType** - You can choose between `preferOxygenResources` (default value) and `preferReferencedResources`. When choosing `preferOxygenResources`, the libraries that are referenced in the Oxygen XML Editor `lib` directory will have precedence over those referenced in the `plugin.xml` configuration file, if they have the same package names. When choosing `preferReferencedResources`, the libraries that are referenced in the `plugin.xml` configuration file will have precedence over those found in the Oxygen XML Editor `lib` directory, if they have the same package names.

The plugin descriptor is an XML file that defines how the plugin is integrated in Oxygen XML Editor and what libraries are loaded. The structure of the plugin is integrated in Oxygen XML Editor descriptor file is fully described in a DTD grammar located in `[OXYGEN_INSTALL_DIR]/plugins/plugin.dtd`. Here is a sample plugin descriptor used by the Capitalize Lines sample plugin:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin
    name="Capitalize Lines"
    description="Capitalize the first character on each line"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.caplines.CapLinesPlugin">
  <runtime>
    <library name="lib/caplines.jar"/>
  </runtime>
  <extension type="selectionProcessor"
    class="ro.sync.sample.plugin.caplines.CapLinesPluginExtension"
    keyboardShortcut="ctrl shift EQUALS"/>
</plugin>
```

If your plugin is of the Selection, Document or General types, and thus contributes an action either to the contextual menu or to the main menu of the Text editing mode, then you can assign a keyboard shortcut for it. You can use the `keyboardShortcut` attribute for each `extension` element to specify the desired shortcut.

**Tip:** To compose string representations of the desired shortcut keys you can go to the Oxygen XML Editor Menu Shortcut Keys preferences page, press Edit on any action, press the desired key sequence and use the representation that appears in the Edit dialog box.
Referencing Libraries

To reference libraries, use either of the following elements:

- `<library name="path/libraryName" scope="global"/>` - To point to specific libraries. Notice that the value of `library name` includes the path (relative or absolute) to the library.

  **Note:** You can use the `${oxygenInstallDir}` editor variable (on page 282) as part of the value of the `name` attribute. You can also use a system variable (`${system(var.name)}`) or environment variable (`${env(VAR_NAME)}`).

- `<librariesFolder name="path/libraryFolderPath" scope="global"/>` - To point to multiple libraries located in the specified folder. Notice that the value of `libraryFolderPath` includes the path (relative or absolute) to the library folder.

Both elements support the `scope` attribute that defines the loading priority. It can have one of the following three values:

- **local** - The library is loaded in the plugin's own class loader. This is the default behavior.
- **global** - The library is loaded in the main application class loader as the last library in the list (as if it would be present in the application `lib` directory).
- **globalHighPriority** - The library is loaded in the main application class loader as the first library in the list (useful to patch certain resources located in other JARs (on page 3283) of the application).

Installing an Oxygen XML Editor Plugin

Choose one of the following methods to install a plugin (on page 3285) in Oxygen XML Editor:

**Manual Method**

To manually install a plugin in Oxygen XML Editor, follow these steps:

1. Go to the Oxygen XML Editor installation directory and locate the `plugins` directory.

   **Note:** The `plugins` directory contains all the plugins available to Oxygen XML Editor.

2. In the `plugins` directory, create a subfolder to store the `plugin` files (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`).

3. In the new folder, place the `plugin` descriptor file (`plugin.xml`), the Java classes of the `plugin`, and the other files that are referenced in the descriptor file.

4. Restart Oxygen XML Editor.
Automatic Method

To install an add-on that is hosted on a remote update site, follow these steps:

1. Go to Help > Install new add-ons.
2. In the displayed dialog box, enter or paste the update site that hosts the add-on in the Show add-ons from field (or select it from the drop-down menu, if applicable). The default add-ons are hosted on https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml. If you want to see a list of all the default and sample add-ons that are available on the Oxygen remote update sites, choose ALL AVAILABLE SITES from the drop-down menu. The add-ons list contains the name, status, update version, Oxygen XML Editor version, and the type of the add-on (either framework, or plugin). A short description of each add-on is presented under the add-ons list.

   **Note:** To see all the versions of the add-ons, deselect Show only compatible add-ons and Show only the latest version of the add-ons. Incompatible add-ons are shown only to acknowledge their presence on the remote update site, but you cannot install an incompatible add-on.

3. Choose the add-ons you want to install, press the Next button, then follow the on-screen instructions.

   **Note:** Accepting the license agreement of the add-on is a mandatory step in the installation process.

   **Note:** All add-ons are installed in the extensions directory inside the Oxygen XML Editor preferences directory (on page 80).

Types of Plugin Extensions Available with the SDK

A plugin (on page 3285) can have one or more defined plugin extensions that provide functionality to the application. This section presents the plugin extensions that are available.

Workspace Access Plugin Extension

This type of plugin (on page 3285) allows you to contribute actions to the main menu and toolbars, create custom views, interact with the application workspace, make modifications to opened documents, and add listeners for various events.

Many complex integrations (such as integrations with Content Management Systems) usually requires access to some workspace resources such as toolbars, menus, views, and editors. This type of plugin is also useful because it allows you to make modifications to the XML content of an opened editor.
The plugin must implement the `ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension` interface. The callback method `applicationStarted` of this interface allows access to a parameter of the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` type (allows for API access to the application workspace).

The `StandalonePluginWorkspace` interface has three methods that can be called to customize toolbars, menus, and views:

### `addToolbarComponentsCustomizer`

Contributes to or modifies existing toolbars. You can specify additional toolbar IDs in the associated `plugin.xml` descriptor file using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess" ............>
  <runtime>
    ........
  </runtime>

  <extension type="WorkspaceAccess" ............/>
  ........
  <toolbar id="SampleID" initialSide="NORTH" initialRow="1"/>
</plugin>
```

The `toolbar` element adds a toolbar in the Oxygen XML Editor interface and allows you to contribute your own plugin-specific actions. The following attributes are supported:

- **id** - Unique identifier for the toolbar.
- **initialSide** - Specifies the place where the toolbar is initially displayed. The allowed values are `NORTH` and `SOUTH`.
- **initialRow** - Specifies the initial row on the specified side where the toolbar is displayed. For example, the first toolbar has an initial row of `0` and the next toolbar has an initial row of `1`.

The `ro.sync.exml.workspace.api.standalone.ToolbarInfo` toolbar component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the toolbar when the application starts.

### `addViewComponentCustomizer`

Contributes to or modifies existing views, or contributes to the reserved custom view. You can specify additional view IDs in the associated plugin.xml descriptor using the following construct:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomWorkspaceAccess">
    <runtime>..........

    <extension type="WorkspaceAccess">

    <view id="SampleID" initialSide="WEST" initialRow="0"/>
</view>

</extension>
</runtime>
</plugin>
```

The `view` element adds a view in the Oxygen XML Editor interface and allows you to contribute your own plugin-specific UI components. The following attributes are supported:

- **id** - Unique identifier of the view component.
- **initialSide** - Specifies the place where the view is initially displayed. The allowed values are: NORTH, SOUTH, EAST, and WEST.
- **initialRow** - Specifies the initial row on the specified side where the view is displayed. For example, in Oxygen XML Editor, the Project view (on page 333) has an initial row of 0 and the Outline view (on page 347) has an initial row of 1. Both views are in the WEST part of the workbench.
- **initialState** - Specifies the initial state of the view. The allows values are: hidden, docked, autohide, and floating. By default, the view is visible and docked.

The `ro.sync.exml.workspace.api.standalone.ViewInfo` view component information with the specified ID will be provided to you by the customizer interface. Therefore, you will be able to provide Swing components that will appear on the view when the application starts.

**addMenuBarCustomizer**

Contributes to or modifies existing menu components.

Access to the opened editors can be done by first getting access to all URLs opened in the workspace using the `StandalonePluginWorkspace.getAllEditorLocations(int editingArea)` API method. There are two available editing areas: the DITA Maps Manager editing area and the
main editing area. Using the URL of an opened resource, you can gain access to it using the `StandalonePluginWorkspace.getEditorAccess(URL location, int editingArea)` API method. A `ro.sync.exml.workspace.api.editor.WSEditor` then allows access to the current editing page.

A special editing API is supported for the **Text** mode (`ro.sync.exml.workspace.api.editor.page.text.WSTextEditorPage`) and the **Author** mode (`ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPage`).

To be notified when editors are opened, selected, and closed, you can use the `StandalonePluginWorkspace.addEditorChangeListener` API method to add a listener.

**Examples:**

- A simple Maven-based sample of a workspace access plugin is available here: [https://github.com/oxygenxml/sample-plugin-workspace-access](https://github.com/oxygenxml/sample-plugin-workspace-access).
- A more complex sample of a workspace access plugin mimicking a CMS integration is available in the Author SDK: [https://www.oxygenxml.com/oxygen_sdk.html](https://www.oxygenxml.com/oxygen_sdk.html).

### Adding a Custom View in Oxygen XML Editor

To add a custom view in Oxygen XML Editor, follow this procedure:

1. Locate the `plugin.xml` descriptor file for your plugin (should be located inside the `plugins` folder, for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`). Define the ID of the view you want to add and specify the location where it will be placed:

   ```xml
   <view id="SampleWorkspaceAccessID" initialSide="WEST" initialRow="0"/>
   ```

2. In your **Workspace Access Plugin Extension** implementation, where the `applicationStarted` callback is received, add a view component customizer like this:

   ```java
   pluginWorkspaceAccess.addViewComponentCustomizer(new ViewComponentCustomizer() { 
       public void customizeView(ViewInfo viewInfo) {
           if (
               //The view ID defined in the "plugin.xml"
               "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
               cmsMessagesArea = new JTextArea("CMS Session History: ");
               viewInfo.setComponent(new JScrollPane(cmsMessagesArea));
               viewInfo.setTitle("CMS Messages");
               viewInfo.setIcon(Icons.getIcon(Icons.CMS_MESSAGES_CUSTOM_VIEW_STRING));
           }
       }
   });
   ```
Oxygen XML Editor 21.1 User Guide | 17 - Using the Oxygen XML SDK | 2587

3. Define the cmsMessagesArea as a static field (if you can access the messages area from
anywhere in your code).

Workspace Access Plugin Extension (JavaScript-Based)
This is a JavaScript-based plugin (on page 3285) extension that allows you to contribute actions
to the main menu and toolbars, create custom views, interact with the application workspace, make
modifications to opened documents, and add listeners for various events.
This extension can use the same API as the Workspace Access plugin extension (on page 2583), but
the implementation is JavaScript-based and uses the bundled Rhino library to create and work with
Java API from the JavaScript code.
First, you need to create a custom plugin folder inside the plugins folder (for example,
[OXYGEN_INSTALL_DIR]/plugins/myPlugin). This folder will contain your custom plugin
descriptor file (plugin.xml) and all other resources for the plugin.
The plugin descriptor file (named plugin.xml) needs to reference a JavaScript file, as in the
following example:
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
id="unique.id.value"
name="Add Action To DITA Maps Manager popup-menu"
description="Plugin adds action to DITA Maps Manager contextual menu."
version="1.0"
vendor="Syncro Soft"
class="ro.sync.exml.plugin.Plugin"
classLoaderType="preferReferencedResources">
<extension type="WorkspaceAccessJS" href="wsAccess.js"/>
</plugin>

In the example above, the JavaScript file wsAccess.js (located in your custom plugin folder (on
page 2587)) will be called. This JavaScript file needs to have two JavaScript methods defined inside.
Methods that will be called when the application starts and when it ends:
function applicationStarted(pluginWorkspaceAccess) {
..........


function applicationClosing(pluginWorkspaceAccess) {
    ..........
}

With regard to the `applicationStarted` callback, besides using the `ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace` API with the `pluginWorkspaceAccess` parameter, you can also use a globally defined field called `jsDirURL` that points to the folder where the JavaScript file is located.

Below is a much larger example with a JavaScript Workspace Access plugin extension implementation that adds a new action in the contextual menu of the DITA Maps Manager view (on page 2990). The action starts the `notepad.exe` application and passes the reference to the currently selected `topicref` to it.

```javascript
function applicationStarted(pluginWorkspaceAccess) {
    Packages.java.lang.System.err.println("Application started "+ pluginWorkspaceAccess);
    edChangedListener = {
        /*Called when a DITA Map is opened*/
        editorOpened: function (editorLocation) {
            Packages.java.lang.System.err.println("running " + editorLocation);
            /*Get the opened DITA Map*/
            editor = pluginWorkspaceAccess.getEditorAccess(editorLocation,
            Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);
            ditaMapPage = editor.getCurrentPage();
            /*Add listener called when right-click is done in the DITA Maps manager*/
            customizerObj = {
                customizePopUpMenu: function (popUp, ditaMapDocumentController) {
                    Packages.java.lang.System.err.println("RIGHT CLICK" + popUp);
                    tree = ditaMapPage.getDITAMapTreeComponent();
                    /*Selected tree path*/
                    sel = tree.getSelectionPath();
                    if (sel != null) {
                        selectedElement = sel.getLastPathComponent();
                        /*Reference attribute*/
                        href = selectedElement.getAttribute("href");
                        if (href != null) {
                            try {
                                /*Create absolute reference*/
```
absoluteRef = new Packages.java.net.URL(selectedElement.getXMLBaseURL(), href.getValue());
Packages.java.lang.System.err.println("Computed absolute reference "+ absoluteRef);
mi = new Packages.java.swing.JMenuItem("Run notepad");
popUp.add(mi);
actionPerfObj = {
  actionPerformed: function (e) {
    try {
      Packages.java.lang.Runtime.getRuntime().exec("notepad.exe "+ pluginWorkspaceAccess.getUtilAccess().locateFile(absoluteRef));
    } catch (e1) {
      e1.printStackTrace();
    }
  }
}
mi.addActionListener(new JavaAdapter(Packages.java.awt.event.ActionListener, actionPerfObj));

function applicationClosing(pluginWorkspaceAccess) {
  ditaMapPage.setPopUpMenuCustomizer(new Packages.ro.sync.exml.workspace.api.editor.page.ditamap.DITAMapPopupMenuCustomizer(customizerObj));
}
edChangedListener = new JavaAdapter(Packages.ro.sync.exml.workspace.api.listeners.WSEditorChangeListener, edChangedListener);
pluginWorkspaceAccess.addEditorChangeListener(edChangedListener, Packages.ro.sync.exml.workspace.api.PluginWorkspace.DITA_MAPS_EDITING_AREA);

def function applicationClosing(pluginWorkspaceAccess) {
Declaring Multiple Modules

JavaScript-based plugins can include multiple modules of JavaScript files in the plugin. In those files, you can declare functions that can be used in the main `WorkspaceAccessJS` JavaScript file. Thus, you can use those external script files as a library of functions. The modules must be declared in the plugin descriptor file (`plugin.xml`).

For example:

```xml
<!DOCTYPE plugin PUBLIC "-//Oxygen Plugin" "../plugin.dtd">
<plugin
  id="unique.id.value"
  name="Add Action To DITA Maps Manager popup-menu"
  description="Plugin adds action to DITA Maps Manager contextual menu."
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="WorkspaceAccessJS" href="wsAccess.js"/>
  <extension type="WorkspaceAccessJSModule" href="wsAccessModule1.js"/>
  <extension type="WorkspaceAccessJSModule" href="wsAccessModule2.js"/>
</plugin>
```

For more information and some samples, see GitHub Project with Multiple Workspace Access JavaScript-Based Plugin Samples.

Author Stylesheet Plugin Extension

This type of plugin (on page 3285) allows you to add a stylesheet (CSS or LESS) that renders elements in Author mode.

To specify additional stylesheets, edit the plugin descriptor and add extension elements that point to them, as in the following example:

```xml
<extension type="AuthorStylesheet" href="showTables.css"/>
<extension type="AuthorStylesheet" href="hideButtons.css"/>
```
Using this mechanism, you can add one or more CSS stylesheets to merge with the existing ones. Whenever you add a new stylesheet using this plugin, it will have priority over all other stylesheets applied on the file edited in Author mode.

If your implementation requires more flexibility (such as a dynamic change of the stylesheet), you should consider using the StylesFilter plugin extension (on page 2598).

**Additional Framework Plugin Extension**

This type of plugin (on page 3285) allows you to add a new framework straight from the plugin.

To specify additional frameworks, edit the plugin descriptor and add `extension` elements that point to them, as in the following example:

```xml
<extension type="AdditionalFrameworks" path="framework_directory"/>
```

The path attribute should be a sub-directory of the plugin. If the plugin is installed as an add-on (on page 75), the new framework will be set as read-only and editing it will only be possible if you duplicate it (on page 93). If the plugin is installed in the \{OXYGEN_INSTALL_DIR\}/plugins directory, the new frameworks will be editable.

**Additional XProc Engine Plugin Extension**

This type of plugin (on page 3285) contributes a folder that contains an external XProc engine. The name of the plugin extension is **AdditionalXProcEngine** and it makes it easier to integrate an external XProc engine (on page 1747). After the plugin is installed, when you run an XProc transformation scenario, your external XProc engine can be selected from the Processor drop-down menu in the XProc tab.

An example of the plugin.xml file looks like this:

```xml
<plugin
  id="morgana.xproc.addon"
  name="Contribute Morgana XProc"
  description="Contribute Morgana XProc"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="AdditionalXProcEngine" path="MorganaXProcEngine/"/>
</plugin>
```

The `path` attribute points to the XProc engine folder that contains the `engine.xml` and all the libraries necessary to run it.
Components Validation Plugin Extension

This type of plugin (on page 3285) allows you to customize the menus, toolbars, and other components by enabling or filtering them from the user interface.

This plugin provides the following API:

**ComponentsValidatorPluginExtension interface**

There is one method that must be implemented:

```java
getComponentsValidator()
```

Returns a `ro.sync.exml.ComponentsValidator` implementation class used for validating the menus, toolbars, and their actions.

**ComponentsValidator interface**

Provides methods to filter various features from being added to the GUI of Oxygen XML Editor:

```java
validateMenuOrTaggedAction(String[] menuOrActionPath)
```

Checks if a menu or a tag action from a menu is allowed and returns a `boolean` value. A tag is used to uniquely identifying an action. The `String[]` argument is the tag of the menu / action and the tags of its parent menus if any.

```java
validateToolbarTaggedAction(String[] toolbarOrAction)
```

Checks if an action from a toolbar is allowed and returns a `boolean` value. The `String[]` argument is the tag of the action from a toolbar and the tag of its parent toolbar if any.

```java
validateComponent(String key)
```

Checks if the given component is allowed and returns a `boolean` value. The `String` argument is the tag identifying the component. You can remove toolbars entirely using this callback.

```java
validateAccelAction(String category, String tag)
```

Checks if the given accelerator action is allowed to appear in the GUI and returns a `boolean` value. An accelerator action can be uniquely identified so it will be removed both from toolbars or menus. The first argument represents the action category, the second is the tag of the action.

```java
validateContentType(String contentType)
```

Checks if the given content type is allowed and returns a `boolean` value. The `String` argument represents the content type. You can instruct Oxygen
XML Editor to ignore content types such as `text/xsl` or `text/xquery`.

`validateOptionPane(String optionPaneKey)`

Checks if the given options page can be added in the preferences option tree and returns a `boolean` value. The `String` argument is the option pane key.

`validateOption(String optionKey)`

Checks if the given option can be added in the option page and returns a `boolean` value. The `String` argument is the option key. This method is mostly used for internal use and it is not called for each option in a preferences page.

`validateLibrary(String library)`

Checks if the given library is allowed to appear listed in the `About` dialog box and returns a `boolean` value. The `String` argument is the library. This method is mostly for internal use.

`validateNewEditorTemplate(EditorTemplate editorTemplate)`

Checks if the given template for a new editor is allowed and returns a `boolean` value. The `EditorTemplate` argument is the editor template. An `EditorTemplate` is used to create an editor for a given extension. You can thus filter what appears in the list of the `New` dialog box.

`isDebuggerperspectiveAllowed()`

Checks if the debugger `perspective` (on page 3285) is allowed and returns a `boolean` value.

`validateSHMarker(String marker)`

Checks if the given marker is allowed and returns a `boolean` value. The `String` argument represents the syntax highlight marker to be checked. If you decide to filter certain content types, you can also filter the syntax highlight options so that the content type is no longer present in the Preferences options tree.

`validateToolbarComposite(String toolbarCompositeTag)`

Checks if the toolbar composite is available. A toolbar composite is a toolbar component such as a drop-down menu.

**Tip:** The best way to decide what to filter is to observe the values that Oxygen XML Editor passes when these callbacks are called. You have to create an implementation for this interface that lists in the console all values received by each function. Then you can decide on the values to filter and act accordingly.
Contribute Additional Languages Plugin Extension

This type of plugin allows you to contribute new translation languages to the Oxygen XML Editor UI.

The AdditionalUITranslation plugin extension provides the ability to contribute new translation languages to the interface in Oxygen XML Editor.

A sample plugin.xml file looks like this:

```xml
<plugin id="romanian.i18n.provider"
       name="Add Romanian as an user interface language"
       description="Add Romanian as an user interface language"
       version="1.0"
       vendor="Syncro Soft"
       class="ro.sync.exml.plugin.Plugin">
  <extension type="AdditionalUITranslation" href="translation.xml"/>
</plugin>
```

where the translation.xml has a structure like this:

```xml
<translation>
  <languageList>
    <language description="Romanian" lang="ro_RO" localeDescription="Romana"/>
  </languageList>
  <key value="Error">
    <val lang="ro_RO">Eroare</val>
  </key>
.........................
</translation>
```

If all error keys are not translated in the custom translation.xml contributed by the plugin, the fallback is the default English translation. Once this plugin is installed, the Languages drop-down menu in the Options > Preferences > Global will be updated to include the newly added languages. The end user will still need to select that language in the drop-down menu to use it.

Contribute External DITA-OT Distribution Plugin Extension

This type of plugin allows you to contribute an external DITA-OT distribution to Oxygen XML Editor.
Oxygen XML Editor comes bundled with DITA-OT version 3.3.1. If you want to use a different DITA-OT version, the `AdditionalDITAOT` plugin extension provides the ability to contribute an external distribution of the *DITA Open Toolkit* to Oxygen XML Editor.

**Example**

For instance, if you wanted to use a DITA-OT version 1.8, your `plugin.xml` file might look like this:

```xml
<plugin
  id="dita-ot-18"
  name="Contribute DITA OT 1.8"
  description="Contributes DITA OT 1.8"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin">
  <extension type="AdditionalDITAOT"
              path="DITA-OT1.8.5"
              description="DITA OT 1.8"/>
</plugin>
```

The `path` attribute points to a folder located relative to the `plugin.xml` file and this folder is where the additional distribution of DITA-OT would be located.

When Oxygen XML Editor is started with this plugin enabled, that addition DITA-OT version can now be selected in the *DITA Open Toolkit* option in the *DITA preferences page* (on page 225).

**Custom Protocol Plugin Extension**

This type of plugin (on page 3285) allows you to work with a custom designed protocol for retrieving and storing files.

It provides the following API:

**`URLStreamHandlerPluginExtension` interface**

There is one method that must be implemented:

```java
getURLStreamHandler(String protocol)
```

It takes as an argument the name of the protocol and returns a `URLStreamHandler` object, or null if there is no URL handler for the specified protocol.

This type of `plugin` extension can be usually combined with a *Workspace Access plugin extension* (on page 2583) that can add a custom toolbar with custom actions for opening documents from a certain source.
As an alternative, two older plugin extensions can also be used to add a toolbar action for showing a custom URL chooser:

**URLChooserPluginExtension2 interface**

Makes it possible to create your own dialog box that works with the custom protocol. This interface provides two methods:

*chooseURLs(StandalonePluginWorkspace workspaceAccess)*

Returns a URL[] object that contains the URLs the user decided to open with the custom protocol. You can invoke your own URL chooser dialog box here and then return the chosen URLs having your own custom protocol. You have access to the workspace of Oxygen XML Editor.

*getMenuName()*

Returns a String object that is the name of the entry added in the File menu.

**URLChooserToolbarExtension interface**

Makes it possible to provide a toolbar entry that is used for launching the custom URLs chooser from the URLChooserPluginExtension implementation. This interface provides two methods:

*getToolbarIcon()*

Returns the javax.swing.Icon image used on the toolbar.

*getToolbarTooltip()*

Returns a String that is the tooltip used on the toolbar button.

Lock Handler Plugin Extension

This type of plugin extension (on page 3285) is used for locking resources from a specific protocol. It provides the following API:

**LockHandlerFactoryPluginExtension interface**

You need to implement the following two methods:

*LockHandler getLockHandler()*

Gets the lock handler for the current handled protocol. Might be null if not supported.

*boolean isLockingSupported(String protocol)*

Checks if a lock handler can be provided for a specific protocol.
To use this type of extension in your plugin, create an extension of LockHandlerFactory type in your plugin.xml file and specify the class implementing LockHandlerFactoryPluginExtension:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomLockHandler" ..............>
  <runtime>........</runtime>
  <extension type="LockHandlerFactory" class="LockHandlerFactoryPluginExtensionImpl"/>
  ............
</plugin>
```

Open Redirect Plugin Extension

This type of plugin (on page 3285) is useful for opening multiple files with only one open action.

For example, when a zip archive or an ODF file or an OOXML file is open in the Archive Browser view (on page 2191) a plugin of this type can decide to open a file also from the archive in an XML editor panel. This file can be the document.xml main file from an OOXML file archive or a specific XML file from a zip archive.

The plugin must implement the interface OpenRedirectExtension. It only has one callback: redirect(URL) that receives the URL of the file opened by the Oxygen XML Editor user. If the plugin decides to open also other files it must return an array of information objects (OpenRedirectInformation[]) that correspond to these files. Such an information object must contain the URL that is opened in a new editor panel and the content type (for example, text/xml). The content type is used for determining the type of editor panel. A null content type allows auto-detection of the file type.

Option Page Plugin Extension

This type of plugin extension (on page 3285) allows you to add custom Preferences pages.

The extension must implement the ro.sync.exml.plugin.option.OptionPagePluginExtension class. The provided callbacks allow you to create a custom Swing component that will be added to the page and to react to various calls to persistently save the page settings using the OptionsStorage API.
All preferences pages that are contributed by a plugin are listed in the Preferences dialog box in the Plugins category. As long as the added preferences page has the same name as its plugin, it will be promoted to the first level of the hierarchy within the Plugins category.

The plugin.xml configuration file can specify one or more such extensions using constructs like this:

```xml
<extension type="OptionPage" class="my.pack.CustomOptionPagePluginExtension"/>
```

Resource Locking Custom Protocol Plugin Extension

This type of plugin (on page 3285) allows you to work with a custom designed protocol for retrieving and storing files and it can lock a resource when opening it in Oxygen XML Editor.

This type of plugin extends the custom protocol plugin type with resource locking support and provides the following API:

**URLStreamHandlerWithLockPluginExtension interface**

The plugin receives callbacks following the simple protocol for resource locking and unlocking imposed by Oxygen XML Editor.

There are two additional methods that must be implemented:

- **getLockHandler()**
  
  Returns a LockHandler implementation class with the implementation of the lock specific methods from the plugin.

- **isLockingSupported(String protocol)**
  
  Returns a boolean that is true if the plugin accepts to manage locking for a certain URL protocol scheme (such as ftp, http, https, or customName).

Styles Filter Plugin Extension

This type of plugin (on page 3285) allows you to dynamically modify the CSS styles used to render elements in the Author mode.

The plugin must extend the ro.sync.exml.plugin.author.css.filter.GeneralStylesFilterExtension class. This class has a callback on which you can alter the styles for an Author mode element.

This extension point is similar with the Styles Filter that you set at the framework (on page 3282) level. The only difference is that the plugin filters styles are used for any opened XML document, regardless of the document type. The changes made by this plugin are prioritized over the changes made by the framework-level filter.
Note: Alternatively, you can use the AuthorStylesheet plugin extension (on page 2590), which does not require any additional Java development and is compatible with Oxygen XML Web Author.

Related Information:

- Customizing the CSS Styles Filter (on page 2424)

Targeted URL Stream Handler Plugin Extension

This type of plugin (on page 3285) can be used when it is necessary to impose custom URL stream handlers for specific URLs.

This plugin extension can handle the following protocols: http, https, ftp or sftp, for which Oxygen XML Editor usually provides specific fixed URL stream handlers. If it is set to handle connections for a specific protocol, this extension will be asked to provide the URL stream handler for each opened connection of a URL having that protocol.

To use this type of plugin, you have to implement the ro.sync.exml.plugin.urlstreamhandler.TargetedURLStreamHandlerPluginExtension interface, that provides the following methods:

```java
boolean canHandleProtocol(String protocol)
```

This method checks if the plugin can handle a specific protocol. If this method returns true for a specific protocol, the getURLStreamHandler(URL) method will be called for each opened connection of a URL having this protocol.

```java
URLStreamHandler getURLStreamHandler(URL url)
```

This method provides the URL handler for the specified URL and it is called for each opened connection of a URL with a protocol for which the canHandleProtocol(String) method returns true.

If this method returns null, the default Oxygen XML Editor URLStreamHandler is used.

To use this type of extension in your plugin, create an extension of TargetedURLHandler type in your plugin.xml file and specify the class that implements TargetedURLStreamHandlerPluginExtension:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin SYSTEM "../plugin.dtd">
<plugin name="CustomTargetedURLStreamHandlerPlugin" ...........
    <runtime>
        .......
    </runtime>
```
This extension can be useful in situations when connections opened from a specific host must be handled in a particular way. For example, the Oxygen XML Editor HTTP URLStreamHandler may not be compatible for sending and receiving SOAP using the SUN Web Services implementation. In this case, you can override the stream handler (set by Oxygen XML Editor) to use the default SUN URLStreamHandler, since it is more compatible with sending and receiving SOAP requests.

```java
public class CustomTargetedURLStreamHandlerPluginExtension
    implements TargetedURLStreamHandlerPluginExtension {

    @Override
    public boolean canHandleProtocol(String protocol) {
        boolean handleProtocol = false;
        if ("http".equals(protocol) || "https".equals(protocol)) {
            // This extension handles both HTTP and HTTPS protocols
            handleProtocol = true;
        }
        return handleProtocol;
    }

    @Override
    public URLStreamHandler getURLStreamHandler(URL url) {
        // This method is called only for the URLs with a protocol
        // where canHandleProtocol(String) method returns true (HTTP and HTTPS)

        URLStreamHandler handler = null;

        String host = url.getHost();
        String protocol = url.getProtocol();
        if ("some_host".equals(host)) {
            // When there are connections opened from some_host, the SUN HTTP(S)
            // handlers are used
            if ("http".equals(protocol)) {
            }
        }
        return handler;
    }
```
} else {
    handler = new sun.net.www.protocol.https.Handler();
}
}
return handler;

XML Refactoring Operations Plugin Extension

This type of plugin allows you to specify one or more directories where the XML Refactoring operation resources are loaded.

The RefactoringOperationsProvider extension can be used to specify the location where custom XML Refactoring operation resources (XQuery Update script or XSLT stylesheet and Operation Descriptor files) are stored. Oxygen XML Editor will scan the specified locations to load the custom operations when the XML Refactoring tool is opened, and allows you to share your custom refactoring operations.

**Example: XML Refactoring Operations Plugin Extension**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plugin PUBLIC "-/Oxygen Plugin" ".../plugin.dtd">

<plugin
    id="refactoring.operations"
    name="Refactoring operations plugin"
    description="Contains operation descriptors and related scripts"
    version="1.0">
    <extension type="RefactoringOperationsProvider">
        <folder path="customDir/"/>
        <folder path="customDir2"/>
    </extension>
</plugin>
```

Plugin Extensions Designed to Work only in the Text Editing Mode

These plugin extensions operate only when editing documents in the Text mode. They are mounted automatically by the application on the contextual menu in the Plugins submenu.
General Plugin Extension

This type of plugin (on page 3285) allows you to invoke custom code to interact with the workspace in Text mode.

This plugin is the most general plugin type and provides a limited API:

**GeneralPluginExtension interface**

Intended for general-purpose plugins, kind of external tools but triggered from the Plugins menu. The implementing classes must provide the method process(GeneralPluginContext), which must provide the plugin processing. This method takes as a parameter a GeneralPluginContext object.

**GeneralPluginContext class**

Represents the context in which the general plugin extension does its processing. The getPluginWorkspace() method allows you access to the workspace of Oxygen XML Editor.

Selection Plugin Extension

This type of plugin (on page 3285) allows you to manage selections of text.

A selection plugin can be applied to both XML and non-XML documents. The plugin is started by making a selection in the editor, then selecting the corresponding menu item from the Plugins submenu in the contextual menu of Text mode.

This plugin type provides the following API:

**SelectionPluginExtension interface**

The context containing the selected text is passed to the extension and the processed result is going to replace the initial selection. The process(GeneralPluginContext) method must return a SelectionPluginResult object that contains the result of the processing. The String value returned by the SelectionPluginResult object can include editor variables (on page 276) such as ${caret} and ${selection}.

**SelectionPluginContext object**

Represents the context and provides four methods:

- getSelection() - Returns a String that is the current selection of text.
- getFrame() - Returns a Frame that is the editing frame.
- getPluginWorkspace() - Returns access to the workspace of Oxygen XML Editor.
- getDocumentURL() - Returns the URL of the current edited document.

Related Information:
Example - Uppercase Plugin

The following plugin is called UppercasePlugin and is an example of a Selection plugin. It is used in Oxygen XML Editor for capitalizing the characters in the current selection. This example consists of two Java classes and the plugin descriptor file:

• **UppercasePlugin.java**:

```java
package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.Plugin;
import ro.sync.exml.plugin.PluginDescriptor;

public class UppercasePlugin extends Plugin {

  /**
   * Plugin instance.
   */
  private static UppercasePlugin instance = null;

  /**
   * UppercasePlugin constructor.
   *
   * @param descriptor Plugin descriptor object.
   */
  public UppercasePlugin(PluginDescriptor descriptor) {
    super(descriptor);

    if (instance != null) {
      throw new IllegalStateException("Already instantiated!");
    }
    instance = this;
  }

  /**
   * Get the plugin instance.
   */
  @return the shared plugin instance.
```
```java
public static UppercasePlugin getInstance() {
    return instance;
}
}

package ro.sync.sample.plugin.uppercase;

import ro.sync.exml.plugin.selection.SelectionPluginContext;
import ro.sync.exml.plugin.selection.SelectionPluginExtension;
import ro.sync.exml.plugin.selection.SelectionPluginResult;
import ro.sync.exml.plugin.selection.SelectionPluginResultImpl;

public class UppercasePluginExtension implements SelectionPluginExtension {
    /**
     * Convert the text to uppercase.
     *
     * @param  context  Selection context.
     * @return          Uppercase plugin result.
     */
    public SelectionPluginResult process(SelectionPluginContext context) {
        return new SelectionPluginResultImpl(
                context.getSelection().toUpperCase());
    }
}

• plugin.xml:

<!--DOCTYPE plugin SYSTEM ".//plugin.dtd"-->
<plugin
    name="UpperCase"
    description="Convert the selection to uppercase"
    version="1.0.0"
    vendor="SyncRO"
    class="ro.sync.sample.plugin.uppercase.UppercasePlugin">
    <runtime>
        <library name="lib/uppercase.jar"/>
    </runtime>
</plugin>
```
Document Plugin Extension

This type of plugin (on page 3285) allows you to manage the current document.

The document plugin type can only be applied to an XML document. It can modify the current document that is received as a callback parameter.

The plugin is started by selecting the corresponding menu item from the Plugins submenu in the contextual menu of Text mode. It provides the following API:

**DocumentPluginExtension interface**

Receives the context object containing the current document. The `process(GeneralPluginContext)` method can return a `DocumentPluginResult` object containing a new document.

**DocumentPluginContext object**

Represents the context and provides three methods:

- `getDocument()` - Returns a `javax.swing.text.Document` object that represents the current document.
- `getFrame()` - Returns a `java.awt.Frame` object that represents the editing frame.
- `getPluginWorkspace()` - Returns access to the workspace of Oxygen XML Editor.

How to Write a CMS Integration Plugin

To have a complete integration between Oxygen XML Editor and a CMS, you usually have to write a plugin (on page 3285) that combines the following two available plugin extensions:

- **Workspace Access** (on page 2583)
- **Custom protocol** (on page 2610)

The usual set of requirements for an integration between Oxygen XML Editor and the CMS are as follows:

1. Contribute to the Oxygen XML Editor toolbars and main menu with your custom Check Out and Check In actions:
   - **Check Out** triggers your custom dialog boxes that allow you to browse the remote CMS and choose the resources you want to open.
   - **Check In** allows you to send the modified content back to the server.
You can use the **Workspace Access plugin extension** (and provided sample Java code) for all these operations.

2. When **Check Out** is called, use the Oxygen XML Editor API to open your custom URLs (URLs created using your custom protocol). It is important to implement and use a **Custom Protocol** extension to be notified when the files are opened and saved and to be able to provide the content for the relative references the files may contain to Oxygen XML Editor. Your custom `java.net.URLStreamHandler` implementation checks out the resource content from the server, stores it locally and provides its content. Sample **Check Out** implementation:

```java
/**
 * Sample implementation for the "Check Out" method.
 * @param pluginWorkspaceAccess (Workspace Access plugin).
 * @throws MalformedURLException
 */
private void checkOut(StandalonePluginWorkspace pluginWorkspaceAccess)
    throws MalformedURLException {
    //TODO Show the user a custom dialog box for browsing the CMS
    //TODO after user selected the resource create a URL with a custom protocol
    //which will uniquely map to the resource on the CMS using the URLHandler
    //something like:
    URL customURL = new URL("mycms://host/path/to/file.xml");
    //Ask Oxygen to open the URL
    pluginWorkspaceAccess.open(customURL);
    //Oxygen will then your custom protocol handler to provide the contents for
    //the resource "mycms://host/path/to/file.xml"
    //Your custom protocol handler will check out the file in a temporary
    //directory, for example, and provide the content from it.
    //Oxygen will also pass through your URLHandler if you have any relative
    //references which need to be opened/obtained.
}
```

Figure 734. Check Out Process Diagram
The phases are:

- 1 - Browse CMS repository
- 2 - User chooses a resource
- 3 - Use API to open custom URL: `mycms://path/to/file.xml`
- 4 - Get content of URL: `mycms://path/to/file.xml`
- 5 - Get content of resource
- 6 - Store on disk for faster access
- 7 - Retrieve content from disk if already checked out
- 8 - Retrieved content

3. Contribute a special **Browse CMS** action to every dialog box in Oxygen XML Editor where a URL can be chosen to perform a special action (such as the **Reuse Content** or **Insert Image** action).

Sample code:

```java
//Add an additional browse action to all dialog boxes/places
//where Oxygen allows selecting a URL.
pluginWorkspaceAccess.addInputURLChooserCustomizer
(new InputURLChooserCustomizer() {

    public void customizeBrowseActions
    (List<Action> existingBrowseActions, final InputURLChooser chooser) {
        //IMPORTANT, you also need to set a custom icon on the action
        //for situations when its text is not used for display.
        Action browseCMS = new AbstractAction("CMS") {

            public void actionPerformed(ActionEvent e) {
```

```java
```
When inserting references to other resources using the actions already implemented in Oxygen XML Editor, the reference to the resource is made by default relative to the absolute location of the edited XML file. You can gain control over the way in which the reference is made relative for a specific protocol like this:

```java
pluginWorkspaceAccess.addRelativeReferencesResolver(
    //Your custom URL protocol for which you already have a
    //custom URLStreamHandlerPluginExtension set up.
    "mycms",
    //The relative references resolver
    new RelativeReferenceResolver()
)
```

4. Write the `plugin.xml` descriptor file. Your `plugin` combines the two extensions using a single set of libraries. The descriptor would look like this:
5. Create a `cmsaccess.jar` **JAR (on page 3283)** archive containing your implementation classes.
6. Copy your new `plugin` directory in the `plugins` subfolder of the Oxygen XML Editor install folder (for example, `[OXYGEN_INSTALL_DIR]/plugins/myPlugin`) and start Oxygen XML Editor.

Class Loading Issues

It is possible that the Java libraries you have specified in the `plugin` libraries list conflict with the ones already loaded by Oxygen XML Editor. To instruct the `plugin` to prefer its libraries over the ones used by Oxygen XML Editor, you can add the following attribute on the `<plugin>` root element:

```
classLoaderType="preferReferencedResources" from the plugin.xml descriptor file.
```

A **Late Delegation Class Loader** (the main class loader in Oxygen XML Editor) is a `java.net.URLClassLoader` extension that prefers to search classes in its own libraries list and only if a class is not found there to delegate to the parent class loader.

The main Oxygen XML Editor Class Loader uses as libraries all **JARS** specified in the `[OXYGEN_INSTALL_DIR]/lib` directory. Its parent class loader is the default JVM Class loader. For each `plugin` instance, a separate class loader is created having as parent the Oxygen XML Editor Class Loader.
The plugin class loader can be either a standard java.net.URLClassLoader or a LateDelegationClassLoader (depending on the attribute classLoaderType in the plugin.xml). Its parent class loader is always the Oxygen XML Editor LateDelegationClassLoader.

If you experience additional problems, such as:

```java
java.lang.LinkageError: ClassCastException:
attempting to cast
jar:file:/C:/jdk1.6.0_06/jre/lib/rt.jar!/javax/xml/ws/spi/Provider.class
to jar:file:/D:/Program Files/Oxygen XML Editor 12/plugins/wspcaccess/../../../xdocs/lib/jaxws/jaxws-api.jar!/javax/xml/ws/spi/Provider.class
javax.xml.ws.spi.Provider.provider(Provider.java:94)
javax.xml.ws.Service.<init>(Service.java:56)
```

The cause could be the fact that some classes are instantiated using the context class loader of the current thread. The most straightforward fix is to write your code in a try/finally statement:

```java
ClassLoader oldClassLoader = Thread.currentThread().getContextClassLoader();
try {
    //This is the implementation of the WorkspaceAccessPluginExtension plugin interface.
    Thread.currentThread().setContextClassLoader(
        CustomWorkspaceAccessPluginExtension.
        this.getClass().getClassLoader());
    //WRITE YOUR CODE HERE
} finally {
    Thread.currentThread().setContextClassLoader(oldClassLoader);
}
```

How to Write A Custom Protocol Plugin

To create a custom protocol plugin (on page 3285), follow these steps:

1. Write the handler class for your protocol that implements the java.net.URLStreamHandler interface.
Be careful to provide ways to encode and decode the URLs of your files.

2. Write the plugin class by extending ro.sync.exml.plugin.Plugin.

3. Write the plugin extension class that implements the ro.sync.exml.plugin.urlstreamhandler.URLStreamHandlerPluginExtension interface.

It is necessary that the plugin extension for the custom protocol implements the URLStreamHandlerPluginExtension interface. Without it, you cannot use your plugin, because Oxygen XML Editor is not able to find the protocol handler.

You can choose also to implement the URLChooserPluginExtension interface. It allows you to write and display your own customized dialog box for selecting resources that are loaded with the custom protocol.

An implementation of the extension URLHandlerReadOnlyCheckerExtension allows you to:

• Mark a resource as read-only when it is opened.
• Switch between marking the resource as read-only and read-write while it is edited.

It is useful when opening and editing CMS resources.

4. Write the plugin.xml descriptor file.

Remember to set the name of the plugin class to the one from the second step and the plugin extension class name with the one you have chosen at step 3.

5. Create a JAR (on page 3283) archive with all these files.

6. Create a custom plugin folder inside the plugins folder (for example, [OXYGEN_INSTALL_DIR]/plugins/myPlugin) that contains your new plugin.

How to Share a Class Loader Between a Framework and Plugin

In some cases you may need to extend the functionality of Oxygen XML Editor both through a framework (on page 3282) and through a plugin (on page 3285). Normally, a framework and a plugin both run in their own private classloader. If the framework and the plugin use the same JAVA extensions/classes, it is recommended that they share the same classloader. This way, the common classes are loaded by only one Class Loader and they will both use the same static objects and have the ability to cast objects between one another.

To do this, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select the document type, go to the Classpath tab, and in the Use parent classloader from plugin with ID fields introduce the ID of the plugin. This ID is declared in the configuration file of the plugin (on page 2581).
Important: The shared classes must be specified only in the configuration files of the plugin, and not in the configuration file and the document type class path at the same time.

Packing and Deploying Plugins as Add-ons

Packing a Plugin as an Add-on

This first procedure is suitable for developers who want a better control over the add-on (on page 3285) package or those who want to automate some of the steps:

1. Pack the plugin (on page 3285) as a ZIP file or a Java Archive (on page 3283). Note that you should pack the entire root directory not just its contents.
2. Digitally sign the package. Note that you can perform this step only if you have created a Java Archive at the previous step. You will need a certificate signed by a trusted authority. To sign the JAR you can either use the jarsigner command-line tool inside Oracle's Java Development Kit. ([JDK_DIR]/bin/jarsigner.exe) or, if you are working with Apache Ant (on page 3279), you can use the signjar task (a front for the jarsigner command-line tool).

Note: The benefit of having a signed add-on is that you can verify the integrity of the add-on issuer. If you do not have such a certificate you can generate one yourself using the keytool command-line tool. This approach is mostly recommended for tests since anyone can create a self signed certificate.
3. Create a descriptor file. You can use a template that Oxygen XML Editor provides. To use this template, go to File > New and select the Oxygen add-ons update site template. Once deployed, this descriptor file is referenced as update site.

Alternatively, you can use the Add-ons Packager plugin by following this procedure:

1. Install the Add-ons Packager plugin following the procedure described in Installing Add-ons (on page 75).
2. Restart Oxygen XML Editor. If the add-on is correctly installed, the Add-ons packager toolbar action is available.
3. Invoke the Add-ons packager toolbar action and input the required information in the displayed dialog box.
4. Press OK to complete the packaging process.

Deploying an Add-on

To deploy an add-on, copy the ZIP or Java Archive (on page 3283) file and the descriptor file to an HTTP server. The URL to this location serves as the Update Site URL.
Testing Plugins and Java Extensions

In the various procedures for creating a plugin (on page 3285), you are usually instructed to copy your plugin folder to the \[OXYGEN_INSTALL_DIR]/plugins/ directory. If you want to test the code in your plugin without copying it to that folder, follow this procedure:

1. Create a file called plugin.redirect that contains the full file path references to your project (for example, C:\Users\john_doe\Documents\sample-plugin-folder).
2. Save that file in any folder (for example, called sample_test_folder) inside the \[OXYGEN_INSTALL_DIR]/plugins/ directory.

**Step Result:** Oxygen XML Editor will automatically load the plugin from your project location.

3. Now you can modify the Java code, the IDE will automatically compile it, and if the plugin.xml file has a classpath reference to the compiled classes folder, you can restart Oxygen XML Editor and test your changes.

Creating and Running Automated Tests

If you have developed complex custom plugins (on page 3285) or frameworks (on page 3282) (document types), the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Editor standalone installation includes a main oxygen.jar library located in the \[OXYGEN_INSTALL_DIR]. That JAR (on page 3283) library contains a base class for testing developer customizations named: ro.sync.exml.workspace.api.PluginWorkspaceTCBase.

To develop JUnit tests for your customizations using the Eclipse workbench, follow these steps:

1. Create a new Eclipse Java project and copy the entire contents of the \[OXYGEN_INSTALL_DIR] folder to the new project.
2. Add all JAR libraries present in the \[OXYGEN_INSTALL_DIR]/lib directory to the Java Build Path->Libraries tab. Make sure that the main JAR library oxygen.jar or oxygenAuthor.jar is the first one in the Java classpath by moving it up in the Order and Export tab.
3. Click Add Library and add the JUnit and JFCUnit libraries.
4. Create a new Java class that extends ro.sync.exml.workspace.api.PluginWorkspaceTCBase.
5. Pass the following parameters to the constructor of the super class:
• File installationFolder - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started.
• File frameworksFolder - The file path to the frameworks directory. It can point to a custom framework directory where it resides.
• File pluginsFolder - The file path to the plugins directory. It can point to a custom plugin directory where it resides.
• File optionsFolder - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
• String licenseKey - The license key used to license the test class.
• int productID - The ID of the product and should be one of the following: PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT, PluginWorkspaceTCBase.XML_EDITOR_PRODUCT, or PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT.

6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```java
public class MyTestClass extends PluginWorkspaceTCBase {

/**
 * Constructor.
 */

public MyTestClass() throws Exception {
    super(null, new File("frameworks"), new File("plugins"), null,
    "------START-LICENSE-KEY------
    "
    "Registration_Name=Developer"
    "Company="
    "Category=Enterprise"
    "Component=XML-Editor, XSLT-Debugger, Saxon-SA"
    "Version=14"
    "Number_of_Licenses=1"
    "Date=09-04-2012"
    "Trial=31"
    
```
public void testOpenFileAndBoldEXM_20417() throws Exception {
    WSEditor ed = open(new File("D:/projects/eXml/test/authorExtensions/dita/sampleSmall.xml").toURL());
    // Move caret
    moveCaretRelativeTo("Context", 1, false);
    // Insert <b>
    invokeAuthorExtensionActionForID("bold");
    assertEquals("<?xml version="1.0" encoding="utf-8"?>
    <!DOCTYPE task PUBLIC "-//OASIS//DTD DITA Task//EN" "http://docs.oasis-open.org/dita/v1.1/OS/dtd/task.dtd">
    <task id="taskId">
        <title>Task title</title>
        <prolog/>
        <taskbody>
            <context>
                <p>Context for the current task</p>
            </context>
            <steps>
                <step>
                    <cmd>Task step.</cmd>
                </step>
            </steps>
        </taskbody>
    </task>
    ", getCurrentEditorXMLContent());
}
Debugging a Plugin Using IntelliJ IDEA

To use *IntelliJ IDEA* to debug problems in the code of a *plugin* without having to re-bundle the plugin's Java classes in a *JAR* library, follow these steps:

1. Download and install Oxygen XML Editor.
2. Set up the *Oxygen SDK* following this set of instructions.
3. Create a Java Project (for example, *MyPluginProject*) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the *MyPluginProject* folder, create a folder called *myPlugin*. In this new folder, copy the *plugin.xml* file from the sample plugin. Modify the added *plugin.xml* to add a library reference to the directory where IntelliJ IDEA copies the compiled output. To find out where this directory is located, go to *File > Project Structure*. Then select the *Modules* category and inspect the value of the *Output path* text box from the *Path* tab.

   Example: If the output path is `C:/Users/myUser/Documents/MyPluginProject/target/classes`, then in the *plugin.xml*, you need to add the following library reference in the *runtime* element:

   ```xml
   <library name="../target/classes"/>
   ```

5. Copy the *plugin.dtd* from the *{OXYGEN_INSTALL_DIR}/plugins* folder in the root *MyPluginProject* folder.
6. In the *MyPluginProject* dependences (*File > Project Structure > Modules > Dependences*), add external *JAR* references to all the *JAR* libraries in the *{OXYGEN_INSTALL_DIR}/lib* folder. Now your *MyPluginProject* should compile successfully.
7. In IntelliJ IDEA, create a new *Java Application* configuration for debugging (*Run > Edit Configurations... > + > Application*). Set the *Main class* box to *ro.sync.exml.Oxygen* and add the following code snippet in the *VM options* input box, making sure that the path to the *plugins* directory is the correct one:

   ```bash
   -Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
   -XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
   ```

8. Add a *breakpoint* in the source of one of your Java classes.
9. Debug the created configuration. When the code reaches your breakpoint, the IntelliJ IDEA debugging view should take over.
Debugging a Plugin Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of a plugin (on page 3285) without having to re-bundle the plugin's Java classes in a JAR (on page 3283) library, follow these steps:

1. Download and install Oxygen XML Editor.
2. Set up the Oxygen SDK following this set of instructions.
3. Create an Eclipse Java Project (for example, MyPluginProject) from one of the sample plugins (for example, the Workspace Access plugin).
4. In the MyPluginProject folder, create a folder called myPlugin. In this new folder, copy the plugin.xml file from the sample plugin. Modify the added plugin.xml to add a library reference to the directory where Eclipse copies the compiled output. To find out where this directory is located, invoke the contextual menu of the project (in the Project view (on page 333)), and go to Build Path > Configure Build Path. Then inspect the value of the Default output folder text box.

Example: If the compiled output folder is classes, then in the plugin.xml, you need to add the following library reference:

```xml
<library name="../classes"/>
```

5. Copy the plugin.dtd from the [OXYGEN_INSTALL_DIR]/plugins folder in the root MyPluginProject folder.
6. In the MyPluginProject build path, add external JAR references to all the JAR libraries in the [OXYGEN_INSTALL_DIR]/lib folder. Now your MyPluginProject should compile successfully.
7. In the Eclipse IDE, create a new Java Application configuration for debugging. Set the Main class box to ro.sync.exml.Oxygen. Click the Arguments tab and add the following code snippet in the VM arguments input box, making sure that the path to the plugins directory is the correct one:

```bash
-Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
-XX:MaxPermSize=384m -Dcom.oxygenxml.editor.plugins.dir=D:\projects\MyPluginProject
```
8. Add a breakpoint (on page 2314) in the source of one of your Java classes.
9. Debug the created configuration. When the code reaches your breakpoint (on page 2313), the Eclipse IDE debugging perspective should take over.

Debugging an Oxygen SDK Extension Using the Eclipse Workbench

To use the Eclipse workbench to debug problems in the code of an extension (on page 3285) without having to bundle its Java classes in a JAR (on page 3283) library, perform the following steps:

1. Download and install Oxygen XML Editor.
2. Create an Eclipse Java Project (for example, `MySDKProject`) with the corresponding Java sources (for example, a custom implementation of the `ro.sync.ecss.extensions.api.stylesFilter` interface).

3. In the Project build path, add external JAR references to all the JAR libraries in the `{OXYGEN_INSTALL_DIR}/lib` folder. In the build path Order and Export panel, make sure that the `oxygen.jar` entry is before all other libraries. Now your Project should compile successfully.

4. Start the standalone version of Oxygen XML Editor from the `{OXYGEN_INSTALL_DIR}` and in the Document Type Association preferences page (on page 92), edit the document type (for example, DITA) to open the Document Type configuration dialog box (on page 95). In the Classpath tab, add a reference to your Project's classes directory and in the Extensions tab, select your custom `StylesFilter` extension as a value for the CSS styles filter property. Close the application to save your changes.

5. Create a new Java Application configuration for debugging. The Main Class should be `ro.sync.exml.Oxygen`. The given VM Arguments should be:

   ```
   -Dcom.oxygenxml.app.descriptor=ro.sync.exml.EditorFrameDescriptor -Xmx1024m
   ```

6. Add a breakpoint (on page 2314) in one of the source Java classes.

7. Debug the created configuration. When the code reaches your breakpoint (on page 2313), the Eclipse IDE debugging perspective should take over.

Disabling a Plugin

To disable a plugin (on page 3285), use one of the following two methods:

- Open the Preferences dialog box (Options > Preferences) (on page 79), go to Plugins, and deselect the plugin that you want to disable.
- Create an empty file called `plugin.disable` next to the plugin configuration file (`plugin.xml`). The plugin will be disabled and will no longer be loaded by the application on startup.

**Note:** This is useful if you want to temporarily stop work on a plugin and use the application without it.

Oxygen XML Author Component

The Oxygen XML Author Component was designed as a subset of Oxygen XML Editor that can be integrated into another application under the terms of the Oxygen XML Editor SDK agreement to provide functionality for editing and authoring XML documents. The component can be embedded in a third-party standalone Java application to provide WYSIWYG-like XML editing directly in your application.
More information about the setup for the Oxygen XML Author Component can be found on the Oxygen SDK page.

Licensing

The licensing terms and conditions for the Oxygen XML Author Component are defined in the Oxygen SDK License Agreement. To obtain the licensing terms and conditions and other licensing information as well, you can also contact the support team at support@oxygenxml.com. You may also obtain a free of charge evaluation license key for development purposes, subject to registration. Any deployment of an application developed using the Oxygen XML Author Component is also subject to the terms of the SDK agreement.

There are two main categories of Oxygen XML Author Component integrations:

- **Integration for internal use.**
  
  You develop an application that embeds the Author Component to be used internally (in your company or by you). You can buy and use previously purchased Oxygen XML Editor floating licenses to enable the runtime usage of the Oxygen XML Author Component as it was integrated into the application.

- **Integration for external use.**
  
  Using the Oxygen XML Author Component, you create an application that you distribute to other users outside your company (with a CMS for example). In this case, you should apply for a Value Added Reseller (VAR) partnership by contacting the Oxygen Sales Team (https://www.oxygenxml.com/sales_support.html).

From a technical point of view, the Oxygen XML Author Component provides the Java API to:

- Inject floating license server details in the Java code.

  The following link provides details about how to configure an HTTP floating license server: https://www.oxygenxml.com/license_server.html#floating_license servlet.

```java
AuthorComponentFactory.getInstance().init(frameworkZips, 
    optionsZipURL, codeBase, appID,
    //The servlet URL
    "http://www.host.com/servlet",
    //The HTTP credentials user name
    "username",
    //The HTTP credentials password
    "password"); 
```
• Display the license registration dialog box, where the user will paste their license key.

This is the default behavior if a null license key is set using the API (as in the following example). This transfers the licensing responsibility to the end user. The user can license an Oxygen XML Author Component using standard, named-user based Oxygen XML Editor license keys. The license key will be saved to the local user's disk and on subsequent runs, the user will not be asked again to provide a license key.

```java
AuthorComponentFactory.getInstance().init(
    frameworkZips, optionsZipURL, codeBase, appID,
    //Null license key, will ask the user.
    null);
...
```

• Inject the licensing information key directly in the component's Java code.

Note that this method can only be used for evaluation and site license keys. For example:

```java
AuthorComponentFactory.getInstance().init(
    frameworkZips, optionsZipURL, codeBase, appID,
    //The license key if it is a fixed license.
    licenseKey);
...
```

Related Information:

- https://www.oxygenxml.com/sdk_agreement.html

Installation Requirements

Running the Oxygen XML Author Component embedded in a third-party Java/Swing application requires:

• Oracle (Sun) Java JRE version 1.8.
• At least 100 MB disk space and 100MB free memory.

Customization

For a special type of XML, you can create a custom framework (on page 3282) (which also works in a standalone version of Oxygen XML Editor). Oxygen XML Editor already has frameworks for editing
DocBook, DITA, TEI, and so on. Their sources are available in the Oxygen SDK. This custom framework is then packed in a zip archive and used to deploy the component.

Figure 735. Components of a Custom Framework

![Diagram showing components of a custom framework]

Multiple frameworks can coexist in the same component and can be used at the same time for editing XML documents.

Figure 736. Multiple Frameworks
You can add on your custom toolbar all actions available in the standalone Oxygen XML Editor application for editing in the **Author** mode. You can also add custom actions defined in the **framework** customized for each XML type.

The Oxygen XML Author Component can also provide the **Outline** (on page 347), **Model** (on page 353), **Elements** (on page 432), and **Attributes** (on page 426) views, which can be added to your own developed containers.

The main entry point for the Oxygen XML Author Component Java API is the **AuthorComponentFactory** class.

**Related Information:**

- Creating and Configuring Custom Frameworks (on page 2322)

- Oxygen XML Author Component (on page 2618)

- AuthorComponentFactory API
Example - Customizing the DITA Framework

If you look inside the bundle-frameworks\oxygen-frameworks folder distributed with the Oxygen XML Author Component sample project, it contains a frameworks folder. Customizations that affect the framework configuration for the component should first be done in a standalone installation of Oxygen XML Editor.

An Oxygen XML Editor standalone installation also includes a frameworks folder that contains the dita framework located in \[OXYGEN_INSTALL_DIR]\frameworks\dita. The dita framework contains a bundled DITA-OT distribution that contains the DTDs used for DITA editing. If your DTD specialization is a DITA OT plugin, it should be installed (on page 3256) in the DITA-OT-DIR\plugins folder.

To make changes to the DITA framework configuration, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, and edit or extend the framework. These changes will affect the \[OXYGEN_INSTALL_DIR]\frameworks\dita\dita.framework configuration file.

After you do this, you can re-pack the Oxygen XML Author Component following the instructions from the README.html file located in the Oxygen XML Author Component sample project. The Author Component sample project and the Oxygen XML Editor standalone installation should be of the same version.

Related Information:

• Advanced Framework Customization (on page 2322)

Packing a Fixed Set of Options

The Oxygen XML Author Component shares a common internal architecture with the standalone application, although it does not have Preferences dialog boxes. However, the Author Component can be configured to use a fixed set of user options on startup.

The sample project contains a module called bundle-options. The module contains a file called options.xml in the oxygen-options folder. Such an XML file can be obtained by exporting the options to an XML format from an installation of Oxygen XML Editor.

To create an options file in the Oxygen XML Editor:

• Make sure the options that you want to set are not stored at project level (on page 265).
• Set the values you want to impose as defaults in the Preferences pages (on page 79).
• Select Options > Export Global Options.
Adding MathML support in the Oxygen XML Author Component

By default, the Oxygen XML Author Component does not come with the libraries necessary for viewing and editing MathML equations in the Author mode. You can view and edit MathML equations either by adding support for JEuclid (on page 2624) or by adding support for MathFlow (on page 2624).

Adding MathML Support Using JEuclid

By default, the JEuclid library is excluded from the Oxygen SDK artifact dependencies. To enable it, comment the following lines in the pom.xml file:

```xml
<exclusion>
  <artifactId>jeuclid-core</artifactId>
  <groupId>net.sourceforge.jeuclid</groupId>
</exclusion>
```

To edit specialized DITA Composite documents with MathML content, include the entire MathML2 framework directory (for example, the default location is: 
\[OXYGEN_INSTALL_DIR\]/frameworks/mathml2) in the frameworks (on page 3282) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

Adding MathML Support Using MathFlow

In the pom.xml file, add dependencies to the following additional libraries used by the MathFlow library to parse MathML equations:

1. MFComposer.jar
2. MFExtraSymFonts.jar
3. MFSimpleEditor.jar
4. MFStructureEditor.jar
5. MFStyleEditor.jar

**Note:** For MathFlow 2.1, all of these JAR (on page 3283) files are packaged into one file called MathFlow.jar.

You can reference these additional libraries from the MathFlow SDK as in the example below:

```xml
<dependency>
  <groupId>com.dessci</groupId>
  <artifactId>MFComposer</artifactId>
</dependency>
```
In addition, you must obtain fixed MathFlow license keys for editing and composing MathML equations and register them using these API methods: `AuthorComponentFactory.setMathFlowFixedLicenseKeyForEditor` and `AuthorComponentFactory.setMathFlowFixedLicenseKeyForComposer`.

To edit specialized DITA Composite with MathML content, include the entire `${OXYGEN_INSTALL_DIR}/frameworks/mathml2` Mathml2 framework directory in the frameworks (on page 3282) bundled with the component in the bundle-frameworks module. This directory is used to solve references to MathML DTDs.

More documentation is available on the Design Science MathFlow website.

Adding Support to Insert References from a WebDAV Connection

Predefined actions that insert references, such as the Insert Image action, includes a URL chooser field with a drop-down menu that allows you to select a Browse Data Source Explorer action. This action opens the Data Source Explorer (on page 2198) that allows you to view a WebDAV connection.

To use a WebDAV connection in the Oxygen XML Author Component, follow these steps:

1. Open a standalone Oxygen XML Editor 21.1 and configure a WebDAV connection (on page 2254).
2. Pack the fixed set of options (on page 2623) from the standalone application to use them with the Oxygen XML Author Component project.
3. In the Oxygen XML Author Component, the defined connection still does not work when expanded because the additional JAR libraries used to browse the WebDAV repository are missing. By default, the httpclient dependency of the Oxygen SDK artifact is excluded. You can enable it by commenting the following lines:

```xml
<exclusion>
  <artifactId>httpclient</artifactId>
  <groupId>org.apache.httpcomponents</groupId>
</exclusion>
```

If you want to have multiple WebDAV connection URLs, user names, and passwords (depending on the user who started the component), you can use a more flexible approach by using the following API:
Using Plugins with the Oxygen XML Author Component

To bundle Workspace Access plugins (on page 3285) that are developed for the standalone application with the Oxygen XML Author Component, follow these steps:

- The bundle-plugins module must contain the additional plugin directories in the dropins subdirectory. The content must also contain a plugin.dtd file. Copy the plugin.dtd file from an \{OXYGEN_INSTALL_DIR\}\plugins folder.
- In the class that instantiates the AuthorComponentFactory (for example the ro.sync.ecss.samples.AuthorComponentSample class), call the methods AuthorComponentFactory.getPluginToolbarCustomizers(), AuthorComponentFactory.getPluginViewCustomizers(), and AuthorComponentFactory.getMenubarCustomizers(), obtain the customizers that have been added by the plugins and call them to obtain the custom swing components that they contribute. There is a commented-out example for this in the AuthorComponentSample.reconfigureActionsToolbar() method for adding the toolbar from the Acrolinx plugin.

⚠️ Important: As the Oxygen XML Author Component is just a subset of the entire application, there is no guarantee that all the functionality of the plugin will work.

Frequently Asked Questions

Installation and Licensing

1. Are there any client requirements beyond the Java VM?

   Oracle (formerly Sun) Java JRE version 1.8. At least 200 MB disk space and 200MB free memory is necessary for the Oxygen XML Author Component.

2. Does the Oxygen XML Author Component support multiple documents being open simultaneously? What are the licensing ramifications?
A single AuthorComponentFactory instance can create multiple EditorComponentProvider editors that can then be added and managed by the developer who customizes the component in a Swing JTabbedPane. A single license (floating or user-based) is enough for this.

If you need to run multiple distinct Java processes using the Oxygen XML Author Component, the current floating license model allows for only two concurrent components from the same computer when using the HTTP floating license server. An additional started component will take an extra license seat.

**Functionality**

1. What graphic formats can be directly rendered in the Oxygen XML Author Component?

   GIF, JPEG, PNG, BMP and SVG.

2. Can links be embedded to retrieve (from the server) and “play” other types of digital assets, such as audio or video files?

   You could add listeners to intercept clicks and open the clicked links. This would require a good knowledge of the Oxygen SDK. The Oxygen XML Author Component can only render static images (no GIF animations).

3. Does the Oxygen XML Author Component provide methods for uploading ancillary files (new graphics, for instance) to the hosting server?

   No.

4. Does the Oxygen XML Author Component provide any type of autosave functionality?

   By default no, but you could customize it to save its content periodically to a file on disk.

5. Assuming multiple documents can be edited simultaneously, can content be copied, cut, and pasted from one Oxygen XML Author Component “instance” to another?

   Yes.

6. Does the Oxygen XML Author Component support pasting content from external sources (such as a web page or a Microsoft Word document and, if so, to what extent?

   If no customizations are available, the content is pasted as simple text. Customizations are provided for the major frameworks (DITA, DocBook, TEI, etc.) that use a conversion XSLT stylesheet to convert HTML content from clipboard to the target XML.

7. Can UTF-8 characters (such as Greeks, mathematical symbols, etc.) be inserted and rendered?

   Any UTF-8 character can be inserted and rendered, provided that the font used for editing supports rendering the characters. The font can be changed by developers but not by the users. When using a logical font (by default, Serif for the Oxygen XML Author Component), the JVM will
know how to map all characters to glyphs. There is no character map available but you could implement one.

Customization

1. Describe, in general terms, the menus, toolbars, contextual menu options, helper panes, and so on, that are available for the Oxygen XML Author Component out-of-the-box.

You can mount all actions available in the standalone Oxygen XML Editor application on your custom toolbar. This includes custom actions defined in the framework customized for each XML type.

The Oxygen XML Author Component also can provide the Outline (on page 347), Model (on page 353), Elements (on page 432), and Attributes (on page 426) views that can be added to your own panels.

2. Describe, in general terms, the actions, project resources (for example, DTD/Schema for validation purposes, CSS/XSL for styling, etc.) and typical level of effort that would be required to deploy a Oxygen XML Author Component solution for a customer with a proprietary DTD.

The Author mode internal engine uses CSS to render XML.

For a special type of XML, you can create a custom framework (which also works in an Oxygen XML Editor standalone version) that would also contain default schemas and custom actions. A simple framework would probably need 2-3 weeks development time. For a complex framework with many custom actions, it could take a long time. Oxygen XML Editor already has frameworks for editing (DocBook, DITA, TEI, etc.) and sources for them are available in the Oxygen SDK.

Multiple frameworks can co-exist in the same Oxygen XML Editor instance and can be used at the same time for editing XML documents.

3. Many customers desire a very simplistic interface for contributors (with little or no XML expertise) but a more robust XML editing environment for editors (or other users with more advanced XML expertise). How well does the Oxygen XML Author Component support varying degrees of user interface complexity and capability?

• Showing/hiding menus, toolbars, helpers, etc.

You assemble all the UI parts from the Oxygen XML Author Component. For example, you could provide two implementations: one for advanced users and one for content authors.

• Forcing behaviors (for example, ensuring change tracking (on page 3288) is on and preventing it from being shut down).

You could avoid placing the change tracking toolbar actions in the UI. You could also use the API to turn change tracking ON when the content has been loaded.
• Preventing access to "privileged" editor processes (for example, accept/reject changes).

You can remove the change tracking actions completely in a custom implementation, including the ones from the contextual menu.

• Presenting and/or describing XML constructs (for example, tags) in "plain-English".

Using our API, you can customize what the Outline view or Breadcrumb displays for each XML tag. You can also customize the in-place content completion list.

• Presenting a small subset of the overall XML tag set (rather than the full tag set) for use by contributors (for example, allowing an author to only insert Heading, Para, and inline emphasis).

The API allows for a content completion filter that also affects the Elements view.

4. Does the Oxygen XML Author Component API provide access to the XML document, for manipulation purposes, using common XML syntax (such as DOM, XPath, etc.)?

Yes, using the Oxygen XML Author Component API.

5. Can custom dialog boxes be developed and launched to collect information in a "form" (with scripting behind to push tag the collection information and embed it in the XML document)?

Yes.

6. Can project resources and customizations be readily shared between the desktop and component versions of your Oxygen XML Author Component product line?

A framework developed for the standalone version of the Oxygen XML Editor application can then be bundled with the Oxygen XML Author Component. For example, you could use the same framework that you use in the Oxygen XML Editor standalone distribution.

A custom editing solution can deploy one or more frameworks that can be used at the same time.

Print Document Within the Oxygen XML Author Component

Question

Can a document be printed within the Oxygen XML Author Component?

Answer

You can use the following API method to either print the document content to the printer or to show the Print Preview dialog box, depending on the preview parameter value:

AuthorComponentProvider.print(boolean preview)
Here is the online Javadoc for this method: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/component/AuthorComponentProvider.html#print(boolean)

Oxygen XML Web Author Component

The **Oxygen SDK** provides the ability to integrate the Oxygen XML Web Author into your existing content ecosystem and it allows anyone in your organization to access your content from anywhere they have an internet connection. Oxygen XML Web Author is highly versatile and can be customized to work with any XML vocabulary, most file repository systems, and virtually any type of workflow.

**Web Author Component Integration**

For information about integrating Oxygen XML Web Author into your environment, see [Web Author Integration](#).

**Web Author Customization**

For detailed information about customizing Web Author, see the [Oxygen XML Web Author Customization Guide](#).

**Using Web Author**

For information about using the Web Author product, see the [Oxygen XML Web Author User Manual](#).

**Web Author vs. Web Author Component**

The purpose of this topic is to help you choose which distribution of Oxygen XML Web Author is appropriate for your particular use-case.

Oxygen XML Web Author has two distributions:

1. **Oxygen XML Web Author** (product) - This version can be downloaded from the Oxygen website and is licensed according to the [Web Author License Agreement](#).
2. **Web Author Component** - Provided as a Maven artifact (according to the [SDK Agreement](#)) that is used in the [Web Author Component integration project](#). This project can be used as a starting point for your integration.

**Note:** The formal definition for Web Author Component inside the SDK agreement is: "Web Author Component is a subset of Software composed of a server component operating as a service application and a client component deployed to a web browser, such as an [HTML5](#)."
Based application, where the client component is not installed on the client machine but is in use by the client machine while the browser is connected to the server component."

For End Users

For end users, the recommended distribution is Oxygen XML Web Author (product).

For Plugin and Framework Developers

If you develop frameworks or plugins that provides enhanced functionality for Oxygen XML Web Author, it is recommended to distribute the plugin or framework separately from Web Author. They will work with both types of distributions and the end users can choose:

- To install your plugin or framework in Web Author.
- To use a solution based on Web Author that has the plugin or framework installed by default.
- To use a solution based on Web Author and install the plugin or framework themselves.

Example of such plugins/frameworks:

- Integration with a terminology database.
- Adding support to edit embedded SVG snippets.
- Providing support for a specific XML language.

For Integration Developers

If you want to integrate Oxygen XML Web Author into another application (for example, a CMS), that you distribute to your end users, there are several aspects to consider when choosing between the two distributions:

**Functionality**

Both versions have the same features.

**Legal**

If you want to use the Web Author Component, you must have your own application that is not called Oxygen XML Web Author, but will contain Web Author as a software component provided by Syncro Soft. Hence, Syncro Soft does not have a direct legal link with your users, you will handle the licensing of your application to your end users.

For the official details, you can consult the license agreements for both distributions:
2. Web Author Component: https://www.oxygenxml.com/sdk_agreement.html

Financial

If you choose to use the Web Author product to distribute as a plugin or framework, then you act as a channel reseller, basically reselling Oxygen XML Web Author to your end users and you must pay Syncro Soft the corresponding cost of the license.

The Web Author Component is available with more flexible pricing alternatives that are negotiated for each contract and include:

- Subscription packages similar to the ones used for the Web Author product, but you may get a discount depending on the partnership level (Gold, Silver, Bronze).
- Solution OEM license.

If you choose to integrate the Web Author Component into your application, the cost is based on royalties, rather than a cost for the license. That means you do not need to pay for the ability to include the component in your application, but when you distribute your application you must pay a royalty to Syncro Soft.

Customization

It is strongly recommended to implement any customization as a combination of plugins, frameworks, and options. If you are using Web Author Component, you can also alter the Web Author files, but this is discouraged since those files are not considered API and may change in a future version.

Deployment

If you want to use Oxygen XML Web Author (product), you can install it using the installation kits, then configure the plugins, frameworks, and options using a browser-based UI. Alternatively, you can configure Oxygen XML Web Author to load the configuration from a custom directory (Oxygen Data Directory) along with desired plugins, frameworks, and options.

If you want to use Web Author Component, you can use the Web Author Component integration project to build a custom WAR file with plugins, frameworks, and options bundled. This WAR file can be deployed in any Servlet container (for example, Tomcat).
Distribution

If you want to use Oxygen XML Web Author (product), your users must download Oxygen XML Web Author from the Oxygen website, while you will distribute your plugins/frameworks to your users. You should provide instructions on how to deploy and use Oxygen XML Web Author. Alternatively, you can install and configure it for them.

If you want to use Web Author Component, you will distribute the customized WAR file.

SDK Common Use Cases

This section contains details for specific use cases regarding customizations using the Oxygen SDK, Author Component (on page 2618), or plugins (on page 2580).

For additional questions, contact the Oxygen support team. The preferred approach is via email because these types of questions must be analyzed thoroughly. The Oxygen support team also provides code snippets, if applicable.

To stay up-to-date with the latest changes, discuss issues, and ask for solutions from other developers working with the Oxygen SDK, register on the Oxygen-SDK mailing list.

Add Custom Actions to the Contextual Menu?

Question

How do I add my own custom actions to the contextual menu using an API?

Answer

The WSAuthorEditorPageBase.addPopUpMenuCustomizer and WSTextEditorPage.addPopUpMenuCustomizer API methods allow you to customize the contextual menu shown either in the Author or Text modes. The API is available both in the standalone application and in the Eclipse plugin.

Here is an elegant way to add actions to the Author page from your Eclipse plugin extension:

1. Create a pop-up menu customizer implementation:

```java
import org.eclipse.jface.action.ContributionManager;
import org.eclipse.ui.PlatformUI;
import org.eclipse.ui.menus.IMenuService;
import org.eclipse.ui.menus.IMenuContributionBuilder;
import org.eclipse.ui.menus.MenuContributionBuilder;
import org.eclipse.ui.menus.MenuManager;
import org.eclipse.ui.menus.MenuManagerFactory;
import org.eclipse.ui.menus.MenuPart;
import org.eclipse.ui.menus.MenuPartManager;
import org.eclipse.ui.menus.MenuPartManagerFactory;
import org.eclipse.ui.menus.MenuItem;
import org.eclipse.ui.menus.MenuItemFactory;
import org.eclipse.ui.menus.WorkspaceMenuFactory;
import ro.sync.ecss.extensions.api.AuthorAccess;
```
import ro.sync.ecss.extensions.api.structure.AuthorPopupMenuCustomizer;

/**
 * This class is used to create the possibility to attach certain
 * menuContributions to the {\link ContributionManager}, which is used for the
 * popup menu in the Author Page of the Oxygen Editor.<br />
 * You just need to use the org.eclipse.ui.menus extension and add a
 * menuContribution with the locationURI: <b>menu:oxygen.authorpage</b>
 */
public class OxygenAuthorPagePopupMenuCustomizer implements AuthorPopupMenuCustomizer {

    @Override
    public void customizePopUpMenu(Object menuManagerObj, AuthorAccess authoraccess) {
        if (menuManagerObj instanceof ContributionManager) {
            ContributionManager contributionManager = (ContributionManager) menuManagerObj;
            IMenuService menuService = (IMenuService) PlatformUI.getWorkbench().getService(IMenuService.class);

            menuService.populateContributionManager(contributionManager,
                    "menu:oxygen.authorpage");
            contributionManager.update(true);
        }
    }
}

2. Add a workbench listener and add the pop-up customizer when an editor is opened in the Author page:

    Workbench.getInstance().getActiveWorkbenchWindow().getPartService().addPartListener(
        new IPartListener() {
            @Override
            public void partOpened(IWorkbenchPart part) {
                if (part instanceof ro.sync.xml.workspace.api.editor.WSEditor) {
                    WSEditorPage currentPage = ((WSEditor)part).getCurrentPage();
                    if (currentPage instanceof WSAuthorEditorPage) {
                        ((WSAuthorEditorPage)currentPage).addPopUpMenuCustomizer(new OxygenAuthorPagePopupMenuCustomizer());
                    }
                }
            }
        });
Add Custom Callouts

**Question**

I want to highlight validation errors, instead of underlining them (for example, changing the text background color to red or yellow). Also, I want a message displayed directly at the error position that describes the problem. Is this possible using the API?

**Answer**

The Plugins API allows you to set a `ValidationProblemsFilter` that gets notified when automatic validation errors are available. Then you can map each of the problems to an offset range in the **Author** mode using the API `WSTextBasedEditorPage.getStartEndOffsets(DocumentPositionedInfo)`. For each of those offsets, you can add either persistent or non-persistent highlights. If you add persistent highlights, you can also customize callouts to appear for each of them. The downside is that they need to be removed before the document gets saved. The result would look something like this:

*Figure 737. Custom Callouts with Persistent Highlights*
Here is a working example:

```java
/**
 * Plugin extension - workspace access extension.
 */

public class CustomWorkspaceAccessPluginExtension
    implements WorkspaceAccessPluginExtension {

    /**
     * @see ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension
     * applicationStarted(
     * ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
     */

    public void applicationStarted(
        final StandalonePluginWorkspace pluginWorkspaceAccess)
    {
        pluginWorkspaceAccess.addEditorChangeListener(
            new WSEditorChangeListener() {
                /**
                 * @see WSEditorChangeListener#editorOpened(java.net.URL)
                 */
                @Override
                public void editorOpened(URL editorLocation) {
                    final WSEditor currentEditor = pluginWorkspaceAccess.getEditorAccess( editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
                    WSEditorPage currentPage = currentEditor.getCurrentPage();
                    if(currentPage instanceof WSAuthorEditorPage) {
                        final WSAuthorEditorPage currentAuthorPage =
```
currentAuthorPage.getPersistentHighlighter().setHighlightRenderer(new PersistentHighlightRenderer() {
    @Override
    public String getTooltip(AuthorPersistentHighlight highlight) {
        return highlight.getClonedProperties().get("message");
    }
    @Override
    public HighlightPainter getHighlightPainter(AuthorPersistentHighlight highlight) {
        //Depending on severity could have different color.
        ColorHighlightPainter painter = new ColorHighlightPainter(Color.COLOR_RED, -1, -1);
        painter.setBgColor(Color.COLOR_RED);
        return painter;
    }
});
currentAuthorPage.getReviewController().getAuthorCalloutsController().setCalloutsRenderingInformationProvider(new CalloutsRenderingInformationProvider() {
    @Override
    public boolean shouldRenderAsCallout(AuthorPersistentHighlight highlight) {
        //All custom highlights are ours
        return true;
    }
    @Override
    public AuthorCalloutRenderingInformation getCalloutRenderingInformation(final AuthorPersistentHighlight highlight) {
        final AuthorPersistentHighlight highlight =

Add Custom Highlights to Content

**Question**

How can I add custom highlights to the document content in **Author** mode?

**Answer**

There are two types of highlights you can add:
1. **Non-Persistent Highlights** - Such highlights are removed when the document is closed and then re-opened.

You can use the following API method:

```java
ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getHighlighter()
```

to obtain an `AuthorHighlighter` that allows you to add a highlight between certain offsets with a specified painter.

For example, you can use this support to implement your own spell checker with a custom highlight for the unrecognized words.

2. **Persistent Highlights** - Such highlights are saved in the XML content as processing instructions.

You can use the following API method:

```java
ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getPersistentHighlighter()
```

to obtain an `AuthorPersistentHighlighter` class that allows you to add a persistent highlight between certain offsets, set new properties for a specific highlight, and render it with a specified painter.

For example, you can use this support to implement your own way of adding review comments.

**Auto-Generate an ID When a Document is Opened or Created**

**Question**

Is it possible to configure how the application generates IDs? For project compliance, I need IDs that have a certain format for each created topic.

**Answer**

This could be done implementing a [plugin (on page 3285)](on_page) for Oxygen XML Editor using the Plugins SDK:
There is a type of plugin called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented plugin would intercept the opened editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```java
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
    }
    /**
     * @see WSEditorChangeListener#editorPageChanged(java.net.URL)
     */
    @Override
    public void editorPageChanged(URL editorLocation) {
        WSEditor ed = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
    }

    private void generateID(WSEditor ed) {
        if(ed.getCurrentPage() instanceof WSAuthorEditorPage) {
            WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage) ed.getCurrentPage();
            AuthorDocumentController ctrl = authorEditPage.getDocumentController();
            AuthorElement root = ctrl.getAuthorDocumentNode().getRootElement();
            if(root.getAttribute("id") == null || !root.getAttribute("id").getValue().startsWith("generated_")) {
                ctrl.setAttribute("id", new AttrValue("generated_" + Math.random()), root);
            }
        }
    }

}, PluginWorkspace.MAIN_EDITING_AREA);
```
Change the Default Track Changes (Review) Author Name

**Question**

How can I change the default author name used for Track Changes (on page 3288) in the Author Component?

**Answer**

The Track Changes (Review) author name is determined in the following order:

1. **API** - The review user name can be imposed through the following API:

   ```java
   ro.sync.ecss.extensions.api.AuthorReviewController.setReviewerAuthorName(String)
   ```

2. **Options** - If the author name was not imposed from the API, it is determined from the Author option set in the Review preferences page (on page 141).

3. **System properties** - If the author name was not imposed from the API or from the application options then the following system property is used:

   ```java
   System.getProperty("user.name")
   ```

So, to impose the Track Changes author, use one of the following approaches:

1. Use the API to impose the reviewer author name. Here is the online Javadoc of this method:
   https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorReviewController.html#setReviewerAuthorName(java.lang.String)

2. Customize the default options and set a specific value for the Author name option set in the Review preferences page (on page 141).

3. Set the value of user.name system property when the Author Component is initializing and before any document is loaded.

---

Change the DOCTYPE of an Opened XML Document

**Question**

How to change the DOCTYPE of a document opened in the Author mode?

**Answer**

The following API:
ro.sync.ecss.extensions.api.AuthorDocumentController.getDoctype()

allows you to get the **DOCTYPE** of the current XML file opened in the **Author** mode.

There is also an API method available that would allow you to set the **DOCTYPE** back to the XML:

```
ro.sync.ecss.extensions.api.AuthorDocumentController.setDoctype(AuthorDocumentType)
```

Here is an example of how this solution would work:

```java
AuthorDocumentType
dt = new AuthorDocumentType("article", "testSystemID", "testPublicID",
                      "<!DOCTYPE article PUBLIC "testPublicID" "testSystemID">");
docController.setDoctype(dt);
```

Basically, you could take the entire content from the existing **DOCTYPE**, modify it to your needs, and create another **AuthorDocumentType** object with the new content and with the same public, system IDs.

For example, you could use this API is you want to add unparsed entities in the XML **DOCTYPE**.

### Control XML Serialization in the Oxygen XML Author Component

#### Question

How can I force the Oxygen XML Author Component to save the XML with zero indent size and not to break the line inside `block elements` **(on page 3280)**?

#### Answer

Usually, in a standalone version of Oxygen XML Editor, the `Editor > Format` and `Editor > Format > XML` preferences pages allow you to control the way the XML is saved on the disk after you edit it in the **Author** mode.

Also, the `APIAccessibleOptionTags` interface contains a list of all accessible keys that can be read or set from the options.

In the Oxygen XML Editor application, you can either bundle a default set of options **(on page 262)** or use the `PluginWorkspace.setGlobalObjectProperty(String, Object)` API:

```java
//For not breaking the line
//Long line
```
In the Oxygen XML Author Component, you can either bundle a fixed set of options (on page 2661), or use the Java API to set properties that overwrite the default options.

```java
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_LINE_WIDTH, new Integer(100000));
//Do not break before inline elements
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_FORMAT_INDENT_INLINE_ELEMENTS, false);
//For forcing zero indent
//Force indent settings to be controlled by us
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_DETECT_INDENT_ON_OPEN, false);
//Zero indent size
pluginWorkspace.setObjectProperty
    (APIAccessibleOptionTags.EDITOR_INDENT_SIZE, 0);
```

Customize the Default Icons for Toolbars/Menus

**Question**

How can I change the default icons used for the built-in actions?

**Answer**

If you look inside the main JAR library \[OXYGEN\_INSTALL\_DIR\lib\oxygen.jar \text{ or } \[OXYGEN\_INSTALL\_DIR\lib\author.jar\], it contains an images folder that contains all the images used for buttons, menus, and toolbars.

To overwrite them with your own creations, follow these steps:

1. In the \[OXYGEN\_INSTALL\_DIR\lib\ directory create a folder called endorsed.
2. In the endorsed folder create another folder called images.
3. Add your own images in the images folder.

You can use this mechanism to overwrite any kind of resource located in the main Oxygen JAR library. The folder structure in the endorsed directory and in the main Oxygen JAR must be identical.

Customize the Outline View in Text Mode?

**Question**

How do I customize the Outline view (on page 347) in Text mode?

**Answer**

Suppose that you have the following XML document:

```xml
<doc startnumber="15">
    <sec counter="no">
        <info/>
        <title>Introduction</title>
    </sec>
    <sec>
        <title>Section title</title>
        <para>Content</para>
    </sec>
</doc>
```
and you want to display the XML content in a simplified Outline view like this:

```
<doc>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
  <sec>
    <title>Section title</title>
    <para>Content</para>
  </sec>
<sec>
  <title>Section title</title>
  <para>Content</para>
</sec>
</doc>
```

Usually, an Outline view should have the following characteristics:

1. Double-clicking a node in the Outline view would select the corresponding XML content in the editor.
2. When the cursor moves in the opened XML document, the Outline view would select the proper entry.
3. When modifications occur in the document, the Outline view would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```java
/**
 * Simple Outline for Text mode based on executing XPaths over the text content.
 */
public class CustomWorkspaceAccessPluginExtension implements WorkspaceAccessPluginExtension {
    /**
     * The custom outline list.
     */
    private JList customOutlineList;

    /**
     * Maps outline nodes to ranges in document
     */
    private WSXMLTextNodeRange[] currentOutlineRanges;
```
/**
 * The current text page
 */
private WSXMLTextEditorPage currentTextPage;

/**
 * Disable CaretListener when we select from the CaretListener.
 */
private boolean enableCaretListener = true;

/**
 * @see WorkspaceAccessPluginExtension#applicationStarted
 * (ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
 */
@Override
public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
pluginWorkspaceAccess.addViewComponentCustomizer
(new ViewComponentCustomizer() {
/**
 * @see ViewComponentCustomizer#customizeView
 * (ro.sync.exml.workspace.api.standalone.ViewInfo)
 */
@Override
public void customizeView(ViewInfo viewInfo) {
    if(
        //The view ID defined in the "plugin.xml"
        "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
        customOutlineList = new JList();
        //Render the content in the Outline.
        customOutlineList.setCellRenderer(new DefaultListCellRenderer() {
/**
 * @see javax.swing.DefaultListCellRenderer#getListCellRendererComponent
 * (javax.swing.JList, java.lang.Object, int, boolean, boolean)
 */
@Override
public Component getListCellRendererComponent
(JList<?> list, Object value, int index,
    boolean isSelected, boolean cellHasFocus) {
    //
JLabel label = (JLabel) super.getListCellRendererComponent(list, value, index, isSelected, cellHasFocus);

String val = null;

if(value instanceof Element) {
    Element element = ((Element)value);
    val = element.getNodeName();
    if(!"".equals(element.getAttribute("startnumber"))) {
        val += " + " + element.getAttribute("startnumber") + "';
    }
    NodeList titles = element.getElementsByTagName("title");
    if(titles.getLength() > 0) {
        val += " '" + titles.item(0).getTextContent() + "';
    }
}

label.setText(val);

return label;

//When we click a node, select it in the text page.
customOutlineList.addMouseListener(new MouseAdapter() {

Difference Between a Framework (Document Type) and a Plugin Extension

Question

What is the difference between a Framework (on page 3282) and a Plugin (on page 3285) Extension?

Answer

There are two possible ways to customize the application:

1. Implement a plugin.

   A plugin serves a general purpose and influences any type of XML file that you open in Oxygen XML Editor.
   
   For the Oxygen XML Editor Plugins API, Javadoc, samples, and documentation, go to https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

2. Create or modify the document type (on page 2322) that is associated to your specific XML vocabulary.

   This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

   For example, if the end users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA framework. If you look in the Document Type Association preferences page (on page 92) there is a DITA document type. If you edit that document type you will see that it has an Author tab in the Document Type Configuration dialog box (on page 95). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

   For information about developing your own document types (frameworks), see the Advanced Framework Customization (on page 2322) section.

   If you look on disk in the [OXYGEN_INSTALL_DIR]\frameworks\dita folder, there is a file called dita.framework. That file gets updated when you edit a document type from the Document Type Association preferences page (on page 92). Then you can share that updated file with all users.

   The same folder contains some JAR (on page 3283) libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.
The Oxygen SDK contains the Java sources from all the DITA Java customizations:

https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK

⚠️ **Important:** It is possible for a plugin to share the same classes with a framework. For further details, go to How to Share the Classloader Between a Framework and a Plugin (on page 2611).

**Disable Context-Sensitive Menu Items for Custom Author Actions**

**Question**

Is there a way to disable menu items for custom Author mode actions depending on the cursor context?

**Answer**

By default, Oxygen XML Editor does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain Author mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own ro.sync.ecss.extensions.api.ExtensionsBundle implementation you can overwrite the method:

ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()

and when the extension state listener gets activated, you can use the API like this:

```java
/**
 * @see ro.sync.ecss.extensions.api.AuthorExtensionStateListener#activated
 * (ro.sync.ecss.extensions.api.AuthorAccess)
 */

public void activated(final AuthorAccess authorAccess) {
    //Add a caret listener to enable/disable extension actions:
    authorAccess.getEditorAccess().addAuthorCaretListener(new AuthorCaretListener())
}
```java
@Override
public void caretMoved(AuthorCaretEvent caretEvent) {
    try {
        Map<String, Object> authorExtensionActions =
            authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();

        //Get the action used to insert a paragraph. It's ID is "paragraph"
        AbstractAction insertParagraph = (AbstractAction) authorExtensionActions.get("paragraph");

        //Evaluate an XPath expression in context of the current node
        Object[] evaluateXPath = authorAccess.getDocumentController().evaluateXPath
            ("*[ancestor-or-self::p]", false, false, false, false);

        if (evaluateXPath != null && evaluateXPath.length > 0 &&
            evaluateXPath[0] != null) {
            //We are inside a paragraph, disable the action.
            insertParagraph.setEnabled(false);
        } else {
            //Enable the action
            insertParagraph.setEnabled(true);
        }
    } catch (AuthorOperationException e) {
        e.printStackTrace();
    }
}
```

When the extension is deactivated, you should remove the `CaretListener` to avoid adding multiple listeners that perform the same functionality.

### Dynamically Add Form Controls Using a Styles Filter

**Question**

How do I add form controls using an API?

**Answer**

Usually, a form control is added from the CSS using one of the built-in form controls *(on page 2541)*. However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically `ro.sync.ecss.extensions.api.StylesFilter`. 
For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:

```java
public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT
                && "before".equals(authorNode.getName())) {
            authorNode = authorNode.getParent();
        }
        if ("country".equals(authorNode.getName())) {
            // This is the BEFORE pseudo element of the "country" element.
            // Read the supported countries from the configuration file.
            Map<String, Object> formControlArgs = new HashMap<String, Object>();
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDIT, "#text");
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_TYPE, InplaceEditorArgumentKeys.TYPE_COMBOBOX);
            String countries = readCountriesFromFile();
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);
            formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDITABLE, "false");

            // We also add a label in form of the form control.
            Map<String, Object> labelProps = new HashMap<String, Object>();
            labelProps.put("text", "Country: ");
            labelProps.put("styles", "* {width: 100px; color: gray;}");
            StaticContent[] mixedContent = new StaticContent[]{
                new LabelContent(labelProps),
                new EditorContent(formControlArgs)
            };
            styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);
        }

        // The added form control is the only way the element can be edited.
        if ("country".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_VISIBITY, "-oxy-collapse-text");
        }

        return styles;
    }
}
```
If the execution of the `formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);` line consumes too much execution time (for example, if it connects to a database or if it needs to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called *lazy evaluation* and can be implemented as follows:

```java
formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES,
    new LazyValue<List<CIValue>>() {
        public java.util.List<CIValue> get() {
            // We avoid reading the possible values until they are actually requested.
            // This will be a List with CIValues created over countries:
            // France, Spain, Great Britain
            return readCountriesFromFile();
        }
    });
```

The lazy evaluation approach can be used for the following form controls properties:

- `InplaceEditorArgumentKeys.PROPERTY_VALUES`
- `InplaceEditorArgumentKeys.PROPERTY_LABELS`
- `InplaceEditorArgumentKeys.PROPERTY_TOOLTIPS`

The full source code for this example is available inside the *Oxygen SDK*.

**Dynamically Modify the Content Inserted by the Author**

**Question**

Is there a way to insert typographic quotation marks instead of double quotes?

**Answer**

By using the API you can set a document filter to change the text that is inserted in the document in *Author* mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```java
authorAccess.getDocumentController().setDocumentFilter(new AuthorDocumentFilter() {
    /**
     * @see ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText
     */
    @Override
    public void insertText(TextContent textContent, InsertionPosition insertionPosition) { /* implementation */ }
});
```
```java
@Override
public void insertText(AuthorDocumentFilterBypass filterBypass,
        int offset, String toInsert) {
    if(toInsert.length() == 1 && toInsert.equals("\"\") {  // User typed a quote but he actually needs a smart quote.
        // So we either have to add \u201E (start smart quote)
        // Or we add \u201C (end smart quote)
        // Depending on whether there's already a start smart quote inserted in the current paragraph.
        try {
            AuthorNode currentNode = authorAccess.getDocumentController().getNodeAtOffset(offset);
            int startOfTextInCurrentNode = currentNode.getStartOffset();
            if(offset > startOfTextInCurrentNode) {
                Segment seg = new Segment();
                authorAccess.getDocumentController().getChars(startOfTextInCurrentNode,
                        offset - startOfTextInCurrentNode, seg);
                String previousTextInNode = seg.toString();
                boolean insertStartQuote = true;
                for (int i = previousTextInNode.length() - 1; i >= 0; i--) {
                    char ch = previousTextInNode.charAt(i);
                    if('\u201C' == ch) {
                        // Found end of smart quote, so yes, we should insert a start one
                        break;
                    } else if('\u201E' == ch) {
                        // Found start quote, so we should insert an end one.
                        insertStartQuote = false;
                        break;
                    }
                }
                if(insertStartQuote) {
                    toInsert = \u201E;
                } else {
                    toInsert = \u201C;
                }
            }
        }
```
catch (BadLocationException e) {
    e.printStackTrace();
}
} System.err.println("INSERT TEXT |" + toInsert + "|");
    super.insertText(filterBypass, offset, toInsert);
});

You can find the online Javadoc for AuthorDocumentFilter API here: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro-sync/ecss/extensions/api/AuthorDocumentFilter.html

An alternative to using a document filtering is the use of a ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).

Extend the Java Functionality of an Existing Framework (Document Type)

Question

How can I change the way a DocBook 4 xref displays in Author mode based on what element is at the linkend?

Answer

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Editor classes:

   <dependency>
   <groupId>com.oxygenxml</groupId>
   <artifactId>oxygen-sdk</artifactId>
   <version>${oxygen.version}</version>
   </dependency>

   where ${oxygen.version} is the version of Oxygen XML Editor.

   Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the [OXYGEN_INSTALL_DIR]\frameworks\docbook\docbook.jar to the classpath of the project.

4. For your custom resolver implementation you can start from the Java sources of the `ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` (the Java code for the entire DocBook customization is present in a subfolder in the Oxygen SDK).

5. Pack your extension classes in a JAR (on page 3283) file. Copy the JAR to: `{OXYGEN_INSTALL_DIR}\frameworks\docbook\custom.jar`.

7. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association. Edit the DocBook 4 document type. In the Classpath list add the path to the new JAR. In the extensions list select your custom extension instead of the regular DocBook one.

8. You can rename the document type and the docbook framework folder to something else (such as custom_docbook) and share it with others. A document type can also be installed using the add-on support (on page 2372).

### Impose Custom Options for Authors

#### Question

How to enable Track Changes (on page 3288) at startup?

#### Answer

There are two ways to enable Track Changes for every document that you open:

1. You could customize the default options (on page 262) that are used by your authors and set the Track Changes - Initial State option (on page 140) to Always On.

2. Use an API to toggle the Track Changes state after a document is opened in Author mode:

```java
// Check the current state of Track Changes
boolean trackChangesOn = authorAccess.getReviewController().isTrackingChanges();
if (!trackChangesOn) {
    // Set Track Changes state to On
    authorAccess.getReviewController().toggleTrackChanges();
}
```
Insert an Element with all the Required Content

Question

I am inserting a DITA image element using the API that points to a certain resource and has required content. Can the required content be automatically inserted by the application?

Answer

The API ro.sync.ecss.extensions.api.AuthorSchemaManager can propose valid elements that can be inserted at the specific offset. Using the method AuthorSchemaManager.createAuthorDocumentFragment(CIElement), you can convert the proposed elements to document fragments (on page 3281) (which have all the required content filled in) that can then be inserted in the document.

```java
ing AuthorSchemaManager schemaManager =
      this.authorAccess.getDocumentController().getAuthorSchemaManager();

    WhatElementsCanGoHereContext context =
      schemaManager.createWhatElementsCanGoHereContext (
      this.authorAccess.getEditorAccess().getCaretOffset());

    List<CIElement> possibleElementsAtCaretPosition =
      schemaManager.whatElementsCanGoHere(context);

    loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
        CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
        List<CIAttribute> attrs = possibleElement.getAttributes();
        if (attrs != null) {
            for (int j = 0; j < attrs.size(); j++) {
                CIAttribute ciAttribute = attrs.get(j);
                if (ciAttribute.getName().equals("class") ) {
                    if (ciAttribute.getDefaultValue() != null &&
                        ciAttribute.getDefaultValue().contains("  topic/image ") ) {
                        //Found a CIElement for image
                        //Create a fragment that contains all required child elements already built.
                        AuthorDocumentFragment frag =
                          schemaManager.createAuthorDocumentFragment(possibleElement);
                        //Now set the @href to it.
                        //Ask the user and obtain a value for the @href
                        //Then:
```
String href = "test.png";
List<AuthorNode> nodes = frag.getContentNodes();
if (!$nodes.isEmpty()) {
    AuthorElement imageEl = (AuthorElement) nodes.get(0);
    imageEl.setAttribute("href", new AttrValue(href));
}
//And insert the fragment.
this.authorAccess.getDocumentController().insertFragment
(this.authorAccess.getEditorAccess().getCaretOffset(), frag);
break loop;
}
/**
 * @see WSEditorChangeListener#editorOpened(java.net.URL)
 */

@Override
public void editorOpened(URL editorLocation) {
    WSEditor openedEditor = pluginWorkspaceAccess.getCurrentEditorAccess
            (StandalonePluginWorkspace.MAIN_EDITING_AREA);
    if (openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {
        WSAuthorEditorPage authPage = (WSAuthorEditorPage)
                openedEditor.getCurrentPage();
        WSEditorDocumentController docController =
                authPage.getDocumentController();
        try {
            //All changes will be undone by pressing Undo once.
            docController.beginCompoundEdit();
            fixupImageRefs(docController,
                    docController.getAuthorDocumentNode());
        } finally {
            docController.endCompoundEdit();
        }
    }

    private void fixupImageRefs
            (AuthorDocumentController docController, AuthorNode authorNode) {
        if (authorNode instanceof AuthorParentNode) {
            //Recurse
            List<AuthorNode> contentNodes =
                    ((AuthorParentNode)authorNode).getContentNodes();
            if (contentNodes != null) {
                for (int i = 0; i < contentNodes.size(); i++) {
                    fixupImageRefs(docController, contentNodes.get(i));
                }
            }
        }
        if (authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
            AuthorElement elem = (AuthorElement) authorNode;
            if ("image".equals(elem.getLocalName())) {
                if (elem.getAttribute("href") != null) {
                    String originalHref = elem.getAttribute("href").getValue();
                }
            }
        }
    }
}
2. An API to open XML documents in the application:

```java
ro.sync.exml.workspace.api.Workspace.open(URL)
```

So you can create a plugin that automatically opens XML documents one at a time from a certain folder in the application, makes modifications to them, and saves the content by calling:

```java
ro.sync.exml.workspace.api.editor.WSEditorBase.save()
```

then closes the editor by calling:

```java
ro.sync.exml.workspace.api.Workspace.close(URL)
```

Modify the XML Content on Save

**Question**

Is it possible to get Oxygen XML Editor to update the revised date on a DITA document when it is saved?

**Answer**

The Plugins SDK contains a sample plugin type called **WorkspaceAccess**. Such a plugin is notified when the application starts.

You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use the **Author API** to change attributes before the save takes place:

```java
@Override
public void applicationStarted(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener
```
```java
(new WSEditorChangeListener(){
    //An editor was opened
    @Override
    public void editorOpened(URL editorLocation) {
        final WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        if(editorAccess != null){
            editorAccess.addEditorListener(new ro.sync.exml.workspace.api.listeners.WSEditorListener(){
                //Editor is about to be saved
                @Override
                public boolean editorAboutToBeSavedVeto(int operationType) {
                    if(EditorPageConstants.PAGE_AUTHOR.equals(editorAccess.getCurrentPageID())){
                        WSAuthorEditorPage authorPage = (WSAuthorEditorPage) editorAccess.getCurrentPage();
                        AuthorDocumentController controller = authorPage.getDocumentController();
                        try {
                            //Find the revised element
                            AuthorNode[] nodes = controller.findNodesByXPath("//revised", true, true, true);
                            if(nodes != null && nodes.length > 0){
                                AuthorElement revised = (AuthorElement) nodes[0];
                                //Set the modified attribute to it...
                                controller.setAttribute("modified", new AttrValue(new Date().toString()), revised);
                            }
                        } catch (AuthorOperationException e) {
                            e.printStackTrace();
                        }
                    }
                }
            });
        }
    }
}, PluginWorkspace.MAIN_EDITING_AREA);
```
Multiple Rendering Modes for the Same Document in Author Mode

**Question**

How can I add multiple buttons, each showing a different visualization mode of the same document in Author mode?

**Answer**

In the toolbar in Author mode, there is a Styles drop-down menu that contains alternate CSS styles (on page 3279) for the same document. To add an alternate CSS stylesheet, open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Type Association, select the document type associated with your documents and press Edit. In the Document Type configuration dialog box (on page 95) that appears, go to the Author tab, and in the CSS subtab add references to alternate CSS stylesheets.

For example, one of the alternate CSS stylesheets offered for the DITA document type is located here (by default):

```
[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideColspec.css
```

If you open it, you will see that it imports the main CSS (on page 3284) and then adds selectors of its own.

Obtain a DOM Element from AuthorNode or AuthorElement

**Question**

Can a DOM Element be obtained from an AuthorNode or an AuthorElement?

**Answer**

No, a DOM Element cannot be obtained from an AuthorNode or an AuthorElement. The AuthorNode structure is also hierarchical but the difference is that all the text content is kept in a single text buffer instead of having individual text nodes.

There is an image in the Javadoc documentation that explains this situation: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/node/AuthorDocumentFragment.html
Obtain the Currently Selected Element Using the Author API

Question

In Author mode, if an element is fully selected, I want to perform an action on it. If not, I want to perform an action on the node that is located at the cursor position. Is this possible via the API?

Answer

When an element is fully selected by the user the selection start and end offsets are actually outside of the node's offset bounds. So using AuthorDocumentController.getNodeAtOffset will actually return the parent of the selected node. A special API is available that makes it easier for you to determine this situation: WSAuthorEditorPageBase.getFullySelectedNode().

```java
AuthorDocumentController controller = authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();

int caretOffset = authorAccess.getEditorAccess().getCaretOffset();

AuthorElement nodeAtCaret = (AuthorElement) authorAccess.getEditorAccess().getFullySelectedNode();

if (nodeAtCaret == null) {
    // We have no fully selected node. We can look at the cursor offset.
    nodeAtCaret = (AuthorElement) authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    // Or we could look at the selection start and end, see which node is the parent of each offset and get the closest common ancestor.
}
```

Open a Document in Oxygen from Another Application

⚠️ Restriction: This feature is currently only available for Mac OS X users.

The Oxygen XML Editor installation kit for Mac OS X comes with a special protocol handler that can be used if you want to open remote resources in the application (for example, opening a file from a CMS). The protocol is edit-in-oxygen and you can use it from a command line like this:

```
open edit-in-oxygen:protocol://host/path/file.xml
```

For example, if you start the following from the command line:
Run XSLT or XQuery Transformations

Question

Can I run XSL 2.0 / 3.0 transformation with Saxon EE using the Oxygen SDK?

Answer

The API class `ro.sync.exml.workspace.api.util.XMLUtilAccess` allows you to create an XSLT Transformer that implements the JAXP interface `javax.xml.transform.Transformer`. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an `AuthorAccess` API available:

```java
InputSource is = new org.xml.sax.InputSource
(URLUtil.correct(new File("test/personal.xsl")).toString());
xslSrc = new SAXSource(is);
javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer(xslSrc, null, AuthorXMLUtilAccess.TRANSFORMER_SAXON.EnterpriseEdition);
transformer.transform(new StreamSource(new File("test/personal.xml")),
new StreamResult(new File("test/personal.html")));
```

If you want to create the transformer from the plugin side, you can use this method instead: `ro.sync.exml.workspace.api.PluginWorkspace.getXMLUtilAccess()`.

Save a New Document with a Predefined File Name Pattern

Question

Is it possible to get Oxygen XML Editor to automatically generate a file name comprising a UUID plus file extension using the SDK?

Answer

This could be done implementing a plugin (on page 3285) for Oxygen XML Editor using the Plugins SDK.
There is a type of plugin called *Workspace Access* that can be used to add a listener to be notified before an opened editor is saved. The implemented plugin would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```java
private static class CustomEdListener extends WSEditorListener{
    private final WSEditor editor;
    private final StandalonePluginWorkspace pluginWorkspaceAccess;
    private boolean saving = false;

    public CustomEdListener(StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {
        this.pluginWorkspaceAccess = pluginWorkspaceAccess;
        this.editor = editor;
    }

    @Override
    public boolean editorAboutToBeSavedVeto(int operationType) {
        if (!saving &&
            editor.getEditorLocation().toString().contains("Untitled") ) {
            File chosenDir = pluginWorkspaceAccess.chooseDirectory();
            if(chosenDir != null) {
                final File chosenFile =
                    new File(chosenDir, UUID.randomUUID().toString() + ".dita");
                SwingUtilities.invokeLater(new Runnable() {
                    @Override
                    public void run() {
                        try {
                            saving = true;
                            editor.saveAs(new URL(chosenFile.toURI().toASCIIString()));
                        } catch (MalformedURLException e) {
                            e.printStackTrace();
                        } finally {
                            saving = false;
                        }
                    }
                });
        }
        //Reject the original save request.
    }
}
```
    return false;
}
    return true;
}

@Override
    public void applicationStarted
        (final StandalonePluginWorkspace pluginWorkspaceAccess) {
            pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
                @Override
                public void editorOpened(URL editorLocation) {
                    final WSEditor editor = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
                    if(editor != null && editor.getEditorLocation().toString().contains("Untitled")) {
                        //Untitled editor
                        editor.addEditorListener(new CustomEdListener(pluginWorkspaceAccess, editor));
                    }
                }
            }, PluginWorkspace.MAIN_EDITING_AREA);
        ................................................................................................

Split Paragraph on Enter (Instead of Showing Content Completion List)

**Question**

Is it possible to split the paragraph on Enter instead of showing the content completion list?

**Answer**

Yes, it is possible by creating your own custom operation.

To obtain this behavior, follow this procedure:

1. Create a custom **Author mode operation** *(on page 2476)* that handles the split. You can use the `AuthorDocumentController.split` API to achieve this.
2. Create a JAR library that contains its compiled version.
3. **Open the Preferences dialog box (Options > Preferences) (on page 79), go to Document Types Association, and select your framework.**

4. **Click Edit and in the Document Type configuration dialog box (on page 95), go to the Classpath tab (on page 99) and add a reference to the JAR library for your custom operation.**

5. Go to the Author tab, then go to the Actions subtab.

6. Click the **New** button and use the Action dialog box (on page 102) to create your own paragraph split action.

7. Make sure you assign **Enter** as the **Shortcut Key** and specify your custom operation in the Operations section.

---

**Result:** Now, when you press **Enter**, your Java operation will be invoked to split the paragraph instead of opening the **Content Completion Assistant**.

**Tip:** The **Content Completion Assistant** can still be invoked by using the **Ctrl+Space** keyboard shortcut.

---

**Use Custom Rendering Styles for Entity References, Comments, or PIs**

**Problem**

Is there a way to display entity references in the **Author** mode without the distinct gray background and tag markers?

**Solution**

There is a built-in CSS stylesheet in the Oxygen XML Editor libraries that is used when styling content in the **Author** mode, no matter what CSS you use. This CSS has the following content:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
    display:block !important;
}

oxy|cdata {
    display:morph !important;
    white-space:pre-wrap !important;
}
```
border-width: 0px !important;
margin: 0px !important;
padding: 0px !important;
}

oxy|processing-instruction {
    display: block !important;
    color: rgb(139, 38, 201) !important;
    white-space: pre-wrap !important;
    border-width: 0px !important;
    margin: 0px !important;
    padding: 0px !important;
}

oxy|comment {
    display: morph !important;
    color: rgb(0, 100, 0) !important;
    background-color: rgb(255, 255, 210) !important;
    white-space: pre-wrap !important;
    border-width: 0px !important;
    margin: 0px !important;
    padding: 0px !important;
}

oxy|reference:before,
oxy|entity[href]:before{
    link: attr(href) !important;
    text-decoration: underline !important;
    color: navy !important;

    margin: 2px !important;
    padding: 0px !important;
}

oxy|reference:before {
    display: morph !important;
    content: url(../images/editContent.gif) !important;
}

oxy|entity[href]:before{
display: morph !important;
content: url(../images/editContent.gif) !important;
}

oxy|reference,
oxy|entity {
  editable:false !important;
  background-color: rgb(240, 240, 240) !important;
  margin:0px !important;
  padding: 0px !important;
}

oxy|reference {
  display:morph !important;
}

oxy|entity {
  display:morph !important;
}

oxy|entity[href] {
  border: 1px solid rgb(175, 175, 175) !important;
  padding: 0.2em !important;
}

xi|include {
  display:block !important;
  margin-bottom: 0.5em !important;
  padding: 2px !important;
}

xi|include:before,
xi|include:after{
  display:inline !important;
  background-color:inherit !important;
  color:#444444 !important;
  font-weight:bold !important;
}

xi|include:before {
  content:url(../images/link.gif) attr(href)  !important;
In the CSS used for rendering the XML in Author mode, do the following:

1. Import the special Author mode namespace.
2. Use a special selector to customize the entity node.

Example:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');

oxy|entity {
    background-color: inherit !important;
    margin: 0px !important;
    padding: 0px !important;
    -oxy-display-tags:none;
}
```

You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and CDATA sections. You can also customize the way xi:include elements are rendered.
18. Add-ons

Oxygen XML Editor offers various default add-ons that can be installed to provide additional functionality to Oxygen XML Editor. Some additional community submissions are also available, although community add-ons are not officially supported or endorsed. For more information see the Oxygen XML SDK Add-on Repositories web page.

This chapter contains information about the default add-ons that are available to install directly from Oxygen XML Editor.

To install one of the default add-ons, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the add-on you want to install and click Next.
4. Restart the application.

Batch Converter Add-on

Oxygen XML Editor offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats. You can convert between the following formats:

- HTML to XHTML
- HTML to DITA
- Markdown to XHTML
- Markdown to DITA
- XML to JSON
- JSON to XML
- HTML to DocBook4
- HTML to DocBook5
- Markdown to DocBook4
- Markdown to DocBook5
- Excel to DITA

To install it the add-on, follow these instructions:
1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Batch Converter** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** A Batch Converter submenu will now be available in the **Tools** menu and in the contextual menu of the **Project** view. This submenu will contain a list of the various types of available conversions. Selecting one of the types of conversions will open a dialog box where you can configure options for the conversion.

For more information, see the details for this Batch Converter add-on in GitHub.

### CGM Image Support Add-on

Oxygen XML Editor offers two add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Oxygen CGM support** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** You should be able to see CGM images in **Author** mode.

For more information, see the details about this CGM Support add-on in GitHub.

### Alternate Method Using the ISOView Active X Component

⚠️ **Restriction:** This support will only work on 32 bit versions of Oxygen XML Editor.

If you already have the **ISOView Active X** component for Internet Explorer installed, you may want to use it to render CGM images instead of the components provided in the plugin described above.

To use your existing ISOView Active X component to render CCM images, follow these steps:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.
3. Select **CGM Form control (Active X-based)** plugin and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.
6. The **CGM Form Control** plugin automatically renders CGM files in DITA, DocBook, and XHTML, so for those **frameworks**, this step is not necessary. For other **frameworks (on page 3282)**, modify your CSS according to your particular **framework**.

If you have an XML:

```xml
<image href="MyCGMFile.cgm"/>
```

You need a CSS rule like this:

```css
image[href$=".cgm"],
image[href$=".CGM"]{
  content: oxy_editor(
    saHeavyFormControlClassName , "com.oxygenxml.activex.fctrl.ActiveXFormControl",
    href, oxy_url(oxy_base-uri() , attr(href)));
}
```

**Result:** After performing these steps, you should now be able to see CGM images in **Author** mode.

### Content Fusion Connector Add-on

Oxygen XML Editor includes an **Oxygen Content Fusion Connector** add-on that comes bundled and pre-installed. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to virtually any type of workflow that a collaborative team may use for their documentation review process. The add-on provides access to the **Show Content Fusion Tasks Manager** toolbar button. Clicking this button will open the **Content Fusion Tasks Manager** view where you can create tasks, manage them, attach documents, and upload them to the **Content Fusion** server. You can also go to **Window > Show View > Content Fusion Tasks Manager** to open the view. If the button is not displayed on the toolbar or the view is not listed in the **Show View** menu, see **Re-installing the Content Fusion Connector Add-on**.

To fully take advantage of all of the benefits and features, your organization will need an **Oxygen Content Fusion Enterprise Server**. This solution allows you to host, setup, and configure your own server and control your data. With this model, you are also able to upload custom frameworks and plugins, and to configure various settings. It is possible to evaluate **Content Fusion** free of charge, for a limited time. For more information, see the **Oxygen Content Fusion website**.
For more information about using Content Fusion in Oxygen XML Editor, see the Oxygen Content Fusion User Guide.

DITA Prolog Updater Add-on

Oxygen XML Editor offers an add-on that contributes a preferences page (Options > Preferences > Plugins > DITA Prolog Updater) that includes various options for updating the prolog section of a DITA topic or map.

Installing the Add-on

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA Prolog Updater add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: The DITA Prolog Updater preferences page will now be available in Options > Preferences > Plugins.

DITA Prolog Updater Preferences Page

The contributed preferences page includes the following general options:

Author

Specifies the name of the author. By default, it is the system user name.

Date format

Specifies the format of the date that will be added in the prolog section. If the date format entered is invalid, the yyyy/MM/dd format is used by default.

These options are followed by the following options that can be set for DITA topics or maps (or both):

Enable automatic prolog update on save

When this option is selected, the prolog is updated anytime the document is saved.

Set creator name

When this option is selected, the author is set as the document’s creator in the prolog when the document is saved. This option is only applicable for new documents.
Set created date

When this option is selected, a created date is added to the prolog when the document is saved. This option is only applicable for new documents.

Update contributor names

When this option is selected, the author is set as a contributor in the prolog when the document is saved. This option is only applicable for already existing documents.

Update revised dates

When this option is selected, a revised date is added to the prolog when the document is saved. This option is only applicable for already existing documents.

For more information, see the details for this DITA Prolog Updater add-on in GitHub.

DITA OT 3.x Publishing Engine Add-on

Oxygen XML Editor offers an add-on that contributes an option in the DITA preferences page (Options > Preferences > DITA) to provide the ability to publish DITA content using DITA-OT 3.x, by default.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA OT 3.x Publishing Engine add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: The DITA preferences page will now include a radio button where you can select DITA-OT 3.x as the default publishing engine.

For more information, see the details for this DITA OT 3.x Publishing Engine add-on in GitHub.

DITA Translation Package Builder Add-on

Oxygen XML Editor offers an add-on that contributes contextual menu actions that help you build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Translation Package Builder add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** A Translation Package Builder submenu will now be available in the contextual menu of the DITA Maps Manager. This submenu includes actions to generate a package of modified files that can be sent to translators, as well as an action to extract translated files back into your DITA project.

For more information, see the details for this Translation Package Builder add-on in GitHub.

---

**DocBook Checker Add-on**

Oxygen XML Editor offers an add-on that allows you to validate DocBook files. It reports issues such as broken internal and external links, problems with images, or profiling conditions that conflict with profiling preferences.

To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DocBook Checker add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** A Check DocBook for Completeness action will now be available on the toolbar and in the contextual menu. This action opens a dialog box that offers various validation options for running a completeness check on the current DocBook document.

For more information, see the details for this DocBook Checker add-on in GitHub.

---

**Embed Images Add-on**

Oxygen XML Editor offers an add-on that contributes a contextual menu action to embed all images referenced in a DITA, DocBook, or XHTML document as base 64 encoded. This is helpful if you want to transfer a document with image references over media designed to deal with textual data (for example, uploading as a blog post or sending via email) and you want to ensure the data remains intact.

To install the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://raw.githubusercontent.com/oxygenxml/oxygen-embed-images/master/addon.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Oxygen Embed Images add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** An **Embed all referenced images as Base64-encoded** action will now be available in the contextual menu when editing DITA, DocBook, or XHTML documents in **Author** mode.

---

**Excel XLSX Libraries Add-on**

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Editor needs additional libraries from the Apache POI project. Oxygen XML Editor offers an add-on that provides this support.

To add this support, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select Excel XLSX libraries add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** You can now use the **Import wizard** (on page 2279) to import data from Excel 2007 or newer.

---

**Related Information:**

- Exporting XML Content to Excel (on page 892)

---

**Git Support Add-on**

Oxygen XML Editor offers an add-on that contributes a built-in Git client directly into Oxygen XML Editor. Once this add-on is installed, a **Git Staging** view is available that includes various actions that perform common Git commands, such as push, pull, change branch, commit, and more. It also includes a built-in tool for comparing and merging changes.

To install it the add-on, follow these instructions:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Git Support (Experimental) add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: A Git Staging view will now be available in Oxygen XML Editor. If it is not visible, go to Window > Show View and select Git Staging. This view acts as a basic Git client integrated directly into Oxygen XML Editor and it provides support for committing changes to a Git repository, comparing and merging changes, and other Git commands.

For more information, see the details for this Git Support add-on in GitHub.

ICU4J Library Add-on

Oxygen XML Editor offers an add-on that provides the entire ICU4J JAR library used for sorting and collations with XSLT processors. The Saxon 9 XSLT processor has an xsl:sort element that can be used to sort elements based on their text content. If the XML elements contain text in exotic languages, Saxon needs a more powerful sort algorithm and this JAR library adds this capability.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Contribute ICU4J Library add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: The ICU4J library is now contributed to the Oxygen installation directory.

For more information, see the details for this Contribute ICU4J Library add-on in GitHub.

PDF Image Rendering Add-on

Starting with Oxygen XML Editor version 20.0, PDF images are rendered in Author mode and PDF output. For previous versions, they are not rendered by default. However, Oxygen XML Editor does provide an add-on that contributes the Apache PDFBox library to offer support for rendering of PDF images.
Installing the PDF Image Rendering Add-on

Oxygen XML Editor offers an add-on that contributes the Apache PDFBox library for you. To install this add-on, follow these steps:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the PDF Image Rendering add-on and click Next.
4. Select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The Apache PDFBox libraries are now contributed to the Oxygen installation directory and you should be able to see PDF images in Author mode.

For more information, see the details about this PDF Image Rendering add-on in GitHub.

Saxon XSLT and XQuery Transformer Add-on

Oxygen XML Editor offers an add-on that installs an external Saxon XSLT and XQuery processor and allows you to validate and transform XSLT and XQuery documents with that external processor. The default add-on update site includes versions for Saxon 9.6, 9.7, 9.8, and 9.9.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select one of the versions of the Saxon XSLT and XQuery Transformer add-on (9.6, 9.7, 9.8, or 9.9) and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: When you configure the validation or transformation scenario, you will now have the option to choose the particular Saxon transformer.

⚠️ Restriction: Debugging XSLT/XQuery transformations based on this engine is NOT supported.
XSpec Helper View Add-on

Oxygen XML Editor offers an add-on that contributes an **XSpec Test Results** view, that provides the ability to run XSpec test scenarios and view the results directly in the application.

To install the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open the add-on selection dialog box.
2. Paste **https://www.oxygenxml.com/InstData/Addons/community/updateSite.xml** in the **Show add-ons from** field (or select it from the drop-down menu).
3. Select the **XSpec Helper View** and **XSpec Framework** add-ons (both are required), and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

The add-on contributes a **Run XSpec test scenarios** button on the main toolbar. Click that button to execute an XSpec file and open its results in the **XSpec Test Results** view. At this point you can do the following:

- Switch to the XSLT and use the **Run** buttons in this view to execute a particular scenario.
- For each test, there is also a **Show** button that selects the corresponding test in the main editing area.
- For failed tests, you can click a particular test to open a diff comparison between the expected and actual results.

For more information, see the details for this **Oxygen XSpec Helper View** add-on in GitHub.
19.

Tools

Oxygen XML Editor includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The Tools menu.
- The Refactoring submenu from the contextual menu in the Project view (on page 333).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 2990).

Note: The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values.
For your convenience, the last 5 operations that were finished (on page 1142) or previewed (on page 1142) also appear in the Refactoring submenu of the contextual menu in the Project view and the DITA Maps Manager.

**XML Refactoring Wizard**

The XML Refactoring tool includes the following wizard pages:

**Refactoring operations**

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

![XML Refactoring Wizard](image)

**Configure Operation Parameters**

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Scope section

In the Scope section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 3281) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 3288).

Filters
The Filters section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Finish**

After clicking the Finish button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any Undo action will only revert changes on the current document.

**Troubleshooting:** If an operation fails, a notification will be displayed in the Results panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

**Tip:** If an operation takes longer than expected you can use the Stop button in the progress bar to cancel the operation.

**Restriction:** XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

**Built-in Refactoring Operations**

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the Refactoring operations wizard page. You can also access the operations from the Refactoring submenu in the contextual menu of Author or Text mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.
Tip: Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

**Refactoring Operations for Attributes**

**Add/Change attribute**

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

**Parent element section**

- **Element**
  
  The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

- **Local name**
  
  The local name of the affected attribute.

- **Namespace**
  
  The namespace of the affected attribute.

- **Value**
  
  The value for the affected attribute.

**Options section**

You can choose between one of the following options for the Operation mode:

- **Add the attribute in the parent elements where it is missing**
  
  Adds the attribute to all instances of the specified parent element.

- **Change the value in the parent elements where the attribute already exists**
  
  Replaces the value of the already existing attribute in all instance of the specified parent element.

- **Both**
Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

**Convert attribute to element**

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**New element section**

**Local name**

The local name of the new element.

**Namespace**

The namespace of the new element.

**Delete attribute**

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be deleted.

**Rename attribute**
Use this operation to rename an attribute. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be renamed.

**New local name**

The new local name of the attribute.

**Replace in attribute value**

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

**Target attribute section**

**Element**

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be modified.

**Find / Replace section**

**Find**

The text fragments to find. You can use Perl-like regular expressions.

**Replace with**

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

**Refactoring Operations for Comments**

**Delete comments**
Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

**Element**

The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:** Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

---

**Refactoring Operations for DITA**

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS tables to simple tables**

Use this operation to convert DITA CALS tables to simple tables.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs (on page 3133).

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2990))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2990))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type (on page 3059).
Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (on page 3059).

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (on page 3059).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (on page 3059).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (on page 3059).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (on page 3059).

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only
Excludes non-XML file types from the operation.

**Look inside archives**

If this option is selected, the scope of the operation will include files inside archives.

### Refactoring Operations for *Elements*

#### Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

**Element**

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

#### Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

**Element**

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

#### Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**

The local name of the element to be inserted.

**Namespace**

The namespace of the element to be inserted.

**Location section**

**XPath**
An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**
Local name
The local name of the Wrapper element.

Namespace
The namespace of the Wrapper element.

Wrap element content
Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)
The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name
The local name of the Wrapper element that will surround the content of the target.

Namespace
The namespace of the Wrapper element that will surround the content of the target.

Refactoring Operations for Fragments

Insert XML fragment
Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment
The XML fragment to be inserted.

Location section

XPath
An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position
The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the target element.

Refactoring Operations for **JATSKit**

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:
Scope

Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, or just the Current file.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Look inside archives

If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for Publishing Template

These operations are for those who use Oxygen Publishing Templates for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom HTML page layout files (on page 1909) that are included in a custom Publishing Template that was created in Oxygen XML Editor version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor version 21.0.

Update HTML Pages

⚠️ Attention: This operation is only used by Oxygen XML Editor and should not be used manually.

Additional Notes

فاقيت: There are some operations that allow <ANY> for the local name and namespace parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

فاقيت: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the Options >
Preferences > XML > XSLT-FO-XQUERY > XPath (on page 214) page. This preferences page can be easily opened by clicking the link in the note *(Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section)* at the bottom of the Configure Operation Parameters wizard page.

Custom Refactoring Operations

While Oxygen XML Editor includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

Figure 741. Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the XML Refactoring Tool and presented in the Refactoring Operations wizard page (on page 1140), along with the built-in operations.
After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- **When loading the document:**
  - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- **When saving the updated XML document:**
  - The **DOCTYPE** will be preserved.

  **Note:** This can be changed using **Saxon extension functions in XSLT (on page 1170)**.
  - The DTD entities will be preserved as they are in the original document when the document is saved.
  - The attribute values will be kept in their original form without being normalized.
  - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:** To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes` namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

**Restriction:** **Comments or processing instructions** that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use **Saxon extension functions and the XSLT stylesheet method (on page 1170)** to implement the new custom XML refactoring operation.

### Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an **XQuery Update script (on page 1160)** or **XSLT stylesheet file (on page 1165)**.
2. Create an **XML Refactoring Operation Descriptor** file contains the path to the **XQuery Update script (on page 1163)** or **XSLT stylesheet (on page 1168)**.
3. Store both files in one of the locations that Oxygen XML Editor (on page 1172) scans when loading the custom operations.

**Result:** Once you run the XML Refactoring tool again, the custom operation appears in the Refactoring Operations wizard page (on page 1140).

### Related Information:
- Storing and Sharing Refactoring Operations (on page 1172)

### Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an XQuery Update script (on page 1160) or XSLT stylesheet (on page 1165) that is needed to process the refactoring operations. The easiest way to create this script file is to use the New document wizard to create a new XQuery or XSLT file and you can use the XQuery method example (on page 1160) or XSLT method example (on page 1165) to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script (on page 1160) or XSLT stylesheet (on page 1165). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the refactoring operation descriptor file that is associated with this operation.

**Note:** The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario (on page 1749) and choose Saxon EE as the transformation engine. Also, you need to make sure the Enable XQuery update option is selected in the Saxon processor advanced options (on page 1696).

**Note:** If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the XML /XSLT-FO-XQuery / XPath preferences page (on page 214).

The next step in creating a custom refactoring operation is to create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (on page 1163) or XSLT stylesheet (on page 1168).

### Related Information:
- XQuery Update Script for Creating a Custom Operation (on page 1160)
Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the New document wizard and choose the XML Refactoring Operation Descriptor template.

Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script (on page 1160) or XSLT stylesheet (on page 1165) that is associated with the particular operation through the script element.

You can specify a category for your custom operations to logically group certain operations. The category element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is Other operations.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation_descriptor.xsd.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the parameters section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the XML Refactoring tool within the Configure Operation Parameters wizard page (on page 1140) for that particular operation.

The value of the first description element in the parameters section will be displayed at the top of the Configure Operation Parameters wizard page (on page 1140).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - **TEXT** - Generic type used to specify a simple text fragment.
**XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.

**Note:** The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

**Note:** A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

**Note:** When writing XPath expressions, you can only use prefixes declared in the Options > Preferences > XML > XSLT-FO-XQUERY > XPath (on page 214) options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with **REG_EXP_FIND** to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for NC_NAME values. It is useful when you want to specify the local part of a QName (on page 3286) for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.

- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
    <value name="before">Before</value>
    <value name="after" default="true">After</value>
    <value name="firstChild">First child</value>
    <value name="lastChild">Last child</value>
</possibleValues>
```
Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

**elementLocation**

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `label` attribute is displayed in the application as the label of the text field. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `elementLocation`:

```xml
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</ElementLocation>
```

**attributeLocation**

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `label` attributes is displayed in the application as the label of the associated text fields. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `attributeLocation`:

```xml
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path"/>
</attributeLocation>
```
<description>Element path description.</description>
</element>

<attribute label="Attribute">
  <description>Attribute path description.</description>
</attribute>
</AttributeLocation>

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as label of the associated combo. The name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the allowsAny attribute, the application will propose <ANY> as a possible value for the Name and Namespace combo boxes. You can also use the useCurrentContext attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an elementParameter:

```xml
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>

  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the label attribute is displayed in the application as the label of the associated combo box. You can also use the useCurrentContext attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.
**Note:** An attributeParameter is dependant upon an elementParameter. The list of attributes and namespaces are computed based on the selection in the elementParameter combo boxes.

Example of an attributeParameter:

```xml
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>

  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

**Note:** All built-in operations are loaded from the `[OXYGEN_INSTALL_DIR]/refactoring` folder.

**Related Information:**

- Example of an Operation Descriptor File with an XQuery Update script *(on page 1163)*

**XSLT Stylesheet for Creating a Custom Operation**

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of image elements where a deprecated alt attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the image element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 742. Example: Custom XML Refactoring Operation
An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file (on page 1168) that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to Convert an Attribute to an Element

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
exclude-result-prefixes="xs"
xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
version="2.0">

<xsl:param name="element_localName" as="xs:string" required="yes"/>
<xsl:param name="element_namespace" as="xs:string" required="yes"/>
<xsl:param name="attribute_localName" as="xs:string" required="yes"/>
<xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
```
<xsl:template match="node() | @*">
  <xsl:copy>
    <xsl:apply-templates select="node() | @*"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="/*[xr:check-local-name($element_localName, ., true())
and
xr:check-namespace-uri($element_namespace, .)]">
  <xsl:variable name="attributeToConvert" select="@*[xr:check-local-name($attribute_localName, ., true())
and
xr:check-namespace-uri($attribute_namespace, .)]"/>

  <xsl:choose>
    <xsl:when test="empty($attributeToConvert)"
    >
      <xsl:copy>
        <xsl:apply-templates select="node() | @*"/>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <xsl:copy>
        <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]"/>
        <xsl:copy-of select="."/>
      </xsl:copy>
    </xsl:otherwise>
  </xsl:choose>

  <!-- The new element namespace -->
  <xsl:variable name="nsURI" as="xs:string" select="$new_element_namespace as $new_element_namespace eq $xr:NO-NAMESPACE">
    <xsl:choose>
      <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
        <xsl:value-of select="''"/>
      </xsl:when>
      <xsl:otherwise>
        <xsl:value-of select="$new_element_namespace"/>
      </xsl:otherwise>
    </xsl:choose>
  </xsl:variable>

  <xsl:element name="{$new_element_localName}" namespace="{$nsURI}"

Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML Catalog (on page 3289) set in the XML Refactoring framework (on page 3282).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor

xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"

id="convert-attribute-to-element"

name="Convert attribute to element">

<description>Converts the specified attribute to an element. The new element will be inserted as first child of the attribute’s parent element.</description>

<!-- For the XSLT stylesheet option uncomment the following line and comment the line referring the XQuery Update script -->

<!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->

<script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>

<parameters>

<description>Specify the attribute to be converted to element.</description>

<section label="Parent element">

<elementParameter id="elemID">

<localName label="Name" name="element_localName" allowsAny="true">

<description>Local name of the parent element.</description>

</localName>

```
Note: If you are using an XSLT file, the line with the `script` element would look like this:

```xml
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor when it loads the custom operation (on page 1172). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:
Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script (on page 1160) in that refactoring operations can only be performed on comments or processing instructions that are inside the root element. Thus, using the XQuery method, comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
    <child>
        <!-- comment before root -->
        <!-- comment after root -->
        <!-- comment after root -->
        <!-- comment after root -->
        <!-- comment after root -->
    </child>
</root>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

**Note:** They belong to the [http://www.oxygenxml.com/ns/xmlRefactoring/functions](http://www.oxygenxml.com/ns/xmlRefactoring/functions) namespace.
• **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```xml
<!-- comment after root -->
<?pi after root ?>
```

• **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child/>
</root>
<!-- Inserted comment -->
```

• **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
```

• **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```xml
<!-- Inserted comment -->
<root>
  <child/>
</root>
<!-- comment after root -->
<?pi after root ?>
```

**XSLT Example:**

To process content after the root node, the XSLT would look like this:
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
  <xsl:template match="/">
    <!-- The comment content that will be inserted after the root element -->
    <xsl:variable name="commentAsText">&lt;!-- COMMENT ADDED FROM XR OPERATION--&gt;</xsl:variable>
    <!-- Retrieve the content after the root element as is -->
    <xsl:variable name="after-root-content" as="xs:string"
      select="xrf:get-content-after-root()"/>
    <xsl:variable name="processedContent"
      select="concat($after-root-content, $commentAsText)"/>
    <!-- Update the content after the root element -->
    <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>
  </xsl:template>
</xsl:stylesheet>

**Note:** The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

### Storing and Sharing Refactoring Operations

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A *refactoring* folder, created inside a directory that is associated to a *framework* you are customizing. To associate the parent directory to the *framework*, you need to add it in the **Classpath** tab of the **Document type** configuration dialog box *(on page 99)*.
• A folder that you specify in the Load additional refactoring operations from text box (on page 224) in the XML Refactoring preferences page (on page 224).

Note: If you share a project with your team, you can also share the custom operation by doing the following:
1. Save the custom operation in a folder that is part of your project.
2. Switch the XML Refactoring option page to project level (on page 3286):
   a. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to XML > XML Refactoring (on page 224).
   b. Select Project Options (on page 3286) at the bottom of the dialog box.
3. In the Load additional refactoring operations from text box (on page 224), use the $pd editor variable (on page 282) so that the folder path is declared relative to the project.
• A folder specified by the XML Refactoring Operations Plugin Extension (on page 2601).
• The refactoring folder from the Oxygen XML Editor installation directory ([OXYGEN_INSTALL_DIR]/refactoring/).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as framework (on page 3282) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in [OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

• The operation name, description, and category.
• The description of the parameters element.
• The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

${i18n(translation_key)}
Oxygen XML Editor scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactoring/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.
- An i18n folder inside any specified folder. In this case, you need to open the Preferences dialog box (Options > Preferences) (on page 79), go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.
- An i18n folder located in directories specified through the XML Refactoring Operations Plugin Extension (on page 2601).
- The refactoring/i18n folder from the Oxygen XML Editor installation directory ({OXYGEN_INSTALL_DIR}/refactoring/i18n).

Example: Refactoring Operation Descriptor File with i18n Support

```xml
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
  name="$i18n(Remove_text_content)">
  <description>$i18n(Remove_text_content_description)</description>
  <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
  <parameters>
    <description>$i18n(parameters_description)</description>
    <parameter label="$i18n(Element_name)" name="element_localName"
      type="NC_NAME">
      <description>$i18n(Element_name_descriptor)</description>
      <possibleValues>
        <value default="true" name="value1">$i18n(value_1)</value>
        <value name="value2">$i18n(value_2)</value>
      </possibleValues>
    </parameter>
  </parameters>
</refactoringOperationDescriptor>
```

Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page (on page 193).
To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the Tools menu. This action is also available in the contextual menu of the schema Design mode (on page 1252). The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page (on page 196). You can also run the tool from the command line using exported options.

Schema Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the Schema tab.

Figure 744. Generate Sample XML Files Dialog Box (Schema Tab)

This tab includes the following options:

**URL**

- Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Namespace**

- Displays the namespace of the selected schema.

**Root Element**
After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**

Path to the folder where the generated XML instances will be saved.

**Filename prefix and Extension**

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances** (on page 1307).

**Number of instances**

The number of XML files to be generated.

**Open first instance in editor**

When selected, the first generated XML file is opened in the editor.

**Namespaces section**

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

**Options Tab (Generate Sample XML Files Tool)**

The **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Options** tab allows you to set specific options for namespaces and elements.

Figure 745. Generate Sample XML Files Dialog Box (Options Tab)
This tab includes the following options:

**Namespace / Element table**

 Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces ( `<ANY>` - `<ANY>` ). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

**Settings subtab**

**Namespace**

 Displays the namespace specified in the table at the top of the dialog box.

**Element**

 Displays the element specified in the table at the top of the dialog box.

**Generate optional elements**

 When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).
Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

⚠️ **Important**: If all of the following are true, the Generate Sample XML Files tool outputs invalid values:

- At least one of the restrictions is a `regexp`.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.
Type alternative strategy

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

- **First** - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
- **Random** - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `xs:choice` and `substitutionGroup`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.
Advanced Tab (Generate Sample XML Files Tool)

The Generate Sample XML Files tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The Advanced tab allows you to set some options regarding output values and performance.

Figure 746. Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `a` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

Running the Generate Sample XML Files Tool from the Command Line

The Generate Sample XML Files tool can be also used from command line by running the script called `xmlGenerator.bat` (on Windows) / `xmlGenerator.sh` (on Mac OS X / Unix / Linux) located in the Oxygen XML Editor installation folder. The parameters can be set in the dialog box, exported to
an XML file on disk with the **Export settings** button, and then reused from command line. With the exported settings file, you can generate the same XML instances from the command line as from the dialog box. For example:

```
xmlGenerator.bat path_of_CFG_file
```

The script can be integrated in an external batch process launched from the command line. The command-line parameter of the script is the relative path to the exported XML settings file. The files specified with relative paths in the exported XML settings will be made absolute relative to the folder where the script is run.

The following example shows such an XML configuration file:

```xml
<settings>
  <schemaSystemId>http://www.w3.org/2001/XMLSchema.xsd</schemaSystemId>
  <documentRoot>schema</documentRoot>
  <outputFolder>D:\projects\output</outputFolder>
  <filenamePrefix>instance</filenamePrefix>
  <filenameExtension>xml</filenameExtension>
  <noOfInstances>1</noOfInstances>
  <openFirstInstance>true</openFirstInstance>
  <defaultNamespace>&lt;NO_NAMESPACE&gt;</defaultNamespace>
  <element namespace="&lt;ANY>" name="&lt;ANY>">
    <generateOptionalElements>false</generateOptionalElements>
    <generateOptionalAttributes>false</generateOptionalAttributes>
    <valuesForContentType>DEFAULT</valuesForContentType>
    <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
    <maximumRecursivityLevel>1</maximumRecursivityLevel>
    <choicesAndSubstitutions strategy="RANDOM"
      generateOthersAsComments="false"/>
    <attribute namespace="&lt;ANY>" name="&lt;ANY>">
      <attributeValue>attrValue1</attributeValue>
      <attributeValue>attrValue2</attributeValue>
    </attribute>
  </element>
</settings>
```
Generate Sample JSON Files

Oxygen XML Editor includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select Generate Sample JSON Files from the Tools menu. The action opens a dialog box where you can configure a variety of options for generating the files.

Figure 747. Generate Sample JSON Files Dialog Box

The Generate Sample JSON Files dialog box includes the following fields and options:

**Schema URL**

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Output folder**
Path to the folder where the generated JSON instances will be saved.

**File name**

The name of the instance(s) that will be generated. By default, `instance.json` is used.

**Number of instances**

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

**Property Value**

You can specify the way the values of the properties are generated. The following options are available:

- **None** - Assigns empty values for properties (a template file will be generated). This is the default value.
- **Default** - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- **Random** - Assigns random values according to schema restrictions.

**Generate optional properties**

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

**Generate additional content**

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

**Choice strategy**

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either `oneOf` or `anyOf`). The following options are available:

- **First** - The first defined schema in `oneOf` or `anyOf` will be used.
- **Random** - A random schema defined in `oneOf` or `anyOf` will be used.

**Recursion level**

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

**Open first instance in editor**

If selected, the first generated instance is opened in the editor.
You can click **OK** at any point to generate the sample JSON files.

## Converting Schema to Another Schema Language

The **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses **Trang multiple format converter** to perform the actual schema conversions.

To use this tool, select the **Generate/Convert Schema (Alt + Shift + C (Command + Alt + C on OS X))** action from the **Tools** menu or from the **Open with** submenu when invoking the contextual menu in the **Project view** (on page 333). This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

### Figure 748. Generate/Convert Schema Dialog Box

The **Generate/Convert Schema** dialog box includes the following options:

**Input section**

- **Input** allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

**Output section**
Allows you to select the language of the target schema.

**Options**

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

**Output file**

Specifies the path for the output file that will be generated.

**Close dialog when finished**

If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

**Advanced options**

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

**XML 1.0 DTD Input section**

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
• **annotation-prefix** - Default values are represented using an annotation attribute prefixed with `prefix:defaultValue` where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a prefix unless that conflicts with a prefix used in the DTD.

• **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.

• **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element.

• **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.

• **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select **W3C XML Schema** for the output.

• **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.

• **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).

• **any-attribute-process-contents** - Specifies the value for the `processContents` attribute of anyAttribute elements. The default is skip (corresponding to RELAX NG semantics).
Converting Database to XML Schema

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the Convert DB Structure to XML Schema action from the Tools menu.
   
   Result: The Convert DB Structure to XML Schema dialog box is opened and your current database connections are displayed in the Connections section.

2. If the database source is not listed, click the Configure Database Sources button to open the Data Sources preferences page (on page 229) where you can configure data sources and connections.

3. In the Format for generated schema section, select one of the following formats:
   - Flat schema - A flat structure that resembles a tree-like view of the database without references to elements.
   - Hierarchical schema - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click Connect.
   
   Result: The database structure is listed in the Select database tables section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected Hierarchical schema for the format, you can configure the database columns.
   a. Select the database column you want to configure.
   b. In the Criterion section you can choose to convert the selected database column as an Element, Attribute, or to be Skipped in the resulting XML Schema.
   c. You can also change the name of the selected database column by changing it in the Name text field.

7. Click Generate XML Schema.
   
   Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema linked by xs:include and xs:import statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The Flatten Schema operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the xs:include and xs:import statements.
The Flatten Schema action is available from the Tools menu or the contextual menu in Text mode. The action opens the Flatten Schema dialog box that allows you to configure the operation.

Figure 749. Flatten Schema Dialog Box

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

Note: If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the xs:include, xs:redefine, and xs:override elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the Flatten Schema dialog box:

File name

The name of the output file.

Output directory

The path of the output directory where the flattened schema file will be saved.

Open the flattened XML Schema file in editor
Opens the main flattened schema in the editing area after the operation completes.

**Use the XML Catalogs when collecting the referenced XML Schemas**

Enables the imported and included schemas to be resolved through the available XML Catalogs (on page 3289).

*Note:* Changing this option triggers the recalculation of the dependencies graph for the main schema.

**Process the imported XML Schemas resolved through the XML Catalogs**

Specifies whether or not the imported schemas that were resolved through an XML Catalog (on page 3289) are also processed.

**Flatten the imported XML Schema(s)**

Specifies whether or not the imported schemas are flattened.

*Note:* For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

**Flatten Schema from the Command Line**

The Flatten Schema tool can be also ran from command line by using the following command:

- `flattenSchema.bat` on Windows
- `sh flattenSchema.sh` on OS X and Linux

The command line accepts the following parameters:

- `-in:inputSchemaURL` - The input schema URL.
- `-outDir:outputDirectory` - The directory where the flattened schemas should be saved.
- `-flattenImports:<boolean_value>` - Controls whether or not the imported XML Schemas should be flattened. The default value is `true`.
- `-useCatalogs:<boolean_value>` - Controls if the references to other XML Schemas should be resolved through the available XML Catalogs (on page 3289). The default value is `false`.
- `-flattenCatalogResolvedImports:<boolean_value>` - Controls whether or not the imported schemas that were resolved through the XML Catalogs (on page 3289) should be flattened. The default value is `true`.

*Note:* This option is used only when `-useCatalogs` is set to `true`.
- `-verbose` - Provides information about the current flatten XML Schema operation.
- `--help` - Prints the available parameters for the operation.
flattenSchema.bat -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose

Example: Command-Line Example for OS X

sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose

Example: Command-Line Example for Unix/Linux

sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
   -flattenCatalogResolvedImports:true -verbose

JSON to XML Converter

Oxygen XML Editor includes a useful and simple tool for converting JSON files to XML. It can be found in the Tools menu.

To convert a JSON document to XML, follow these steps:

1. Select the JSON to XML action from the Tools menu. The JSON to XML dialog box is displayed:

   ![JSON to XML Dialog Box](image)

2. Choose or enter the Input URL of the JSON document.
3. Choose the path of the Output file that will contain the resulting XML document.
4. Select the Open in Editor option to open the resulting XML document in the main editing pane.
5. Click the Convert button.

The original JSON document is now converted to an XML document.

![Example: XML to JSON Operation Result](image)
Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```json
{
  "personnel": {
    "person": [
      { "name": "Boss" },
      { "name": "Worker" }
    ],
  },
  "id": "personnel-id"
}
```

It is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>
```
• If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```json
[
   {"name": "Boss"},
   {"name": "Worker"}
]
```

it is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<array>
   <array>
      <name>Boss</name>
   </array>
   <array>
      <name>Worker</name>
   </array>
</array>
```

• If the name of a JSON property contains characters that are not valid in XML element names (for example, $), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```json
{"$id": "personnel-id"}
```

is converted to:

```xml
<_X24_id>personnel-id</_X24_id>
```

### Online JSON to XML Converter

For a simple ONLINE tool for converting a single JSON file to XML, or vice versa, go to: [https://www.oxygenxml.com/xml_json_converter.html](https://www.oxygenxml.com/xml_json_converter.html).
XML to JSON Converter

Oxygen XML Editor includes a useful and simple tool for converting XML files to JSON. It can be found in the Tools menu.

To convert an XML document to JSON, follow these steps:

1. Select the XML to JSON action from the Tools menu. The XML to JSON dialog box is displayed:

   ![Figure 752. XML to JSON Dialog Box](image)

2. Choose or enter the Input URL of the XML document.
3. Choose the path of the Output file that will contain the resulting JSON document.
4. Select the Open in Editor option to open the resulting JSON document in the main editing pane.
5. Click the Convert button.

The original XML document is now converted to a JSON document.

![Figure 753. Example: XML to JSON Operation Result](image)
Conversion Details

- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```xml
<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
```

it is converted to:

```json
{
  "personnel": [],
  "person": [
    {
      "id": "person.one",
      "name": "Boss"
    },
    {
      "id": "person.two",
      "name": "Worker"
    }
  ]
}
```
• If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a `content` property with its value set as the text content.

```xml
<person>
  <name>Boss <i>One</i></name>
</person>
```

is converted to:

```json
"person": {
  "name": {
    "content": "Boss",
    "i": "One"
  }
}
```

• If the XML document contains element names that contain hexadecimal codes (for example, if they were escaped during a JSON to XML conversion (on page 1438)), it will be converted to the normal character value in the converted JSON document.

```xml
<_%24_id>personnel-id</_%24_id>
```

is converted to:

```json
{"$id": "personnel-id"}
```

**Online XML to JSON Converter**

For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: [https://www.oxygenxml.com/xml_json_converter.html](https://www.oxygenxml.com/xml_json_converter.html).

Compiling an XSL Stylesheet for Saxon

As of Saxon 9.7, it is possible to export a compiled form of a stylesheet as an XML file (called a stylesheet export file or SEF). Oxygen XML Editor includes a simple tool called Compile XSL Stylesheet for Saxon (found in the Tools menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

• Use Saxon-JS to run transformations in a browser - A stylesheet export file (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```html
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
    window.onload = function() {
        SaxonJS.transform({
            stylesheetLocation: "books.sef",
            sourceLocation: "books.xml"
        });
    }
</script>
```

• Use SEF to run transformations in Oxygen XML Editor - You can also use a stylesheet export file (SEF) in Oxygen XML Editor to apply an XSLT transformation over an XML file. This requires Saxon-EE or Saxon-PE versions of the Saxon product and you must select one of those two versions for the Target when you configure the SEF file (on page 1234). When configuring the XSLT transformation, you will specify the SEF file in the XSL URL field (on page 1675).

Compiling an SEF File

The Compile XSL Stylesheet for Saxon tool can be found in the Tools menu and it compiles a specified stylesheet as an XML file (stylesheet export file with a file extension of .sef).

Selecting this tool opens the Compile XSL Stylesheet for Saxon dialog box that allows you to configure some options for conversion.
This dialog box includes the following options:

**XSL URL**

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the `Browse` drop-down list.

**Target**

Allows you to select the type of Saxon product that the export file will be used with. You can choose Saxon-JS, Saxon-EE, Saxon-PE, or Saxon-HE.

**Relocatable**

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a relocatable export package (SEF) that can be deployed to a different location, with a different base URI.

**Output file**

You can specify the path where the output file will be saved by entering it in the text field, using the `Insert Editor Variables` button, or using the browsing actions in the `Browse` drop-down list.

**Open in Editor**

Select this option to open the resulting stylesheet export file in the main Oxygen XML Editor editing pane.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 9.8.0.12 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the `Insert Editor Variables` button, or using the browsing actions in the `Browse` drop-down list.
Compile

Use this button to generate the stylesheet export file according the options selected in this dialog box.

Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Editor provides support for formatting and indenting (pretty-print (on page 3286)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

To format and indent multiple files, use the Format and Indent Files action that is available in the contextual menu of the Project view (on page 333) or from the Tools menu. This opens the Format and Indent Files dialog box that allows you to configure options for the action.

Figure 755. Format and Indent Files Dialog Box

The Scope section allows you choose from the following scopes:

- **All opened files** - The pretty-print (on page 3286) is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the pretty-print (on page 3286) is performed in the files located at a specified path.

The Options section includes the following options:
• **File filter** - Allow you to filter the files from the selected scope.
• **Recurse subdirectories** - When selected, the *pretty-print (on page 3286)* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
• **Include hidden files** - When selected, the *pretty-print (on page 3286)* is also performed in the hidden files.
• **Make backup files with extension** - When selected, Oxygen XML Editor makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

### Generate Documentation

Oxygen XML Editor includes a tool for generating documentation for XSLT, XML Schema, XQuery, and WSDL documents.

### Generating Documentation for an XML Schema

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:** You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view (on page 333)**.

Figure 756. XML Schema Documentation Dialog Box
The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

**Output Tab**

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format *(on page 1318).*
  - **PDF** - The documentation is generated in PDF output format *(on page 1321).*
  - **DocBook** - The documentation is generated in DocBook output format *(on page 1321).*
  - **DITA** - The documentation is generated in DITA output format *(on page 1321).*
  - **Custom** - The documentation is generated in a custom output format *(on page 1321)*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the
intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as Open in Editor and the result will be opened in Oxygen XML Editor (in the current editor).

**Note:** To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the xml:lang attribute set to the selected language. If you choose a primary language code (for example, en for English), this includes all its possible variations (en-us, en-uk, etc.).

**Settings Tab**

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

Figure 757. Settings Tab of the XML Schema Documentation Dialog Box
The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the **Schema Design Properties (on page 154)** page.

- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.

- **Namespace** - Displays the namespace for each component.

- **Location** - Displays the schema location for each component.

- **Type** - Displays the component type if it is not an anonymous one.

- **Type hierarchy** - Displays the types hierarchy.

- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - **xs:all** - Its children will be separated by space characters.
  - **xs:sequence** - Its children will be separated by comma characters.
  - **xs:choice** - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the assert elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command line interface (on page 1323).)

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

**Related Information:**

- Customizing PDF or DocBook Output of Generated XML Schema Documentation (on page 1322)

**Generating Documentation for an XSLT Stylesheet**

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom output
format (on page 1229), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the XSLT Stylesheet Documentation dialog box, select XSLT Stylesheet Documentation from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view (on page 333).

Figure 758. XSLT Stylesheet Documentation Dialog Box

The XSL URL field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format (on page 1227).
  - **Custom** - The documentation is generated in a custom output format (on page 1229), allowing you to control the output. Click the Options button to open a Custom format options dialog box (on page 1230) where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.
• **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

• **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

**Settings Tab**

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

**Figure 759. Settings Tab of the XSLT Stylesheet Documentation Dialog Box**

The **Settings** tab allows you to choose whether or not to include the following components: Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets.

You can choose whether or not to include the following other details:
• **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  ◦ Oxygen XML Editor built-in XSLT documentation schema.
  ◦ A subset of DocBook 5 elements. The recognized elements are: `section`, `sect1` to `sect5`, `emphasis`, `title`, `ulink`, `programlisting`, `para`, `orderedlist`, `itemizedlist`.
  ◦ A subset of DITA elements. The recognized elements are: `concept`, `topic`, `task`, `codeblock`, `p`, `b`, `i`, `ul`, `ol`, `pre`, `sl`, `sli`, `step`, `steps`, `li`, `title`, `xref`.
  ◦ Full XHTML 1.0 support.
  ◦ XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  ◦ DOXSL documentation framework (on page 3282). Supported elements are: `codefrag`, `description`, `para`, `docContent`, `documentation`, `parameter`, `function`, `docSchema`, `link`, `list`, `listitem`, `module`, `parameter`, `template`, `attribute-set`.

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a custom format (on page 1229) instead of the built-in HTML format (on page 1227) and providing your own XSLT stylesheets.

• **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.

• **Namespace** - Shows the namespace for named XSLT elements.

• **Location** - Shows the stylesheet location for each XSLT element.

• **Parameters** - Shows parameters of templates and functions.

• **References** - Shows the named XSLT elements that are referenced from within an element.

• **Used by** - Shows the list of all the XSLT elements that reference the current named element.

• **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.

• **Overriding** - Shows the list of all the XSLT elements that override the current element.

• **Return type** - Shows the return type of the function.

• **Source** - Shows the text stylesheet source for each XSLT element.

• **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.

• **Generate index** - Creates an index with all the XSLT elements included in the documentation.
Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface (on page 1230).)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

Related Information:
- XSLT Stylesheet Component Documentation Support (on page 1210)

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view (on page 333).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

Figure 760. XQuery Documentation Dialog Box

The following options are available:
• **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  ◦ **URL** - The URL of the file in which you want to generate the documentation.
  ◦ **Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

• **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.

• **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

• **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  **Note:** To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 79), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

• **Output** - Allows you to specify where the generated documentation is saved on disk.

### Generating Documentation for WSDL Documents

You can use Oxygen XML Editor to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format (on page 1375) by using a custom stylesheet.

**Note:** The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** (on page 333).

Figure 761. WSDL Documentation Dialog Box
The Input URL field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format (on page 1374).
  - Custom - The documentation is generated in a custom output format (on page 1375), allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  **Note:** To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 79), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the \texttt{xml:lang} attribute set to the selected language. If you choose a primary language code (for example, \texttt{en} for English), this includes all its possible variations (\texttt{en-us}, \texttt{en-uk}, etc.).

### Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

**Figure 762. Settings Tab of the WSDL Documentation Dialog Box**

The **Settings** tab allows you to choose whether or not to include the following:

• **Components**
  
  ◦ **Services** - Specifies whether or not the generated documentation includes the WSDL services.

  ◦ **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
• **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
• **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
• **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
• **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.
• **Component Details**
  • **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  • **Location** - Presents the location information for each WSDL or XML Schema component.
  • **Used by** - Presents the list of components that reference the current one.
  • **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  • **Source** - Presents the XML fragment that defines the current component.
  • **Instance** - Generates a sample XML instance for the current component.

**Note:** This option applies to the XML Schema components only.
  • **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
  • **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.

• **Generate index** - Displays an index with the components included in the documentation.
  • **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  • **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface (**on page 1376**)).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the WSDL documentation.

### Canonicalizing Files

You can select the **canonicalization (**on page 3280**) algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.
The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 3280) method is used.

   **Note:** *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 3280) method is used.

- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 3280) method is used.

   **Note:** *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive **Canonicalization** is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may
occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 3280) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the Canonicalize action was selected from the Tools menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:

- Digital Signatures Overview (on page 1174)

### Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

**Figure 764. Signature Settings Dialog Box**

![Signature Settings Dialog Box](image-url)
The following options are available:

**Note:** If Oxygen XML Editor could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page](on page 223) where you can configure a valid certificate.

- **Input** - Available if the Sign action was selected from the Tools menu. Specifies the location of the input URL.

- **Transformation Options** - See the [Digital Signature Overview](on page 1174) section for more information about these options.
  - **None** - If selected, no canonicalization (on page 3280) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 3280) method is used.
    
    **Note:** *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.
  
  - **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 3280) method is used.
  
  - **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 3280) method is used.
    
    **Note:** *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.
  
  - **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 3280) method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.

- **ID** - Provides ID of the XML element to be signed.

- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](on page 1174) for more information.
- **Detached** - If selected, the detached signature is used. See the Digital Signature Overview (on page 1174) for more information.
- **Append KeyInfo** - If this option is selected, the ds:KeyInfo element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.
- **Output** - Available if the Sign action was selected from the Tools menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor.

**Related Information:**

- Digital Signatures Overview (on page 1174)
- Verifying Signature (on page 1181)
- Example of How to Digitally Sign XML Files or Content (on page 1182)

**Verifying Signature**

You can verify the signature of a file by selecting the Verify Signature action from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu. The Verify Signature dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

**Related Information:**

- Signing Files (on page 1179)
- Example of How to Digitally Sign XML Files or Content (on page 1182)
WSDL SOAP Analyzer

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated WSDL SOAP Analyzer tool (available from the toolbar or Tools menu).

Oxygen XML Editor provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the WSDL SOAP Analyzer toolbar button.
- Use the WSDL SOAP Analyzer action from the Tools menu.
- Go to Open with > WSDL SOAP Analyzer in the contextual menu of the Project (on page 333) view.

Figure 765. WSDL SOAP Analyzer Dialog Box
This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is http://schemas.xmlsoap.org/soap/envelope/ for SOAP 1.1 or http://www.w3.org/2003/05/soap-
envelope for SOAP 1.2. Usually you just have to change a few values for the request to be valid.
The Content Completion Assistant (on page 3280) is available for this editor and is driven by the
schema that defines the type of the current message. While selecting various operations, Oxygen
XML Editor remembers the modified request for each one. You can press the Regenerate button
to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can
  have an idea about how the response looks like. After pressing the Send button, it presents the
  message received from the server in response to the Web Service request. It may show also error
  messages. If the response message contains attachments, Oxygen XML Editor prompts you to
  save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema,
  but it fails to be valid (for example, in the case of a message that is defined by means of an
  element that is not found in the types section of the WSDL). In such a case, the errors are listed
  here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor is
  connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service,
the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit
the request, eventually attach files to it and send it to the server. Watch the server response in the
response area. You can find more details in the Testing Remote WSDL Files (on page 1379) section.

Note: SOAP requests and responses are automatically validated in the WSDL SOAP Analyzer
using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the Save button to a
Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs
and parameters.

You can open the result of a Web Service call in an editor panel using the Open button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to Tools > WSDL SOAP Analyzer.

2. On the WSDL File tab enter the URL of the remote WSDL file.
   You enter the URL:
   - by typing
   - by browsing the local file system
• by browsing a remote file system
• by browsing a UDDI Registry (on page 1379)

3. Press the OK button.
This will open the WSDL SOAP Analyzer tool (on page 1376). In the Saved SOAP Request tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

UDDI Registry Browser

Pressing the button in the WSDL File Opener dialog box (menu Tools > WSDL SOAP Analyzer) opens the UDDI Registry Browser dialog box.

Figure 766. UDDI Registry Browser Dialog Box

The fields of the dialog box are as follows:

• URL - Type the URL of an UDDI registry or choose one from the default list.
• Keywords - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
• Rows to fetch - The maximum number of rows to be displayed in the result list.
• Search by - You can choose to search either by company or by provided service.
• Case sensitive - When selected, the search takes into account the keyword case.
• Search - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the OK button, the UDDI Registry Browser dialog box is closed and you are returned to the WSDL File Opener dialog box.

XML Schema Regular Expressions Builder

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting XML Schema Regular Expressions Builder from the Tools menu.

Figure 767. XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing Ctrl + Space (Command + Space on OS X).

Error display area
If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (↩) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the Available expressions table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous Category combo box. You can add an expression in the Regular expressions editor by double-clicking the expression row in the table. You will notice that in the case of Character categories and Block names, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The Insert button will become active when an editor is opened in the background and there is an expression in the Regular expressions editor.

The regular expression builder cannot be used to insert regular expressions in the Grid mode (on page 392) or schema Design mode (on page 623). Accordingly, the Insert button will be not available if the current document is edited in these modes.

**Note:** Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.
Large File Viewer

XML files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between multiple database formats. Traditional XML text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all of the file content must be loaded in memory before the user can actually view it.

The best performance of the viewer is obtained for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding, the rendering performance is higher for files consisting of long lines (up to few thousands characters) and may degrade for short lines. In fact, the maximum size of a file that can be rendered in the Large File Viewer decreases when the total number of the text lines of the file increases. Trying to open a very large file (for example, a file of 4 GB) with a very high number of short lines (100 or 200 characters per line) may produce an out of memory error (OutOfMemoryError) that would require either increasing the Java heap memory with the -Xmx startup parameter or decreasing the total number of lines in the file.

The powerful Large File Viewer is available from the Tools menu or as a standalone application. You can also right-click a file in your project and choose to open it with the viewer. It uses an efficient structure for indexing the opened document. No information from the file is stored in the main memory, just a list of indexes in the file. In this way the viewer can open very large files, up to 10 gigabytes. If the opened file is XML, the encoding used to display the text is detected from the XML prolog of the file. For other file types, the encoding is taken from the Oxygen XML Editor options. See Encoding for non-XML files (on page 123).

Figure 768. Large File Viewer
Large File Viewer components:

- The menu bar provides menu driven access to all the features and functions that are available in Large File Viewer:

  **File > Open**

  Opens files in the viewer (also available in the contextual menu).

  **File > Exit**

  Closes the viewer.

  **Edit > Copy**

  Copies the selected text to clipboard (also available in the contextual menu).

  **Find > Find**

  Opens a reduced **Find** dialog box that provides some basic search options, such as:

  ◦ **Case sensitive** - When selected, operations are case-sensitive.

  ◦ **Regular Expression** - When selected, allows you to use any regular expression in Perl-like syntax *(on page 753).*

  ◦ **Wrap around** - Continues the find operation from the start/end of the document after reaching the end/., depending on whether the search is in forward or backward direction.

  **Help > Help**
Provides access to the User Manual.

- The status bar provides information about the current opened file path, the Unicode representation of the character at cursor position and the line and column in the opened document where the cursor is located.

⚠️ **Attention:** For faster computation the **Large File Viewer** uses a fixed font (plain, monospace font of size 12) to display characters. The font is not configurable from the **Preferences page (on page 79)**.

ℹ️ **Tip:** The best performance of the viewer is accomplished for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding the rendering performance is high for files consisting of short lines (up to a few thousand characters) and may degrade for long lines.

**Hex Viewer**

When the Unicode characters that are visible in a text viewer or editor are not enough and you need to see the byte values of each character of a document, you can start the **Hex Viewer** that is available on the **Tools menu**. It has two panels: the characters are rendered in the right panel and the bytes of each character are displayed in the left panel. There is a 1:1 correspondence between the characters and their byte representation: the byte representation of a character is displayed in the same matrix position of the left panel as the character in the matrix of the right panel.

Figure 769. Hex Viewer
To open a file in **Hex Viewer** use the **File > Open** action. Alternatively, you can drag a file and drop it in the **Hex Viewer** panel.

**Standalone SVG Viewer**

Oxygen XML Editor includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

**Figure 770. SVG Viewer**

You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.
If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the Project view (on page 333) and selecting Open with > SVG Viewer.

**Actions Available in the SVG Viewer**

The following actions are available in the SVG Viewer:

**Zoom in**

To zoom in on an image, use any of the following methods:

- Scroll forward with the mouse wheel.
- Select Zoom in from the contextual menu.
- Use the \(\text{Ctrl} + \text{I} \ (\text{Command} + \text{I} \text{ on OS X})\) keyboard shortcut.

**Zoom out**

To zoom in on an image, use any of the following methods:

- Scroll backward with the mouse wheel.
- Use the \(\text{Ctrl} + \text{O} \ (\text{Command} + \text{O} \text{ on OS X})\) keyboard shortcut.
- Select Zoom out from the contextual menu.

**Rotate**

To rotate an image, use either of the following methods:

- Use the \(\text{Ctrl} + \text{Right-Click} + \text{Drag} \ (\text{Command} + \text{Right-Click} + \text{Drag on OS X})\) shortcut.
- Select Rotate from the contextual menu. This rotates the image exactly 90 degrees clockwise.

**Refresh**

To refresh (or reset) an image, use either of the following methods:

- Use the \(\text{Ctrl} + \text{T} \ (\text{Command} + \text{T} \text{ on OS X})\) keyboard shortcut.
- Select Refresh from the contextual menu.

**Move**

To move an image, use either of the following methods:

- Use the Arrow Keys on your keyboard.
- Use the \(\text{Shift} + \text{Left-Click} + \text{Drag}\) shortcut.

**Pan**
To pan an image, **click and drag** the image with your mouse.

Related Information:

- Editing SVG Files *(on page 1499)*

## Tree Editor

The **Tree Editor** *(Tools > Tree Editor)* is used for editing the content of a document displayed as an XML tree. The workspace offers the following functional areas:

- **Main menu** - Provides access to all the features and functions available in Oxygen XML Editor Tree Editor.
- **Toolbar** - Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function.
- **Editor panel** - Easy editing of structured mark-up documents. Each token has an associated icon for easier visual identification.
- **Message panel** - Displays messages returned from user operations.
- **Model view** - Shows the detailed information about the attribute or element that you are working on.
- **All Elements panel** - Presents a list of all defined elements that can be inserted within your document.

The tree editor does not offer entity support. Entities are not presented with a special type of node in the tree and new entity nodes cannot be inserted in the document.

## Compare Files

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder *(diffFiles.exe)*.

Figure 771. Compare Files Tool
Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

**Compare Files**

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the **Perform File Differencing** button from the toolbar.

3. You can use the drop-down menu on the left side of the toolbar to change the **algorithm** (on page 2773) for the operation.

4. You can also use the **Diff Options** button to access the **Files Comparison** preferences page where you can choose to ignore certain types of markup and configure various options.
5. If you are comparing XML documents using the XML Fast or XML Accurate algorithms, you can enter an XPath 2.0 expression in the Ignore nodes by XPath text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

Figure 772. Two-Way Differences

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 242), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the Close (Ctrl + W (Command + W on OS X)) button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:
• Use the navigation buttons on the toolbar (or in the Compare menu).
• Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
• Click a colored area in between the two text editors.

Editing Actions

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar (on page 2783) and in the various menus (on page 2787) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- Append left change to right and Append right change to left
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- Copy change from left to right and Copy change from right to left
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- Remove change
  Rejects the change on the particular side and preserves the particular content on the other side.

Two-Way Diff Algorithms

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in Author mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in Author mode.
• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.

• **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (*.xquery, .xq, .xqy, .xqm extensions), DTD file types (*.dtd, .ent, .mod extensions), TEXT file type (*.txt extension), or PHP file type (*.php extension).

For example:

- When comparing XML files or fragments, a token can be one of the following:
  - The name of an XML tag
  - The `<` character
  - The `>` sequence of characters
  - The name of an attribute inside an XML tag
  - The `=` sign
  - The `"` character
  - An attribute value
  - The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)

- When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

### Three-Way Comparisons

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

- **Visualize and merge content that was modified by you and another member of your team.**
- **Marks differences correctly even when the document structure is rearranged.**
- **Allows you to merge XML-relevant modifications.**
To perform a three-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the ✓ - Browse drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the ⚡ Three-Way Comparison button on the toolbar and select the base file in the Base field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the ✓ - Browse drop-down menu.

3. To highlight the differences, click the 🔍 Perform File Differencing button on the toolbar.

4. You can use the drop-down menu on the left side of the toolbar to change the algorithm (on page 2773) for the operation.

5. You can also use the ⚙ Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (ancestor) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

Figure 774. Three-Way Differences

<table>

**Highlighting Colors**
The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 242), but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Navigate Differences**

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
- Click a colored area in between the two text editors.

**Editing Actions**

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the toolbar (on page 2783) and in the various menus (on page 2787) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right and Append right change to left**
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right and Copy change from right to left**

  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
Rejects the change on the particular side and preserves the particular content on the other side.

**Three-Way Diff Algorithms**

Oxygen XML Editor offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in Author mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Second-Level Comparisons**

For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second-level comparison for the **Lines**, **XML Fast**, and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons for the **Lines** algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the **XML Fast** and **XML Accurate** algorithms, the second-level comparison is processed using a syntax-aware comparison (on page 2774), meaning that it looks for identical tokens. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Figure 775. Second-Level Diff Comparison

Note: If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

To do a word level comparison, select **Show word level details** from the contextual menu or **Compare** menu.

Figure 776. Word Level Comparison
To do a character level comparison, select **Show Character Level details** from the contextual menu or **Compare** menu.

Figure 777. Character Level Comparison

**Author Visual Mode**

The **Compare Files** tool includes an **Author** mode that displays the files in a visual mode similar to the **Author** editing mode in *Oxygen XML Editor/Author*. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool's **Text** or **Author** mode, it detects the **Initial Edit Mode** in the **Document Type Association** configuration (on page 96) and the mode the files were last opened in *Oxygen XML Editor/Author*.

**Note:** This mode is not available if the **Enable file comparison in Author mode** option (on page 239) is not selected in the **Diff > Files Comparison** preferences page.

This visual mode includes unique features such as a **Tags Display Mode** drop-down button (on page 2785) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the **Track Changes** feature (although the **Track Changes** feature is not available in the comparison tool).

Figure 778. File Comparison Tool - Author Mode
Author Mode Algorithms

The visual **Author** mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second-Level Comparisons

The visual **Author** mode automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Related Information:

- [Files Comparison Preferences Page (on page 239)](on page 239)
Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (\textit{diffFiles.bat} on Windows, \textit{diffFiles.sh} on OS X and Linux). To specify the files to compare, you can pass command-line arguments using the following construct:

\texttt{diffFiles.bat/diffFiles.sh [path to left file] [path to right file] [path to 3-way base file]}

If three files are specified, the tool will start in the \textit{3-way comparison mode} (on page 2774). If only two files are specified, the tool will start in the \textit{2-way comparison mode} (on page 2771). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the \texttt{-ext} argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type \texttt{diffFiles.bat --help} in the command line.

\textbf{Example:}

To do a 3-way comparison, the command line might look like this:

\begin{itemize}
  \item \textbf{Windows}
    \begin{verbatim}
    diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
    \end{verbatim}
  \end{itemize}

\textbf{Tip:} If there are spaces in the path names, surround the paths with quotes.

\begin{itemize}
  \item \textbf{Linux}
    \begin{verbatim}
    diffFiles.sh home/file1 home/file2 home/basefile
    \end{verbatim}
  \end{itemize}

\begin{itemize}
  \item \textbf{Mac OS X}
    \begin{verbatim}
    diffFiles.sh documents/file1 documents/file2 documents/basefile
    \end{verbatim}
  \end{itemize}

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your \texttt{.gitconfig} file and then you can simply start the tool from the command line.
To integrate the **Compare Files** tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the **Oxygen Compare Files** tool:
   - **Manual Configuration** - Locate your Git user-specific configuration file (.gitconfig) and edit it with a text editor (for example, in Windows, the .gitconfig file is most likely located in your user home directory). Add (or replace) the following lines:
     ```
     [diff]
     tool = oxygendiff
     [merge]
     tool = oxygendiff
     [difftool "oxygendiff"]
     cmd = '{pathToOxygenInstallDir}/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL
     [mergetool "oxygendiff"]
     cmd = '{pathToOxygenInstallDir}/diffFiles.exe' -ext $LOCAL $REMOTE $BASE
     trustExitCode = true
     [difftool]
     prompt = false
     ```
   - **Command Line Configuration** - To automatically configure the .gitconfig file, you can run the following commands from a command line:
     ```
     git config --global diff.tool oxygendiff
     git config --global difftool.oxygendiff.cmd '{Oxygen install dir}/diffFiles.exe -ext $REMOTE $LOCAL $LOCAL'
     git config --global merge.tool oxygendiff
     git config --global mergetool.oxygendiff.cmd '{Oxygen install dir}/diffFiles.exe -ext $LOCAL $REMOTE $BASE $MERGED'
     git config --global mergetool.oxygendiff.trustExitCode true
     ```
   - **Note**: For Mac OS X, the cmd lines would start with something like: `sh "Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, the cmd lines would start with something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the **Compare Files** tool and see a comparison of changes for a particular file, run the following command from a command line:

git difftool [PathToFile]

**Tip:** If the file you want to compare has conflicts, you can start the Compare Files tool as a merge conflict resolution tool by running the following command:

git mergetool [PathToFile]

For more information about the Git `difftool` syntax, see [https://git-scm.com/docs/git-difftool](https://git-scm.com/docs/git-difftool).

For more information about the Git `mergetool` syntax, see [https://git-scm.com/docs/git-mergetool](https://git-scm.com/docs/git-mergetool).

### How to Integrate the File Comparison Tool with SourceTree

The file comparison tool can be integrated with SourceTree so that you can use it to compare changes. The advantages of doing this include:

- The *Oxygen Compare Files* tool presents the files side-by-side and makes it much easier to determine real changes.
- The *Oxygen Compare Files* tool includes XML comparison algorithms.
- The *Oxygen Compare Files* tool includes various options for configuring the comparison.
- The *Oxygen Compare Files* tool allows you to navigate through changes.

To integrate the Compare Files tool with SourceTree, follow this procedure, depending on your operating system:

**Windows**

1. In SourceTree, go to Tools > Options.
2. Go to the Diff tab.
3. In the External Diff/Merge section, configure the settings as follows:
   - **External Diff Tool** - Select Custom.
   - **Diff Command** - Enter the path of the *Oxygen diffFile.exe* file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
   - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
   - **Merge Tool** - Select Custom.
   - **Diff Command** - Enter the path of the *Oxygen diffFile.exe* file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
   - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.
4. Click OK.
Result: In SourceTree, you can now compare file changes with the Oxygen Compare Files tool by simply selecting External Diff from the contextual menu, Actions menu, or Ctrl+D.

Mac OS X

1. In SourceTree, go to SourceTree > Preferences.
2. Go to the Diff tab.
3. In the External Diff/Merge section, configure the settings as follows:
   - External Diff Tool - Select Custom.
   - Diff Command - Enter a command-line argument to launch the Oxygen diffFiles.sh file (for example: sh "/Applications/Oxygen XML Editor/diffFiles.sh").
   - Arguments - Enter -ext $REMOTE $LOCAL $LOCAL.
   - Merge Tool - Select Custom.
   - Diff Command - Enter a command-line argument to launch the Oxygen diffFiles.sh file (for example: sh "/Applications/Oxygen XML Editor/diffFiles.sh").
   - Arguments - Enter -ext $LOCAL $REMOTE $BASE $MERGED.
4. Close the preferences dialog box.

Result: In SourceTree, you can now compare file changes with the Oxygen Compare Files tool by simply selecting External Diff from the contextual menu or Actions menu.

Toolbar and Contextual Menu Actions of the Compare Files Tool

The toolbar of the Compare Files tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

Figure 779. Compare Toolbar

The following actions are available:

Algorithm

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):
• **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).

• **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.

• **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.

• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.

• **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in **Author** mode.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.

• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Diff Options**

Opens the **Files Comparison preferences page (on page 239)** where you can configure various options.

**Three-Way Comparison**

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Synchronized scrolling**

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.
Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences. This option is not available when the file comparison is in Author mode.

Note: When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Tags Display Mode

Allows you to select the amount of markup to be displayed in the Author visual mode (on page 2778). You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Inline Tags, Partial Tags, or No Tags.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.
Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an XPath expression (on page 2182) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter \@id). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

Note: If an XPath expression is specified in the Ignore nodes by XPath option (on page 241) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Base

Available for three-way comparisons (on page 2774). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

Left-Side (Source) File

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

Save

Saves the changes made in the source (left-side) file.

Reload

Reloads the source (left-side) file.

Close

Closes the source (left-side) file.
Right-Side (Target) File

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing actions in the · Browse drop-down menu.

 Lawson Save

Saves the target (right-side) file.

 Reload

Reloads the target (right-side) file.

 Close

Closes the target (right-side) file.

Compare Files Tool Menus

The menus in the Compare Files tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

 File Menu

Source > Open

Browses for a file that will be displayed in the left panel.

Source > Open URL

Browses for a remote file that will be displayed in the left panel.

Source > Open File from Archive

Browses an archive for a file that will be displayed in the left panel.

Source > Reload

Reloads the file in the left panel.

Source > Save

Saves the changes made to the file in the left panel.

Source > Save As

Allows you to choose a destination to save the file in the left panel.

Source > Close

Closes the file in the left panel.
Target > Open

Browses for a file that will be displayed in the right panel.

Target > Open URL

Browses for a remote file that will be displayed in the right panel.

Target > Open File from Archive

Browses an archive for a file that will be displayed in the right panel.

Target > Reload

Reloads the file in the right panel.

Target > Save

Saves the changes made to the file in the right panel.

Target > Save As

Allows you to choose a destination to save the file in the right panel.

Target > Close

Closes the file in the right panel.

Base > Open

Browses for a file that will be compared with both files in a three-way comparison (on page 2774).

Base > Open URL

Browses for a remote file that will be compared with both files in a three-way comparison (on page 2774).

Base > Open File from Archive

Browses an archive for a file that will be compared with both files in a three-way comparison (on page 2774).

Close (Ctrl + W (Command + W on OS X))

Closes the application.

Edit Menu

Cut

Cut the selection from the currently focused editor panel to the clipboard.

Copy

Copy the selection from the currently focused editor panel to the clipboard.
Paste
Paste content from the clipboard into the currently focused editor panel.

Select all
Selects all content in the currently focused editor panel.

Undo
Undo changes in the currently focused editor panel.

Redo
Redo changes in the currently focused editor panel.

Find Menu

Find/Replace
Perform find/replace operations in the currently focused editor panel.

Find Next
Go to the next match using the same options as the last find operation. This action runs in both editor panels.

Find Previous
Go to the previous match using the same options as the last find operation. This action runs in both editor panels.

Compare Menu

Three-Way Comparison
Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing
Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))
Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Last Change (Ctrl + E (Command + E on OS X))**

Jumps to the last change.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Copy All Changes from Left to Right**

Copies all changes from the file in the left panel to the file in the right panel.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy Change from Left to Right**

Copies the selected difference from the file in the left panel to the file in the right panel.

**Show Word Level Details**

Provides a word-level comparison of the selected change.

**Show Character Level Details**

Provides a character-level comparison of the selected change.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.
**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

### Options Menu

**Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

### Help Menu

**Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**
Opens the Oxygen XML Editor Support Center web page in a browser.

## Compare Directories

The **Compare Directories** tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (*diffDirs.exe*).

![Compare Directories Tool](image)

### Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (*diffDirs.bat* on Windows, *diffDirs.sh* on OS X and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct: `diffDirs.bat/diffDirs.sh [directory path 1] [directory path 2]`.

If you pass only one argument, you are prompted to manually choose the second directory or archive.

**Example:**

To do a comparison between two directories, the command line would look like this:

**Windows**
Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the ➔ · **Browse** drop-down menu.

   **Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the 📀 **Perform Directories Differencing** button from the toolbar.

3. You can also use the ⚙ **Diff Options** button to access the **Directories Comparison preferences page** (on page 242) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the ➔ · **Browse** drop-down menu to select the archives in the left and right panels.

2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, select the **Look in archives** option (on page 243) in the **Directories Comparison preferences page**.

3. To highlight the differences, click the 📂 **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An **X** symbol, when a file or a folder exists in only one of the compared directories.
• A ≠ symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the Directories Comparison / Appearance preferences page (on page 244). You can double-click lines marked with the ≠ symbol to open a Compare Files window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press Enter) on a line with a pair of files, Oxygen XML Editor starts a file comparison (on page 2770) between the two files, using the Compare Files tool.

Related Information:

• Compare Files (on page 2770)

Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the Compare Directories tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 781. Compare toolbar

<table>
<thead>
<tr>
<th>Toolbar Actions</th>

</tbody>
</table>
Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

### Binary Compare

Performs a byte-level comparison on the selected files.

### Diff Options

Opens the [Directory Comparison preferences page](on page 242) where you can configure various options.

### Show Only Modifications

Displays a more uncluttered file structure by hiding all identical files.

#### File and folder filters

Differences can be filtered using three combo boxes: **Include files**, **Exclude files**, and **Exclude folders**. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out all JPEG and GIF image files, edit the **Exclude files** filter box to read `*.jpeg, *.png`. Each filter includes a drop-down menu with the latest 15 filters applied.

### Contextual Menu Actions

#### Perform Files Differencing

Opens the [Compare Files tool](on page 2770) that allows you to compare the currently selected files.

#### Binary Compare

Performs a byte-level comparison on the selected files.

#### Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

#### Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

**Open**

If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

**Open in System Application**
Opens the selected file in the system application that is associated with that type of file. The action is available when launching the Compare Directories tool from the Tools menu in Oxygen XML Editor.

Show in Explorer

Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus

The menus in the Compare Directories tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

File Menu

Close (Ctrl + W (Command + W on OS X))

Closes the application.

Compare Menu

Perform Directories Differencing

Looks for differences between the two directories displayed in the left and right side of the application window.

Perform Files Differencing

Opens the Compare Files tool (on page 2770) that allows you to compare the currently selected files.

Copy Change from Right to Left

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

Copy Change from Left to Right

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

Options Menu

Preferences
Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**

**Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Editor Support Center web page in a browser.

**Compare Images**

You can use the **Compare Directories** tool to compare images. If you double-click a line that contains two different images, the **Compare images** window is displayed. This dialog box presents the images
in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: GIF, JPG, JPEG, PNG, and BMP.

**Compare Directories Against a Base (3-Way)**

The *Compare Directories Against a Base (3-way)* tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

**How to Perform 3-Way Directory Comparisons**

To perform a 3-way directories comparison, follow these steps:

1. Select **Compare Directories Against a Base (3-way)** from the **Tools** menu.

   **Step Result:** This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

   **Figure 782. Compare Directories Against a Base File Set Chooser**

2. Select the file sets to be compared:
   - **Base directory** - This is the original (base) file set before any modifications were made by your or others.
   - **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.
   - **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.
3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.

4. Use the features and actions described in the next section to identify and merge the changes.

### 3-Way Directory Comparison and Merge Tool

![Comparison and Merge Tool](image)

The 3-way directory comparison and merge tool includes the following information, features, and actions:

**Number of Changes and Conflicts**

The first thing you see in top-left corner of the tool is grand total of all the changes made by others, changes made by you, and the number of conflicts.

**Filter Buttons**

In the top-right corner you can use the toggle buttons to filter the list of modifications:

- **Show all files**
  
  Use this button to show all modified and unmodified files, as well as conflicts.

- **Show only files modified by you and others**
Filters the list to show all files that have been modified, including conflicts.

- **Show only files modified by others**
  Filters the list to only show the files that were modified by others.

- **Show only files modified by you**
  Filters the list to only show the files that were modified by you.

- **Show only conflicting files**
  Filters the list to only show files that contain conflicts.

**List of Files Panel**
This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to **Automatically merge** the changes made by others with your changes. If there is a conflict, the default is **<Select action>** and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the file set with changes made by others is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

**File Comparison Panels**
If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

**Note:** If Oxygen XML Editor does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Editor to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:
File Path

The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

× Close

Closes the file comparison panel.

Algorithm Drop-Down Menu

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

• **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
• **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the **Files Comparison preferences page (on page 239)** where you can configure various options.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.
**Tags Display Mode**

Allows you to select the amount of markup to be displayed in the **Author** visual mode. You can choose between: **Full Tags with Attributes**, **Full Tags**, **Block Tags**, **Inline Tags**, **Partial Tags**, or **No Tags**.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

Left-Side File (Your changes)
Above the panel you can see the file path and the following two buttons:

- **Save**
  Saves changes made to the file.

- **Reload**
  Reloads the file.

**Right-Side File (Changes made by others)**

Above the panel you can see the file path and the following two buttons:

- **Reload**
  Reloads the file.

**Displaying Changes in the File Comparison Panels**

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

![File Comparison Panels](image)

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the **Files Comparison / Appearance preferences page (on page 242)**, but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Direct Editing Actions in the File Comparison Panels**

In addition to selecting merge actions from the drop-down menus in the **Merge Action** column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed.
when you save the modified document (Save button or Ctrl+S) or when you click the Perform File Differencing button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append right change to left**
  Copies the content of the selected change from the right side and appends it on the left side.

- **Copy change from right to left**
  Replaces the content of a change in the left side with the content of the change in the right side.

- **Remove change**
  Removes the change from the left side.

Any time you save manual changes (Save button or Ctrl+S), the selection in the Merge Action column in the top panel automatically changes to Use merged and a copy of the original file is kept so that you can revert to the original file if necessary. To discard your manual changes and revert to your original changes, select a different action in the Merge Action drop-down menu.

**Open Merged Files**

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

**Applying Changes**

When you click the Apply button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the Merge Action drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click Apply, your local changes will be preserved for the unresolved conflicts.
- **Overwrite your changes** - If you select this option and then click Apply, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.
Cancel - You can click the Cancel button to go back to the merge tool to resolve the conflicts individually.

Cancelling Changes

If you click the Cancel button at the bottom of the merge tool, all the changes you made in the tool will be lost.

Author Visual Mode

The Comparison and Merge tool includes an Author mode that displays the files in a visual mode similar to the Author editing mode in Oxygen XML Editor/Author. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool’s Text or Author mode, it detects the Initial Edit Mode in the Document Type Association configuration (on page 96) and the mode the files were last opened in Oxygen XML Editor/Author.

Note: This mode is not available if the Enable file comparison in Author mode option (on page 239) is not selected in the Diff > Files Comparison preferences page.

This visual mode includes unique features such as a Tags Display Mode drop-down button (on page 818) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the Track Changes feature (although the Track Changes feature is not available in the comparison tool).

Figure 785. File Comparison Tool - Author Mode
Author Mode Algorithms

The visual Author mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second Level Comparisons

The visual Author mode automatically performs a second level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second level comparisons is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Syncro SVN Client (Deprecated)

The Syncro SVN Client is a client application for the Apache Subversion™ version control system, compatible with Subversion 1.6, 1.7, and 1.8 servers. It manages files and directories that change over time and are stored in a central repository. The version control repository is much like an ordinary file server, except that it remembers every change ever made to your files and directories. This allows you to access older versions of your files and examine the history of how and when your data changed.

To start Syncro SVN Client, go to Tools > SVN Client.

⚠️ **Attention:** The Syncro SVN Client that comes bundled with Oxygen XML Editor is considered deprecated as of version 21.0.
Main Window

This section explains the main window of Syncro SVN Client.

Views

The main window consists of the following views:

- **Repositories view (on page 2897)** - Allows you to define and manage Apache Subversion™ repository locations.
- **Working Copy view (on page 2902)** - Allows you to manage with ease the content of the working copy.
- **History view (on page 2917)** - Displays information (author name, revision number, commit message) about the changes made to a resource during a specified period of time.
- **Editor view (on page 2923)** - Allows you to edit various types of text files, with full syntax-highlight.
- **Annotations view (on page 2924)** - Displays a list with information regarding the structure of a document (author and revision for each line of text).
- **Compare view (on page 2926)** - Displays the differences between two revisions of a text file from the working copy.
- **Image Preview panel (on page 2930)** - Allows you to preview standard image files supported by Syncro SVN Client: JPG, GIF and PNG.
- **Compare Images view (on page 2930)** - Displays two images side by side.
- **Properties view (on page 2930)** - Displays the SVN properties of a resource under version control.
- **Console view (on page 2932)** - Displays information about the currently running operation, similar with the output of the Subversion command-line client.
- **Dynamic Help view (on page 2932)** - Shows information about the currently selected view.

The main window's status bar presents in the left side the operation in progress or the final result of the last performed action. In the right side there is a progress bar for the running operation and a stop button to cancel the operation.

SVN Main Menu

The main menu of the Syncro SVN Client is composed of the following menus:

**File Menu**

- **New submenu:**
  - **New File**
This operation creates a new file as a child of the selected folder from the Repositories view (on page 2897) tree or the Working Copy view (on page 2902) tree, depending on the view that was last used. Note that for the Working Copy view (on page 2902), the file is added to version control only if the selected folder is under version control.

**New Folder (Ctrl (Command on OS X) + Shift + F)**

This operation creates a new folder as a child of the selected folder from the Repositories view (on page 2897) tree or the Working Copy view (on page 2902) tree, depending on the view that was last used. Note that for the Working Copy view (on page 2902), the file is added to version control only if the selected folder is under version control.

**New External Folder (Ctrl (Command on OS X) + Shift + W)**

This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (on page 2938), and ideally a particular revision, stored in the svn:externals property of the selected folder.

**Tip:** You can specify a particular revision of the external item by using a peg revision (on page 2940) at the end of the URL (for example, URL@rev1234). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- ../ - Relative to the URL of the directory that the svn:externals property is set.
- ^/ - Relative to the root of the repository in which the svn:externals property is versioned.
- // - Relative to the scheme of the URL of the directory that the svn:externals property is set.
- / - Relative to the root URL of the server in which the svn:externals property is versioned.
Important: To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the svn:externals property that is set on the parent folder.
2. For the change to take effect, use the Update operation on the parent folder of the external item.

Note: Syncro SVN Client does not support definitions of local relative external items.

Open (Ctrl (Command on OS X) + O)
This action opens the selected file in an editor where you can modify it. The action is active only when a single item is selected. The action opens a file with the internal editor or the external application associated with that file type. This action works on any file selection from the Repositories view (on page 2897), Working Copy view (on page 2902), History view (on page 2917), or Directory Change Set view (on page 2921), depending on the view that was last used to invoke it. In the case of a folder, the action opens the selected folder with the system application for folders (for example, Windows Explorer on Windows or Finder on OS X, etc). Note that opening folders is available only for folders selected in the Working Copy view (on page 2902).

Open with(Ctrl (Command on OS X) + Shift + O)
Displays the Open with dialog box for specifying the editor in which the selected file is opened. If multiple files are selected only external applications can be used to open the files. This action works on any file selection from Repositories view (on page 2897), Working Copy view (on page 2902), History view (on page 2917), or Directory Change Set view (on page 2921), depending on the view that was last used to invoke it.

Show in Explorer/Show in Finder
Opens the parent directory of the selected working copy file and selects the file.

Save (Ctrl (Command on OS X) + S)
Saves the local file currently opened in the editor or the Compare view.

Save as
Saves any file selected in the Repositories, History, or Directory Change Set view.
Copy URL Location (Ctrl (Command on OS X) + Alt + U)

Copies the URL location of the resource currently selected in the Repositories view to clipboard.

Copy to

Copies the currently selected resource, either in Repositories or Working copy view, to a specified location.

Note: This action can also be used from History and Directory Change Set views to recover older versions of a repository item.

Move to (Ctrl (Command on OS X) + M)

Moves the currently selected resource, either in Repositories or Working copy view, to a specified location.

Rename (F2)

Renames the resource currently selected, either in Repositories or Working copy view.

Delete (Delete)

Deletes the resource currently selected either, in Repositories or Working copy view.

Locking:

- Scan for locks (Ctrl (Command on OS X) + L) - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under version control. For more details see Scanning for locks (on page 2839).
- Lock (Ctrl (Command on OS X) + K) - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under version control. For more details on the use of this action see Locking a file (on page 2840).
- Unlock (Ctrl (Command on OS X) + Alt + K) - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).

Show SVN Properties (Ctrl (Command on OS X) + P)

Opens the Properties view (on page 2930) and displays the SVN properties for a selected resource from Repositories view (on page 2897).
or Working Copy view (on page 2902), depending on the view that was last used to invoke it.

Show SVN Information (Ctrl (Command on OS X) + I)

Provides additional information for a selected resource. For more details, go to Obtain information for a resource (on page 2856).

Exit (Ctrl (Command on OS X) + Q)

Closes the application.

Edit Menu

Undo (Ctrl (Command on OS X) + Z)

Undo edit changes in the local file that is currently opened in the editor or the Compare view.

Redo (Ctrl (Command on OS X) + Y)

Redo edit changes in the local file that is currently opened in the editor or the Compare view.

Cut (Ctrl (Command on OS X) + X)

Cut selection from the local file that is currently opened in the editor view or the Compare view to clipboard.

Copy (Ctrl (Command on OS X) + C)

Copy selection from the local file that is currently opened in the editor or the Compare view to clipboard.

Paste (Ctrl (Command on OS X) + V)

Paste selection from clipboard into the local file that is currently opened in editor or the Compare view.

Find/Replace (Ctrl (Command on OS X) + F)

Perform find and replace operations in the local file that is currently opened in the editor or the Compare view.

Find Next (F3)

Go to the next match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the Console view).

Find Previous (Shift + F3)
Go to the previous match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the Console view).

Repository Menu

New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))
Displays the Add SVN Repository dialog box. This dialog box allows you to define a new repository location.

Figure 786. Add SVN Repository Dialog Box

![Add SVN Repository Dialog Box](image)

If the Validate repository connection option is selected, the URL connection is validated before being added to the Repositories view.

Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))
Context-dependent action that allows you to edit the selected repository location using the Edit SVN Repository dialog box. It is active only when a repository location root is selected.

Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))
Context-dependent action that allows you to change the selected repository revision using the Change the Revision to Browse dialog box. It is active only when a repository location root is selected.

Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))
Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

Refresh (F5)
Refreshes the resource selected in the Repositories view.

Check out (Ctrl + Alt + O (Command + Alt + O on OS X))
Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section Check out a working copy (on page 2829).
Export

Opens the Export dialog box (on page 2892) that allows you to configure options for exporting a folder from the repository to the local file system.

Import:

**Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))**

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section Importing resources into a repository (on page 2890).

ℹ️ Note: The difference between the Import folder and Share project actions is that the latter also converts the selected directory into a working copy.

**Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))**

Imports the files selected from the file system into the selected folder in the repository.

Working Copy Menu

 мн Working Copies Manager ( on OS X)

Opens a dialog box with a list of working copies that the Apache Subversion™ client is aware of. In this dialog box you can add existing working copies or remove those that are no longer needed.

Switch to

Selects one of the following view modes: ℹ️ All Files, ➯ Modified, ➪ Incoming, ➜ Outgoing, or ➚ Conflicts.

 мн Refresh (F5)

Refreshes the state of the selected resources or of the entire working copy (if there is no selection).

 мн Synchronize (Ctrl (Command on OS X) + Shift + S)

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to Modified view mode if the Always switch to 'Modified' mode option (on page 236) is selected.

Update (Ctrl (Command on OS X) + U)
Updates all the selected resources that have incoming changes to the HEAD revision. If one of the selected resources is a directory then the update for that resource will be recursive.

**Update to revision/depth**

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update *depth* for the current folder. You can find out more about the *depth* term in the sparse checkouts (on page 2895) section.

**Commit**

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the **Commit** dialog box you can also enter a comment before sending your changes to the repository.

**Update all**(Ctrl (Command on OS X) + Shift + U)

Updates all resources from the working copy that have incoming changes. It performs a recursive update on the synchronized resources.

**Commit all**

Commits all the resources with outgoing changes. It is disabled when *Incoming* mode is selected or the synchronization result does not contain resources with outgoing changes. It performs a recursive commit on the synchronized resources.

**Revert** (Ctrl (Command on OS X) + Shift + V)

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes (on page 2847) for more information.

**Edit conflict** (Ctrl (Command on OS X) + E)

Opens the Compare editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see Edit conflicts (on page 2845).

**Mark Resolved** (Ctrl (Command on OS X) + Shift + R)

Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts (on page 2849).

**Mark as Merged** (Ctrl (Command on OS X) + Shift + M)
Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the Merge conflicts (on page 2849) section for more information about how you can solve the pseudo-conflicts.

**Override and Update**

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2847) section.

**Override and Commit**

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2849).

**Mark as copied**

You can use this action to mark an item from the working copy as a copy of an other item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

**Mark as moved**

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

**Mark as renamed**

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The Mark as renamed action is available when you select two items from the same directory (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

**Add to "svn:ignore" (Ctrl (Command on OS X) + Alt + I)**

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the svn:ignore property in the parent directory of the resource. Read more
about this in the Ignore Resources Not Under Version Control (on page 2835) section.

Add to version control (Ctrl (Command on OS X) + Alt + V)

Allows you to add resources that are not under version control. For further details, see Add Resources to Version Control (on page 2833) section.

Remove from version control

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

Clean up (Ctrl (Command on OS X) + Shift + C)

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under version control.

Expand All (Ctrl (Command on OS X) + Alt + X)

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

Collapse all (Ctrl (Command on OS X) + Alt + Z)

Collapses all descendants of the selected folder. The same behavior is obtained by double-clicking a expanded folder.

Compare Menu

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on OS X))

Jumps to the last change.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Show Word Level Details

Provides a word-level comparison of the selected change.

Show Character Level Details

Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.
**Note:** When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**History Menu**

**Show History** *(Ctrl (Command on OS X) + H)*

Displays the history for a SVN resource at a given revision. The resource can be one selected from the Repositories view, Working Copy view, or from the Affected Paths table from the History view, depending on which view was last focused when this action was invoked.

**Show Annotation** *(Ctrl + Shift + A (Command + Shift + A on OS X))*

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2924), along with the history of the file in the History view.

**Repositories**

This operation is available for any resource selected from view, Working Copy view, History view or Directory Change Sets view, depending on which view was last focused when this action was invoked.

**Revision Graph** *(Ctrl (Command on OS X) + G)*

This action allows you to see the graphical representation of a resource’s history. For more details about a resource’s revision graph see the section Revision Graph (on page 2933). This operation is available for any resource selected in the Repositories view or Working Copy view.

**Tools Menu**

**Share project**

Allows you to share a new project (on page 2826) using an SVN repository. The local project is automatically converted into an SVN working copy.

**Branch / Tag**

Allows you to copy the selected resource from the Repositories view or Working Copy view to a branch or tag into the repository. To read more
about this operation, see the section Creating a Branch / Tag (on page 2858).

Merge (Ctrl (Command on OS X) + J)

Allows you to merge the changes made on one branch back into the trunk, or vice versa, using the selected resource from the working copy. To read more about this operation, see the section Merging (on page 2860).

Switch (Ctrl (Command on OS X) + Alt + W)

Allows you to change the repository location of a working copy, or only of a versioned item of the working copy, within the same repository. It is available when the selected item of the working copy is a versioned resource, except for external items. To read more about this action, see the Switching the Repository Location (on page 2875) section.

Relocate

Allows you to change the base URL of the root folder of the working copy to a new URL when the base URL of the repository changed. For example, if the repository itself was moved to a different server. This operation is only available for the root item of the working copy. To read more about this operation, see the Relocate a Working Copy (on page 2877) section.

Create patch (Ctrl (Command on OS X) + Alt + P)

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see the section about patches (on page 2880).

Working copy format

This submenu contains the following two operations:

Upgrade

Upgrades the format of the currently loaded working copy to the newest one known by Syncro SVN Client. This allows you to benefit of all the new features of the client.

Downgrade

Downgrades the format of the currently loaded working copy to SVN 1.7 format. This is useful if you want to use older SVN clients with the current working copy, or, by mistake, you have upgraded the format of an older working copy to SVN 1.8.

Note: SVN 1.7 working copies cannot be downgraded to older formats.
See the section Working Copy Format (on page 2909) to read more about this subject.

Options Menu

Preferences

Opens the Preferences dialog box.

Menu Shortcut Keys

Opens the Menu Shortcut Keys preferences page (on page 248), where users can configure in one place the keyboard shortcuts available for menu items available in Syncro SVN Client.

Global Run-Time Configuration

Allows you to configure SVN general options, that should be used by all the SVN clients you may use:

- **Edit 'config' file** - In this file you can configure various SVN client-side behaviors.
- **Edit 'servers' file** - In this file you can configure various server-specific protocol parameters, including HTTP proxy information and HTTP timeout settings.

Export Options

Allows you to export the current options to an XML file.

Import Options

Allows you to import options you have previously exported.

Reset Options

Resets all your options to the default ones.

Reset Authentication

Resets the Subversion authentication information.

Window Menu

Show View

Allows you to select the view you want to bring to front.

Show Toolbar

Allows you to select the toolbar you want to be visible.

Enable flexible layout
Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

**Reset Layout**

Resets all the views to their default position.

**Help Menu**

**Help (F1)**

Opens the Help dialog box.

**Use online help (selected by default)**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Show Dynamic Help view**

Displays the Dynamic Help view.

**Report Problem**

Opens a dialog box that allows you to write the description of a problem that was encountered while using the application.

**Support Center**

Opens the Support Center web page in a browser.

**About**

Opens the About dialog box.

**SVN Main Toolbar**

The toolbar of the Syncro SVN Client SVN Repositories window contains the following actions:

**Check out**

Checks out a working copy from a repository. The repository URL and the working copy format must be specified.

**Synchronize**

Synchronizes the current working copy with the repository.
Update All
Updates all resources of the working copy that have an older revision that repository.

Commit All
Commits all resources of working copy that have a newer version compared to that of the repository.

Refresh
Refreshes the whole content of the current working copy from disk starting from the root folder. At the end of the operation, the modified files and folders that were not committed to repository yet, are displayed in the Working Copy view.

Compare
The selected resource is compared with:

- The BASE revision, when the selected resource is:
  - Locally modified and the All Files view mode is currently selected (no matter if there are incoming changes).
  - Locally modified and there are no incoming changes when any other view mode is selected.
- The remote version of the same resource, when remote information is available after a Synchronize operation (only when one of Modified, Incoming, Outgoing and Conflicts view modes is selected).
- The working copy revision, when the selected resource is from the History view.

Show History
Displays the history of the selected resource (from the Working Copy or Repository views) in the History view.

Show Annotation
Displays the annotations of the selected resource. The selected resource can be in the Working Copy or the History views.

Revision Graph
Displays the revision graph of the selected resource. The selected resource can be in the Working Copy or the Repositories views.
Enable/Disable flexible layout

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

Status Bar

The status bar of the Syncro SVN Client window displays important details of the current status of the application. This information is available only in the Working Copy view.

Figure 787. Status bar

The status bar is composed of the following areas:

- The path of the currently processed file from the current working copy (during an operation such as Check out or Synchronize) or the result of the last operation.
- The current status of the following working copy options:
  - Show ignored files ( ).
  - Show deleted files ( ).
  - Process svn:externals definitions ( ).
  The options for ignored and deleted files are switched on and off from the Settings menu (on page 2908) of the Working Copy panel:
- The format of the currently loaded working copy.
- The current numbers of incoming changes ( ), outgoing changes ( ) and conflicting changes ( ).
- A progress bar for the currently running SVN operation and a button ( ) that allows you to stop it.

Getting Started

This section explains the basic operations that can be done in Syncro SVN Client.

SVN Repository Location

This section explains how to add and edit the repository locations in Syncro SVN Client.
Add / Edit / Remove Repository Locations

Usually, team members do all of their work separately, in their own working copy, and then must share their work by committing their changes. This is done using an Apache Subversion™ repository. Oxygen XML Editor supports versions 1.4, 1.5, 1.6, 1.7, and 1.8 of the SVN repository format.

Before you can begin working with a Subversion repository, you must define a repository location in the Repositories view (on page 2897).

To create a repository location, use the New Repository Location action that is available in the Repository menu, the Repositories view toolbar, and in the contextual menu. This action opens the New Repository Location dialog box, which prompts you for the URL of the repository (on page 2938) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2940) (for example, URL@rev1234) to browse only that specific revision. No authentication information is requested at the time the location is defined. It is left to the Subversion client to request the user and password information when it is needed. The main benefit of allowing Subversion to manage your password is that it prompts you for a new password only when your password changes.

Once you enter the repository URL, Oxygen XML Editor tries to contact the server to get the content of the repository for displaying it in the Repositories view (on page 2897). If the server does not respond in the timeout interval set in the preferences, an error is displayed. If you do not want to wait until the timeout expires, you can use the Stop button from the toolbar of the view.

To edit a repository location, use the Edit Repository Location action that is available in the Repository menu and in the contextual menu. This action opens the Edit Repository Location dialog box, which prompts you for the URL of the repository (on page 2938) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2940) (for example, URL@rev1234) to browse only that specific revision.

To remove a repository location, use the Remove Repository Location action that is available in the Repository menu and in the contextual menu. A confirmation dialog box is displayed to make sure that you do not accidentally remove the wrong locations.

The order of the repositories can be changed in the Repositories view at any time with the Up arrow and Down arrow buttons on the toolbar of the view. For example, pressing the up arrow once moves the selected repository in the list up one position.

To set the reference revision number of an SVN repository use the Change the Revision to Browse action that is available in the Repository menu and in the contextual menu. The revision number of the repository is used for displaying the contents of the repository when it is viewed in the Repositories view (on page 2897). Only the files and folders that were present in the repository at the moment when this revision number was generated in the repository are displayed as contents of the repository.
tree. Also, this revision number is used for all the operations executed directly from the Repositories view (on page 2897).

**Authentication**

Five protocols are supported: HTTP, HTTPS, SVN, SVN + SSH and FILE. If the repository that you are trying to access is password protected, the **Enter authentication data** dialog box requests a user name and a password. If the **Store authentication data** checkbox is selected, the credentials are stored in Apache Subversion™ default directory:

- **Windows** - `%HOME%\Application Data\Subversion\auth`. Example: `C:\Documents and Settings\John\Application Data\Subversion\auth`
- **Linux and OS X** - `$HOME/.subversion/auth`. Example: `/home/John/.subversion/auth`

There is one file for each server that you access. If you want to make Subversion forget your credentials, you can use the **Reset authentication** command from the **Options** menu. This causes Subversion to forget all your credentials. When you reset the authentication data, restart Oxygen XML Editor for the change to take effect.

**Tip:** The **FILE** protocol is recommended if the SVN repository and Oxygen XML Editor are located on the same computer as it ensures faster access to the SVN repository compared with other protocols.

For HTTPS connections where client authentication is required by your SSL server, you must choose the certificate file and enter the corresponding certificate password that is used to protect your certificate.

When using a secure HTTP (HTTPS) protocol for accessing a repository, a **Certificate Information** dialog box is displayed and asks you whether you want to accept the certificate permanently, temporarily, or simply deny it.

If the repository has SVN+SSH protocol, the SSH authentication can also be made with a private key and a pass phrase.

Figure 788. SSH Authentication Dialog Box
After the SSH authentication dialog box, another dialog box appears for entering the SVN user name that accesses the SVN repository. The SVN user name is recorded as the *committer* in SVN operations.

When connecting for the first time to a Subversion repository through SVN+SSH protocol, you will be asked to confirm if you trust the SSH host. The same dialog box is also displayed when the server changed the SSH key or when the key was deleted from the local Subversion cache folder.

Figure 789. SSH server name and key fingerprint

**Share a Project**

Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. The shared project directory is automatically converted to a working copy and added under Syncro SVN Client management. The **Share project** action is available in the **Tools** menu and the contextual menu of the **Repositories** view.
The following options can be configured in the **Share project** dialog box:

**Project**

*The location of the project folder ([on page 2938](#)) on the local disk by using the text box or the **Browse** button. This folder should not be empty or already under version control.*

⚠️ **Important**: By default, the SVN system only imports the content of the specified folder, and not the root folder itself. Therefore, it is recommended to use the **Browse** button to select the project folder so that the client will automatically append the name of it to the specified URL.

**URL**

*The new location of the project ([on page 2938](#)) (inside the repository) that will be used to access it.*

🔍 **Note**: **Peg revisions** have no effect for this operation since it is used to send information to the repository.

⚠️ **Attention**: If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

**Format**

*The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.*

**Share files matching global ignore patterns**
When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The global-ignores property in the SVN configuration file (on page 2937).
- The File name ignore patterns option (on page 237) in the SVN > Working Copy preferences page (on page 236).

**Enable automatic properties/Disable automatic properties**

Enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the SVN configuration file (on page 2937).

**Note:** This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the auto-props section). Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

**Defining a Working Copy**

An Apache Subversion™ working copy is an ordinary directory tree on your local system, containing a collection of files. You can edit these files however you want, your working copy being your private work area. To make your own changes available to others or incorporate changes made by others, you must explicitly tell Subversion to do so. You can even have multiple working copies of the same project.

**Figure 791. Working Copy View**
A Subversion working copy also contains some extra files, created and maintained by Subversion, to help it keep track of your files. In particular, each directory in your working copy contains a subdirectory named `.svn`, also known as the working copy administrative directory. This administrative directory contains an unaltered copy of the last updated files from the repository. This copy is usually referred to as the pristine copy or the BASE revision of the working copy. These files help Subversion recognize which files contain unpublished changes, and which files are out-of-date with respect to others' work.

A typical Subversion repository often holds the files (or source code) for several projects. Usually each project is a subdirectory in the repository's file system tree. In this arrangement, a user's working copy usually corresponds to a particular sub-tree of the repository.

Check Out a Working Copy

_Ccheck out_ means to make a copy of a project from a repository to your local file system. This copy is called a working copy. An Apache Subversion™ working copy is a specially formatted directory structure that contains additional `.svn` directories that store Subversion information, as well as a pristine copy of each item that is checked out.

To check out a working copy, locate and select the desired directory in the Repositories view and select the Check out action from the contextual menu, the toolbar, or the Repository menu.
The following options can be configured in the **Check out** dialog box:

**URL**

The location of the repository directory *(on page 2938)* to be **checked out**.

**Note:** To check out an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* *(on page 2940)* at the end (for example, `URL@rev1234`).

**Revision**

You can choose between the **HEAD** or **Other** revision. If you need to check out a specific revision, specify it in the **Other** text box or use the **History** button and choose a revision from the **History** dialog box *(on page 2831)*.

**Check out to**

Specify the **location where you want to check out** *(on page 2938)* the new working copy by typing the local path in the text box or by using the **Browse** button. If the specified local path does not point to an existing directory, it will automatically be created.

**Important:** By default, the SVN system only checks out the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the **Browse** button to select the **check out** location so that the client will automatically append the name of the remote directory to the path of the selected directory.

**Warning:** The destination directory should be empty. If files exist, they are skipped (left unchanged) by the **check out** operation and displayed as **modified** *(on page 2905)* after the operation has finished. Also, the destination directory must not already be under version control.

**Format**
The SVN format of the working copy. You can choose between SVN 1.8 or SVN 1.7.

**Depth**

The depth is useful if you want to check out only a part of the selected repository directory and bring the rest of the files and subdirectories in a future update. You can find out more about the checkout depth in the sparse checkouts (on page 2895) section. You can choose between the following depths:

- **Recursive (infinity)** - Checks out all the files and folders contained in the selected folder.
- **Immediate children (immediates)** - Checks out only the child files and folders without recursing subfolders.
- **File children only (files)** - Checks out only the child files.
- **This folder only (empty)** - Checks out only the selected folder (no child file or folder is included).

**Ignore “svn:externals” definitions**

When selected, external items are ignored in the check out operation. This option is only available if you choose the Recursive (infinity) depth.

After a check out, the new working copy is added to the list in the Working Copy view (on page 2902) and loaded automatically.

**History Dialog Box**

The History dialog box presents a list of revisions for a resource. It is opened from the dialog boxes that require setting an SVN revision number, such as the Check Out dialog box (on page 2829) or the Branch / Tag dialog box (on page 2858). It presents information about revision, commit date, author, and commit comment.

Figure 793. History Dialog Box
The initial number of entries in the list is 50. Additional revisions can be added to the list using the 
[Get next 50](#) and [Get all](#) buttons. The list of revisions can be refreshed at any time with the [Refresh](#) button. You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the [Group by date](#) button from the toolbar.

The **Affected Paths** area displays all paths affected by the commit of the revision selected in history. You can see the changes between the selected revision and the file's previous state using the [Compare with previous version](#) action, available in the contextual menu.

**Use an Existing Working Copy**

Using an existing working copy is the process of taking a working copy that exists on your file system and connecting it to Apache Subversion™ repository. If you have a brand new project that you want to import into your repository, then see the section [Import resources into the repository](on page 2890). The following procedure assumes that you have an existing valid working copy on your file system.

1. Click the [Working Copies Manager](#) toolbar button ![on Mac OS X](#) in the [Working Copy view](on page 2902).

   This action opens the **Working copies list** dialog box.
2. Press the Add button.
3. Select the working folder copy from the file system. The name is useful to differentiate between working copies located in folders with the same name. The default name is the name of the root folder of the working copy.

**Note:** For SVN 1.7 and newer working copies, all the internal information is kept only in the root directory. Thus, Syncro SVN Client needs to load the whole working copy.

4. Press the OK button.

The selected working copy is loaded and presented in the **Working Copy view (on page 2902)**.

**Note:** You can add working copies older than SVN 1.7. However, to load any of them, Syncro SVN Client will require to upgrade the working copy to SVN 1.8 format.

Manage Working Copy Resources

This section explains how to work with the resources that are displayed in the **Working Copy view**.

**Edit Files**

You can edit files from the **Working Copy view (on page 2902)** by double clicking them or by right clicking them and choosing Open from the contextual menu.

Note that only one file can be edited at a time. If you try to open another file, it is opened in the same editor window. The editor has syntax highlighting for known file types, meaning that a different color is used for each type of recognized token in the file. If the selected file is an image, then it is previewed in the editor, with no access to modifying it.

After modifying and saving a file from a working copy, a modified marker - an asterisk (*) - will be added to the file's icon in the **Working Copy view (on page 2902)**. The asterisk marks the files that have local modifications that were not committed to the repository.

**Add Resources to Version Control**

To share new files and folders (created in your working copy), add them to version control using the Add to version control option from the **Working Copy view (on page 2902)**.

You can easily spot resources not under version control by the unversioned () icon displayed in the **Local file status** column. Resources scheduled for addition are displayed with this added () icon in the **Working Copy view** and are added in the repository after you commit them.

**Note:** Do not make a confusion between  and  icons. The former icon stands for resources that are actually copies of resources already committed in the repository, meaning they are scheduled for addition with history.
When you use the Add to version control option on a directory, its entire structure is scanned and all the resources that can be added under version control are presented.

Although it is not mandatory to add resources under version control explicitly, it is recommended. If you forgot to add a resource, when you commit your changes (on page 2851), the resource is presented in the commit dialog box, but not selected. When you commit and unversioned resource, it is automatically added under version control before starting the commit operation.

Figure 794. Add to Version Control Dialog Box

![Add to Version Control Dialog Box](image)

**Note:** Ignored items can also be added under version control.

The Depth column is displayed only when directories are also presented in the dialog box. For any directory, you can use one of the available values to instruct Subversion to limit the scope of the operation to a particular tree depth.

**Note:** The initial value of the Depth field can have the following values, depending on the listing mode of the items in the working copy view (on page 2908):

- **infinity** - When the working copy items are presented as a tree.
- **files** - When the working copy items are presented compressed.
- **empty** - When the working copy items are presented flat.

When you add unversioned or ignored directories, the initial value of the Depth field also depends on the state of the Show unversioned directories content and Show ignored directories content options. If these options are selected, the value is based on the listing mode of the items in the working copy view. When they are not selected, the value is empty.

The following options are available in this dialog box:
• **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.

**Note:** This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the `config` file of the Subversion configuration directory, in the `auto-props` section. Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

• **No ignore** - when you select this option, file-name patterns defined to ignore unversioned resources do not apply. Resources that are located inside an unversioned directory selected for addition, and match these patterns, are also scheduled for addition in the repository.

**Note:** This option is available only when directories are also presented in the dialog box.

You can define file-name patterns to ignore unversioned resources in one of the following locations:

- In the `config` file of the Subversion configuration directory (the `global-ignores` option from the `miscellany` section).
- In the Oxygen XML Editor options (open the Preferences dialog box (Options > Preferences) (on page 79) and go to SVN > Working copy > Application global ignores).

Each of the above two options is activated only when you select an item for which the option can be applied.

**Ignore Resources Not Under Version Control**

Some resources inside your working copy do not need to be subject to version control. These resources can be files created by the compiler, `*.obj`, `*.class`, `*.lst`, or output folders used to store temporary files. Whenever you commit changes (on page 2851), Apache Subversion™ shows your modified files in the commit dialog box, but the unversioned files are also listed. Since the unversioned files are committed unless otherwise specified, it is difficult to see exactly what you are committing.

The best way to avoid these problems is to add the derived files to the Subversion ignore list. That way they are never displayed in the commit dialog box and only genuine unversioned files that must be committed are displayed.

You can choose to ignore a resource by using the Add to `svn:ignore` action in the contextual menu of the Working Copy view (on page 2902).
In the **Add to svn:ignore** dialog box, you can specify the resource to be ignored by name or by a custom pattern. The custom pattern can contain the following wildcard characters:

- `*` - Matches any string of characters of any size, including the empty string.
- `?` - Matches any single character.

For example, you can choose to ignore all text documents by using the pattern: `*.txt`.

The action **Add to svn:ignore** adds a predefined Subversion property called `svn:ignore` to the parent directory of the specified resource. In this property, there are specified all the child resources of that directory that must be ignored. The result is visible in the **Working Copy** view. The ignored resources are represented with gray icons.

### Delete Resources

The **Delete** action is available in the contextual menu of the **Working Copy** view ([on page 2902](#)). When you delete an item from the working copy, it is marked as deleted (scheduled for deletion from repository upon the next commit) and removed from the file system. Depending on the state of each item, you are prompted to confirm the operation.

If a resource is deleted from the file system without Subversion's knowledge, the resource is marked as **missing** ([ ] ) in your working copy. You can decide what you want to do with a **missing** item:

- In the case of a commit, any **missing** item is first automatically deleted and then committed.

  **Note:** Not any **missing** item can be committed as **deleted**, and removed from the repository. For example, you cannot commit an item that no longer exists on the disk and that was scheduled for addition ([ ] ) previously, since this item does not exist in the repository, but you can use the **Delete** action instead.

- If you want to recover **missing** items, either update ([on page 2850](#)) the items themselves or one of their parent directories. This fetches their latest version from the repository.

You can also delete conflicting items (file content conflicts, property conflicts, tree-conflicts) and Syncro SVN Client automatically marks them as resolved.

  **Note:** It is recommended that you resolve conflicts manually to avoid losing any important remote modifications.

Finally, you can change your mind and **revert** ([on page 2847](#)) the deleted items to their initial, pristine, state.
Copy Resources

You can copy resources from various locations of the working copy. You select them in the Working Copy view (on page 2902) and then use Copy to from the contextual menu. This is not a simple file system copy, but an Apache Subversion™ command. It will copy the resource and the copy will also have the original history. This is one of the important features of Subversion, as you can keep track of where the copied resources originated.

Based on the selected items, the Copy to action is available only if it can be performed. Even if the operation would not normally be possible in SVN (due to some invalid local file states against copy), Oxygen XML Editor performs the copy operation as a simple file system operation. This means no SVN versioning meta-data is affected.

Note:

- If you copy an item to a directory that is not under version control (on page 2905) (unversioned or ignored), the history of the item is not preserved. For example, when copying directories, all items inside them will also be copied without history.
- If you copy a directory that contains external (on page 2904) items, these are not copied. This is specific for SVN 1.7 working copies only. To fetch the external items, use the Update operation on the copied directory.

In the Copy to dialog box, you can navigate through the working copy directories to choose a target directory, to copy inside it. If you try to copy a single resource you are also able to change that resource's name. For versioned items, you can select Ignore resource history to copy them without their history (similar to a simple file system copy).

Note: The Copy to dialog box only presents all the local directories that are a valid destination against the copy operation, based on their local file status. Also, the working copy settings (on page 2908) are taken into account.

In the Commit dialog box, only the directory in question will appear without its children.

Move Resources

As in the case of the copy command, you can move several resources at once. Select the resources in the Working Copy view (on page 2902) and choose the Move to action from the contextual menu. The move command actually behaves as if a copy followed by a delete command were issued. You will find the moved resources at the desired destination and also at their original location, but marked as deleted.

Note: External items cannot be moved using the Move to action, because they cannot be deleted. Instead, you should edit the svn:externals property defining the external item and use the Update operation on the item's parent folder for the change to take effect.
Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Rename Resources

The Rename action is available in the contextual menu of the Working Copy view (on page 2902) and can be performed on a single resource. This action acts as a move command with the destination directory being the same as the original location of the resource. A copy of the original item is created with the new name, also keeping its history. The original item is marked as deleted.

Note: External items cannot be renamed using the Rename action because they cannot be deleted. Instead, you should edit the svn:externals property defining the external item, then use the Update operation on the item’s parent folder for the change to take effect.

Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Lock / Unlock Resources

The idea of version control is based on the copy-modify-merge model of file sharing. This model states that each user contacts the repository and creates a local working copy (check out). Users can then work independently and modify their working copies according to their needs. When their goal has been accomplished, it is time for the users to share their work with the others, to send them to the repository (commit). When a user has modified a file that has been also modified on the repository, the two files will have to be merged. The version control system assists the user with the merging as much as it can, but in the end the user is the one that must make sure it is done correctly.

The copy-modify-merge model only works when files are contextually mergeable: this is usually the case of line-based text files (such as source code). However this is not always possible with binary formats, such as images or sounds. In these situations, the users must each have exclusive access to the file, ending up with a lock-modify-unlock model. Without this, one or more users could end up wasting time on changes that cannot be merged.

An SVN lock is a piece of metadata that grants exclusive access to a user. This user is called the lock owner. A lock is uniquely identified by a lock token (a string of characters). If someone else attempts to commit the file (or delete a parent of the file), the repository demands two pieces of information:

- User authentication - the user performing the commit must be the lock owner
- Software authorization - the user's working copy must have the same lock token as the one from the repository, proving that it is the same working copy where the lock originated from.
Scanning for Locks

When starting to work on a file that is not contextually mergeable (usually a binary file), it is better to verify if someone else is not already working on that file. You can do this in the Working Copy view (on page 2902) by selecting one or more resources, then right-clicking them and choosing the Scan for Locks action from the contextual menu.

Figure 795. Locked Items Dialog Box

The Locked items dialog box contains a table with all the resources that were found locked on the repository. For each resource there are specified: resource path, state of the lock, owner of the lock, lock comment, creation and expiration date for the lock (if any).

The state of the lock can be one of the following:

- 🗝️ - Appears when one of the following conditions apply:
  - Another user has locked the file in the repository.
  - The file was locked by the same user from another working copy.
  - The file was locked from the Repositories view.
- 🗝️ - Displayed after you have locked a file from the current working copy.
- 🗝️ - A file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).
- 🗝️ - A file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

You can unlock a resource by selecting it and pressing the Unlock button.

Related Information:

- Working Copy Locks (on page 2906)
Locking a File

By locking a file, you have exclusive write access to it in the repository.

You can lock a file from your working copy or directly from the Repositories view.

⚠️ **Note:** You can only lock files (not directories). This is a restriction imposed by Apache Subversion™.

The Lock dialog box allows you to write a comment when you set a lock or when you steal an existing one. Note that you should steal a lock only after you made sure that the previous owner no longer needs it. Otherwise, you may cause an unsolvable conflict, which could be the reason the lock was put there in the first place. The Subversion server can have a policy concerning lock stealing, as it may not allow you to do this if certain conditions are not met.

The lock stays in place until you unlock the file or until someone breaks it. There is also the possibility that the lock expires after a period of time specified in the Subversion server policy.

Unlocking a File

A file can be unlocked from the contextual menu of the Working Copy view (on page 2902). A dialog box will prompt you to confirm the unlocking and it will also allow you to break the lock (unlock it by force).

Synchronize with Repository

In the work cycle you will need to incorporate other people's changes (update) and to make your own work available to others (commit). This is what the Incoming and Outgoing modes of the Working Copy view (on page 2902) was designed for, to help you send and receive modifications from the repository.

The Incoming and Outgoing modes of this view focus on incoming and outgoing changes. The incoming changes are the changes that other users have committed in the repository since you last updated your working copy. The outgoing changes are the modifications you made to your working copy as a result of editing, removing or adding resources.

The view presents the status of the working copy resources against the BASE revision after a Refresh operation. You can view the state of the resources versus a repository HEAD revision by using the Synchronize action from the Working Copy view (on page 2902).
View Differences

One of the most common requirements in project development is to see what changes have been made to the files from your Working Copy or to the files from the repository. You can examine these changes after a synchronize operation with the repository, by using the Open in compare editor action from the contextual menu.

The text files are compared using a built-in Compare view (on page 2926) that uses a line differencing algorithm or a specified external diff application (if such an application is set in the SVN Diff preferences page (on page 237)). When a file with outgoing status is involved, the compare is performed between the file from the working copy and the BASE revision of the file. When a file with incoming or conflict status is involved, the differences are computed using a three-way algorithm that means that the local file and the repository file are each compared with the BASE revision of the file. The results are displayed in the same view. The differences obtained from the local file comparison are considered outgoing changes and the ones obtained from the repository file comparison are considered incoming changes. If any of the incoming changes overlap outgoing changes then they are in conflict.

A special case of difference is a diff pseudo-conflict. This is the case when the left and the right sections are identical but the BASE revision does not contain the changes in that section. By default, this type of changes are ignored. If you want to change this, you can go to the SVN preferences page and select the Allow unversioned obstructions option (on page 235).

The right editor of the internal compare view presents either the BASE revision or a revision from the repository of the file so its content cannot be modified. By default, when opening a synchronized file in the Compare view, a compare is automatically performed. After modifying and saving the content of the local file presented in the left editor, another compare is performed. You will also see the new refreshed status in the Working Copy view (on page 2902).

Figure 796. Compare View
At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

There are three types of differences:

- **Incoming changes** - Changes committed by other users and not present yet in your working copy file. They are marked with a blue highlight and on the middle divider the arrows point from right to left.
- **Outgoing changes** - Changes you have done in the content of the working copy file. They are marked with a gray highlight and the arrows on the divider are pointing from left to right.
- **Conflicting changes** - This is the case when the same section of text that you already modified in the local file has been modified and committed by some other person. They are marked with a red highlight and red diamonds on the divider.

There are numerous actions and options available in the Compare View toolbar (on page 2928) or in the Compare menu from the main menu. You can decide that some changes need adjusting or that new ones must be made. After you perform the adjustments, you may want to perform a new compare between the files. For this case there is an action called Perform files differencing.
After each files differencing operation the first found change will be selected. You can navigate from one change to another by using the actions **Go to first**, **Go to previous**, **Go to next** and **Go to last modification**. If you decide that some incoming change needs to be present in your working file you can use the action **Copy change from right to left**. This is useful also when you want to override the outgoing modifications contained in a conflicting section. The **Copy all non-conflicting changes from right to left** action copies all incoming changes that are not contained inside a conflicting section in your local file.

Suppose that only a few words or letters are changed. Considering that the differences are performed taking whole lines of text into account, the change will contain all the lines involved. To find exactly what words or letters have changed, the **Word Details** and **Character Details** dialog boxes are available. They present a more detailed comparison result when you double-click the middle divider of a difference.

When you want to examine only the changes in the real text content of the files, while disregarding the changes in the number of white spaces between words or lines, there is an option available in the **SVN Preferences** (on page 234) that allows you to enable or disable the white space ignoring feature of the compare algorithm.

**Conflicts**

A file conflict occurs when two or more developers have changed the same few lines of a file or the properties of the same file. As Subversion knows nothing of your project, it leaves resolving the conflicts to the developers. Whenever a conflict is reported, you should open the file in question, and try to analyze and resolve the conflicting situation.

**Real Conflicts vs Mergeable Conflicts**

There are two types of conflicts:

- **real conflict** (icon in **Name** column) - Syncro SVN Client considers the following resource states to be real conflicts:
  - **conflicted state** - A file reported by SVN as being in this state is obtained after it was updated/merged while having incoming and outgoing content or property changes at the same time, changes that could not be merged. A content conflict (icon in **Local file status** column) is reported when the modified file has binary content or it is a text file and both local and remote changes were found on the same line. A properties conflict (icon in **Local properties status** column) is reported when a property's value was modified both locally and remotely.
  - **tree conflicted state** (icon in **Local file status** column) - Obtained after an update or merge operation, while having changes at the directory structure level (for example, file is locally modified and remotely deleted or locally scheduled for deletion and remotely modified).
- **obstructed state** ( november in Local file status column) - Obtained after a resource was versioned as one kind of object (file, directory, symbolic link), but has been replaced outside Syncro SVN Client by a different kind of object.

- **pseudo-conflict** ( icon in Name column) - A file is considered to be in pseudo-conflict when it contains both incoming and outgoing changes. When incoming and outgoing changes do not intersect, an update operation may automatically merge the incoming file content into the existing locally one. In this case, the pseudo-conflict marker is removed. This marker is used only as a warning that should prevent you to run into a real conflict.

**Note:**

- A conflicting resource cannot be committed to repository. You have to resolve it first, by using Mark Resolved action (after manually editing/merging file contents) or by using Mark as Merged action (for pseudo-conflicts).
- and icons are presented only when one of the following view modes is selected: Modified, Incoming, Outgoing, Conflicts.
- The icon is used also for folders to signal that they contain a file in real conflict or pseudo-conflict state.

**Content Conflicts vs Property Conflicts**

A Content conflict appears in the content of a file. A merge occurs for every inbound change to a file that is also modified in the working copy. In some cases, if the local change and the incoming change intersect each other, Apache Subversion™ cannot merge these changes without intervention. So if the conflict is real when updating the file in question the conflicting area is marked like this:

```
<<<<<<< filename
your changes
<br><br>code merged from repository
>>>>>> revision
```

Also, for every conflicted file Subversion places three additional temporary files in your directory:

- `filename.ext.mine` - This is your file as it existed in your working copy before you updated your working copy, that is without conflict markers. This file has your latest changes in it and nothing else.
- `filename.ext.rOLDREV` - This is the file that was the BASE revision before you updated your working copy, that is the file revision that you updated before you made your latest edits.
• `filename.ext.rNEWREV` - This is the file that Subversion client just received from the server when you updated your working copy. This file corresponds to the HEAD revision of the repository.

OLDREV and NEWREV are revision numbers. If you have conflicts with binary files, Subversion does not attempt to merge the files by itself. The local file remains unchanged (exactly as you last changed it) and you will get `filename.ext.r*` files also.

A Property conflict is obtained when two people modify the same property of the same file or folder. When updating such a resource a file named `filename.ext.prej` is created in your working copy containing the nature of the conflict. Your local file property that is in conflict will not be changed. After resolving the conflict, you should use the Mark resolved action to commit the file. Note that the Mark resolved action does not really resolve the conflict. It just removes the conflicted flag of the file and deletes the temporary files.

Edit Real Content Conflicts

The conflicts of a file in the conflicted state (a file with the red double arrow icon) can be edited visually with the Compare view (the built-in file comparison tool) or with an external diff application (on page 234). Resolving the conflict means deciding for each conflict if the local version of the change will remain or the remote one instead of the special conflict markers inserted in the file by the SVN server.

The Compare view (or the external diff application set in Preferences (on page 234)) is opened with the Edit Conflict action, which is available on the contextual menus of the Working Copy view (on page 2902) for files in the conflicted state (an update operation was executed but the differences could not be merged without conflicts). The external diff application is called with 3 parameters because it is a 3-way diff operation between the local version of the file from the working copy and the HEAD version from the SVN repository with the BASE version from the working copy as common ancestor.

If the Show warning dialog when edit conflicts option (on page 238) is selected, you will be warned at the beginning of the operation that the operation will overwrite the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<<<, =======, >>>>>>>) with the original local version of the file that preceded the update operation. If you press the OK button the visual conflict editing will proceed and a backup file of the conflict version received from the SVN server is created in the same working copy folder as the file with the edited conflicts. The name of the backup file is obtained by appending the extension `.sync.bak` to the file as stored on the SVN server. If you press the Cancel button the visual editing will be aborted.

The usual actions on the differences between two versions of a file are available on the toolbar of this view:
Save

Saves the modifications of the local version of the file displayed in the left side of the view.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

Synchronized scrolling

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

Note: When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

The operation begins by overwriting the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<<<, =======, >>>>>>>) with the original local version of the file before running the update action that created the conflict. After that the differences between this original local version and the repository version are displayed in the Compare view.

If you want to edit the conflict version of the file directly in a text editor instead of the visual editing offered by the Compare view you should work on the local working copy file after the update operation without running the action Edit Conflict. If you decide that you want to edit the conflict version directly after running the action Edit Conflict you have to work on the .sync.bak file.

If you did not finish editing the conflicts in a file at the first run of the action Edit Conflict you can run the action again and you will be prompted to choose between resuming the editing where the previous run left it and starting again from the conflict file received from the SVN server.

After the conflicts are edited and saved in the local version of the file you should run one of the following:

- The **Mark Resolved** action on the file so that the result of the conflict editing process can be committed to the SVN repository.
- The **Revert** action so that the repository version overwrites all the local modifications.

Both actions remove the backup file and other temporary files created with the conflict version of the local file.

**Revert Your Changes**

If you want to undo changes made in your working copy, since the last update, select the items you are interested in, right-click to display the contextual menu and select **Revert**. A dialog box will open that shows you the files and folders that you have changed and can be reverted. Select those you
want to revert and click the **OK** button. Revert will undo only your local changes. It does not undo any changes that have already been committed. If you choose to revert a conflicting item to its pristine copy, then the eventual conflict is solved by losing your outgoing modifications. If you try to revert a resource not under version control, the resource will be deleted from the file system.

**Note:** By default, a directory will be recursively reverted (including any other modified item it contains). However, if the directory has only property changes, you need to explicitly choose if the operation will include any modified items found inside it.

If you want some of your outgoing changes to be overridden you must first open the file in **Compare view (on page 2926)** and choose the sections to be replaced with ones from the repository file. This can be achieved either by editing directly the file or by using the action **Copy change from right to left** from the **Compare view toolbar (on page 2928)**. After editing the conflicting file you have to run the action **Mark as merged** before committing it.

If you want to drop all local changes and bring all incoming changes into your working copy resource, you can use the **Override and update** action. It discards the changes in the local file and updates it from the repository. A dialog box will display the files that will be affected.

Figure 797. Override and Update Dialog Box
In the first table of the dialog box you will be able to see the resources that will be overridden. In the second table you will find the list of resources that will be updated. Only resources that have an incoming status are updated.

**Tip:** If you want to roll-back out of your working copy changes that have already been committed to the repository, see [Merge Revisions (on page 2865)]().

### Merge Conflicted Resources

Before you can safely commit your changes to the repository you must first resolve all conflicts. In the case of pseudo-conflicts they can be resolved in most cases with an update operation that will merge the incoming modifications into your working copy resource. In the case of real conflicts, conflicts that persist after an update operation, it is necessary to resolve the conflict using the built-in compare view and editor or, in the case of properties conflict, the [Properties view (on page 2930)](). Before you can commit you must *mark as resolved* the affected files.

Both pseudo and real conflicts can be resolved without an update. You should open the file in the compare editor and decide which incoming changes need to be copied locally and which outgoing changes must be overridden or modified. After saving your local file you have to use the *Mark as merged* action from the contextual menu before committing.

### Drop Incoming Modifications

In the situation when your file is in conflict but you decide that your working copy file and its content is the correct one, you can decide to drop some or all of the incoming changes and commit afterwards. The action *Mark as merged* proves to be useful in this case too. After opening the conflicting files with [Compare view (on page 2926)](), [Editor (on page 2923)]() or editing their properties in the [Properties view](#) and deciding that your file can be committed in the repository replacing the existing one, you should use the *Mark as merged* action. When you want to override completely the remote file with the local file you should run the *Override and commit* action, which drops any remote changes and commits your file.

In general it is much safer to analyze all incoming and outgoing changes using the [Compare view](#) and only after to update and commit.

### Tree Conflicts

A *tree conflict* is a conflict at the directory tree structure level and occurs when the user runs an update action on a resource that has the following conditions:

- It is locally modified and the same resource was deleted from the repository (or deleted as a result of being renamed or moved).
• It was locally deleted (or deleted as a result of being renamed or moved) and the same resource is incoming as modified from the repository.

The same conflict situation can occur after a merge or a switch action. The action ends with an error and the folder containing the file that is now in the tree conflict state is also marked with a conflict icon.

Such a conflict can be resolved in one of the following ways that are available when the user double clicks on the conflicting resource or when running the **Edit conflict** action:

**Figure 798. Resolve a tree conflict**

![Tree conflict window](image)

• **Keep local change (delete resource)** - Keeps the incoming change that comes from the repository.

• **Keep incoming modified resource** - If there is a renamed version of the file committed by other user that will be added to the working copy too.

**Update the Working Copy**

While you are working on a project, other members of your team may be committing changes to the project repository. To get these changes, you have to **update** your working copy. Updating may be done on single files, a set of selected files, or recursively on entire directory hierarchies. The update operation can be performed from **Working Copy view (on page 2902)**. It updates the selected resources to the last synchronized revision (if remote information is available) or to the **HEAD** revision of the repository.

There are three different kinds of incoming changes:
• **Non-conflicting** - A non-conflicting change occurs when a file has been changed remotely but has not been modified locally.

• **Conflicting, but auto-mergeable** - An auto-mergeable conflicting change occurs when a text file has been changed both remotely and locally (for example, has non-committed local changes) but the changes are on different lines of text. Not applicable to binary resources (for example, multimedia files, PDFs, executable program files)

• **Conflicting** - A conflicting change occurs when one or more of the same lines of a text file have been changed both remotely and locally.

If the resource contains only incoming changes or the outgoing changes do not intersect with incoming ones then the update will end normally and the Subversion system will merge incoming changes into the local file. In the case of a conflicting situation the update will have as result a file with conflict status.

The Oxygen XML Editor allows you to update your working copy files to a specific revision, not only the most recent one. This can be done by using the Update to revision/depth action from the Working Copy view (All Files view mode) or the Update to revision action from the History view (on page 2917) contextual menu.

If you select multiple files and folders and then you perform an Update operation, all of those files and folders are updated one by one. The Subversion client makes sure that all files and folders belonging to the same repository are updated to the exact same revision, even if between those updates another commit occurred.

When the update fails with a message saying that there is already a local file with the same name Subversion tried to check out a newly versioned file, and found that an unversioned file with the same name already exists in your working folder. Subversion will never overwrite an unversioned file unless you specifically do this with an Override and update action. If you get this error message, the solution is simply to rename the local unversioned file. After completing the update, you can check to see if the renamed file is still needed.

### Send Your Changes to the Repository

Sending the changes you made to your working copy is known as committing the changes. If your working copy is up-to-date and there are no conflicts, you are ready to commit your changes.

The Commit action sends the changes from your local working copy to the repository. The Commit dialog box presents all the items that you can commit.

Figure 799. Commit dialog box
Enter a message to associate with the commit, or choose a previous message from the Previous messages list (the last 10 commit messages will be remembered even after restarting the SVN client application).

An item that can be committed has one of the following states: added, modified (content or properties), replaced, and deleted. All items that have one of these states are selected in the dialog box by default. If you do not want to commit one of the items, deselect it.

⚠️ **Attention:** For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Besides the items that have one of the mentioned states, Syncro SVN Client also includes the files being unversioned or missing and these items are handled automatically:

- **Unversioned** items are added under version control.
- **Missing** items are deleted.

_NOTE:_ If the Show unversioned directories content option is not selected, the Commit dialog box does not display the items inside an unversioned directory.
Unversioned or missing items are not selected by default in the Commit dialog box, unless you have selected them explicitly when issuing the commit command.

**Note:** In some cases, items that have one of the above states are not presented in the Commit dialog box.

For example:

- Items that have been added or replaced previously, but now are presented as missing after being removed from the file system, outside of an SVN client. Such items do not exist in the repository and you should use the Delete action to remove them from your working copy.
- Items that have incoming changes from the repository, after a synchronization. You need to have your working copy up-to-date before committing your changes.
- Files that, after a synchronization, appear as locked by other users or from other locations than the current working copy.

**Note:** Due to dependencies between items, when you select or clear an unversioned (unversioned) or added (added) item in the Commit dialog box, other items with one of these states can be selected or cleared automatically.

The modifications that will be committed for each file can be reviewed in the compare editor window by double clicking a file in the Commit dialog box, or by right clicking and selecting the Show Modifications action from the contextual menu. This option is available to review only file content changes, not property changes.

The **Local file status** column indicates the actual state of the items and the **Local properties status** column indicates whether or not the properties of an item are modified.

The **Lock information** column is displayed if at least one of the files in the Commit dialog box has lock information associated with it, valid against the commit operation.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the config file of the Subversion configuration directory.

  **Note:** This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the config file of the Subversion configuration directory, in the auto-props section. Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

- **Keep locks** - selecting the Keep locks option preserves any locks you set on various files.
Note: This option is available only when files that you locked are presented in the dialog box.

Each of the above options is activated only when you select an item for which the option can be applied.

Your working copy must be up-to-date with respect to the resources you commit. This is ensured by using the Update action prior to committing, resolving conflicts and re-testing as needed. If your working copy resources you are trying to commit are out of date you will get an appropriate error message.

Committing to Multiple Locations

Although Subversion does not support committing to multiple locations at once, Syncro SVN Client offers this functionality regarding external items.

If items to be committed belong to different external definitions than those found in the working copy, they are grouped under the corresponding item that indicates their repository origin. Each parent item is rendered bold and its corresponding repository location is presented when hovering it. Parent items are decorated with a small arrow (▲) if they are external definitions. The working copy root directory is never decorated and is not presented if there are no external items listed (all items belong to the main working copy). Each child item is presented relative to the parent item.

Note: When an external directory has modifications of its own, it is presented both as a parent item and as an item that you can select and commit. This is always the case for external files.

The sets of items belonging to external definitions from the same repository are committed together, resulting a single revision. So, the number of revisions can be smaller than the number of externals. External definitions are considered from the same repository if they have the same protocol, server address, port, and repository address within the server.

Note: External files are always from the same repository as the parent directory that defines them, so they are always committed together with the changes from their parent directory.

Integration with Bug Tracking Tools

Users of bug tracking systems can associate the changes they make in the repository resources with a specific ID in their bug tracking system. The only requirement is that the user includes the bug ID in the commit message that they enter in the Commit dialog box. The format and the location of the ID in the commit message are configured with SVN properties.

To make the integration possible Syncro SVN Client needs some data about the bug tracking tool used in the project. You can configure this using the following SVN properties (on page 2857) that must be
set on the folder that contains resources associated with the bug tracking system (usually they are set recursively on the root folder of the working copy):

- **bugtraq:message** - A string property. If it is set the Commit dialog box (on page 2851) will display a text field for entering the bug ID. It must contain the string %BUGID%, which is replaced with the bug number on commit.

- **bugtraq:label** - A string property that sets the label for the text field configured with the **bugtraq:message** property.

- **bugtraq:url** - A string property that is the URL pointing to the bug tracking tool. The URL string should contain the substring %BUGID% which Syncro SVN Client replaces with the issue number. That way the resulting URL will point directly to the correct issue.

- **bugtraq:warnifnoissue** - A boolean property with the values true/yes or false/no. If set to true, the Syncro SVN Client will warn you if the bug ID text field is left empty. The warning will not block the commit, only give you a chance to enter an issue number.

- **bugtraq:number** - A boolean property with the value true or false. If this property is set to false, then any character can be entered in the bug ID text field. If the property is set to true or is missing then only numbers are allowed as the bug ID.

- **bugtraq:append** - A boolean property. If set to false, then the bug ID is inserted at the beginning of the commit message. If yes or not set, then it is appended to the commit message.

- **bugtraq:logregex** - This property contains one or two regular expressions, separated by a newline. If only one expression is set, then the bug ID's must be matched in the groups of the regular expression string (for example, \[Ii\]ssue #?(\d+) ). If two expressions are set, then the first expression is used to find a string which relates to a bug ID but may contain more than just the bug ID (for example, Issue #123 or resolves issue 123 ). The second expression is then used to extract the bug ID from the string extracted with the first expression. An example: if you want to catch every pattern Issue #XXX and issue #890, #789 inside a log message you could use the following strings:
  
  ◦ \[Ii\]ssue #?(\d+) (,? ?#?(\d+))\
  ◦ (\d+)

The data configured with these SVN properties is stored on the repository when a revision is committed. A bug tracking system or a statistics tool can retrieve the revisions that affected a bug from the SVN server and present the commits related to that bug to the user of the bug tracking system.

If the **bugtraq:url** property was filled in with the URL of the bug tracking system and this URL includes the %BUGID% substring as specified above in the description of the **bugtraq:url** property then the History view (on page 2917) presents the bug ID as a hyperlink in the commit message. Clicking such a hyperlink in the commit message of a revision opens a Web browser at the page corresponding to the bug affected by that commit.
Obtain Information for a Resource

This section explains how to obtain information for a SVN resource:

Request Status Information for a Resource

While you are working with the SVN Client you often need to know which files you have changed, added, removed, or renamed, or even which files got changed and committed by others. This is where the Synchronize action from the Working Copy view (on page 2902) comes in handy. The Working Copy view shows you every file that has changed your working copy, as well as any unversioned files you may have.

If you want more detailed information about a given resource, you can use the Show SVN Information action. This action is available from the File menu or the contextual menu of the Working Copy, Repositories, History, or Directory Change Set views, or from the Revision Graph dialog box. The SVN Information dialog box will be displayed, showing information about the selected resource. The information displayed depends on the location of the item (local or remote) and may include the following:

- Local path and repository location
- Revision number
- Last change author, revision and date
- Information about locks
- Local file status
- Local properties status
- Local directory depth
- Repository location and revision number for copied files or directories
- Path information about locally moved items
- Path information about conflict generated files
- Remote file status
- Remote properties status
- File size and other information

The value of a property of the resource displayed in the dialog box can be copied by right-clicking the property and selecting the Copy action.

Request History for a Resource

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the History view that can be accessed from Repositories view (on page 2897), Working Copy view (on page 2902), Revision Graph (on page 2933), or Directory Change Set view (on page 2921).
From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Related Information:**

- **History View (on page 2917)**

**Management of SVN Properties**

In the **Properties view (on page 2930)** you can read and set the Apache Subversion™ properties of a file or folder. There is a set of predefined properties with special meaning to Subversion. For more information about properties in Subversion see the SVN Subversion specification. Subversion properties are revision dependent. After you change, add or delete a property for a resource, you have to commit your changes to the repository.

If you want to change the properties of a given resource you need to select that resource from the **Working Copy view (on page 2902)** and run the **Show properties** action from the contextual menu. The **Properties view (on page 2930)** will show the local properties for the resource in the working copy. Once the Properties view is visible, it will always present the properties of the currently selected resource. There are actions available in the **Properties view toolbar (on page 2932)** that allow you to add, change, and delete the properties.

If you choose the **Add a new property** action, a new dialog box will appear that contains the following:

- **Name** - Combo box that allows you to enter the name of the property. The drop-down menu of the combo box presents the predefined Subversion properties (such as *svn:ignore*, *svn:externals*, *svn:needs-lock*, etc.)
- **Current value** - Text area that allows you to enter the value of the new property.

If the selected item is a directory, you can also set the property recursively on its children by selecting the **Set property recursively** checkbox.

If you want to change the value for a previously set property, you can use the **Edit property** action, which will display a dialog box with the following information:

- **Name** - Property name (cannot be changed).
- **Current value** - The current value (can be changed).
- **Base value** - The value of the property, if any, from the resource in the pristine copy (cannot be changed).
If you want to completely remove a property previously set you can choose the **Remove property** action. It will display a confirmation dialog box in which you can also choose if the property will be removed recursively.

There is a **Refresh** action in the **Properties view** that can be used when the properties have been changed from outside the view. This can happen, for example, when the view was already presenting the properties of a resource and they have been changed after an **Update** operation.

Branches and Tags

One of the fundamental features of version control systems is the ability to create a new line of development from the main one. This new line of development will always share a common history with the main line if you look far enough back in time. This line is known as a **branch**. Branches are mostly used to try out features or fixes. When the feature or fix is finished, the branch can be merged back into the main branch (**trunk**).

Another feature of version control systems is the ability to take a snapshot of a particular revision, so you can at any time recreate a certain build or environment. This is known as **tagging**. Tagging is especially useful when making release versions.

In Apache Subversion™, there is no difference between a **tag** and a **branch**. On the repository, both are ordinary directories that are created by copying. The trick is that they are cheap copies instead of physical copies. Cheap copies are similar to hard links in Unix, which means that they merely link to a specific tree and revision without making a physical copy. As a result, branches and tags occupy little space on the repository and are created very quickly.

Provided that nobody ever commits to the directory in question, it remains a tag. If people start committing to it, it becomes a branch.

Create a Branch / Tag

To create a branch or tag by copying a directory, use the **Branch/Tag** action that is available in the **Tools** menu when an item is selected in the **Working Copy view** or **Repositories view**, or from the contextual menu of the **Repositories** view.

Figure 800. Branch/Tag Dialog Box
You can configure the following options in this dialog box:

You can specify the source revision of the copy in the **Copy from** section. You can choose between the following options:

- **HEAD revision in the repository** - The new branch or tag will be copied in the repository from the **HEAD** revision. The branch will be created very quickly, as the repository will make a *cheap* copy.

- **Specific revision in the repository** - The new branch will be copied into the repository, but you can specify the exact desired revision. For example, this is useful if you forgot to make a branch or tag when you released your application. If you click the **History** button you can select the revision number from the *History* dialog box (on page 2831). This type of branch will also be created very quickly.

- **Working copy** - (Available only if the item is selected from the **Working copy** view). The new branch will be a copy of your local working copy. If you have updated some files to an older revision in your working copy, or if you have made local changes, that is exactly what goes into the copy. This involves transferring some data from your working copy back to the repository, or more specifically, the locally modified files.

You can specify the location of the new branch or tag in the **Destination** section:

- **Into repository's directory** - The URL of the parent directory (on page 2938) of the new branch or tag.
Note: Peg revisions have no effect for this operation since it is used to send information to the repository.

- **Under the name** - You can specify another branch or tag name other than the name of the resource selected in the Repositories or Working copy view.

The new branch or tag will be created as a child of the specified URL of the repository directory and will have the new name.

Merging

At some stage during the development process, you will want to merge the changes made on a branch back into the trunk, or vice-versa. The merge is accomplished by comparing two points (branches or revisions) in the repository and applying the obtained differences to your working copy. This process is closely related to the diff concept.

Note: A branch is a line of development that exists independently of another line, yet still shares a common history if you look far enough back in time. A branch always begins life as a copy of something (such as a trunk, another branch, or tag), and moves on from there, generating its own history.

The ➔ Merge action is available in the Tools menu. The working copy item selected when you issued the command will be the one receiving the generated changes. If there is no item selected, the merge operation will be performed on the entire working copy.

Figure 801. Merge Wizard
The four types of merging are as follows:

- **Merge revisions** *(on page 2863)* - Port changes from one branch to another. Note that the trunk can also be considered a branch, in this context.
- **Synchronize branch** *(on page 2865)* - Fetch all the changes made on a parent branch (or the trunk) to a child branch.
- **Reintegrate a branch** *(on page 2867)* - Merge a branch back to its parent branch (can also be the trunk).
- **Merge two different trees** *(on page 2869)* - Integrate the changes done on a branch to a different branch.

It is recommended that you enable the following pre-merge check:

**Perform pre-merge best practices checks of the working copy target** *(on page 2862)* - When selected, the SVN Client checks if the working copy target item is ready for the merge operation and displays the pre-merge checks wizard page.

**Remember:** It is a good idea to perform a merge into an unmodified working copy. If you have made changes to your working copy, commit them first. If the merge does not go as you expect, you may want to revert the changes and revert cannot recover your uncommitted modifications.
Important: The above recommendation becomes mandatory when reintegrating a branch (on page 2860).

Pre-Merge Checks

Before performing a merge, it is recommended to make sure that the working copy target item is ready for the merge operation. The SVN Client includes a best practices step that checks various conditions of the working copy target item to ensure that the merge operation will succeed. By selecting the Perform pre-merge best practices checks of the working copy target option in the first page of the Merge wizard, the Pre-merge checks wizard page is displayed to give you a summary of the verified conditions.

Figure 802. Pre-Merge Checks Wizard Page

The following conditions are checked in this operation:

No local modifications

The working copy item (or any of its children) receiving the merge should not contain uncommitted changes, to make it easier to revert merge-generated changes if you encounter unexpected results.

Tip: If this condition fails, you should commit or revert the local modifications before merging.
No switched children

None of the children of the working copy item receiving the merge should be switched, to avoid incomplete merges and subtree mergeinfo.

Tip: If this condition fails, you should switch back all the children before merging.

Complete working copy tree

The working copy item receiving the merge should be a complete directory tree structure with an infinite depth, to avoid incomplete merges and subtree mergeinfo.

Tip: If this condition fails, you should change the sticky depth of the working copy item receiving the merge to infinity value.

No mixed revisions

To avoid unexpected merge conflicts, the working copy item that is receiving the merge should not contain items that were updated to other revisions.

Tip: If this condition fails, you should update the working copy before merging.

Each condition is marked with an icon that represents the state of the condition. The possible states are as follows:

• ✓ (Successful) - The condition is fulfilled successfully.
• ⚠ (Warning) - The condition is not fulfilled, but it is not mandatory.
• ⚠ (Error) - The condition is not fulfilled and is mandatory (therefore, the operation cannot proceed until you solve the error).

Tip: For each condition state, a message is displayed that gives you additional information about the results and, for warning or errors, a hint that explains how you can solve them.

Important: After solving any of the warnings or errors, it is recommended that you perform the pre-merge checks again to make sure your new changes are valid.

Merge Revisions

This case is when you have made one or more changes to a branch and you want to duplicate them in another branch. For example, suppose you know that a problem has been fixed by committing revisions 17, 20, and 25 on branch B1. These changes are also needed in branch B2. Thus, to merge them, you need a working copy of the B2 branch.

To merge revisions from a different branch, follow these steps:

1. Go to menu Tools > Merge.
The **Merge** wizard is opened.

2. Select the **Merge revisions** option.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.

   a. Press the **Next** button.

   If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks** wizard page (on page 2862) is displayed.

   **Note:** If errors are found you need to solve them before proceeding.

4. Press the **Next** button.

   The **Merge revisions** wizard page is displayed.

5. In the **Merge from (URL)** text box, enter the **URL of the branch or tag** (on page 2938) that contain the changes that you want to duplicate in your working copy. You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

   **Note:** If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option (in the **Merge Options** wizard page (on page 2872)) will be selected automatically (and you cannot change this). This is because the **Subversion client cannot track changes between different repositories** (on page 2875).

   **Tip:** You can also specify a **peg revision** (on page 2940) at the end of the URL (for example, URL@rev1234). The peg revision does not affect the merge range you select. By default, the **HEAD** revision is assumed.

6. In the **Revisions to merge** section, choose between the **all revisions** and **specific revision(s)** options.

   - **all revisions** - The operation will include **all eligible revisions** that were not yet merged.
   - **specific revision(s)** - You can specify one or more individual revisions and/or revision ranges. Also, you can mix **forward** ranges (for example, 1-5), **backward ranges** (for example, 20-15), and subtract specific revisions from a range (for example, 1-5, -3).

   **Note:** If using the Subversion command-line client, a revision range of the form 1-5 means all changes starting from revision 2 up to revision 5 (the changes necessary to reach revision 5, committed after revision 1). Unlike the Subversion command-line client, in **Syncro SVN Client** the revision ranges are inclusive, meaning that it will process all revisions, starting with revision 1, up to and including revision 5.
Attention: The HEAD revision is the only non-numerical revision allowed, and it can only be used when specifying revision ranges as one of the ends of the range (for example, 10-HEAD). Be careful when using it, as it might not refer to the desired revision, if it has recently been committed by another user.

Tip: If you want to perform a reverse merge and roll-back your working copy changes that have already been committed to the repository, use the negative revisions notation (for example, -7) or backward revision ranges (for example, 20-10).

a. If you press the History button, the History dialog box (on page 2831) is displayed, which allows you to select one or more revisions to be merged.

7. Optionally, if you want to configure the options (on page 2872) for your merge, press the Next button.
   The Merge Options wizard page (on page 2872) is displayed that allows you to configure options for the operation.

Warning: If the Ignore ancestry / Disable merge tracking option is selected and you chose all revisions in the Revisions to merge section, revisions that were previously merged will also be included, which may result in conflicts.

8. Press the Merge button.
   The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2874) after making major changes.

Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Synchronize a Branch

While working on your own branch, other people on your team might continue to make important changes in the parent branch (which can be the trunk itself or any other branch). It is recommended to periodically duplicate those changes in your branch to make sure your changes are compatible with them. This is done by performing a synchronize merge, which will bring your branch up-to-date with any changes made to its ancestral parent branch since your branch was last created or synchronized.
Subversion is aware of the history of your branch and can detect when it split away from the parent branch.

Frequently keeping your branch in sync with the parent branch helps you to prevent unexpected conflicts when the time comes for you to duplicate your changes back into the parent branch. The synchronization uses *merge tracking* to skip all those revisions that have already been merged, thus a sync merge can be repeated periodically to fetch all the latest changes of the parent branch to keep up-to-date with it.

**Important:** It is recommended to synchronize the whole working copy that was created from the child branch (the root of the working copy), rather than just a part of it.

After running the *synchronize* merge, your working copy from the child branch now contains new local modifications, and these edits are duplications of all of the changes that have happened on the *trunk* since you first created your branch. At this point, your private branch is now synchronized with the trunk.

To synchronize your branch with its parent branch, follow these steps:

1. Go to **Tools > Merge**. The Merge wizard is opened.
2. Select the **Synchronize branch** option.
3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
   a. Press the **Next** button.
      If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks wizard page (on page 2862)** is displayed.

      **Note:** If errors are found you need to solve them before proceeding.
4. Press the **Next** button.
   The Synchronize branch wizard page is displayed.
5. In the **Parent branch (URL)** text box, enter the **URL of the branch from which you created your branch (on page 2938)**. This means that the URL must belong to the same repository as your working copy that was created from the child branch.
   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.
Tip: You can also specify a peg revision (on page 2940) at the end of the URL (for example, URL@rev1234). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the HEAD revision is assumed.

6. Optionally, if you want to configure the options (on page 2872) for your merge, press the Next button.
   The Merge Options wizard page (on page 2872) is displayed that allows you to configure options for the operation.

   Note: The Ignore ancestry / Disable merge tracking option is not available for this merge type, since a synchronization merge should always be recorded in the destination branch.

7. Press the Merge button.
   The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2874) after making major changes.

   Note: The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

Reintegrate a Branch

There are some conditions that apply to reintegrate a branch:

- The server must support merge tracking.
- The source branch (to be reintegrated) must be coherently synchronized with its parent branch.
  This means that all revisions between the branching point and the last revision merged from the parent branch to the child branch must be merged to the latter one (there must be no missing revisions in-between).
- The working copy must not contain the following:
  - Local modifications.
  - A mixture of revisions (all items must point to the same revision).
  - Sparse directories (all directories must be of infinity depth).
  - Switched items.
- The revision of the working copy must be greater than or equal to the last revision of the parent branch with which the child branch was synchronized.
Tip: You can use the pre-merge checks option (on page 2862) to make sure these conditions are fulfilled.

This method is useful when you have a feature branch on which the development has concluded and it should be merged back into its parent branch. Since you have kept the feature branch synchronized with its parent, the latest versions of them will be absolutely identical except for your feature branch changes. These changes can be reintegrated into the parent branch by using a working copy of it and the Reintegrate a branch option.

This method uses the merge-tracking features of Apache Subversion™ to automatically calculate the correct revision ranges and to perform additional checks that will ensure that the branch to be reintegrated has been fully updated with its parent changes. This ensures that you do not accidentally undo work that others have committed to the parent branch since the last time you synchronized the child branch with it. After the merge, all branch development will be completely merged back into the parent branch, and the child branch will be redundant and can be deleted from the repository.

Tip: Before reintegrating the child branch it is recommended to synchronize it with its parent branch one more time, to help avoid any possible conflicts.

To reintegrate a child branch into its parent branch, follow these steps:

1. Go to menu Tools > Merge.
   The Merge wizard is opened.

2. Select the Reintegrate a branch option.

   Note: This option is not available if the selected working copy item (or if it is a directory, any of the items inside of it) has any type of modification. This is because it is mandatory for the target item to have no modifications.

3. It is recommended that you select the Perform pre-merge best practices checks of the working copy target option to make sure that the working copy target item is ready for the merge operation.

   a. Press the Next button.
      If the Perform pre-merge best practices checks of the working copy target option is selected, the Pre-Merge Checks wizard page (on page 2862) is displayed.

      Note: If errors are found you need to solve them before proceeding.

4. Press the Next button.
   The Reintegrate a branch wizard page is displayed.
5. In the **Child branch (URL)** text box, enter the **URL of the child branch to be reintegrated** ([on page 2938](#)). This means that the URL must belong to the same repository as your working copy that was created from the parent branch.

You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** You can also specify a **peg revision** ([on page 2940](#)) at the end of the URL (for example, `URL@rev1234`). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the **HEAD** revision is assumed.

The **Merge Options** wizard page ([on page 2872](#)) is displayed that allows you to configure options for the operation.

**Note:** Since a **reintegrate merge** is so specialized, most of the merge options are not available, except for those in the **File Comparison** category.

6. Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to **resolve conflicts** ([on page 2874](#)) after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

### Merge Two Different Trees

This merge type is useful when you need to duplicate changes from one child branch (for example, **CB1**) to another child branch (**CB2**) from the same parent branch. The SVN client will calculate the changes necessary to get from the **HEAD** revision of the parent branch (or the **trunk**) to the **HEAD** revision of one of its child branches (**CB1**), and apply those changes to your working copy of the other branch (**CB2**). The result is that the latter child branch (**CB2**) will also include the changes made on the original child branch (**CB1**), although that branch was not reintegrated into the parent branch.

This merge type could also be used to reintegrate a child branch back into its parent when the repository does not support **merge tracking**.
Note: If the server does not support *merge-tracking*, then this is the only way to merge a branch back to its parent.

1. Go to menu **Tools > Merge**. 
   The Merge wizard is opened.

2. Select the option **Merge two different trees**.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
   a. Press the Next button.
      If the **Perform pre-merge best practices checks of the working copy target** option is selected, the Pre-Merge Checks wizard page *(on page 2862)* is displayed.

   Note: If errors are found you need to solve them before proceeding.

4. Press the Next button.
   The **Merge two different trees** wizard page is displayed.

5. In the **From (starting URL and revision)** section enter the URL of the first branch *(on page 2938)*. 
   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

   Tip: If you are using this method to merge a feature branch back to its parent branch, you need to start the merge wizard from within a working copy of the parent. In this field enter the full URL of the parent branch. This may sound wrong, but remember that the parent is the starting point to which you want to add the branch changes.

   Note: If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option *(in the Merge Options wizard page (on page 2872))* will be selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories *(on page 2875)*.

   Tip: You can also specify a **peg revision** *(on page 2940)* at the end of the URL (for example, `URL@rev1234`). By default, the **HEAD** revision is assumed.

6. Enter the last revision number at which the two trees were synchronized by choosing between **HEAD revision** and **other revision**.

   - **HEAD revision** - Use this option if you are sure that no one else has committed changes since the last synchronization.
• **other revision** - Use this option to input a specific revision number and avoid losing recent commits. You can use the History button to see a list of all revisions.

7. In the **To (ending URL and revision)** section enter the URL of the second branch *(on page 2938).* You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop down menu, which displays a history of previously used URLs.

**Tip:** If you are using this method to merge a feature branch back to its parent branch, enter the URL of the feature branch. This way, only the changes unique to this branch will be merged, since the branch should have been periodically synchronized with its parent.

**Attention:** The URL must point to the same repository as the one in the **From (starting URL and revision)** field. Otherwise, the operation will not be allowed, since Subversion cannot compute changes between items from different repositories.

**Tip:** You can also specify a peg revision *(on page 2940)* at the end of the URL (for example, URL@rev1234). By default, the HEAD revision is assumed.

8. Select a revision to compute all changes committed up to that point by choosing between **HEAD revision** and **other revision**.
   - **HEAD revision** - This is the default selected revision.
   - **other revision** - Use this option if you want to enter a previous revision. You can use the History button to see a list of all revisions.

9. Optionally, if you want to configure the options *(on page 2872)* for your merge, press the **Next** button.

The **Merge Options** wizard page *(on page 2872)* is displayed that allows you to configure options for the operation.

**Warning:** If the Ignore ancestry / Disable merge tracking option is selected and you chose all revisions in the Revisions to merge section, revisions that were previously merged will also be included, which may result in conflicts.

10. Press the **Merge** button.

The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts *(on page 2874)* after making major changes.
**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

**Merge Options**

Here is the list of options that can be used when merging:

![Merge Wizard - Advanced Options](image)

- **Depth** (This option is applicable only for directories) - sets the depth of the merge operation. You can specify how far down into your working copy the merge should go by selecting one of the following values:
  - **Current depth** - Obeys the depths registered for the directories in the working copy that are to be switched.
  - **Recursive (infinity)** - Merges all the files and folders contained in the selected folder. This is the recommended depth for most users, to avoid incomplete merges and subtree mergeinfo.
  - **Immediate children (immediates)** - Merges only the child files and folders without recursing subfolders.
  - **File children only (files)** - Merges only the child files.
  - **This folder only (empty)** - Merges only the selected folder (no child files or folders are included).

**Note:** The *depth* term is described in the Sparse checkouts *(on page 2895)* section. The default depth is the current depth of the working copy item receiving the merge.
• **Ignore ancestry / Disable merge tracking** - Changes the way two items are merged if they do not share a common ancestry. Most merges involve comparing items that are ancestrally related to one another. However, occasionally you may want to merge unrelated items. If this option is not selected, the first item will be replaced with the second item. In these situations, you would want the merge to do a path-based comparison only, ignoring any relations between the items. For example, if two different files have the same name and are in the same relative location, deselecting the option replaces one of the files with the other one, and selecting it merges their contents.

**Note:** If the URL of the merge source belongs to a different repository than the URL of the target working copy item (the one receiving the changes), this option is selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories.

• **Force deletion of modified or non-versioned items, if necessary** - If not selected, when the merge operation involves deleting locally modified or non-versioned items, it will fail. This is done to prevent data loss. This option is only available if there are uncommitted changes in the working copy.

• **Only record the merge (block revisions from getting merged)** - Available when the **Ignore ancestry / Disable merge tracking** option (on page 2873) is not selected. It enables a special mode of the merge operation that just records it in the local merge tracking information, without actually performing it (does not modify any file contents or the structure of your working copy). You might want to select this option for two possible reasons:
  ◦ You made (or will make) the merge manually, and therefore need to mark the revisions as being merged to make the merge tracking system aware of them. This will exclude them from future merges.
  ◦ You want to prevent one or more particular changes from being fetched in subsequent merges.

• **Ignore line endings** - Allows you to specify how the line ending changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.

• **Ignore whitespaces** - Allows you to specify how the whitespace changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
  ◦ **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

**Note:** Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.
  ◦ **Ignore all whitespaces** - Ignores all types of whitespace changes.

• **Test merge** - Performs a dry run of the merge operation, allowing you to preview it without actually performing the merge. In the **Console** view you will see a list of the working copy items
that will be affected and how they will be affected. This is helpful in detecting whether or not a merge will be successful, and where conflicts may occur.

Resolving Merge Conflicts

After the merge operation is finished, it is possible to have some items in conflict. This means that some incoming modifications for an item could not be merged with the current working copy version. If there are such conflicts, the **Merge conflicts** dialog box will appear, presenting the items that are in conflict. This dialog box offers you choices for resolving the conflicts.

Figure 804. Merge Conflicts Dialog Box

The options to resolve a conflict are as follows:

- **Resolve later** - Used for leaving the conflict as it is, to manually resolve it later.
- **Keep incoming** - This option keeps all the incoming modifications and discards all current ones from your working copy.
- **Keep outgoing** - This option keeps all current modifications from your working copy and discards all incoming ones.
- **Mark resolved** - You should choose this option after you have manually solved the conflict, to instruct the Subversion that it was resolved. To do this, use the **Edit conflict** button, which displays a dialog box that presents the contents of the conflicting items (the content of the working copy version versus the incoming version).
Additional Notes About the Merge Operation

**Sub-tree Merges**

It is recommended to perform a merge on the whole working copy (select its root directory when triggering the operation) to avoid *sub-tree mergeinfo*. *Sub-tree mergeinfo* is the *mergeinfo* recorded to describe a *sub-tree merge*. That is, a merge done directly to a child of a branch root that might be needed in certain situations. There is nothing special about *sub-tree merges* or *sub-tree mergeinfo* except that the complete record of merges to a branch may not be contained solely in the *mergeinfo* on the branch root and you may have to look to any *sub-tree mergeinfo* to get a full accounting. Fortunately, Subversion does this for you and rarely will you need to look for it.

**Merging from Foreign Repositories**

Subversion supports merging from foreign repositories. While all merge source URLs must point to the same repository, the merge target (from the working copy) may come from a different repository than the source. However, copies made in the merge source will be transformed into plain additions in the merge target. Also, *merge-tracking* is not supported for merges from foreign repositories.

**Note:** When performing merges from repositories other than the one corresponding to the target item (from the working copy), the **Ignore ancestry / Disable merge tracking** option (on page 2873) in the **Merge Options** wizard page (on page 2872) will be selected automatically (and you cannot change this).

**General Merge Recommendations**

As a recommendation, you should only merge into clean working copies that **do not** contain any of the following:

- Modifications.
- Sparse directories (all directories must be of depth *infinity*).
- Switched items.

**Important:** This recommendation becomes mandatory when performing a **reintegrate merge** (on page 2867) operation. Also, trying to merge to mixed-revision working copies will fail in all types of merge operations.

**Remember:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.
Switch the Repository Location

The **Switch** action is useful when the repository location of a working copy, or an already committed item in the working copy, must be changed within the same repository. The action is available on the **Tools** menu when a versioned resource is selected in the current working copy that is displayed in the **Working Copy** view (on page 2902).

**Note:** *External* items cannot be switched using this action. Instead, change the value of the **svn:externals** property set on the parent directory of the external item and update the parent directory.

Figure 805. **Switch** Dialog Box

![Switch Dialog Box](image)

The following options can be configured in the **Switch** dialog box:

**Switch to URL**

The new location in the same repository (on page 2938) you are switching to.

**Tip:** You can switch to items that were deleted, moved, or replaced, by specifying the original URL (before the item was removed) and use a **peg revision** (on page 2940) at the end (for example, `URL@rev1234`).

**Note:** For items that are already switched (on page 2904) that you want to switch back, the proposed URL is the original location of the item.

**Revision**

The specific version of the location that you are switching to.

**Depth - (This option is applicable only for directories)**

Current depth
Obeys the depths registered for the directories in the working copy that are to be switched.

**Recursive (infinity)**

Switches the location of the selected folder and all of its files and folders.

**Immediate children (immediates)**

Switches the location of the selected folder and its child files and folders without recursing subfolders.

**File children only (files)**

Switches the location of the selected folder and its child files.

**This folder only (empty)**

Switches the location of the selected folder (no child files or folders are included).

**Ignore "svn:externals" definitions**

When selected, external items are ignored in the switch operation. This option is only available if you choose the Current depth or Recursive (infinity) depth.

**Change the working copy item to the specified depth**

Changes the sticky depth on the directory in the working copy.

**Ignore ancestry**

When not selected, the SVN system does not allow you to switch to a location that does not share a common ancestry with the current location. If selected, the SVN does not check for a common ancestry.

**Relocate a Working Copy**

Sometimes the base URL of the repository is changed after a working copy is checked out from that URL. For example, if the repository itself is moved to a different server. In such cases, you do not have to check out a working copy from the new repository location. It is easier to change the base URL of the root folder of the working copy to the new URL of the repository (on page 2938).

**Note:** Peg revisions have no effect for this operation.

This Relocate action is available in the Tools menu when selecting the root item of the working copy.

**Note:** External items that are defined using absolute URLs and that point to the same repository as the working copy are not affected by the Relocate action (the URL is not updated). To relocate these items, change the value of the svn:externals property for each external item (set on their parent directories). For example, if an external item is defined as externalDir http://host/path/to/repo/to/dir and the repository was moved to another server (host2) and its protocol changed to
Then the value of the property needs to be updated to `externalDir https://host2/path/to/repo/to/dir`.

**Tip:** If you edit external items using the method described in the previous note, on the next update the system will try to fetch the external items again. To avoid this, you can invoke the **Relocate** action on each of these external items.

### Patches

This section explains how to work with patches in Syncro SVN Client.

#### What is a Patch

Suppose you are working with a set of XML files that you want to tag the project and distribute releases to other team members. While working on the project and correcting problems, you may need to distribute the corrections to other team members. In this case, you can distribute a patch (a collection of differences) that would correct the problems when applied over the last distribution. By default, the Syncro SVN Client generates patches in the **Unified Diff format**, but it can also use the **Git format** *(on page 2890)*.

Creating a patch in Apache Subversion™ implies the access to either two revisions of a versioned item, or two different versioned items from the repository:

- **Two revisions of a version item** - the item can be local or remote and you can select two versions of it. This also applies when you need to generate a patch that only contains the changes in the working copy that were not yet committed.
- **Two different versioned items from the repository** - the items are remote and you need to specify a revision for both.

**Warning:** The resulting patch file may contain content that was written using a mix of encodings, based upon the encodings of the files that were compared. If you open the generated patch file in a text editor, it may result in unrecognizable content.

### Generating a Patch - Local Items

Based on a versioned item (already committed or scheduled for addition) in the working copy, you can generate patches that contain the local changes, the differences between a specific revision of that item and the item itself, or differences between the pristine item and another item from the repository. There are four options for generating a patch based upon local items.

To open the **Create patch** wizard, use the ![Create patch](createpatch.png) **Create patch** action from the **Tools** menu or from the contextual menu in the **Modified, Incoming, Outgoing**, or **Conflicts** modes.
Create Patch from Local Modifications

This is the most commonly used type of patch and contains only the local changes for the selected item.

This option is useful if you want to share changes with other team members and you are not yet ready to commit them. This option is only available for local items that contain modifications. It is not available for items in which the local file status is unversioned or ignored, and in some cases missing or obstructed (on page 2905).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch from local modifications option in the dialog box.

3. Optionally, if you want to configure the options (on page 2887) for your patch, press the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

4. Press the Create patch button.
If the patch is applied on a folder of the working copy and that folder contains unversioned files (on page 2905), this step of the wizard offers the option of selecting the ones that will be included in the patch.

Figure 807. Create Patch Dialog Box - Add Unversioned Resources

The patch is created and stored in the path specified in the Output section of the Options page (on page 2887) or in the default location.

Create Patch Against a Specific Revision

This type of patch contains changes between an old revision and the current content from the selected item within the working copy.

This option is useful if you want to obtain differences between an older revision and the current state of the working copy (for instance, to test how current changes apply to an older version).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch against a specific revision option in the dialog box.

3. Press the Next button.
   The second step of the wizard is opened:

Figure 808. Create Patch Wizard - Step 2
4. Select the revision to create patch against.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2831) to display a list of the item revisions.

   **Note:** If the revision to create patch against is older than the revision for which the working copy item was updated, the patch will include changes that were made after the selected revision.

5. Optionally, if you want to configure the options (on page 2887) for your patch, press the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

6. Press the Create patch button.
   The patch is created and stored in the path specified in the Output section of the Options page (on page 2887) or in the default location.

Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.
Tip: If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the Create patch between two repository items option (on page 2883) instead.

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch between two revisions of an item option in the dialog box.

3. Press the Next button.
   The second step of the wizard is opened:

   ![](Figure 809. Create Patch Wizard - Step 2)

4. Select the starting and ending revisions in the From and To sections.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2831) to display a list of the item revisions.

   Note: The patch will only include changes between the two specified revisions, starting with the changes that were made after the older revision.

   Tip: If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the From section and the older version in the To section.

5. Optionally, if you want to configure the options (on page 2887) for your patch, press the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

6. Press the Create patch button.
   The patch is created and stored in the path specified in the Output section of the Options page (on page 2887) or in the default location.
Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:** To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a **peg revision** (on page 2940) at the end (for example, `URL@rev1234`).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the **Create patch** wizard.

2. Select the **Create patch between two repository items** option in the dialog box.

3. Press the **Next** button.
   The second step of the wizard is opened:

Figure 810. Create Patch Wizard - Step 2
4. Select the starting and ending URLs (on page 2938) and revisions in the From and To sections. You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2831) to display a list of the item revisions.

⚠️ **Important:** Both URLs must point to items from the same repository.

⚠️ **Note:** If you use a peg revision in the URL field, anything specified in the other revision field is ignored.

5. Optionally, if you want to configure the options (on page 2887) for your patch, press the Next button. This options page does not remember your selections when creating future patches. It will revert to the default values. The Options wizard page is displayed.

6. Press the Create patch button. The patch is created and stored in the path specified in the Output section of the Options page (on page 2887) or in the default location.

---

Generating a Patch - Remote Items

Based on a repository item, you can generate patches that contain the differences between two specific revisions of that item, or between a revision of that same item and another revision of another item from the repository. There are two options for generating a patch based upon remote items.

To open the Create patch wizard, use the Create patch action from the Tools menu.

Figure 811. Create Patch Wizard - Remote Items
Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

**Tip:** If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the Create patch between two repository items option (on page 2883) instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the Create patch wizard.

2. Select the Create patch between two revisions of an item option in the dialog box.

3. Press the **Next** button.
   The second step of the wizard is opened:

   Figure 812. Create Patch Wizard - Step 2

4. Select the starting and ending revisions in the **From** and **To** sections.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2831) to display a list of the item revisions.

   **Note:** The patch will only include changes between the two specified revisions, starting with the changes that were made after the older revision.

   **Tip:** If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the From section and the older version in the To section.

5. Optionally, if you want to configure the options (on page 2887) for your patch, press the **Next** button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The **Options** wizard page is displayed.
6. Press the **Create patch** button. The patch is created and stored in the path specified in the **Output** section of the **Options page** *(on page 2887)* or in the default location.

### Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:** To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a **peg revision** *(on page 2940)* at the end (for example, `URL@rev1234`).

The steps are as follows:

1. Go to menu **Tools > Create patch**. This opens the **Create patch** wizard.

2. Select the **Create patch between two repository items** option in the dialog box.

3. Press the **Next** button. The second step of the wizard is opened:

   Figure 813. Create Patch Wizard - Step 2
4. Select the starting and ending URLs (on page 2938) and revisions in the From and To sections. 
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can press the History button (on page 2831) to display a list of the item revisions.

   **Important:** Both URLs must point to items from the same repository.

   **Note:** If you use a peg revision in the URL field, anything specified in the other revision field is ignored.

5. Optionally, if you want to configure the options (on page 2887) for your patch, press the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

6. Press the Create patch button.
   The patch is created and stored in the path specified in the Output section of the Options page (on page 2887) or in the default location.

Patch Options
Patch Section

Depth - (This option is applicable only for directories)

- Current depth
  The depth of recursing the folder for creating the patch is the same as the depth of that same folder in the working copy (available only when generating patches that contain changes from the working copy).

- Recursive (infinity)
  The patch is created on all the files and folders contained in the selected folder.

- Immediate children (immediates)
  The patch is created only on the child files and folders without recursing subfolders.

- File children only (files)
  The patch is created only on the child files.

- This folder only (empty)
The patch is created only on the selected folder (no child file or folder is included in the patch).

**Ignore content of added files**

When selected, the patch file does not include the content of the *added* items. This option corresponds to the `--no-diff-added` option of the `svn diff` command.

**Ignore content of delete files**

When selected, the patch file does not include the content of the *deleted* items. This option corresponds to the `--no-diff-deleted` option of the `svn diff` command.

**Treat copied files as newly added**

When selected, copied items are treated as new, rather than comparing the items with their sources. This option corresponds to the `--show-copies-as-adds` option of the `svn diff` command.

**Include files having a binary MIME type**

When selected, the application is forced to compare items that are considered binary file types. This option corresponds to the `--force` option of the `svn diff` command.

**Ignore properties**

When selected, differences in the properties of items are ignored. This option corresponds to the `--ignore-properties` option of the `svn diff` command.

**Properties only**

When selected, only differences in the properties of the items are included in the patch file (file content is ignored). This option corresponds to the `--properties-only` option of the `svn diff` command.

> **Note:** The **Ignore properties** and **Properties only** options are mutually exclusive.

**Notice ancestry**

If selected, the SVN common ancestry is taken into consideration when calculating the differences. This option corresponds to the `--notice-ancestry` option of the `svn diff` command.

**Files Comparison Section**

**Ignore line endings**

If selected, the differences in line endings are ignored when the patch is generated. This option corresponds to the `--ignore-eol-style` option of the `svn diff` command.

**Ignore whitespaces**
If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** (`--ignore-space-change`) - Ignores changes in the amount of whitespaces or changes to their type (for example, when changing the indentation or changing tabs to spaces).

  **Note:** Whitespaces that are added or removed are still considered to be changes.

- **Ignore all whitespaces** (`--ignore-all-space`) - Ignores all types of whitespace changes.

Output Section

**Save as**

The patch will be created and saved in the specified file.

**Use Git extended diff format**

When selected, the patch is generated using the *Git* format. This option corresponds to the `--git` option of the *svn diff* command.

Working with Repositories

This section explains how to locate and browse SVN repositories in Syncro SVN Client.

**Importing Resources Into a Repository**

Importing resources into a repository is the process of copying local files and directories into a repository so that they can be managed by an Apache Subversion™ server. If you have already been using Subversion and you have an existing working copy you want to use, then you will likely want to follow the procedure for using an existing working copy (on page 2832).

The **Import folder** and **Import Files** actions are available from the **Import** submenu of the **Repository** menu or of the contextual menu in the **Repositories** view. These actions open a dialog box that allow you to select the directories or files that will be imported into the selected repository location.

The **Import folder** action opens the **Import folder** dialog box.

Figure 815. **Import Folder** Dialog Box
You can configure the following options:

**Folder**

Specify the local folder *(on page 2938)* by using the text box or the **Browse** button. This folder should not be empty or already under version control.

⚠️ **Important:** By default, the SVN system only imports the content of the specified folder, and not the folder itself. Therefore, it is recommended to use the **Browse** button to select the local folder so that the client will automatically append the name of it to the specified URL.

**URL**

Specify the repository location *(on page 2938)* that will be used to access the folder to be imported.

⚠️ **Note:** Peg revisions have no effect for this operation since it is used to send information to the repository.

⚠️ **Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

**Depth**

- **Recursive (infinity)**
  
  Imports all the files and folders contained in the selected folder.

- **Immediate children (immediates)**
  
  Imports only the child files and folders without recursing subfolders.

- **File children only (files)**
  
  Imports only the child files.
This folder only (empty)

Imports only the selected folder (no child file or folder is included).

Share files matching global ignore patterns

When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in the SVN configuration file (on page 2937).
- The File name ignore patterns option (on page 237) in the SVN > Working Copy preferences page (on page 236).

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the SVN configuration file (on page 2937).

Note: This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the `auto-props` section). Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

Exporting Resources From a Repository

This is the process of taking a resource from the repository and saving it locally in a clean form, with no version control information. This is very useful when you need a clean build for an installation kit.

The Export dialog box is similar to the Check out dialog box:

Figure 816. Export from Repository Dialog Box
You can configure the following options:

**URL**

Specify the source directory from the repository (on page 2938) by using the text box or the Browse button.

**Tip:** To export an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a peg revision (on page 2940) at the end (for example, URL@rev1234).

**Note:** The content of the selected directory from the repository and not the directory itself will be exported to the file system.

**Revision**

You can choose between the HEAD or Other revision. If you need to export a specific revision, specify it in the Other text box or use the History button and choose a revision from the History dialog box.

**Export to**

Specify the location where you want to export the repository directory by typing the local path in the text box or by using the Browse button. If the specified local path does not point to an existing directory, it will automatically be created.

**Important:** By default, the SVN system only exports the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the Browse button to select the export location so that the client will automatically append the name of the remote directory to the path of the selected directory.

**Warning:** The destination directory should be empty. If files exist, they will be overwritten by exported files with matching names.

**Depth**

- **Recursive (infinity)**
  
  Exports all the files and folders contained in the selected folder.

- **Immediate children (immediates)**
  
  Exports only the child files and folders without recursing subfolders.

- **File children only (files)**
  
  Exports only the child files.

- **This folder only (empty)**
  
  Exports only the selected folder (no child file or folder is included).
Ignore "svn:externals" definitions

When selected, external items are ignored in the export operation. This option is only available if you choose the **Recursive (infinity)** depth.

**EOL style**

Defines the *end-of-line (EOL)* marker that should be used when exporting files that have the value or the `svn:eol-style` property set to *native*. You can choose between the following styles:

- **Default** - It uses the system-specific *end-of-line* marker.
- **CRLF** - The Windows-specific *end-of-line* marker (*carriage return - line feed*).
- **LF** - The Unix / OS X-specific *end-of-line* marker (*line feed*).
- **CR** - The Mac OS 9 (or older)-specific *end-of-line* marker (*carriage return*).

**Ignore keywords**

When selected, the export operation does not expand the SVN keywords found inside the files.

**Copy / Move / Delete Resources From a Repository**

Once you have a location defined in the **Repositories view (on page 2897)**, you can run commands (such as copy, move, and delete) directly on the repository. The commands correspond to the following actions in the contextual menu:

The **Copy to** and **Move to** action allows you to copy and move individual or multiple resources to a specific directory from the **HEAD** revision of the repository.

Figure 817. Copy/Move Items in Repository
The dialog box used to copy or move items allows you to browse the HEAD revision of the repository and select the destination of the items, presenting its repository URL below the tree view.

The **Source** section presents relevant options regarding the item(s) that you move or copy:

- **URL** - This field is displayed only if you copy/move a single item.
- **Revision** - Presents the revision from which you copy one or more items, allowing you to also choose another revision.

**Note**: Since only items from the HEAD revision can be moved, the **Revision** options are not presented for the **Move to** action.

**Note**: When you copy a single item while browsing a revision other than HEAD, the **Revision** options present this revision but does not allow you to change it. The same applies if copying multiple items.

- **New name** - This option is presented when you copy or move a single item, allowing you to also rename it.

Another useful action is **Delete**, allowing you to erase resources directly from the repository.

All three actions are commit operations and you will be prompted with the **Commit message** dialog box.
Sparse Checkout

Sometimes you only need to check out certain parts of a directory tree. In this case, you can check out the top directory (using the **Check out** action from the **Repositories** view (on page 2898)) and then recursively update only the needed directories (using the **Update** action from the **Working Copy** view (on page 2910)). Each directory then has a depth set to it, with four possible values:

- **Recursive (infinity)** - Updates all descendant directories and files recursively.
- **Immediate children (immediates)** - Updates the directory, including direct child directories and files, but does not populate the child directories.
- **File children only (files)** - Updates the directory, including only child files without the child directories.
- **This folder only (empty)** - Updates only the selected directory, without updating any children.

For some operations, you can use as depth the current depth registered on the directories from the working copy (the value **Current depth**). This is the depth value defined in a previous check out or update operation.

The sparse checked out directories are presented in the **Working Copy** view (on page 2902) with a marker corresponding to each depth value, in the top left corner, as follows:

- 🗑 **Recursive (infinity)** - This is the default value and it is has no mark. The directory has no limiting depth.
- 📖 **Immediate children (immediates)** - The directory is limited to direct child directories (without contents) and files.
- 📜 **File children only (files)** - The directory is limited to direct child files only.
- 🗑️ **This folder only (empty)** - The directory has empty depth set.

A depth set on a directory means that some operations process only items within the specified depth range. For example, **Synchronize** on a working copy directory reports the repository modified items within the depth set on the directory and those existing in the working copy outside of this depth.

The depth information is also presented in the **SVN Information** dialog box and in the tool tip displayed when hovering a directory in the **Working Copy** view.

**Syncro SVN Client Views**

The main working area occupies the center of the application window, which contains the most important views:

- **Repositories View** (on page 2897)
- **Working Copy View** (on page 2902)
The other views that support the main working area are also presented in this section.

Repositories View

The **Repositories** view allows you to define and manage Apache Subversion™ repository locations and browse repositories. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If no connections to your repository are available, you can add a new repository location *(on page 2823)*. Repository files and folders are presented in a tree view with the repository locations at the first level, where each location represents a connection to a specific repository. More information about each resource is displayed in a tabular form:

- **Date** - Date when the resource was last modified.
- **Revision** - The revision number at the time the resource was last modified.
- **Author** - Name of the person who made the last modification on the resource.
- **Size** - Resource size on disk.
- **Lock information** - Information about the lock status of a file. When a repository file is locked by a user the ⚒ icon is displayed in this column. If no icon is displayed the file is not locked. The tooltip of this column displays the details about the lock:
  - **Owner** - The name of the user who created the lock.
  - **Date** - The date when the user locked the file.
  - **Expires on** - Date when the lock expires. Lock expiry policy is set in the repository options, on the server side.
  - **Comment** - The message attached when the file was locked.
- **Type** - Contains the resource type or file extension.

Figure 818. Repositories View
The Repositories view’s toolbar contains the following buttons:

- **New Repository Location** - Allows you to enter a new repository location by means of the Add SVN Repository dialog box.
- **Move Up** - Move the selected repository up one position in the list of repositories in the Repositories view.
- **Move Down** - Move the selected repository down one position in the list of repositories in the Repositories view.
- **Collapse all** - Collapses all repository trees.
- **Stop** - Stops the current repository browsing operation executed when a repository node is expanded. This is useful when the operation takes too long or the server is not responding.
- **Settings** - Allows you to configure the resource table appearance.

Repositories View Contextual Menu Actions

The Repositories view contextual menu contains various actions, depending on the selected item. If a repository location is selected, the following management actions are available:
New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))
Displays the Add SVN Repository dialog box. This dialog box allows you to define a new repository location.

Figure 819. Add SVN Repository Dialog Box

If the Validate repository connection option is selected, the URL connection is validated before being added to the Repositories view.

Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))
Context-dependent action that allows you to edit the selected repository location using the Edit SVN Repository dialog box. It is active only when a repository location root is selected.

Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))
Context-dependent action that allows you to change the selected repository revision using the Change the Revision to Browse dialog box. It is active only when a repository location root is selected.

Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))
Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

The following actions are common to all repository resources:

Open
Opens the selected file in the Editor view in read-only mode.

Open with
Displays the Open with dialog box to specify the editor in which the selected file is opened. If multiple files are selected, only external applications can be used to open the files.

Save as
Saves the selected files locally, as they are in the browsed revision.

Refresh (F5)
Refreshes the resource selected in the **Repositories** view.

**Check out (Ctrl + Alt + O (Command + Alt + O on OS X))**

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see the section **Check out a working copy (on page 2829)**.

**Branch/Tag**

Allows you to create a branch or a tag from the selected folder in the repository. To read more about how to create a branch/tag, see the **Creation and management of Branches/Tags (on page 2858)** section.

**Share project**

Allows you to share a new project (on page 2826) using an SVN repository. The local project is automatically converted into an SVN working copy.

**Import:**

**Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))**

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section **Importing resources into a repository (on page 2890)**.

**Note:** The difference between the **Import folder** and **Share project** actions is that the latter also converts the selected directory into a working copy.

**Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))**

Imports the files selected from the file system into the selected folder in the repository.

**Export**

Opens the **Export dialog box (on page 2892)** that allows you to configure options for exporting a folder from the repository to the local file system.

**Show History (Ctrl + H (Command + T on OS X))**

Displays the history of the selected resource. At the start of the operation, you can set filtering options.

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

Opens the **Show Annotation** dialog box that computes the annotations for a file and displays them in the **Annotations view (on page 2924)**, along with the history of the file in the **History** view.
Revision Graph (\texttt{Ctrl + G (Command + G on OS X)})

This action allows you to see the graphical representation of a resource history. For more details about a resource revision graph see Revision Graph (on page 2933). This operation is available for any resource selected in the Repositories view or Working Copy view.

Copy URL Location (\texttt{Ctrl + Alt + U (Command + Alt + U on OS X)})

Copies to clipboard the URL location of the selected resource.

Copy to

Copies to a specified location the currently selected resource(s). This action is also available when you browse other revisions than the latest one (\texttt{HEAD}), to allow restoring previous versions of an item.

Move to (\texttt{Ctrl + M (Command + M on OS X)})

Moves to a specified location the currently selected resource(s).

Rename (\texttt{(F2)})

Renames the selected resource.

Delete (\texttt{(Delete)})

Deletes selected items from the repository via an immediate commit.

New Folder (\texttt{Ctrl + Shift + F (Command + Shift + F on OS X)})

Allows you to create a folder in the selected repository path (available only for folders).

Locking

The following options are available only for files:

\begin{itemize}
  \item Lock (\texttt{Ctrl + K (Command + K on OS X)})
    
    Allows you to lock certain files for which you need exclusive access. For more details on the use of this action, see Locking a file (on page 2840).
  \item Unlock (\texttt{Ctrl + Shift + K (Command + Shift + K on OS X)})
    
    Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (\textit{break the lock}).
\end{itemize}

Show SVN Properties (\texttt{Ctrl + Shift + P (Command + Shift + P on OS X)})

Brings up the Properties view (on page 2930) displaying the SVN properties for the selected resource. This view does not allow adding, editing, or removing SVN properties of a repository resource. These operations are allowed only for working copy resources.

Show SVN Information (\texttt{Ctrl + I (Command + I on OS X)})
Provides additional information for the selected resource. For more details, go to Obtain information for a resource (on page 2856).

Assistant Actions

When there is no repository configured, the Repositories view mode lists the following two actions:

Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the Repositories view. These operations behave in the same way with the Copy to/Move to operations.

Working Copy View

The Working Copy view allows you to manage the content of an SVN working copy. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The toolbar contains the following:

- The list of defined working copies.
- A set of view modes that allow you to filter the content of the working copy based on the resource status (such as incoming or outgoing changes).
- Settings menu.

If you click any of the view modes (All Files, Modified, Incoming, Outgoing, Conflicts), the information displayed changes as follows:

- **All Files** - Resources (files and folders) are presented in a hierarchical structure with the root of the tree representing the location of the working copy on the file system. Each resource has an icon representation that describes the type of resource and also depicts the state of that resource with a small overlay icon.

Figure 821. Working Copy View - All Files View Mode
• Modified - The resource tree presents resources modified locally (including those with conflicting content) and remotely. Decorator icons are used to differentiate between various resource states:

- Incoming modification from repository:
  - ■ - File content or properties modified remotely.
  - ■ - New file added remotely.
  - ■ - File deleted remotely.

- Outgoing modification to repository:
  - ■ - File content or properties modified locally.
  - ■ - New file added locally.
  - ■ - File deleted locally.

- Pseudo-conflict state - A resource being locally and remotely modified at the same time, or a parent directory of such a resource.

- Real conflict state - A resource that had both incoming and outgoing changes and not all the differences could be merged automatically through the update operation (manually editing the local file is necessary for resolving the conflict).

Figure 822. Working Copy View - Modified View Mode
The resource tree presents

- **Incoming** - The resource tree presents only incoming changes.
- **Outgoing** - The resource tree presents only outgoing changes.
- **Conflicts** - The resource tree presents only conflicting changes (real conflicts and pseudo-conflicts).

The following columns provide information about the resources:

- **Name** - Resource name. Resource icons can have the following decorator icons:
  - Additional status information:
    - ![Propagated modification marker](image) - A folder marked with this icon indicates that the folder itself presents some changes (such as modified properties) or a child resource has been modified.
    - ![External](image) - This indicates a mapping of a local directory to the URL of a versioned resource. It is declared with a `svn:externals` property in the parent folder and it indicates a working copy not directly related with the parent working copy that defines it.
    - ![Switched](image) - This indicates a resource that has been switched from the initial repository location to a new location within the same repository. The resource goes to this state as a result of the Switch action ([on page 2875](#)) executed from the contextual menu of the Working Copy view.
    - ![Grayed](image) - A resource with a grayed-out icon, but no overlaid icon, is an ignored resource. It is obtained with the Add to `svn:ignore` action.
Current SVN depth of a folder:

- **Immediate children (immediates)** (a variant of sparse checkout (on page 2895)) - The directory contains only direct file and folder children. Child folders ignore their content.

- **File children only (files)** (a variant of sparse checkout (on page 2895)) - The directory contains only direct file children, disregarding any child folders.

- **This folder only (empty)** (a variant of sparse checkout (on page 2895)) - The directory discards any child resource.

**Note:**
- Any folder not marked with one of the depth icons, has recursive depth (infinity) set by default (presents all levels of child resources).
- Although folders not under version control can have no depth set, Oxygen XML Editor presents unversioned and ignored folders with empty depth when Show unversioned directories content or Show ignored directories content options are not selected.

- **Local file status** - Shows the changes of working copy resources that were not committed to the repository yet. The following icons are used to mark resource status:
  - - Resource is not under version control (unversioned).
  - ⚠️ - Resource is being ignored because it is not under version control and its name matches a file name pattern defined in one of the following places:
    - [global-ignores](on page 2820) section in the SVN client-side config file (on page 2820).
    - Application global ignores option (on page 237) of Oxygen XML Editor.
    - The value of a [svn:ignore](on page 2835) property set on the parent folder of the resource being ignored.
  - 📃 - Marks a newly created resource, scheduled for addition to the version control system.
  - 📃 - Marks a resource scheduled for addition, created by copying a resource already under version control and inheriting all its SVN history.
  - 📃 - The content of the resource has been modified.
  - 📃 - Resource has been replaced in your working copy (the file was scheduled for deletion, and then a new file with the same name was scheduled for addition in its place).
  - 📃 - Resource is deleted (scheduled for deletion from Repository upon the next commit).
  - 📃 - The resource is incomplete (as a result of an interrupted check out or update operation).
  - 📃 - The resource is missing because it was moved or deleted without using an SVN-aware application.
  - 📃 - The contents of the resource is in real conflict state (on page 2843).
  - 📃 - Resource is in a name conflict state.
Resource is in *tree conflict* state after an update operation because:
- Resource was locally modified and incoming deleted from repository.
- Resource was locally scheduled for deletion and incoming modified.
- Resource is *obstructed* (versioned as one kind of object: file, directory, or symbolic link, but has been replaced outside Syncro SVN Client by a different kind of object).

**Local properties status** - Marks the resources that have SVN properties, with the following possible states:
- The resource has SVN properties set.
- The resource properties have been modified.
- Properties for this resource are in *real conflict* (on page 2843) with property updates received from the repository.

**Revision** - The current revision number of the resource.

**Date** - Date when the resource was last time modified on the disk.

**BASE Revision** - The revision number of the pristine version of the resource.

**BASE Date** - Date when the pristine version of the resource was last time committed in the repository.

**Author** - Name of the person who made the last modification on the pristine version of the resource.

**Remote file status** - Shows changes of resources recently modified in the repository. The following icons are used to mark incoming resource status:
- Resource is newly added in repository.
- The content of the resource has been modified in repository.
- Resource was replaced in repository.
- Resource was deleted from repository.

**Remote properties status** - Resources marked with the icon have incoming modified properties from the repository.

**Remote revision** - Revision number of the resource latest committed modification.

**Remote date** - Date of the resource latest modification committed on the repository.

**Remote author** - Name of the author who committed the latest modification on the repository.

**Lock information** - Shows the lock state of a resource. The lock mechanism is a convention intended to help you signal other users that you are working with a particular set of files. It minimizes the time and effort wasted in solving possible conflicts generated by clashing commits. A lock gives you exclusive rights over a file, only if other users follow this convention and they do not try to bypass the lock state of a file.

A folder can be locked only by the SVN client application, completely transparent to the user, if an operation in progress was interrupted unexpectedly. As a result, folders affected by the operation are marked with the symbol. To clear the locked state of a folder, use the **Clean up** action.

**Note:** Users can lock only files.
The following lock states are displayed:

- **no lock** - the file is not locked. This is the default state of a file in the SVN repository.

- **remotely locked** - shown when:
  - Another user has locked the file in the repository.
  - The file was locked by the same user from another working copy.
  - The file was locked from the **Repositories** view.

If you try to commit a new revision of the file to the repository, the server does not allow you to bypass the file lock.

**Note:** To commit a new revision, you need to wait for the file to be unlocked. Ultimately, you might try to break or steal the lock, but this is not what other users expect. Use these actions carefully, especially when you are not the file lock owner.

- **locked** - displayed after you have locked a file from the current working copy. Now you have exclusive rights over the corresponding file, being the only one who can commit changes to the file in the repository.

**Note:** Working copies keep track of their locked files, so the locks are presented between different sessions of the application. Synchronize your working copy with the repository to make sure that the locks are still valid (not stolen or broken).

- **stolen** - a file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

- **broken** - a file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

**Note:** To remove the stolen or broken states from your working copy files, you have to Update them.

If one of your working copy files is locked, hover the mouse pointer over the lock icon to see more information:

- Lock type - current file lock state
- Owner - the name of the user who created the lock
- Date - the date when the user locked the file
- Expires on - date when the lock expires. Lock expiry policy is set in the repository options, on the server side
- Comment - the message attached when the file was locked

- **Size** - Resource size on disk
- **Type** - Contains the resource type or file extension

**Note:** The working copy table allows you to show or hide any of its columns and also to sort its contents by any of the displayed columns. The table header provides a contextual menu that allows you to customize the displayed information.
The toolbar contains the following options for switching to a different working copy:

- **List of Defined Working Copies** - A drop-down menu that contains all the working copies Oxygen XML Editor is aware of. When you select a different working copy from the list, the newly selected working copy content is scanned and displayed in the Working Copy view.

- **Working Copies Manager** - Opens a dialog box that displays the working copies Oxygen XML Editor is aware of. In this dialog box, you can add existing working copies or remove those you no longer need. If you try to add a folder that is not a valid Subversion working copy, Oxygen XML Editor warns you that the selected directory is not under version control.

  **Note:** Removing a working copy from this dialog box does NOT remove it from your file system; you will have to do that manually.

**Working Copy Settings**

The **Settings** button from the toolbar of the Working Copy view provides the following options:

- **Show unversioned directories content** - Displays the content of unversioned directories.

  **Note:** If this option is not selected, it will be ignored for items that, after a synchronize, are reported as incoming from the repository. This applies for all working copy modes, except All Files.

- **Show ignored items** - Displays the ignored resource when All Files mode is selected.

- **Show ignored directories content** - Displays the content of ignored directories when All Files mode is selected.

  **Note:** Although ignored items are not presented in the Modified, Incoming, and Conflicts modes, they will be if, after a synchronize, they are reported as incoming from the repository.

- **Show deleted items** - Displays the deleted resource when All Files mode is selected. All other modes always display deleted resources, disregarding this option.

- **Tree / Compressed / Flat** - Affect the way information is displayed inside the Modified, Incoming, Outgoing, and Conflicts view modes.

- **Configure columns** - Allows you to customize the structure of the Working Copy view data. This action opens the following dialog box:

  Figure 823. Configure Columns of Working Copy View
The order of the columns can be changed with the two arrow buttons. The column size can be edited in the **Width of selected column** field. The **Restore Defaults** button reverts all columns to the default order, width, and enabled/disabled state from the installation of the application.

### Working Copy Format

When an SVN working copy is loaded, Syncro SVN Client first checks the format of the working copy:

- If the format is older than SVN 1.7, you are prompted to upgrade it to SVN 1.8 to load it.
- If the format is 1.7, Syncro SVN Client takes into account the state of the [When loading an old format working copy option](on page 236).

To change how working copy formats are handled, open the **Preferences** dialog box (**Options > Preferences**) (on page 79), go to **SVN > Working copy**, and configure the options in the **Administrative area** (on page 236) section.

- **Note:**
  - The format of the working copy can be downgraded or upgraded at any time with the **Upgrade** and **Downgrade** actions available in the **Tools** menu. These actions allow switching between SVN 1.7 and SVN 1.8 working copy formats.
  - SVN 1.7 working copies cannot be downgraded to older formats.
Refresh a Working Copy

A refresh is a frequent operation triggered automatically when you switch between two working copies using the toolbar selector of the Working Copy view and when you switch between Oxygen XML Editor and other applications.

The Working Copy view features a fast refresh mechanism: the content is cached locally when loading the working copy for the first time. Later on, when the same working copy is displayed again, the application uses this cache to detect the changes between the cached content and the current content found on disk. The refresh operation is run on these changes only, thus improving the response time. Improvement is noticeable especially when working with large working copies.

Working Copy View Contextual Menu Actions

The contextual menu in the Working Copy view contains the following actions:

- **Edit conflict (Ctrl (Command on OS X) + E)**
  
  Opens the Compare editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see Edit conflicts (on page 2845).

- **Open in Compare Editor (Ctrl (Command on OS X) + Alt + C)**
  
  Displays changes made in the currently selected file.

- **Open (Ctrl (Command on OS X) + O)**
  
  Opens the selected resource from the working copy. Files are opened with an internal editor or an external application associated with that file type, while folders are opened with the default file system browsing application (Windows Explorer on Windows, Finder on OS X, etc).

- **Open with...**
  
  Submenu that allows you to open the selected resource either with Oxygen XML Editor or with another application.

- **Show in Explorer/Show in Finder**
  
  Opens the parent directory of the selected working copy file and selects the file.

- **Expand All (Ctrl (Command on OS X) + Alt + X)**
  
  Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

- **Refresh (F5)**
  
  Re-scans the selected resources recursively and refreshes their status in the working copy view.
Synchronize (Ctrl (Command on OS X) + Shift + S)

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to Modified view mode if the Always switch to 'Modified' mode option (on page 236) is selected.

Update (Ctrl (Command on OS X)+ U)

Updates the selected resources to the HEAD revision (latest modifications) from the repository. If the selection contains a directory, it will be updated depending on its depth.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update depth for the current folder. You can find out more about the depth term in the sparse checkouts (on page 2895) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the Commit dialog box you can also enter a comment before sending your changes to the repository.

Revert (Ctrl (Command on OS X) + Shift + V)

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes (on page 2847) for more information.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2847) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2849).

Mark Resolved (Ctrl (Command on OS X) + Shift + R)

Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts (on page 2849).

Mark as Merged (Ctrl (Command on OS X) + Shift + M)
Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the [Merge conflicts](on page 2849) section for more information about how you can solve the pseudo-conflicts.

**Create patch (Ctrl (Command on OS X) + Alt + P)**

Allows you to create a file containing all the differences between two resources, based on the `svn diff` command. To read more about creating patches, see the section about patches (on page 2880).

**Compare with:**

- **Latest from HEAD (Ctrl (Command on OS X) + Alt + H)** - Performs a 3-way diff operation between the selected file and the HEAD revision from the repository and displays the result in the Compare view. The common ancestor of the 3-way diff operation is the BASE version of the file from the local working copy.
- **BASE revision (Ctrl (Command on OS X) + Alt + C)** - Compares the working copy file with the BASE revision file (the so-called pristine copy).
- **Revision (Ctrl (Command on OS X) + Alt + R)** - Displays the History view that contains the log history of that resource.
- **Branch/Tag** - Opens the Compare with Branch/Tag dialog box that allows you to specify another file from the repository (on page 2938) (To URL field) to compare with the working copy file. You can specify the revision of the repository file by choosing between HEAD revision or specific Other revision.

**Tip:** To compare with a file that was deleted, moved, or replaced, you need to specify the original URL (before the file was removed) and use a peg revision (on page 2940) at the end (for example, URL@rev1234).

- **Each other** - Compares two selected files with each other.

These compare actions are available only if the selected resource is a file.

**Replace with:**

- **Latest from HEAD** - Replaces the selected resources with their versions from the HEAD revision of the repository.
- **BASE revision** - Replace the selected resources with their versions from the pristine copy (the BASE revision).

**Note:** In some cases it is impossible to replace the currently selected resources with their versions from the BASE/HEAD revision:

- For the **Replace with BASE revision** action, the resources being unversioned or added have no BASE revision, and thus cannot be replaced. However, they will be
deleted if the action is invoked on a parent folder. The action will never work for missing folders or for obstructing files (folders being obstructed by a file), since you cannot recover a tree of folders

- For the Replace with latest from HEAD action, you must be aware that there are cases when resources will be completely deleted or reverted to the BASE revision and then updated to a HEAD revision to avoid conflicts. These cases are:
  - The resource is unversioned, added, obstructed, or modified.
  - The resource is affected by a svn:ignore or svn:externals property that is locally added on the parent folder and not yet committed to the repository.

Show History (Ctrl (Command on OS X) + H)

Displays the History view where the log history for the selected resource will be presented. For more details about resource history, see the sections about the resource history view (on page 2917) and requesting the history for a resource (on page 2856).

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2924), along with the history of the file in the History view.

Revision Graph (Ctrl (Command on OS X) + G)

This action allows you to see the graphical representation history of a resource. For more details about the revision graph of resources, see Revision Graph (on page 2933).

Copy URL Location (Ctrl (Command on OS X) + Alt + U)

Copies the encoded URL of the selected resource from the Working Copy to the clipboard.

Mark as copied

You can use this action to mark an item from the working copy as a copy of an other item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Mark as renamed
You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The **Mark as renamed** action is available when you select two items from the same directory (both the new item and the source item that is usually reported as *missing*), and it depends on the state of the source item.

**Copy to**

Copies the currently selected resource to a specified location.

**Move to**  
*Ctrl + M* (*Command + M on OS X*)

Moves the currently selected resource to a specified location.

**Rename** (*F2*)

As with the move command, a copy of the original resource will be made with the new name and the original will be marked as deleted. Note that you can only rename one resource at a time.

**Delete** (*Delete*)

Schedules selected items for deletion upon the next commit and removes them from the disk. Depending on the state of each item, you are prompted to confirm the operation.

**New:**

- **New File**  
  Creates a new file inside the selected folder. The newly created file will be added under version control only if the parent folder is already versioned.

- **New Folder** (*Ctrl (Command on OS X) + Shift + F*)  
  Creates a child folder inside the selected folder. The newly created folder will be added under version control only if its parent is already versioned.

- **New External Folder** (*Ctrl (Command on OS X) + Shift + W*)  
  This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (*on page 2938*), and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

  **Tip:** You can specify a particular revision of the external item by using a *peg revision* (*on page 2940*) at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

  The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

  - `../` - Relative to the URL of the directory that the `svn:externals` property is set.
Relative to the root of the repository in which the `svn:externals` property is versioned.

Relative to the scheme of the URL of the directory that the `svn:externals` property is set.

Relative to the root URL of the server in which the `svn:externals` property is versioned.

⚠️ **Important:** To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

📝 **Note:** Syncro SVN Client does not support definitions of local relative external items.

### Add to "svn:ignore" (Ctrl (Command on OS X) + Alt + I)

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the [Ignore Resources Not Under Version Control](on page 2915) section.

### Add to version control (Ctrl (Command on OS X) + Alt + V)

Allows you to add resources that are not under version control. For further details, see [Add Resources to Version Control](on page 2919) section.

### Remove from version control

Schedules selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

⚠️ **Clean up** (Ctrl (Command on OS X) + Shift + C)

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under version control.

### Locking:

- **Scan for locks** (Ctrl (Command on OS X) + L) - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only
active for resources under version control. For more details see Scanning for locks (on page 2839).

- **Lock (Ctrl (Command on OS X) + K)** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under version control. For more details on the use of this action see Locking a file (on page 2840).

- **Unlock (Ctrl (Command on OS X) + Alt + K)** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).

**Show SVN Properties (Ctrl + P (Command + P on OS X))**

Brings up the Properties view (on page 2930) and displays the SVN properties for the selected resource.

**Show SVN Information (Ctrl + I (Command + I on OS X))**

Provides additional information for the selected resource from the working copy. For more details, go to Obtain information for a resource (on page 2856).

**Drag and Drop Operations**

The structure of the files tree can be changed with drag and drop operations inside the Working Copy view. These operations behave in the same way with the Copy to / Move to operations.

Also, files and folders can be added to the file tree of the view as unversioned resources by drag and drop operations from other applications (for example, from Windows Explorer or Mac OS X Finder). In this case, the items from the file system are only copied, without removing them from their original location.

**Attention:** When you drag items from the working copy to a different application, the performed operation is controlled by that application. This means that the moved items are left as missing in the working copy (items are moved in the file system only, but no SVN versioning meta-data is changed).

**Assistant Actions**

To ensure a continuous and productive work flow, when a view mode has no files to present, it offers a set of guiding actions with some possible paths to follow.

Initially, when there is no working copy configured the All Files view mode lists the following two actions:

Figure 824. All Files Panel
For **Modified, Incoming, Outgoing, Conflicts** view modes, the following actions may be available, depending on the current working copy state in various contexts:

- **Synchronize with Repository** - Available only when there is nothing to present in the **Modified** and **Incoming** view modes.

- **Switch to Incoming** - Selects the **Incoming** view mode.

- **Switch to Outgoing** - Selects the **Outgoing** view mode.

- **Switch to Conflicts** - Selects the **Conflicts** view mode.

- **Show all changes/incoming/outgoing/conflicts** - Depending on the currently selected view mode, this action presents the corresponding resources after a synchronize operation was executed only on a part of the working copy resources.

- **(Information message)** - Informs you why there are no resources presented in the currently selected view mode.

### History View

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the **History view** that can be accessed from **Repositories view (on page 2897)**, **Working Copy view (on page 2902)**, **Revision Graph (on page 2933)**, or **Directory Change Set view (on page 2921)**. From the **Working copy view** you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The view consists of four distinct areas:

- The table showing details about each revision, such as revision number, commit date and time, number of changes (more details available in the tooltip), author’s name, and a fragment of the commit message.

Some revisions may be highlighted to emphasize:

- The current revision of the resource for which the history is displayed - a bold font revision.

- The last revision in which the content or properties of the resource were modified - blue font revision.

**Note:** Both font highlights may be applied for the same revision.
• The complete commit message for the selected revision.
• A tree structure showing the folders where the modified resources are located. You can compress this structure to a more compact form that focuses on the folders that contain the actual modifications.
• The list of resources modified in the selected revision. For each resource, the type of action done against it is marked with one of the following symbols:
  ◦ - A newly created resource.
  ◦ - A newly created resource, copied from another repository location.
  ◦ - The content/properties of the resource were modified.
  ◦ - Resource was replaced in the repository.
  ◦ - Resource was deleted from the repository.

Figure 825. History View

You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the Group by date button from the toolbar.

History Filter Dialog Box

The History view does not always show all the changes ever made to a resource because there may be thousands of changes and retrieving the entire list can take a long time. Normally you are interested in the more recent ones. That is why you can specify the criteria for the revisions displayed
in the **History view** by selecting one of several options presented in the **History** dialog box that is displayed when you invoke the **Show History** action.

Figure 826. History Filters Dialog Box

![History Filters Dialog Box](image)

Options for the set of revisions presented in the History view are:

- All revisions of the selected resource.
- Only revisions between a start revision number and an end revision number.
- Only revisions added in a period of time (such as today, last week, last month, etc.)
- Only revisions between a start and an end date.
- Only revisions committed by a specified SVN user.

The toolbar of the **History view** has two buttons for extending the set of revisions presented in the view: **Get next 50** and **Get all**.

**History Filter Field**

When only the history entries that contain a specified substring need to be displayed in the **History** view, the filter field displayed at the top of this view is a useful tool. Just enter the search string in the field next to the **Find** label. Only the items (with an author name, commit message, revision number, or date) that match the search string are kept in the **History** view. When you press the **Search** button, the filter action is executed and the content of the table is updated.

**History View Contextual Menu Actions**

The **History** view contains the following contextual menu actions:

- **Compare with working copy**
Compares the selected revision with your working copy file. It is available only when you select a file.

**Open**

Opens the selected revision of the file into the Editor. This is available only for files.

**Open with**

Displays the Open with dialog box to specify the editor in which the selected file will be opened.

**Get Contents**

Replaces the current version from the working copy with the contents of the selected revision from the history of the file. The BASE version of the file is not changed in the working copy so that after this action the file will appear as modified in a synchronization operation, that is newer than the BASE version, even if the contents is from an older version from history.

**Save as**

Allows you to save the contents of a file as it was committed at a certain revision. This option is available only when you access the history of a file.

**Copy to**

Copies to the repository the item whose history is displayed, using the selected revision. This option is active only when presenting the history for a repository item (URL).

![Note:](image) This action can be used to resurrect deleted items also.

**Revert changes from this revision**

Reverts changes that were made in the selected revisions. The changes are reverted only in your working copy and does not affect the repository items. It does not replace your working copy items with those from the selected revisions. This action is available when the resource history was launched for a local working copy resource.

![Note:](image) For items displayed in the Affected Paths section that were added, deleted, or replaced, this action has no effect because such changes are considered to be changes to the parent directory. To revert these type of changes, follow these steps:

1. Request the history for the parent directory.
2. Identify the revision that contains the changes you want to revert.
3. Invoke the action on that revision.

![Warning:](image) There are instances where the SVN Client is not able to identify the corresponding working copy item for the selected item in the Affected Paths section. In this case, the action does not proceed and an error message is displayed. For example,
the selected item in the **Affected Paths** section is from a different repository location than the working copy item for which the history is displayed.

**Update to revision**

Updates your working copy resource to the selected revision. This is useful if you want your working copy to reflect a time in the past. It is best to update a whole directory in your working copy, not just one file. Otherwise, your working copy is inconsistent and you are unable to commit your changes.

**Check out**

Checks out a new working copy of the directory for which the history is presented, from the selected revision.

**Export**

Opens the Export dialog box ([on page 2892](#)) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view ([on page 2924](#)), along with the history of the file in the History view.

**Change**

Allows you to change commit data for a file:

- **Author** - Changes the name of the SVN user that committed the selected revision.
- **Message** - Changes the commit message of the selected revision.

When two resources are selected in the History view, the contextual menu contains the following actions:

**Compare revisions**

When the resource is a file, the action compares the two selected revisions using the Compare view. When the resource is a folder, the action displays the set of all resources from that folder that were changed between the two revision numbers.

**Revert changes from these revisions**

Similar to the **svn merge** command, it merges two selected revisions into the working copy resource. This action is only available when the resource history was requested for a working copy item.

For more information about the History view and its features, see the Request history for a resource ([on page 2856](#)) and Using the resource history view ([on page 2917](#)) sections.
Directory Change Set View

The result of comparing two reference revisions from the history of a folder resource is a set with all the resources changed between the two revision numbers. The changed resources can be contained in the folder or in a subfolder of that folder. These resources are presented in a tree format. For each changed resource all the revisions committed between the two reference revision numbers are presented.

Figure 827. Directory Change Set View

The set of changed resources displayed in the tree is obtained by running the action **Compare revisions** available on the contextual menu of the **History** view when two revisions of a folder resource are selected in the **History** view.

The left side panel of the view contains the tree hierarchy with the names of all the changed resources between the two reference revision numbers. The right side panel presents the list with all the revisions of the resource selected in the left side tree. These revisions were committed between the two reference revision numbers. Selecting one revision in the list displays the commit message of that revision in the bottom area of the right side panel.

Double-clicking a file listed in the left-side tree performs a diff operation between the two revisions of the file corresponding to the two reference revisions. Double-clicking one of the revisions displayed in the right side list of the view performs a diff operation between that revision and the previous one of the same file.

The contextual menu of the right side list contains the following actions:

- **Compare with previous version**
  
  Performs a diff operation between the selected revision in the list and the previous one.

- **Open**
Opens the selected revision in the associated editor type.

**Open with**

Displays a dialog box with the available editor types and allows you to select the editor type for opening the selected revision.

**Save as**

Saves the selected file as it was in the selected revision.

**Copy to**

Copies to the repository the item whose history is displayed, using the selected revision.

*Note:* This action can be used to resurrect deleted items also.

**Check out**

Checks out a new working copy of the selected directory, from the selected revision.

**Export**

Opens the Export dialog box (on page 2892) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show Annotation** (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2924), along with the history of the file in the History view.

**Show SVN Information** (Ctrl (Command on OS X) + I)

Provides additional information for a selected resource. For more details, go to Obtain information for a resource (on page 2856).

Editor Panel of SVN Client

You can open a file for editing in an internal built-in editor. There are default associations between frequently used file types and the internal editors in the File Types preferences panel (on page 250).

The internal editor can be accessed either from the Working copy view (on page 2902) or from the History view (on page 2917). No actions that modify the content are allowed when the editor is opened with a revision from history.

Only one file at a time can be edited in an internal editor. If you try to open another file it will be opened in the same editor window. The editor provides syntax highlighting for known file types. This means that a different color will be used for each recognized token type found in the file. If the file’s content type is unknown you will be prompted to choose the proper way the file should be opened.
After editing the content of the file in an internal editor you can save it to disk by using the Save action from the File menu or the Ctrl + S (Command + S on OS X) key shortcut. After saving your file you can see the file changed status in the Working Copy view.

If the internal editor associated with a file type is not the XML Editor, then the encoding set in the preferences for Encoding for non XML files is used for opening and saving a file of that type. This is necessary because in the case of XML files, the encoding is usually declared at the beginning of the XML file in a special declaration or it assumes the default value UTF-8, but in the case of non-XML files, there is no standard mechanism for declaring the encoding for the file.

Annotations View

Sometimes you need to know not only what was changed in a file, but also who made those changes. The Annotations view displays the revision and the author that changed every line in a file. The annotations of a file are computed and this view is opened with the Show Annotation action, which is available in the History menu, and from the contextual menu of the following views: the Repositories view, Working copy view, History view, and Directory Change Set view.

This action opens a dialog box that allows you to configure some options for showing the annotations.

Figure 828. Show Annotation Options Dialog Box

Once you have configured the options and click OK, the Annotations view is displayed (by default, on the right side of the application). You can click a line in the editor panel where the file is opened to
see the revision in which the line was last modified. The same revision is highlighted in the History view and you can also see all the lines that were changed in the same revision highlighted in the editor panel. Also, the entries of the Annotations view corresponding to that revision are highlighted. Therefore, the Annotations view, History view, and annotations editor panel are all synchronized. Clicking a line in one of them highlights the corresponding lines in the other two.

Figure 829. Annotations View

The following options can be configured in the Show Annotation dialog box:

**From Revision Section**

Select the revision from which to start computing the annotation. If you press the History button, the History dialog box (on page 2831) is displayed, which allows you to select a revision.

**To Revision Section**

Select the ending revision by choosing between the HEAD revision or specify it in the Other text box. If you press the History button, the History dialog box (on page 2831) is displayed, which allows you to select a revision.

**Encoding**

Select the encoding to be used when the annotation is computed. For each line of text, the SVN Client looks through the history of the file to be annotated see when it was last modified, and by whom. It is required that it is in the form of a text file.
Therefore, encoding is needed to properly decode and read the file content. By default, the encoding of the operating system is used.

**Ignore MIME type**

If selected, the file is treated as a text file and ignores what the SVN system infers from the `svn:mime-type` property.

**Ignore line endings**

If selected, the differences in line endings are ignored when the annotation is computed.

**Ignore whitespaces**

If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

  ![Note](image.png)

  Whitespace changes that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.

**Tip:** Selecting any of these ignore options can help you better determine the last time a meaningful change was made to a given line of text.

After you configure the options and press OK, the annotations will be computed and the Annotations view is displayed, where all the users that modified the selected resource will be presented, along with the specific lines and revision numbers modified by each user.

![Note](image.png)

If the file has a very long history, the computation of the annotation data can take a long time to process.

**Compare View**

In the Oxygen XML Editor, there are three types of files that can be checked for differences: text files, image files and binary files. For the text files and image files you can use the built-in Compare view. This view is automatically opened if you select two files and use the Compare with > Each Other action in the contextual menu.

Figure 830. Compare View
At the top of each of the two editors, there are presented the name of the opened file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

When comparing text, the differences are computed using a line differencing algorithm. The view can be used to show the differences between two files in the following cases:

- After obtaining the outgoing status of a file with a Refresh operation, the view can be used to show the differences between your working file and the pristine copy. In this way you can find out what changes you will be committing.
- After obtaining the incoming and outgoing status of the file with the Synchronize operation, you can examine the exact differences between your local file and the HEAD revision file.
- You can use the Compare view from the History view to compare the local file and a selected revision or compare two revisions of the same file.

The Compare view contains two editors. Edits are allowed only in the left editor and only when it contains the working copy file. To learn more about how the view can be used, see View Differences (on page 2840).
Compare View Toolbar

The toolbar of the Compare view contains the operations that can be performed on the source and target files.

Figure 831. Compare View Toolbar

The following actions are available:

**Algorithm**

The algorithm to be used for performing a comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in Author mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Save action**

Saves the content of the left editor when it can be edited.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**Synchronized scrolling**

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

**Format and Indent Both Files** *(Ctrl + Shift + P (Command + Shift + P on OS X))*
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Copy Change from Right to Left**
Copies the selected difference from the file in the right panel to the file in the left panel.

**Copy All Changes from Right to Left**
Copies all changes from the file in the right panel to the file in the left panel.

**Next Block of Changes (Ctrl + Period (Command + Period on OS X))**
Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Ignore Nodes by XPath**
You can use this text field to enter an XPath expression *(on page 2182)* to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter `@id`). This field is only available when comparing XML documents using the **XML Fast** or **XML Accurate** algorithms.
Note: If an XPath expression is specified in the Ignore nodes by XPath option (on page 241) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Most of these actions are also available from the Compare (on page 2807) menu.

Image Preview

You can view your local files by using the built-in Image Preview component. The view can be accessed from the Working copy view (on page 2902) or from the Repository view (on page 2897). It can also be used from the History view (on page 2917) to view a selected revision of a image file.

Only one image file can be opened at a time. If an image file is opened in the Image preview and you try to open another one it will be opened in the same window. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the Image Preview panel using the actions from the contextual menu, you can scale the image at its original size (1:1 action) or scale it down to fit in the view's available area (Scale to fit action).

Compare Images View

The images are compared using the Compare Images view. This view is automatically opened if you select two image files and use the Compare with > Each Other action in the contextual menu. The images are presented in the left and right part of the view, scaled to fit the available area. You can use the contextual menu actions to scale the images at their original size or scale them down to fit the view's available area.

The supported image types are: GIF, JPG/JPEG, PNG, BMP.

Properties View

The properties view presents Apache Subversion™ properties for the currently selected resource from either the Working Copy view or the Repositories view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 832. Properties View
The table includes four columns:

- **State** - Can be one of the following:
  - (empty) - Normal unmodified property (same current and base values)
  - * (asterisk) - Modified property (current and base values are different)
  - + (plus sign) - New property
  - - (minus sign) - Removed property

- **Name** - The property name.

- **Current value** - The current value of the property.

- **Base value** - The base (original) value of the property.

**svn:externals Property**

The `svn:externals` property can be set on a folder or a file. In the first case, it stores the URL of a folder from another repository (on page 2914).

In the second case, it stores the URL of a file from another repository. The external file will be added into the working copy as a versioned item. There are a few differences between directory and external file:

- The path to the external file must be in a working copy that is already checked out. While external directories can place the external directory at any depth and it will create any intermediate directories, external files must be placed into a working copy that is already checked out.
- The external file URL must be in the same repository as the URL that the external file will be inserted into (inter-repository external files are not supported).
- While commits do not descend into an external directory, a commit in a directory containing an external file will commit any modifications to the external file.
The difference between a normal versioned file and an external file is that external files cannot be moved or deleted (the `svn:externals` property must be modified instead. However, external files can be copied).

An external file is displayed as an X in the switched status column.

**Toolbar / Contextual Menu**

The properties view toolbar and contextual menu contain the following actions:

- **Add a new property** - This button invokes the *Add property* dialog box in which you can specify the property name and value.
- **Edit property** - This button invokes the *Edit property* dialog box in which you can change the property value and also see its original (base) value.
- **Remove property** - This button will prompt a dialog box to confirm the property deletion. You can also specify if you want to remove the property recursively.
- **Refresh** - This action will refresh the properties for the current resource.

**Console View**

The *Console View* shows the traces of all the actions performed by the application. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.

Part of the displayed messages mirror the communication between the application and the Apache Subversion™ server. The output is expressed as subcommands to the Subversion server and simulates the Subversion command-line notation. For a detailed description of the Subversion console output read the *SVN User Manual*.

The view has a simple layout, with most of its space occupied by a message area. On its right side, there is a toolbar holding the following buttons:

- **Clear**
  Erases all the displayed messages.
- **Lock scroll**
  Disables the automatic scrolling when new messages are appended in the view.

The maximum number of lines displayed in the console (length of the buffer) can be modified in the *Preferences (on page 234)* page. By default, this value is set to 100.
Dynamic Help View

**Dynamic Help view** is a help window that changes its content to display the help section that is specific to the currently selected view. As you change the focused view, you can read a short description of it and its functionality. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Revision Graph of a SVN Resource

The history of a SVN resource can be watched on a graphical representation of all the revisions of that resource together with the tags in which the resource was included. The graphical representation is identical to a tree structure and very easy to follow.

The graphical representation of a resource history is invoked with the Revision graph action available on the right-click menu of a SVN resource in the Working Copy view (on page 2902) and the Repository view (on page 2897).

Figure 833. Revision Graph of a File Resource

In every node of the revision graph an icon and the background color represent the type of operation that created the revision represented in that node. The commit message associated with that revision, the repository path, and the revision number are also contained in the node. The tooltip displayed when the mouse pointer hovers over a node specifies the URL of the resource, the SVN user who
created the revision of that node, the revision number, the date of creation, the commit message, the
modification type and the affected paths (on page 2831).

The types of nodes used in the graph are:

**Added resource**

The ![new resource] icon for a new resource added to the repository and a green background.

**Copied resource**

The ![copied resource] icon for a resource copied to other location (for example, when a SVN tag is
created and a green background).

**Modified resource**

The ![modified resource] icon for a modified resource and a blue background.

**Deleted resource**

The ![deleted resource] icon for a resource deleted from the repository and a red background.

**Replaced resource**

The ![replaced resource] icon for a resource removed and replaced with another one on the repository and
a orange background.

**Indirect resource**

The ![indirect resource] icon for a revision from where the resource was copied or an indirectly modified
resource, that is a directory in which a resource was modified and a gray background.

The Modification type field of the tooltip specifies how that revision was obtained in the
history of the resource.

A directory resource is represented with two types of graphs:

**Simplified graph**

Lists only the changes applied directly to the directory;

**Complete graph**

Lists also the indirect changes of the directory resource, that is the changes applied to
the resources contained in the directory.

Figure 834. Revision Graph of a Directory (Direct Changes)
The Revision graph toolbar contains the following actions:
Save as image

Saves the graphical representation as image. For a large revision graph you have to set more memory in the startup script (on page 290). The default memory size is not enough when there are more than 100 revisions that are included in the graph.

Show/Hide indirect modifications

Switches between simplified and complete graph.

Zoom In

Zooms in the graph.

Zoom Out

Zooms out the graph. When the font reaches its minimum size, the graph nodes will display only the icons, leading to a very compact representation of the graph.

Reset scale

Resets the graphical scale to a default setting.

Print

Prints the graph.

Print preview

Offers a preview of the graph to allow you to check the information to be printed.

The contextual menu of any of the graph nodes contains the following actions:

Open

Opens the selected revision in the editor panel. Available only for files.

Open with

Opens the selected revision in the editor panel. Available only for files.

Save as

Saves the file for which the revision graph was generated, based on the selected node revision.

Copy to

Copies to the repository the item whose revision graph is displayed, using the selected revision.

Note: This action can be used to resurrect deleted items also.

Compare with HEAD
Compares the selected revision with the HEAD revision and displays the result in the diff panel. Available only for files.

Show History
Displays the history of the resource in the History view (on page 2917). Available for both files and directories.

Check out
Checks out (on page 2829) the selected revision of the directory. Available only for directories.

Export
Opens the Export dialog box (on page 2892) that allows you to configure options for exporting a folder from the repository to the local file system.

When two nodes are selected in the revision graph of a file the right-click menu of this selection contains only the Compare for comparing the two revisions corresponding to the selected nodes. If the resource for which the revision graph was built is a folder then the right-click menu displayed for a two nodes selection also contains the Compare action but it computes the differences between the two selected revisions as a set of directory changes. The result is displayed in the Directory Change Set (on page 2921) view.

Attention: Generating the revision graph of a resource with many revisions may be a slow operation. You should enable caching for revision graph actions so that future actions on the same repository will not request the same data again from the SVN server, which will finish the operation much faster.

Oxygen XML Editor SVN Preferences

The options used in the SVN client are saved and loaded independently from the Oxygen XML Editor options. However, if Oxygen XML Editor cannot determine a set of SVN options to be loaded at startup, some of the preferences are imported from the XML Editor options (such as the License key and HTTP Proxy settings).

There is also an additional set of preferences applied to the SVN client that are set in global SVN files. There are two editing actions available in the Global Runtime Configuration submenu of the Options menu. These actions, Edit 'config' file and Edit 'servers' file, contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their login account.
Entering Local Paths and URLs

The Oxygen XML Editor includes a variety of option configuration pages or wizards that contain text boxes where you specify paths to local resources or URLs of items inside remote repositories. The Oxygen XML Editor provides support in these text boxes to make it easier to specify these paths and URLs.

Local Item Paths

The text boxes used for specifying local item paths support the following:

- **Absolute Paths** - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
- **Relative Paths** - The Oxygen XML Editor only accepts relative paths in the form ~[/...], where ~ is the user home directory.
- **Path Validation** - Oxygen XML Editor validates the path as you type and invalid text becomes red.
- **Drag and Drop** - You can drag files and folders from the file system or other applications and drop them into the text box.
- **Automatic Use of Clipboard Data** - If the text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box.

Repository Item URLs

- **Local Repository Paths** - You can use local paths (absolute or relative) to access local repositories. When you use the **Browse** button, the Oxygen XML Editor will convert the file path to a file:// form of URL, provided that the location is a real repository.
  - **Absolute Paths** - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
  - **Relative Paths** - The Oxygen XML Editor only accepts relative paths in the form ~[/...], where ~ is the user home directory.
- **Peg Revisions** - For URL text boxes found inside dialog boxes where you are pulling information from the repository, you can use peg revisions at the end of the URLs (on page 2940) (for example, URL@rev1234).

**Note:** If you try to use a peg revision number in a dialog box where you are sending information to the repository then the peg revision number will become part of the name of the item rather than searching for the specified revision. For example, in the URL http://host/path/inside/repo/item@100, the item name is considered to be item@100.

**Tip:** You can even use peg revisions with local repository paths. For example, C:\path\to\local\repo@100 will be converted to file:///C:/path/to/local/repo@100 and the Repository browser will display the content of the local repository as it is at revision 100.
• **URL Validation** - Oxygen XML Editor validates the URLs as you type and invalid text becomes red. Even paths to local repositories are not accepted unless using the **Browse** button to convert them to valid URLs.

• **Drag and Drop** - You can drag URLs from other applications or text editors and drop them into the URL text box. You can also drag folders that point to local repositories, from the local file system or from other applications, and they are automatically converted to valid `file://` type URLs.

• **Automatic Use of Clipboard Data** - If the URL text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box. Even valid local paths will be automatically converted to `file://` type URLs.

**Note:** The text boxes that are in the form of a combo box also allow you to select previously used URLs, or URLs defined in the **Repositories** view.

## Technical Issues

This section contains special technical issues found during the use of Syncro SVN Client.

### Authentication Certificates Not Saved

If Syncro SVN Client prompts you to enter the authentication certificate, although you already provided it in a previous session, then you should make sure that your local machine user account has the necessary rights to store certificate files in the Subversion configuration folder (write access to **Subversion** folder and all its subfolders). Usually, it is located in the following locations:

- **Windows:** `\[HOME_DIR]\AppData\Roaming\Subversion`
- **Mac OS X and Linux:** `\[HOME_DIR]/.subversion`

### Updating Newly Added Resources

When you want to get a resource that is part of a newly created structure of folders from the repository, you need to also get its parent folders.

**Figure 836.** Incoming Changes
Syncro SVN Client allows you to choose how you want to deal with the entire structure from that moment onwards:

**Update ancestor directories recursively**

This option brings the entire newly added folders structure into your working copy. In this case, the update time depends on the total number of newly incoming resources, because of the full update operation (not updating only selected resource).

**Update selected files only (leave ancestor directories empty)**

This option brings a skeleton structure composed of the resource's parent folders only, and the selected resource at the end of the operation. All of the parent directories will have depth set to *empty* in your working copy, thus subsequent *Synchronize* operations will not report any remote modifications in those folders. If you need to update the folders to full-depth, you can use the *Update to revision/depth* action (on page 2911) from the working copy view.

**Accessing Old Items from a Repository**

Usually, you point to an item from a repository using a URL. However, sometimes this might not be enough because the URL alone might point to a different item than the one you want and a *peg revision* is needed.

A Subversion repository tracks any change made to its items by using *revisions*, which contain information such as the name of the author who made the changes, the date when they were made, and a number that uniquely identifies each of them. Over time, an item from a specific location in a repository evolves as a result of committing changes to it. When an item is deleted, its entire life cycle (all changes made to it from the moment it was created) remains recorded in the history of the repository. If a new item is created, with the same name and in the same location of the repository as a previously existing one, then both items are identified by the same URL even though they are located in different time frames. This is when a *peg revision* comes in handy. A *peg revision* is nothing more than a normal revision, but the difference between them is made by their usage. Many of the Subversion commands also accept a peg revision as a way to precisely identify an item in time, beside an *operative revision* (the revision regarding the used command).

**Example:**

To illustrate an example, consider the following:

- A new repository file *config* was created, identified by the URL [http://host.com/myRepository/dir/config](http://host.com/myRepository/dir/config).
- The file has been created at revision 10.
- Over time, the file was modified by committing revisions 12, 15, 17.
To access a specific version of the file identified by the URL, you need to use a corresponding revision (the operative revision):

- If a revision number is used that is lower than 10, an error is triggered, because the file has not been created yet.
- If a revision number is used that is between 10 and 19, the specific version you are interested in would be obtained.

**Note:** Although the file was modified in revisions 12, 15, 17, it existed in all revisions between 10 and 19. Starting with a revision at which the file is modified, it has the same content across all revisions generated in the repository until another revision in which it is modified again.

At this point, the file is deleted, creating revision 20. Now, no version of the file can be accessed because it no longer exists in the latest repository revision. This is due to the fact that Subversion automatically uses the HEAD revision as a peg revision (it assumes any item currently exists in the repository if not instructed otherwise). However, using any of the revision numbers from the 10–19 interval (when the file existed) as a peg revision (beside the operative revision), will help Subversion to properly identify the time frame when the file existed, and access the file version corresponding to the operative revision. If you use a revision number greater than 19, this will also trigger an error.

Continuing the example, suppose that at revision 30, a directory called config is created in the same repository location as the deleted file. This means that the new directory will be identified by the same repository address: http://host.com/myRepository/dir/config. If you only use this URL in any Subversion command, you will access the new directory. You will also access the same directory if you use any revision number equal to or greater than 30 as peg revision. However, if you are interested in accessing an old version of the previously existing file, then you must use one of the revisions that existed (10–19), as a peg revision, similar to the previous case.

Checksum Mismatch Error

A **Checksum Mismatch** error could happen if an operation that sends or retrieves information from the repository to the working copy is interrupted. This means that there is a problem with the synchronization between a local item and its corresponding remote item.

If you encounter this error, try the following:

1. Identify the parent directory of the file that caused the error (the file name should be displayed in the error message).

   **Note:** If the parent directory is the root of the working copy or if it contains a large amount of items it is recommended that you check out the working copy again, rather than continuing with the rest of this procedure.
2. Identify the current depth (on page 2905) of that directory.

3. Update the parent directory using the Update to revision/depth action that is available from the contextual menu or the Working copy menu. For the Depth option, select This folder only (empty).

⚠️ Warning: If you have files with changes in this directory, those changes could be lost. You should commit your changes or move the files to another directory outside the working copy prior to proceeding with this operation.

4. After clicking OK the contents of the directory will be erased and the directory is be marked as having an empty depth (on page 2905).

5. Once again, update the same directory using the Update to revision/depth action. This time, for the Depth option, select the depth that was previously identified in step 2.

6. If you moved modified files to another directory outside the working copy, move them back to the original location inside the working copy.

If this procedure does not solve the error, you need to check out the working copy again and move possible changes from the old working copy to the new one.

**External Tools**

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. Oxygen XML Editor offers you the option of integrating such a tool by specifying just the command line for starting the executable file and its working directory. To integrate such a tool, open the Preferences dialog box (Options > Preferences) (on page 79) and go to External Tools (on page 246) (or select Configure from the Tools > External Tools menu).

The External Tools preferences page (on page 246) presents a list of the external tools that have been configured. Once a tool has been configured (on page 246), you can open it by selecting it from the Tools > External Tools menu or from the ⏸️ External Tools drop-down menu on the toolbar (the Tools toolbar needs to be selected in the Configure Toolbars dialog box (on page 273)). You can also assign a keyboard shortcut (on page 248) to be used to launch the tool.

If the external tool is applied on one of the files opened in Oxygen XML Editor, the Save all files before calling external tools option (on page 157) (in the Save preference page) should be selected so that all edited files are automatically saved when an external tool is applied.

When an external tool is launched, the icon on the toolbar changes to a stop icon (⏹️) and you can use this button to stop the tool. When the tool has finished running (or you close it), the icon changes back to the original icon (►️).
Note: Even though you can stop the external tool by invoking the stop action while it is running, that does not necessarily mean it will also stop the processes spawned by that external tool. For instance, if you stop an external tool that runs a batch file, the batch may be stopped but without actually stopping the processes that the batch was running at that time.

Example: Integrating the Ant Tool

This is an example procedure for integrating the Ant build tool into Oxygen XML Editor:

1. Download and install Apache Ant (on page 3279) on your computer.
2. Test your Ant installation from the command-line interface in the directory where you want to use Ant from. For example, run the clean target of your build.xml file C:\projects \XMLproject\build.xml:
   ```
   ant clean
   ```
3. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to External Tools (or select Configure from the Tools > External Tools menu).
4. Click the New button to create a new external tool entry and enter the following information:
   - Name - For example, Ant tool.
   - Working directory - For example, C:\projects\XMLproject.
   - Command line - For example, "C:\projects\XMLproject\ant.bat" clean.
5. Click OK to add the new tool to the list of external tools.
6. Run the tool from Tools > External Tools > Ant tool. You can see the output in the system console:
   ```
   Started: "C:\projects\XMLproject\ant.bat" clean
   Buildfile: build.xml
   
clean:
   [echo] Delete output files.
   [delete] Deleting 5 files from C:\projects\XMLproject
   
   BUILD SUCCESSFUL
   Total time: 1 second
   ```
20.
Common Problems

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor.

Related Information:

- Documents with Long Lines (on page 784)
- Loading Large Documents (on page 781)
- External Tools (on page 2942)

Display Problems on Linux or Solaris

Problem

I experience display problems (such as screen freezes) on Linux or Solaris.

Cause

This is possibly a rendering problem with the off-screen pixmap support.

Solution

Add the following startup parameter (on page 290): `-Dsun.java2d.pmscreen=false`.
Out of Memory on External Processes

Problem

Oxygen XML Editor throws an Out Of Memory error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the Preferences dialog box (Options > Preferences) (on page 79), go to XML > XSLT-FO-XQuery > FO Processors, and increase the value of the Memory available to the built-in FOP option (on page 217).
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

Related Information:

- FO Processors Preferences (on page 216)
- Custom Engines Preferences (on page 215)
- External Tools Preferences (on page 246)
- How to Enable Debugging for FO Processor Transformations (on page 1742)

Too many nested apply-templates calls Error When Running a Transformation

Problem

I'm getting the error message Too many nested apply-templates calls when I try to transform my DocBook file to HTML using default Oxygen XML Editor DocBook to HTML transformation scenario.
Cause

Most likely, this is the result of a masked stack overflow error.

Solution

Try setting a new VM option with the value `-Xss4m`. You can also try to slowly increase this to larger values (e.g. `-Xss5m` or `-Xss6m`). Note that this consumes memory on a per thread basis (Oxygen XML Editor can have tens of threads), so using a very large value here can backfire and leave Oxygen XML Editor without memory.

Related Information:

- Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor (on page 290)

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.

Cause

A possible cause is that the application needs more memory to run properly.

Solutions

- You can increase the maximum amount of memory available to Oxygen XML Editor by setting the `-Xmx` parameter in a configuration file (on page 290) that is specific to the platform that runs the application.

  \[\textbf{Attention:} \text{The maximum amount of memory should be less than 75\% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.}\]

- When installed on a multiple user environment, each instance of Oxygen XML Editor will be allocated the amount stipulated in the memory value. To avoid degrading the general
Performance of the host system, ensure that the amount of memory available is optimally apportioned for each of the expected instances.

Note: When starting Oxygen XML Editor from the icon created on the Start menu or Desktop in Windows (or from the shortcut created on the Linux desktop), the default maximum memory available to the application is set to 40% of the amount of physical RAM (but not more than 700 MB for 32-bit distributions or 4 GB for 64-bit distributions).

When starting Oxygen XML Editor from a command-line script, the default maximum memory is 1 GB for 32-bit distributions or 4 GB for 64-bit distributions.

Performance Issues when Using Oxygen XML Editor with Remote Desktop

Problem

When trying to run Oxygen XML Editor in a Remote Desktop Protocol (RDP) environment, the performance is slow and choppy.

Cause

Running a standalone version of Oxygen XML Editor over a slow RDP connection may result in performance issues.

Solution

As a workaround, you try to run Oxygen XML Editor as an Eclipse plugin when working with a slow RDP connection.

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

'Address Family Not Supported by Protocol Family; Connect' Error

Problem

I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?
**Cause**

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

**Solution**

A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` ( `java.net.preferIPv4Stack=true` ), by following this procedure:

1. Create a file named `custom_commons.vmoptions` and on a single line, add `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Editor installation folder (may need admin access).
2. Restart Oxygen XML Editor.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the `java.net.preferIPv4Stack` property is `true`.

**Application Takes Several Minutes to Start**

**Problem**

Oxygen XML Editor seems to take an abnormally long amount of time to start.

**Cause**

Some anti-virus software can cause Java applications, such as Oxygen XML Editor, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

**Solution**

A possible solution is to add the Oxygen XML Editor folder to the list of exceptions in the anti-virus software settings.
Archive Distribution Fails to Run on Mac OS 10.12 (Sierra)

Problem
For versions prior to 18.1, the classic archive distributions of Oxygen XML Editor (.zip or .tar.gz) fail to run on Mac OS 10.12 (Sierra).

Cause
This happens because the archives get quarantined and Mac OS 10.12 (Sierra) treats quarantined apps differently than older versions and isolates them from their parent folder at launch. If Oxygen XML Editor was already installed when you upgraded to Mac OS 10.12 (Sierra), there are no problems.

Solution
If Oxygen XML Editor was not already installed, or you need to reinstall an older version (prior to version 18.1), the quarantine flag must be removed for the entire content of the Oxygen XML Editor installation directory or the individual applications. To resolve this issue, follow these steps:

1. Open a Terminal window and change the directory to the folder where Oxygen XML Editor is located.
2. Run the following command:

   ```
   xattr -dr com.apple.quarantine oxygen/
   ```

   where "oxygen" is the actual name of the Oxygen XML Editor directory.

   If Oxygen XML Editor is in a location that requires administrator privileges for write access, you need to run the command from an administrator account and prefix the command with `sudo`. You will then be prompted to enter your password.

Cannot Associate Oxygen XML Editor With a File Type on My Windows Computer

Problem
I cannot associate the Oxygen XML Editor application with a file type on my Windows computer by right clicking a file in Windows Explorer, selecting Open With > Choose Program and browsing to the file oxygen21.1.exe. When I select the file oxygen21.1.exe in the Windows file browser dialog box, the Oxygen XML Editor application is not added to the list of applications in the Open With dialog box.
**Cause**

The problem is usually due to old Windows registry entries remaining from previous versions of Oxygen XML Editor.

**Solution**

Uninstall all your installed versions of Oxygen XML Editor and reinstall your current version of Oxygen XML Editor. If you only have the current version installed, you could try to reinstall it without uninstalling it first.

**Cannot Connect to SVN Repository from Repositories View**

**Problem**

I cannot connect to an SVN repository from the Repositories view of SVN Client. How can I find more details about the error?

**Solution**

First check that you entered the correct URL of the repository in the Repositories view. Also check that an SVN server is running on the server machine specified in the repository URL and is accepting connections from SVN clients. You can check that the SVN server accepts connections with the command-line SVN client from CollabNet.

If you try to access the repository with an `svn+ssh` URL, also check that an SSH server is running on port 22 on the server machine specified in the URL.

If the above conditions are verified and you cannot connect to the SVN repository, generate a logging file on your computer and send the logging file to support@oxygenxml.com. For generating a logging file, you need to create a text file called `log4j.properties` in the install folder with the following content:

```
log4j.rootCategory= debug, R2

log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=logging.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
log4j.appender.R2.layout.ConversionPattern=%r %p [%t ] %c - %m%n
```
Restart the application, reproduce the error, close the application, and send the `logging.log` file generated in the install directory to support@oxygenxml.com.

Cannot Open XML Files in Internet Explorer

**Problem**

Before installing Oxygen XML Editor I had no problems opening XML files in Internet Explorer. Now when I try to open an XML file in Internet Explorer, it opens the file in Oxygen XML Editor. How can I load XML files in Internet Explorer again?

**Cause**

XML files are opened in Oxygen XML Editor because Internet Explorer uses the Windows system file associations for opening files and you associated XML files with Oxygen XML Editor in the installer panel called **File Associations**. Therefore, Internet Explorer opens XML files with the associated Windows application.

**Solution**

To open XML files in Internet Explorer, you have to set Internet Explorer as the default system application for XML files. For example, you can do so by following this procedure:

1. Right-click the XML file in Windows Explorer and select **Open With > Choose Default Program**.
2. Expand the section with the down-arrow and select IE in the list of applications.
3. Select the **Always use the selected program** option.

If XML files are still not opened in Internet Explorer, create a file named `revert.vbs` with the following content:

```vbs
function revert()
    Set objShell = CreateObject("WScript.Shell")
    objShell.RegWrite "HKCR\.xml", "xmlfile", "REG_SZ"
    objShell.RegWrite "HKCR\.xml\Content Type", "text/xml", "REG_SZ"
end function

revert()
```

Then run the following command from a command line:

```
wscript revert.vbs
```
Cannot Uninstall Oxygen XML Editor in Windows

**Problem**

When I try to uninstall Oxygen XML Editor in Windows, I get an error that says it cannot find the *files.log* file.

**Cause**

The *install4j* installer that is used by Oxygen XML Editor creates the *files.log* file during the installation process. If you cannot uninstall the product, then most likely something went wrong with this file during the installation process.

**Solution**

To solve this, simply reinstall the software in the same directory as the current installation. This will automatically uninstall the old version or overwrite it with a clean install. You should then be able to uninstall this new installation.

Compatibility Issue Between Java and Certain Graphics Card Drivers

**Problem**

Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in Author or Text mode) being displayed garbled.

**Solution**

If you encounter this problem, update your graphics card driver. Another possible workaround is, open the Preferences dialog box (Options > Preferences) (on page 79), go to Appearance > Fonts, and set the value of the Text antialiasing option (on page 89) to ON.

Note: If this workaround does not resolve the problem, set the Text antialiasing option (on page 89) to other values.
Crash at Startup on Windows with an Error About the nvogl32.dll File

**Problem**

I try to start Oxygen XML Editor on Windows but it crashed with an error message about ‘Fault Module Name: nvogl32.dll’. What is the problem?

**Cause**

It is most likely an OpenGL driver issue.

**Solution**

This can be avoided by creating an empty file called `opengl32.dll` in the Oxygen XML Editor install folder (if you start Oxygen XML Editor with the shortcut created by the installer on the Start menu or on Desktop) or in the subfolder `bin` of the home folder of the Java virtual machine that runs Oxygen XML Editor (if you start Oxygen XML Editor with the `oxygen.bat` script). The home folder of the Java virtual machine that runs Oxygen XML Editor is the value of the `java.home` property that is available in the System properties tab of the About dialog box (opened from the Help > About menu).

Crash in Java Runtime Thread

**Problem**

I encounter consistent crashes in one of the Java runtime threads (for example, AWT-EventQueue, Java2D Queue Flusher, or C2 CompilerThread).

**Cause**

This is usually caused by unknown errors somewhere in the implementation of the Java Runtime.

**Solution**

Although this does not guarantee that it will solve the problem, you could try updating the Java Runtime Environment (JRE) that comes bundled with Oxygen XML Editor to the latest supported version.

⚠️ **Important:** You should only use a version of Java 8.

Windows/Linux
1. Download the latest Java 8 JRE from here: http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html. Download the JRE in the tar.gz format with the same architecture as your Oxygen XML Editor installation (x86=32bit / x64=64bit).

2. Navigate to the Oxygen XML Editor installation folder and rename the jre folder to jre.old (you will need admin privileges if it is installed in Program Files).

3. Unpack the tar.gz and rename the extracted folder to jre.

4. Move that folder to the Oxygen XML Editor installation folder.

5. Verify the paths in the jre folder. The path of the JRE bin folder should be: oxygen/jre/bin.

6. Start Oxygen XML Editor and check the Java version in Help > About > System properties. The java.runtime.version should be match the one you unpacked.

**Mac OS X**

2. Extract the archive contents in a location of your choice (for example, Downloads). You will end up with a folder named something like this: jre1.8.0_181.jre (depending on the version).

3. Move or rename the JRE that was bundled with Oxygen XML Editor. The bundled JRE folder (jre.bundle) is located inside a hidden folder named .install4j (in the Oxygen XML Editor installation folder), so you can not see it in the Mac Finder. Thus, you need to move or rename it via the command line.

For example, if you have Oxygen XML Editor deployed in the Applications folder, the command should look similar to this:

```
mv "/Applications/Oxygen XML Editor/.install4j/jre.bundle"
"/Applications/Oxygen XML Editor/.install4j/jre.bundle.old"
```

4. Move the unpacked JRE folder from the location where you extracted it in the second step to a folder named .install4j/jre.bundle inside the Oxygen XML Editor installation direction.

For example, if you have Oxygen XML Editor deployed in the Applications folder, the command should look similar to this:

```
mv "~/Downloads/jre1.8.0_181.jre"/Applications/Oxygen XML Editor/.install4j/
jre.bundle"
```

The default bundled JRE should now be successfully replaced by the newer one.

5. Start Oxygen XML Editor and check the Java version in Help > About > System properties. The java.runtime.version should be match the one you unpacked.
Damaged File Associations on OS X

Problem

After upgrading OS X and Oxygen XML Editor, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

Cause

The upgrade damaged the file associations in the LaunchService Database on your OS X machine.

Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor installation kit on your desktop.
5. Copy the contents of the archive into the folder /Applications/Oxygen.
6. Run the following command in a Terminal:

   ```
   /System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system -domain user
   ```

7. Restart Finder with the following command:

   ```
   killall Finder
   ```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor icon.
10. Accept the confirmation.

**Result:** When you start Oxygen XML Editor, the file associations should work correctly.
Details to Submit in a Request for Technical Support Using the Online Form

**Problem**

What details should I add to my request for technical support on the online form in the product website?

**Solution**

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (on page 25) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate an Oxygen XML Editor log file, follow these steps:

1. Create a text file called `log4j.properties` in the application installation folder, with the following content:

   ```
   log4j.rootCategory = debug, R2
   log4j.appender.R2=org.apache.log4j.RollingFileAppender
   log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
   log4j.appender.R2.MaxFileSize=12000KB
   log4j.appender.R2.MaxBackupIndex=20
   log4j.appender.R2.layout=org.apache.log4j.PatternLayout
   log4j.appender.R2.layout.ConversionPattern=%r %p [ %t ] %c - %m%n
   ```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `log4j.properties` file because it might cause performance issues if you leave it in the installation folder.
Important: The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the log4j.properties file when you are done with the procedure.

Result: The resulting log file is named oxygen#.log (for example, oxygen.log, oxygen.log.1, oxygen.log.2, etc.) and is located in the Desktop\oxygenLog folder.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

DITA map (on page 3281) transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the the Proxy preferences page (on page 255)

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the force-unique parameter set to true to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique copy-to attribute on any duplicate topic reference that was not handled automatically by DITA-OT:
DITA OT Transformation Takes a Long Time to Process

Problem
A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause
Large delays in DITA OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution
There are several things you can try to troubleshoot this problem:

• If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
• If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
• Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
• You can increase the memory available to Oxygen XML Editor (on page 2946). Sometimes, just increasing the amount of memory available to the DITA OT process may be enough to lower the time necessary for the publishing to run.
• You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
• You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.

• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2960).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 3036). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 3281), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:
DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

**Problem: Cannot Save PDF**

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
Failed to open C:\samples\dita\out\pdf\test.pdf
Failed to open samples\dita\out\pdf\test.pdf
...............[fop]
Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

**Solution: Cannot Save PDF**

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

**Problem: Table Contains More Cells Than Defined in Colspec**

One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
columns specified for the table.
(See position 179: -1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of columns specified for the table.
(See position 179: -1)
```
Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the `XSL-FO` file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2990)) to find the original DITA topic for which the table was generated.

Problem: Broken Link

There is a broken link in the generated `XSL-FO` file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2990) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and search for the unresolved ID references (for example: `unique_4_Connect_42_wrongID`).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view (on page 2990)) to find the original DITA topic for which the table was generated.

- How to Enable Debugging for FO Processor Transformations (on page 1742)

---

### DITA to CHM Transformation Fails - Cannot Open File

**Problem**

The DITA to CHM transformation fails with the following error: 

```
```

**Cause**

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

**Solution**

To solve this issue, close the CHM help file and run the transformation scenario again.

**Tip:** It is a good practice to validate the **DITA map** (on page 3281) before executing the transformation scenario. To do so, run the **Validate and Check for Completeness** action (on page 3036). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the **DITA map**), broken links, and missing external resources.

**Related Information:**

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1664)
DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 3281) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 3036). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1664)

Drag and Drop Without Initial Selection Does Not Work

Problem

When I try to drag with the mouse an unselected file from the Project view (on page 333) or the DITA Maps Manager view (on page 2990), the drag doesn't start, it only selects the resource. I need to drag
the resource again after it becomes selected. Therefore, any drag and drop action without an initial selection becomes a two step operation. How can I fix this?

**Solution**

This is a bug present in JVM versions prior to 1.5.0_09. This issue is fixed in 1.5.0_09 and newer versions. See the installation instructions (on page 33) for setting a specific JVM version for running the Oxygen XML Editor application.

### Gray Window on Linux With the Compiz / Beryl Window Manager

**Problem**

I try to run Oxygen XML Editor on Linux with the Compiz / Beryl window manager but I only get a gray window that does not respond to user actions. Sometimes the Oxygen XML Editor window responds to user actions but after opening and closing an Oxygen XML Editor dialog, or after resizing the Oxygen XML Editor window or a view of the Oxygen XML Editor window, the content of this window becomes gray and it does not respond to user actions.

**Cause**

Sun Microsystems' Java virtual machine does not support the Compiz window manager and the Beryl one very well. It is expected that better support for Compiz / Beryl will be added in future versions of their Java virtual machine.

**Solution**

Try turning off the special effects for the Compiz / Beryl window manager before starting the Oxygen XML Editor application or switch to another window manager.

### Handshake Failure Error When Accessing an HTTPS (SSL) Resource

**Problem**

When attempting to access an HTTPS (SSL) resource, I receive a handshake_failure error.

**Cause**

The issue is most likely due to the limitation of Java cryptography capabilities.
Solution

A solution might be to download and deploy Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files 8 (for Java 8).

❗ Warning: It is possible that this may not be legal in your country. Be advised that you bare legal responsibility for activating unlimited strength Java cryptography capabilities, so you must have the legal right to use such cryptography (consult your export/import control counsel or attorney to determine the exact requirements for your jurisdiction).

To deploy it in Oxygen XML Editor, unpack the downloaded zip archive and move the two jar files (local_policy.jar and US_export_policy.jar) from UnlimitedJCEPolicyJDK8 to the following directory, overwriting existing files:

- **Windows** - [OXYGEN_INSTALL_DIR]/jre/lib/security
- **Linux** - [OXYGEN_INSTALL_DIR]/jre/lib/security
- **Mac OS X** - [OXYGEN_INSTALL_DIR]/jre.bundle/Contents/Home/jre/lib/security

Hunspell Spell Checker is Unusable on Your Platform Error

Problem

When trying to use the Check Spelling option, I receive the error Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session.

Cause

There are instances where Oxygen XML Editor determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

Solution

To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Editor.
2. Open the %APPDATA%/com.oxygenxml folder and look for a file called something like HunspellCrashGuard*.txt. Delete that file.
3. Restart Oxygen XML Editor.
High Resolution Scaling Issues

Problem

I encounter scaling detection issues in a high resolution display. For example, some GUI components are too small.

Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

You can use the `com.oxygenxml.hidpi.scaling` custom system property (on page 288) to force a specific scaling setting. For example: 

```
-Dcom.oxygenxml.hidpi.scaling=1.5
```

for 150% scaling.

Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `external-graphic` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a
resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.

3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the \[OXYGEN_INSTALL_DIR\]/lib/fop.xconf. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in \[DITA-OT-DIR\]/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf. The configuration file contains two XML elements called source-resolution and target-resolution. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial RenderX XEP XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip: It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

Problem

The Ant build process runs out of memory.

Solution

For details about setting custom JVM arguments to the Ant build process, see JVM Arguments (on page 3210).
Java Virtual Machine (JVM) Crash on Mac OS X

**Problem**

Oxygen XML Editor crashed the Apple Java virtual machine or it could not start up on my OS X computer due to a JVM crash.

**Cause**

Usually it is an incompatibility between the Apple JVM and a native library of the host system. More details are available in the crash log file generated by OS X and reported in the crash error message.

**Solution**

If this happens, it is best to send a copy of the logs via email to support@oxygenxml.com. Usually, the operating system will offer a prompt that allows you to see the logs. If not, you should be able to find the logs in the Console app (Applications > Utilities, under ~/Library/Logs/DiagnosticReports. They are usually named JavaApplicationStub*.crash/.hang.

JPEG CMYK Color Space Issues

**Problem**

JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the Author mode.

**Solution**

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the profileFileName.icc to the {OXYGEN_INSTALL_DIR}\lib directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The Unsupported Image Type message is displayed above the image.
Keyboard Language Resets to Default on Windows

**Problem**

In Windows, I have set a specific language for my keyboard and while using Oxygen XML Editor, it keeps getting reset to the default language.

**Cause**

When multiple languages are enabled in Windows, the default shortcut key combination for switching the input language is **Left Alt + Shift**. Trying to use various shortcuts in Oxygen XML Editor that involves combinations of those two keys is probably resetting your input language to the default setting if you press those two keys without a third combination.

**Solution**

You can change the Windows shortcut keys that are assigned to the input language by going to the control panel and searching for the **Switch input languages** option. For example, in Windows 10, go to **Control Panel > Language > Advanced Setting**. In the **Switching input methods** section, click on **Change language bar hot keys**. Click the **Change Key Sequence** button. This opens a dialog box that allows you to switch the shortcut keys for the input language or keyboard layout.

Keyboard Shortcuts Do Not Work At All

**Problem**

The keyboard shortcuts listed in the **Menu Shortcut Keys preferences page (on page 248)** do not work.

**Cause**

Usually this happens when a special keyboard layout is set (in the operating system) that generates non-standard characters. For example, an extended Greek layout will generate special characters that are not present in the default Greek layout. This causes the Java virtual machine that runs the application to receive unexpected key codes.

**Solution**

Reset the keyboard layout to the standard layout for your particular language.
Keyboard Shortcuts Result in Unexpected Behavior

**Problem**

In some rare cases, using certain keyboard shortcuts listed in the Menu Shortcut Keys preferences page (on page 248) result in something different than what is listed in that preferences page.

**Cause**

This is usually caused by the operating system intercepting the keyboard shortcut. For example, certain applications or hardware drivers intercept certain keyboard shortcuts by default. Another example is if you have multiple input sources configured, the operating system might intercept shortcuts if they match the ones used to change between the input sources.

**Solution**

Assign a different keyboard shortcut for the particular action in the Menu Shortcut Keys preferences page (on page 248) or refer to documentation for your operating system or hardware equipment to see if there are options to change the behavior.

Mac Touch Bar Function Keys Do Not Work

**Problem**

I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Editor.

**Causes**

By default, the Touch Bar function keys are not enabled for Oxygen XML Editor.

**Solution**

To enable the Touch Bar function keys for Oxygen XML Editor, follow these steps:

1. Go to System Preferences and select Keyboard.
2. Click Shortcuts.
3. From the left sidebar, select Function Keys.
4. Click the + symbol, select Oxygen from the list of apps, and click Add.
Machine Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server’s Machine Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Machine Signature) is sent to the Oxygen XML Editor servers, which in turn will sign the license key. The Machine Signature is computed from the list of network interfaces of the machine where you deployed the license.

When starting the license server, if you receive an error stating that your server’s Machine Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new machine that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the machine that hosts your license server.

Note: A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat).
The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

**Solution**

The server simply needs to always be restarted from the same location.

**MSXML 4.0 Transformation Issues**

**Problem**

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

**Cause**

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

**Solution**

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

**Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive**

**Problem**

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: **Navigation to the web page was canceled**.

**Cause**

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM opened on a network drive.
Solution

As a workaround, copy the CHM file on your local system and view it there.

Out Of Memory Error When Opening Large Documents

Problem

I am trying to open a file larger than 100 MB in Oxygen XML Editor, but it runs out of memory (OutOfMemoryError).

Solution

You should make sure that the value of the Optimize loading in the Text edit mode for files over option (on page 155) is less than the size of your document. This will enable the optimized support for large documents. If that fails and you still get an Out Of Memory error you should increase the memory available to Oxygen XML Editor (on page 2946).

Other tips:

• Make sure that you close other files before opening the large file.
• You can set the default editing mode in the Preferences dialog box (on page 126). The Text editing mode uses less memory than other editing modes.
• If the file is too large for the editor to handle, you can open it in for viewing in Large File Viewer (on page 2764).

Rectangular Selection Feature Does Not Work On Windows

Problem

When trying to use the Rectangular Selection feature (on page 843) on Windows using both the keyboard and mouse, releasing the Alt key shifts the focus to the main menu instead of entering the edit mode.

Cause

This seems to be an issue caused by something that was changed in Java 8u172.
Solution

A workaround is to use Shift or Ctrl along with Alt and release them simultaneously.

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, map, or binary resource (for example, an image) that is located outside of the folder where the main DITA map (on page 3281) is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause

DITA-OT often has trouble resolving references that are outside the directory where the published DITA map is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:

- Create another DITA map that is located in a folder path above all referenced folders and reference the original DITA map from this new map. Then transform this DITA map instead.
- Edit the transformation scenario and in the Parameters tab, change the value of the fix.external.refs.com.oxygenxml parameter to true. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. **Important:** The fix.external.refs.com.oxygenxml parameter is only supported when the DITA OT transformation process is started from Oxygen XML Editor.
- For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication. **Important:** This method is recommended for transformation scenarios that use an external DITA-OT.
Saxon 9.7 Transformer Issues

**Problem**

I have upgraded to Oxygen XML Editor version 19.0 (which comes bundled with Saxon 9.7) and I am experiencing issues when trying to use the Saxon 9.7 transformer. Is it possible to use the Saxon 9.6 transformer with Oxygen XML Editor version 19.0 or later?

**Solution**

There is a plugin available that can be installed and it allows you to use Saxon 9.6. To install it, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Select the default update site from the drop-down menu (https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml).
3. Select the Saxon 9.6 XSLT and XQuery Transformer plugin and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

**Result:** When you configure the transformation scenario, you will now have the option to choose the Saxon 9.6 transformer.

Scroll Function of my Notebook Trackpad is Not Working

**Problem**

I got a new notebook (Lenovo Thinkpad™ with Windows) and noticed that the scroll function of my trackpad is not working in Oxygen XML Editor.

**Cause**

It is most likely a problem with the Synaptics™ trackpads.

**Solution**

Try adding the following lines to the C:\Program Files\Synaptics\SynTP\TP4table.dat file (depending on your version of Oxygen XML Editor). For example:

```
*,*,oxygen20.1.exe,*,*,*,WheelStd,1,9
```
Segmentation Fault Error on Mac OS X

**Problem**

On Mac OS X, the application gives a *Segmentation fault* error when I double-click the application icon. Sometimes it gives no error but it does not start.

**Solution**

Make sure you have the latest Java update from the Apple website installed. If this does not solve the problem, copy the *JavaApplicationStub* file from the `/System/Frameworks/JavaVM.framework` folder to the `Oxygen.app/Contents/MacOS` folder. To browse the `.app` folder, you have to use the *Command* key while clicking the Oxygen XML Editor icon and select *Show Package Contents*.

Special Characters are Replaced with a Square

**Problem**

My file was created with another application and it contains special characters (such as é, ©, ®, etc.) but Oxygen XML Editor displays a square for these characters.

**Solution**

You must set a font that is able to render the special characters in the *Font preferences* (on page 88). If it is a text file, you must also set the *encoding used for non XML files* (on page 123). If you want to set a font that is installed on your computer but that font is not accessible in the *Font preferences*, this means the Java virtual machine is not able to load the system fonts (probably because it is not a True Type font). It is a problem of the Java virtual machine and a possible solution is to copy the font file in the `[$JVM_DIR]/lib/fonts` folder. `$JVM_DIR` is the value of the property `java.home` that is available in the *System properties* tab of the *About* dialog box that is opened from menu *Help > About*. 
TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The TocJS transformation of a DITA map (on page 3281) does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.
2. Copy the content of the DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles folder to the transformation output folder.
3. Copy the DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html file to the transformation output folder.
5. Locate element <frame name="contentwin" src="concepts/about.html">.
6. Replace "concepts/about.html" with "index.html".

Windows Service Reports Incorrect Function Error When Starting (TCP Server)

Problem

My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

Cause

This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Solution

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.
Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

**Problem**

My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

**Cause**

This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder).

**Solution**

Re-deploy your license key. For more information, see the Setting up a Floating License Server section (on page 67).

Wrong Words are Highlighted when Searching in a User Manual

**Problem**

When I do a keyword search in the User Manual that is included with the Oxygen XML Editor application, the search highlights the wrong word in the text. Sometimes the highlighted word is several words after the matched word.

**Cause**

This does not happen when Oxygen XML Editor runs with a built-in Java virtual machine that was installed by Oxygen XML Editor in a subfolder of the installation folder (for example, on Windows and Linux when installing Oxygen XML Editor with the installation wizard specific for that platform). However, when Oxygen XML Editor runs from an All Platforms installation, it uses whatever JVM was found on the host system, which may be incompatible with the JavaHelp indexer used for creating the built-in User Manual. Such a JVM may offset the highlight of the matched word with several characters, usually to the right of the matched word.
XML Document Takes a Long Time to Open

**Problem**

Oxygen XML Editor takes a long time to open an XML document.

**Cause**

It takes longer to open an XML document if the whole content of your document is on a single line or if the document size is very large.

**Solution**

If the content is on a single line, you can speed up loading by selecting the Format and indent the document on open option (on page 159) (in the Format preferences page).

If the document is very large (above 30 MB), make sure that the value of the Optimize loading in the Text edit mode for files over option (on page 155) (in the Open preferences page) is greater than the size of your document.

If that fails and you get an Out Of Memory error (OutOfMemoryError) you can increase the memory available to Oxygen XML Editor. (on page 2946)

XSLT Debugger Is Very Slow

**Problem**

When I run a transformation in the XSLT Debugger perspective (on page 3285), it is very slow.

**Solution**

If the transformation produces HTML or XHTML output, you can disable rendering of output in the XHTML output view (on page 212) during the transformation process. To view the XHTML output result do one of the following:
• Run the transformation in the **Editor perspective (on page 3285)** and make sure the **Open in Browser/System Application** option (on page 1685) is selected.

• Run the transformation in the **XSLT Debugger perspective (on page 3285)**, save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Internet Explorer).
21. DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework (on page 3282) for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more general information and technical details about working with DITA, refer to the following resources:

- The DITA Specifications.
• The DITA Style Guide Best Practices for Authors.
• Various sample DITA topics and maps can be found in the \(\text{[OXYGEN_INSTALL_DIR]}/\text{samples/dita}\) folder.

Related Information:

• DITA Topics Document Type (Framework) (on page 1573)
• DITA Map Document Type (Framework) (on page 1596)

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor. Oxygen XML Editor makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor

To create a DITA topic (on page 3050):

1. Select File > New or click the New button on the toolbar.

Step Result: The New Document Wizard (on page 676) is displayed:

Figure 837. New DITA Document Wizard
2. Go to **Framework templates > DITA > topic** and select the type of topic that you want to create.

   **Note:** If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved. You can also optionally specify a title.

4. Click **Create**.

**Result:** Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map (on page 16).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents (on page 8) also apply to DITA topics. Oxygen XML Editor also provides additional specific DITA-related support for working with DITA topics (on page 3048), their associated DITA maps (on page 2988), and for creating DITA output (on page 3171).

**Role of Maps**

The basic method that DITA uses to express the relationship between topics is through a **DITA map (on page 3281)**. Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of
any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor

To create a map (on page 3007):

1. Select File > New or click the New button on the toolbar.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 2990). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

![DITA Maps Manager View](image)

Adding Existing Topics to a Map in Oxygen XML Editor

There are several ways to add a topic reference to a map (on page 3010). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the **DITA map** in the **DITA Maps Manager** view *(on page 2990)* and choose **Reference to the currently edited file** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

**Step Result:** This opens the **Insert Reference** dialog box *(on page 3017)* with all of the required fields already filled in for you.

Figure 839. Insert Reference Dialog Box

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select **Insert and close** to add a reference to your topic in the map.
5. Save the **DITA map**.

**Adding New Topics to a Map in Oxygen XML Editor**

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To **add a new topic to a map** *(on page 3010)*, follow these steps:

1. In the **DITA Maps Manager** *(on page 2990)*, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** *(on page 3051)* that allows you to select the
type of document and assists you with naming it. After you have configured your new topic, click Create.

- **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.

- **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.

- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

**Step Result:** The new topic is now referenced (as a topicref) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

You can also change the order and nesting of topics in the DITA Maps Manager view by doing either of the following:

- Select the topic to move while holding down the Alt key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

### Adding Submaps in Oxygen XML Editor

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps (on page 3008). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 3008):
1. Right-click the parent DITA map in the **DITA Maps Manager** view (on page 2990) and choose **Append child > Map reference**.

   **Step Result:** This opens the **Insert Reference** dialog box (on page 3017) with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

3. Select **Insert and close** to add a reference to your submap in the main map.

4. Save the main DITA map.

### Validating a Map in Oxygen XML Editor

Just as it is with your individual topics, it is important to **validate your maps** (on page 3036). Oxygen XML Editor provides a validation function for **DITA maps** that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the **Validate and Check for Completeness** button in the **DITA Maps Manager** view (on page 2990).

   **Step Result:** This opens the **DITA Map Completeness Check** dialog box (on page 3037).

2. Select any of the various options you want to check.

3. Click **Check** to run the validation process.

### Publishing Your Topics in Oxygen XML Editor

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you **create published output** (on page 3171) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Editor manages them by using transformation scenarios.
To publish output for a map:

1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (on page 2990).

**Step Result:** This opens the Configure Transformation Scenario(s) dialog box (on page 1762).

![Configure Transformation Scenarios Dialog Box](image)

2. Select the appropriate transformation depending on the type of output you desire.
3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click Edit.
4. Click Apply associated.

**Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

Related Information:

- DITA Authoring (on page 2981)
- Editing XML Documents in Author Mode (on page 893)
Working with DITA Maps

In the DITA standard architecture you create documents by collecting topics into maps.

DITA Maps

A DITA map (on page 3281) organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor provides support for creating (on page 3007) and managing DITA maps (on page 3010) through the DITA Maps Manager (on page 2990). There are also specialized types of DITA maps, such as a bookmap (on page 3280), which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (on page 3008) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (on page 2990) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (on page 2990) or in the XML Editor. Use any of the following methods to open a map:

• To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).
• To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.
• Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
• If you open a file with the .ditamap or .bookmap extension (from the Project view (on page 333) or a system browser), a dialog box is opened that offers you the choice of opening it in the XML editor or in the DITA Maps Manager.

Note: If you select the Do not show the dialog again option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting Always ask for the When opening a map option in the DITA preferences page (on page 225).

• To open a map in the DITA Maps Manager, you can right-click a map file in the Project view (on page 333) and select Open with > DITA Maps Manager.
• If you have a DITA map file open in the XML editor, you can open it in the DITA Maps Manager by right-clicking the title tab and selecting Open in DITA Maps Manager View.
Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (on page 3035). To support this, Oxygen XML Editor provides an Edit Properties dialog box (on page 3027) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should validate your maps (on page 3036) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

For more information about DITA editing, watch our video demonstration:

https://www.youtube.com/embed/t2cG3Xe1TXY

Related Information:

- DITA Map Document Type (Framework) (on page 1596)
- DITA Map Author Mode Actions (on page 1598)

DITA Maps Manager

Oxygen XML Editor provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a Table of Contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The DITA Maps Manager includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the DITA Maps Manager. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

Figure 841. DITA Maps Manager View
Opening Maps in the DITA Maps Manager

The DITA Maps Manager view supports opening multiple maps at the same time, with each one presented in its own tab. To open a DITA map in the DITA Maps Manager, use any of the following methods:

• To open a submap in its own tab, simply double-click it (or right-click it and select Open).

• If you open a file with a .ditamap or .bookmap extension (from the Project view (on page 333) or a system browser), a dialog box is opened that offers you the choice of opening it in the DITA Maps Manager or the XML editor.

  Note: If you select the Do not show the dialog again option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting the Always ask choice for the When opening a map option in the DITA preferences page (on page 225).

• Right-click a map file in the Project view (on page 333) and select Open with > DITA Maps Manager.

• If you have a DITA map file open in the XML editor, you can right-click the title tab and select Open in DITA Maps Manager View.

By default, when a map is opened in the DITA Maps Manager, its index is automatically refreshed. You can disable this feature by deselecting the Refresh index when opening a map in DITA Maps Manager option (on page 251) in the Open/Find Resource preferences page.
Submap Nodes

If your root map (on page 3287) (main DITA map) references other maps (submaps), they can be expanded and you can navigate their content in the DITA Maps Manager, but the references within those submaps are not editable unless you open the submap separately in its own tab. The references within submap nodes are shown with a gray background.

Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the Ctrl or Shift key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the Ctrl key. The mouse pointer changes to a symbol to indicate that a copy operation is being performed.

Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (Alt + LeftArrow) / Demote (Alt + RightArrow)

You can move nodes between child and parent nodes by using the Promote (Alt + LeftArrow) and Demote (Alt + RightArrow) operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the DITA Maps menu) and their availability depend on the nodes that are selected:

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open Drop-down Menu

You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:
• List of recently viewed DITA maps that can be selected to reopen them.

• **Clear history** - Clears the history list of the recently viewed DITA maps.

• ![Open](open_icon) **Open** - Allows you to open the map in the DITA Maps Manager view (on page 2990). You can also open a map by dragging it from the file system explorer and dropping it into the DITA Maps Manager view (on page 2990).

• ![Open URL](open_url_icon) **Open URL** - Displays the Open URL dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the ![Browse for remote file](browse_icon) drop-down menu.

**Save (Ctrl (Meta on Mac OS)+S)**

Saves the current DITA map.

**Validate and Check for Completeness**

Checks the validity and integrity (on page 3036) of the map.

**Apply Transformation Scenario(s)**

Applies the DITA Map transformation scenario (on page 1641) that is associated with the current map.

**Configure Transformation Scenario(s)**

Opens the Configure Transformation Scenarios(s) dialog box (on page 1762) where you can edit or create transformation scenarios or associate a DITA Map transformation scenario (on page 1702) with the current map.

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Editor, the DITA map is updated automatically.

**Open Map in Editor with Resolved Topics**

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

**Tip:** If you want to print the expanded content, you should consider changing the Styles drop-down to + Print ready.

**Open Map in Editor**
For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Note: You can also use this action to open referenced DITA maps in the Editor.

Profiling/Conditional Text Drop-down Menu

This drop-down menu contains the following actions:

- **Show Profiling Colors and Styles** - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.

- **Show Profiling Attributes** - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.

- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (on page 347) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

- **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (on page 975) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the DITA Maps Manager view. If enabled, it results in the following types of synchronizations:

- If you select a topic tab in the main editing area and it is referenced in the map currently opened in the DITA Maps Manager, the reference to that topic is selected in the DITA Maps Manager.

- If you have a map opened in both the DITA Maps Manager and the main editor, selecting the map tab in the main editing area opens that map in the DITA Maps Manager.
• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the DITA Maps Manager will also select the same topicrefs in the main editor.

• If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the main editor will also select the same topicrefs in the DITA Maps Manager.

Settings

Show extended toolbar

Toggles whether or not the extended toolbar will be displayed in the DITA Maps Manager toolbar.

Show root map toolbar

Toggles whether or not the Root map option (on page 2995) will be displayed in the DITA Maps Manager toolbar.

Show topic titles

Toggles how topics are presented in the DITA Maps Manager. If selected, the title of each topic is shown. Otherwise, the file path (value of the href attribute) for each topic is shown.

Root map

Specifies a master DITA map (root map (on page 3287)) that Oxygen XML Editor uses to define a hierarchical structure of submaps and to establish a key space (on page 3283) that defines the keys that are propagated throughout the entire map structure. For more information, see Selecting a Root Map (on page 3007).

Browse Drop-down menu

You can use this drop-down menu to browse for root maps with the following choices:

• Browse for local file - Opens a local file browser dialog box, allowing you to select a local root map.

• Browse for remote file - Displays the Open URL dialog box (on page 694) that allows you to select a remotely stored root map.

• Browse for archived file - Displays the Archive Browser (on page 2191) that allows you to browse the content of an archive and choose a root map.

• Browse Data Source Explorer - Opens the Data Source Explorer (on page 2198) that allows you to browse the data sources defined in the Data Sources preferences page (on page 229).
Tip: You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- **Search for file** - Displays the Find Resource dialog box (on page 733) to search for a root map.

The following additional actions are displayed in the toolbar when the Show extended toolbar option is selected in the Settings menu:

- **Insert Topic Reference**
  
  Opens the Insert Reference dialog box (on page 3017) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

- **Edit Properties**
  
  Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 3027).

- **Edit Attributes**
  
  Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 426) topic.

- **Delete**
  
  Deletes the selected node.

- **Move Up**
  
  Moves the selected node up within the DITA map tree.

- **Move Down**
  
  Moves the selected node down within the DITA map tree.

- **Promote (Alt + LeftArrow)**
  
  Moves the selected node up one level to the level of its parent node.

- **Demote (Alt + RightArrow)**
  
  Moves the selected node down one level to the level of its child nodes.

**Contextual Menu of the DITA Maps Manager**

**Root Map**
The following actions can be invoked from the contextual menu on the root map (on page 3287) of an opened DITA map (many of them are also available in the DITA Maps menu):

- **Open Map in Editor**
  For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

- **Open Map in Editor with Resolved Topics**
  Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

- **Export DITA Map**
  Opens a dialog box that allows you to choose a destination for exporting the DITA map. It also includes an Export as Zip archive option that allows you to package the DITA map as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map by following all topicref, conref, and xref elements.

- **Find Unreferenced Resources**
  Allows you to search for orphaned resources that are not referenced in the DITA maps.

- **Add to Review Task**
  This action can be used to add the selected documents to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

- **Edit Properties**
  Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 3027).

- **Fast Create Topics**
Opens the **Fast Create Topics** dialog box *(on page 3053)* that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the **DITA map (on page 3281)**.

### Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 3050)*.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the **Inserting References (on page 3017)** topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the **Inserting References (on page 3017)** topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a targeted key definition *(on page 3026)* (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to define a key and a value inside a keyword *(on page 3026)*.
- A set of actions that open the **Insert Reference** dialog box *(on page 3017)* that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

### Search References

Searches all references to the current topic in the entire **DITA map (on page 3281)**.

### Refactoring submenu

The following actions are available from this submenu when invokes from a root map:

- **Rename resource**
  
  Allows you to change the name of a resource linked in the edited **DITA map (on page 3013)**.

- **Move resource**
Allows you to change the location on disk of a resource linked in the edited DITA map (on page 3013).

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Other XML Refactoring Actions**

For your convenience, the last 5 XML Refactoring tool operations (on page 1139) that were finished or previewed will also appear in this submenu.

**XML Refactoring**

Opens the XML Refactoring tool wizard (on page 1139) that presents refactoring operations to assist you with managing the structure of your XML documents.
Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 745) that allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to spell check multiple files (on page 766).

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Editable Child Nodes

The following actions are available when the contextual menu is invoked on an editable child node of a DITA map (submaps need to be opened in the DITA Maps Manager to access these actions since they are in a read-only state in the parent map):

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens the selected resource in the editor.

Add to Review Task

This action can be used to add the selected documents to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your organization will
need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 3027).

**Fast Create Topics**

Opens the Fast Create Topics dialog box (on page 3053) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 3281).

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 3050).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 3017) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 3017) topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 3026) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 3026).
- A set of actions that open the Insert Reference dialog box (on page 3017) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Insert Before submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:
• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 3050).*

• ☐ **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References* *(on page 3017)* topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References* *(on page 3017)* topic.

• **Key Reference** - Opens an *Insert Key Definition* dialog box that allows you to insert a targeted key definition *(on page 3026)* (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an *Insert Key Definition* dialog box that allows you to define a key and a value inside a keyword *(on page 3026).*

• A set of actions that open the *Insert Reference* dialog box *(on page 3017)* that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Insert After submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

• **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 3050).*

• ☐ **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References* *(on page 3017)* topic.

• **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References* *(on page 3017)* topic.

• **Key Reference** - Opens an *Insert Key Definition* dialog box that allows you to insert a targeted key definition *(on page 3026)* (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an *Insert Key Definition* dialog box that allows you to define a key and a value inside a keyword *(on page 3026).*

• A set of actions that open the *Insert Reference* dialog box *(on page 3017)* that allow you to insert various reference specializations (such

Search References

Searches all references to the current topic in the entire DITA map (on page 3281).

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic (on page 1521).

Rename resource

Allows you to change the name of a resource linked in the edited DITA map (on page 3013).

Move resource

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 3013).

Extract to New DITA Map

Use this operation to extract editable topics into a new DITA map. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click Create to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2990))
Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2990))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Other XML Refactoring Actions**

For your convenience, the last 5 XML Refactoring tool operations (on page 1139) that were finished or previewed will also appear in this submenu.
XML Refactoring

Opens the XML Refactoring tool wizard (on page 1139) that presents refactoring operations to assist you with managing the structure of your XML documents.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 745) that allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to spell check multiple files (on page 766).

Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Delete

Deletes the currently selected node from the DITA map.

Remove from Disk

This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the Also remove all descendants option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links.

Organize

Allows you to organize the DITA map with the several submenu actions:
• **Move Up** - Moves the selected node up within the *DITA map* tree.
• **Move Down** - Moves the selected node down within the *DITA map* tree.
• **Promote** *(Alt + LeftArrow)* - Moves the selected node up one level to the level of its parent node.
• **Demote** *(Alt + RightArrow)* - Moves the selected node down one level to the level of its child nodes.

**Expand All**

Allows you to expand the entire *DITA map* structure.

**Collapse All**

Allows you to collapse the entire *DITA map* structure.

**Other Nodes**

The following additional actions are available when the contextual menu is invoked from other nodes, such as a *submap* node or a relationship table:

**Open Map in Editor (available when invoking on a submap)**

Opens the currently selected *DITA map* in the editor.

**Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)**

Opens the parent *DITA map* of the currently selected reference in the *DITA Maps Manager*.

**Edit Attributes (only available for relationship table nodes)**

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the *Attributes View in Author Mode (on page 426)* topic.

**Edit Profiling Attributes (only available for relationship table nodes)**

Allows you to change the *profiling attributes (on page 969)* defined on the selected node.

For more information about the *DITA Maps Manager* view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

**Related Information:**
Creating a Map

To create a DITA map (on page 3281), subject scheme map (on page 3288), bookmap (on page 3280), or other types of DITA maps, follow these steps:

1. Use the New Document wizard (on page 676) to start creating your map.
   
   Tip: If you want the map to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2990)) and selecting New from the Append Child, Insert Before, or Insert After submenu.

2. Select one of the DITA Map templates from the Framework templates folder.

3. Click the Create button.

4. Select whether you want to open the map in the DITA Maps Manager (on page 2990) or the Editor.

5. Save the map using the Save button on the toolbar of the DITA Maps Manager view (on page 2990).

Related Information:

- Customizing Profiling Values with a Subject Scheme Map (on page 3243)
- Managing DITA Maps (on page 3010)

Selecting a Root Map

Oxygen XML Editor allows you to select a root map (on page 3287) (a master DITA map (on page 3281)) that defines a hierarchical structure of submaps and establishes a key space (on page 3283) that defines the keys used in all the other DITA maps and topics in the project. Specifying the correct root map helps to prevent validation problems when you work with keyrefs and also acts as the
foundation for content completion. All the keys that are defined in a root map are available in the submaps that are contained within the root map.

There are several ways to select or change the root map:

- The easiest method is to use the Root map drop-down menu (on page 2995) in the DITA Maps Manager (on page 2990) toolbar to select the appropriate root map.

- If you insert a key reference using the Cross Reference action from the Link drop-down menu (from the toolbar or Link submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

- If you insert a content key reference or key reference using the Reuse Content action (from the toolbar, DITA menu, or Reuse submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

For more information about the DITA root map support, watch our video demonstration:

https://www.youtube.com/embed/e81r3Y1qjnE

Creating DITA Submaps

You can break up a large DITA map (on page 3281) into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an existing topic into a map (on page 3010), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a mapref element or a topicref element with the format attribute set to ditamap. In most cases, Oxygen XML Editor takes care of this for you.

Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select **Append Child > New**. To insert the submap as a sibling to the current node, select **Insert After > New** or **Insert Before > New**.

**Step Result:** This opens a **New DITA file dialog box (on page 3050)** that allows you to select the type of document and assists you with naming it.

3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file type should be `.ditamap`).

4. Click **Create** to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see Managing DITA Maps (on page 3010).

Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a **bookmap (on page 3280)** to organize your topics into a book. A DITA **bookmap** is a specialized type of map, intended for creating output that is structured like a book. A **bookmap** allows you to add book-specific elements such as frontmatter, part, chapter, appendix, and backmatter to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the DITA documentation for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor.

To create a book in DITA using a **bookmap**, follow these steps:

1. Create a new **bookmap (on page 3009)** (File > New > Framework templates > DITA Map > map > Bookmap). If you want the **bookmap** to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2990)) and selecting New from the Append Child, Insert Before, or Insert After submenus.

2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a **bookmap**, or children to a section, right-click the **bookmap** or section icon and choose any of the reference actions in the Append child menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the DITA documentation to fully understand the structure of a DITA **bookmap** and where to create each element.

3. Create special elements such as an **index (on page 3034)** and **table of contents (on page 3033)**. The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. **Add topics (on page 3010)** to your chapters to add content to your book. You may find it easier to manage if you use **submaps (on page 3008)** to create the content of your chapters. This keeps your **bookmap** from becoming long and difficult to manage.
Managing DITA Maps

You may want to manage your DITA maps in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

[https://www.youtube.com/embed/ozFZz6YZMCY](https://www.youtube.com/embed/ozFZz6YZMCY)

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the DITA Maps Manager.
- By highlighting a topic in the DITA Maps Manager, holding down the Alt key, and pressing the arrow keys.
- By showing the extended DITA Maps Manager toolbar (press the Settings icon on the DITA Maps Manager toolbar and select the extended toolbar) and then using the node moving buttons on the toolbar to move topics around in the map.

To understand how to organize topics in a DITA map using the DITA Maps Manager, you can examine and experiment with the sample map called flowers.ditamap, located in the [OXYGEN_INSTALL_DIR]/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.
The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor supports both approaches.

A DITA map (on page 3281) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the topicref element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Editor provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box

The Insert Reference dialog box (on page 3017) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

• Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
• If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select Reference to the currently edited file.
• Selecting an item in the map and click the Insert Reference button from the DITA Maps Manager toolbar.
• Select Insert Reference from the DITA Maps menu.

Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a DITA map by dragging and dropping the file into the DITA Maps Manager (on page 2990). You can drag and drop files from any of the following:

• Your OS file system explorer.
• The Project view (on page 333).
• The Open/Find Resource view (on page 344).

Adding topics this way will not open the Insert Reference dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting Edit Properties.
Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the DITA Maps Manager (on page 2990), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

   **Step Result:** The new topic is now referenced (as a topicref) in the DITA map at the location where you inserted it and the new topic is opened in the editor.
3. Save the DITA map.

Adding Multiple Skeleton Topics at Once

Oxygen XML Editor includes a feature in the DITA Maps Manager (on page 2990) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 3281).

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

For more information, see Fast Create Multiple DITA Topics (on page 3053).
Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2990), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press Delete or Backspace.
- Highlight the topic and click the ✕ Delete button on the DITA Maps Manager (on page 2990) extended toolbar.

Related Information:

- Fast Create Multiple DITA Topics (on page 3053)

Moving and Renaming Resources

You can move or rename resources on disk directly from Oxygen XML Editor and you have the option of updating all the references to the moved or renamed resources. For DITA resources (such as topics and maps), you can do this from the DITA Maps Manager view (on page 2990). For non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can do this from the Project view (on page 333).

Moving or Renaming DITA Resources (Topics or Maps)

To move or rename normal DITA resources (such as topics or maps), use one of the following actions available in the Refactoring submenu of the contextual menu when invoked on the resource in the DITA Maps Manager view (on page 2990):

- Refactoring > Move resource
This action allows you to change the location of a resource linked in the edited DITA map, using the Move resource dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the Move resource operation. No changes are applied.

**Refactoring > Rename resource**

This action allows you to change the name of a resource linked in the edited DITA map (on page 3281), using the Rename resource dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
- **Rename** - Executes the Rename resource operation.
- **Cancel** - Cancels the Rename resource operation. No changes are applied.

⚠️ **Note:** If a root DITA map (on page 3287) is not defined, the move and rename actions are executed in the context of the current DITA map.

**Moving or Renaming Non-DITA Resources and Updating the References to Them**

To move or rename non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming Resources in the Project View (on page 720). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on non-DITA resources while also updating all the references to them, use the following sets of procedures:
1. Enable *Master Files* support and add your root *DITA map* to the *Master Files* folder by following the procedure found here: How to Enable Master Files Support in DITA (on page 3266).

2. Move or rename resources and update the references to them by following the procedure found here: Moving or Renaming Non-DITA Resources and Updating the References to Them (on page 3267).

Related Information:

- Master Files Support in DITA (on page 3266)
- Finding Resources Not Referenced in DITA Maps (on page 3015)

Finding Resources Not Referenced in DITA Maps

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from *DITA maps* (on page 3281). To assist you with organizing project resources, Oxygen XML Editor includes the **Find Unreferenced Resources** action, that searches for such resources.

To perform this search, open the *DITA map* in the *DITA Maps Manager* (on page 2990), invoke the contextual menu on the *map*, and select the **Find Unreferenced Resources** action. It can also be selected from the *DITA Maps* menu. This action opens the **Find Unreferenced Resources** dialog box, shown below.

Figure 842. Find Unreferenced Resources Dialog Box
The Find Unreferenced Resources dialog box includes the following options:

- **DITA Maps** - Provides a list of DITA maps to be included in the search and allows you to Add maps to the list or Remove them.

- **Folders** - Provides a list of folders to be included in the search and allows you to Add or Remove specific folders. All files from this list of folders that are not referenced from the maps specified in the DITA Maps list will be reported.

- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

  **Note:** In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the **Find** button, if the search operation finds unreferenced resources, they are displayed in the **Results** panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select **Remove from Disk**. If you want to see the resource before deciding what to do with it, you can right-click its result and select **Show in Explorer**.
Inserting References in DITA Maps

A DITA map (on page 3281) may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the Insert Reference dialog box (on page 3017).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a DITA map.

Insert Reference Dialog Box

The Insert Reference dialog box allows you to insert and configure references in DITA maps (on page 3281). There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the Insert Reference dialog box, use one of the following methods:

- Select Reference, Reference to the currently edited file, or any of the other specific reference actions that are available from the Append Child, Insert Before, and Insert After submenus when invoking the contextual menu in the DITA Maps Manager (on page 2990).
  + To insert the reference as a child of the current node, select the reference from the Append Child submenu.
  + To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the Insert After submenu.
  + To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the Insert Before submenu.

  Note: The content of these submenus depends on the node that is selected in the DITA map tree when the contextual menu is invoked. For example, if the selected node is a topic reference (topicref), its possible child nodes include the following elements: anchorref, chapter, keydef, mapref, topicgroup, topichead, topicref, topicset, and topicsetref.

- Click the Insert Reference button on the DITA Maps Manager extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select Insert Reference from the DITA Maps menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the Reference or Reference to the currently edited file actions, a Reference type drop-down list is displayed at the top of the Insert Reference dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the
other reference actions in the **Append Child**, **Insert Before**, and **Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**.

**Target Tab**

Figure 843. Insert Reference Dialog Box - Target Tab

The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the **Look in** drop-down list, browsing buttons, or file window in this section. You can use the **Files of type** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**
The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.

### Keys Tab

![Insert Reference Dialog Box - Keys Tab](image)

The **Keys** tab allows you to use and define keys (on page 3024) for indirect referencing. For more information, see **Working with Keys in DITA** (on page 3116). This tab includes the following:

**Define keys**

Use this text field to define the `keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `keyscope` attribute. **Key scopes** allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current **root map** (on page 3287).
The Attributes tab of the Insert Reference dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 226). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

**Collection type**

This drop-down list allows you to select the collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

**Type**

Allows you to select a type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 226).

**Scope**

This property corresponds to the scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be
populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** *(on page 226)*.

**Format**

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** *(on page 226)*.

**Processing Role**

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 846. Insert Reference Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `navtitle`, `linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.
The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root map *(on page 3287)* references a DITA subject scheme map *(on page 3288)* that defines values for the profiling attributes, those values are used.
- If your project defines project-level *(on page 3286)* configuration values for the profiling attributes *(on page 144)*, those values are used.
- If Oxygen XML Editor defines global-level *(on page 3283)* configuration values for the profiling attributes *(on page 144)*, they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see DITA Profiling / Conditional Text *(on page 3225)*.

**Finalizing Your Insert Reference Configuration**

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

**Tip:** You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

**Related Information:**

- DITA Profiling / Conditional Text *(on page 3225)*
Inserting Topic Headings

The `topichead` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `topicref` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child, Insert Before, or Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view (on page 2990).
- Open the **DITA map** in the XML editor (on page 2989) and select the **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box (on page 3017) that allows you to easily insert a `topichead` element. A **Navigation title** ( `navtitle` attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.)

Figure 848. Insert Topic Heading Dialog Box

**Related Information:**

- Insert Reference Dialog Box (on page 3017)
Inserting Topic Groups

The `topicgroup` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `topicgroup` can contain other `topicgroup` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `topicgroup` and its children. You can set the collection-type of a container `topicgroup` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the [DITA Maps Manager](on page 2990) view.

- Open the **DITA map** in the XML editor (on page 2989) and select the **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group** dialog box (on page 3017) that allows you to easily insert a `topicgroup` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

Figure 849. Insert Topic Group Dialog Box

Defining Keys in DITA Maps

DITA uses keys (on page 3116) to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 3287). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a keyword.
- Key with a target (for example, to target a resource such as an image or external link).

The following example is a DITA map (on page 3281) (a key definition submap) that contains some key definitions with various values for the product key and some targets to external URLs:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="url_eula" href="https://www.example.com/eula.html" format="html" scope="external"/>
  <keydef keys="url_eula2" href="https://www.example.com/eula2.html" format="html" scope="external"/>
</map>
```
Note: The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

Key Definition with a Keyword Value

To define a key with a value inside a keyword, follow these steps:

1. [Optional but Recommended] Create a submap (on page 3008) that will contain all of your key definitions and reference the submap in your main (root) map (if you don’t already have one created).
2. Open that map in the DITA Maps Manager (on page 2990).
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition with Keyword from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition). This opens an Insert Key Definition dialog box.
4. Enter the name of the key in the Key field.
5. Enter the key’s value in the Keyword field.
6. Click Insert and close.

Tip: If you need to profile the key or add other attributes, you can right-click the key definition in the DITA Maps Manager, select Edit properties, and configure them in the Profiling tab or Attributes tab, respectively.

Key Definition with a Target

To insert a targeted key definition (for example, to target a resource such as an image or external link), follow these steps:

1. [Optional but Recommended] Create a submap (on page 3008) that will contain all of your key definitions and reference the submap in your main (root) map (if you don’t already have one created).
2. Open that map in the DITA Maps Manager (on page 2990).
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition in the DITA map). This opens an Insert Key Definition dialog box.
4. Go to the Keys tab and enter the name of the key in the Define keys field.
5. Go to the Target tab and select a target resource (such as an image or external link).

Tip: You can profile the key by using the Profiling tab and other attributes can also be defined in the Attributes tab.
6. Once you are done configuring the targeted key definition, click **Insert and close**.

**Related Information:**

- Working with Variable Text in DITA (*on page 3148*)
- Working with Keys in DITA (*on page 3116*)
- DITA 1.3 Specification: Indirect Key-based Addressing

**Edit Properties Dialog Box**

The **DITA Maps Manager** view (*on page 2990*) includes a feature that allows you to view and edit the properties of a selected node. The **Edit properties** action is available on both the **DITA Maps Manager** toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a **DITA map** (*on page 3281*) document in **Author** mode. The action opens the **Edit Properties** dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node for which the action was invoked.

**Note:** If you select multiple sibling nodes and invoke the **Edit properties** action, only the **Profiling** tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the **Edit Properties** dialog box to modify or define attributes, metadata, profiling, or keys in **DITA maps** or topics. You can also use it to modify the title of **root maps** (*on page 3287*).

At the top of the **Edit Properties** dialog box, the **Reference type** drop-down list displays the type of the selected node and it depends on the node for which the action was invoked.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a **root map** (*on page 3287*), only the **Attributes**, **Metadata**, and **Profiling** tabs are accessible and the **Title** property can be configured. Also, if you select multiple nodes, only the **Profiling** tab is available.

**Target Tab**

Figure 850. Edit Properties Dialog Box - Target Tab
The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the **Look in** drop-down list, browsing buttons, or file window in this section. You can use the **Files of type** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.
**Keys Tab**

Figure 851. Edit Properties Dialog Box - Keys Tab

The **Keys** tab allows you to use and define keys (on page 3024) for indirect referencing. For more information, see Working with Keys in DITA (on page 3116). This tab includes the following:

**Define keys**

Use this text field to define the `keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `keyscope` attribute. *Key scopes* allow you to specify different sets of key definitions for different map branches.

**Key reference**

Use this combo box (or the Choose key reference button) to select a key that is already defined in the root map (on page 3287).

---

**Attributes Tab**

Figure 852. Edit Properties Dialog Box - Attributes Tab
The Attributes tab of the Edit Properties dialog box allows you to insert and edit attribute values for the target node for which the action was invoked.

If the target is a root map (on page 3287), the tab displays the title of the map. You can change it in the Title text field and assign it to an Attribute, Element, or All.

Figure 853. Attributes Tab for a Root Map

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 226). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

**Tip:** You can also select the Prefer navigation title for topicref rendering option in the DITA preferences page (on page 226) to always enforce the use of the navtitle value rather than selecting this Lock option on individual topics.

**Collection type**
This drop-down list allows you to select the `collection-type` attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

**Type**

Allows you to select a `type` attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 226).

**Scope**

This property corresponds to the `scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Scope checkbox for the Always fill values for attributes option in the DITA preferences page (on page 226).

**Format**

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Format checkbox for the Always fill values for attributes option in the DITA preferences page (on page 226).

**Processing Role**

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the Value column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

Figure 854. Edit Properties Dialog Box - Metadata Tab
The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `navtitle`, `linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

**Profiling Tab**

Figure 855. Edit Properties Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 3287) references a DITA subject scheme map (on page 3288) that defines values for the profiling attributes, those values are used.
- If your project defines project-level (on page 3286) configuration values for the profiling attributes (on page 144), those values are used.
- If Oxygen XML Editor defines global-level (on page 3283) configuration values for the profiling attributes (on page 144), they are used.
- Otherwise, a basic default set of profiling attributes and values are used.
If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 3225).

**Note:** If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.

Figure 856. Profiling Conflict Panel

---

**Finalizing Your Modifications**

Once you click OK, all your changes are applied to the target node.

---

**Related Information:**

- DITA Profiling / Conditional Text (on page 3225)
- Working with Keys in DITA (on page 3116)

---

**Generating a Table of Contents in DITA**

In DITA, the order and hierarchy of the table of contents of a document is based directly on the DITA map that defines the document (on page 2988). In most cases, the processor generates a table of contents (TOC) based on the hierarchy of the topics in a DITA map. By default, each topicref element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents
at a particular location within your DITA map structure, you can use the toc element in a bookmap (on page 3009) (as in the example below). For more information about the toc element, see https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html.

Example:

```
<bookmap>
    ....
    <frontmatter>
        <booklists>
            <toc href="chapter1.dita"/>
        </booklists>
    </frontmatter>
    ....
```

Creating an Index in DITA

In DITA, indexes are created from indexterm elements. You can insert index term elements:

- In the header of a topic. In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page in which the topic starts, even if it is not the page in which the indexed term occurs.
- In the topicref element in a map that references the topic. This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page in which the topic starts.
- In the body of a topic. In paginated media, this results in an index entry that points to the page in which the indexterm element occurs, even if that is not the page in which the topic starts.

To add index terms to the text of a topic of the topic header, create the elements as you normally would in Oxygen XML Editor (on page 3055). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a bookmap (on page 3280), you need to add an indexlist element to the backmatter of the book.

1. Open your bookmap (on page 3009) in the DITA Maps Manager (on page 2990).
2. Right-click the bookmap and select Append Child > Backmatter.
   The Insert Reference dialog box (on page 3017) appears.
3. Click Insert and Close to insert the backmatter element.
4. Right-click the backmatter element and create a booklists element using Append Child > Book Lists.

5. Use the same steps to create an indexlist element.

**CAUTION:** Adding index entries and an indexlist to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

## Resolving Topic References Through an XML Catalog

There are situations where you want to resolve URIs with an XML Catalog (on page 3289):

- You customized your DITA map (on page 3281) to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor. The DITA Maps Manager view (on page 2990) will solve the displayed topic refs through the added XML catalog, as well as DITA map transformations (for PDF output, XHTML output, etc.)

To add an XML catalog to the DITA framework (on page 3282), follow these steps:

1. Create an XML catalog using the guidelines described in Working with XML Catalogs (on page 1123).
2. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Document Type Association.
3. Select the DITA document type and use the Edit, Duplicate, or Extend button to open a Document type configuration dialog box (on page 95).
4. Go to the Catalogs tab (on page 119).
5. Click on the Add button to open a dialog box that allows you to add your created XML Catalog to the list.
6. After adding your catalog, click OK. You may need to reopen any currently edited files that use the new catalog or run a manual Validate action (on page 1082) for the changes to take effect.

**Note:** You could also add your created catalog to the list of global catalogs in the XML Catalog preferences (on page 189) page.
Chunking DITA Topics

By default, when a DITA map (on page 3281) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as chunking.

To chunk DITA topics, you set the chunking attribute on the topicref that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, by-topic or to-content). See the DITA documentation for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the toc and collection-type attributes on the sub-topics or container topic to suitable values. See the DITA documentation for details.

You can set the collection-type attribute on your topics using the Edit Properties action in the DITA Maps Manager (on page 2990). To set the toc and chunk attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon in the DITA Maps Manager (on page 2990) to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your DITA maps (on page 3281) regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In the DITA Maps Manager view (on page 2990), make sure that the tab that holds your root map (on page 3287) is selected and that the Root map selection is set either to the name of your root map or to <current map>.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click F5 (F5).
3. Click the Validate and Check for Completeness button on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (on page 3037).
4. If you are using profiling, check the Use DITAVAL filters box and select the appropriate option.
5. Select any other options you want to check.
6. Click Check to run the validation process.
Validation Process

The validation process of a DITA map includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an `href` attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The DITA Map Completeness Check dialog box allows you to configure the DITA map validation.

Figure 857. DITA Map Completeness Check Dialog Box
You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (on page 1093).

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.

**Include remote resources**

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

**Use DITAVAL filters**

The content of the map is filtered by applying a profiling condition set (on page 3225) before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager view** (on page 2990). Clicking the **Details** icon opens a topic in the Oxygen XML Editor User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the **DITA map**.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 276) button, or the browsing actions in the **Browse** drop-down list.

**Report references to resources outside of the DITA map folder**
If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 3287) folder.

**Report links to topics not referenced in DITA maps**

Checks that all the topics referenced by other topics are also linked in the DITA map.

**Report multiple references to the same topic**

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique copy-to attribute is used on the topicref element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second topicref has a copy-to attribute set:

```xml
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a copy-to attribute set or both of them have the copy-to attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

**Check for duplicate topic IDs within the DITA map context**

Checks for multiple topics with the same ID in the context of the entire map.

**Report duplicate key definitions**

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the keys attribute, all references will point to the first one encountered and the other will be ignored.

**Note:** This option takes key scopes (on page 3151) into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```
it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 3151) on the second occurrence.

Report unreferenced key definitions

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option (on page 3038) is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any topicref that contains a processing-role attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a conref or conkeyref.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of cols is different than the number of columns detected from the table cols attribute.
- For a CALS table, if the number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the cols, rowsep, or colsep attributes are not numeric.
- For a CALS table, if the namest, nameend, or colname attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 144) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.
Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list.

Export settings

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

Import settings

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.

Check

Use the Check button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

Related Information:

• DITA Maps Manager (on page 2990)

DITA Map Validation and Completeness Check from the Command-Line Interface

⚠️ Important: This command-line script requires a special Oxygen XML Scripting License and does not work with a normal Oxygen XML Editor license. For more information and to obtain an Oxygen XML Scripting License license, see the Oxygen XML Scripting Web Page.

You can execute a Validate and Check for Completeness operation (on page 3036) with a script ran from the command-line interface. The operation can be executed by running the following script:

• Windows:

  validateCheckDITA.bat -i mainDitamapPath -s settingsFile -r reportFile

• Linux:

  sh validateCheckDITA.sh -i mainDitamapPath -s settingsFile -r reportFile

• Mac OS X:

  sh validateCheckDITA.sh -i mainDitamapPath -s settingsFile -r reportFile
The script is located in the Oxygen XML Editor installation folder and can be integrated in an external batch process launched from the command-line interface. The script accepts a variety of command-line arguments that allow you to configure the validation.

The accepted arguments are as follows:

**mainDitamapPath**

The path to the main DITA map file to validate. This is a required parameter.

**settingsFile**

The options file for the validate and completeness check. This file can be obtained from the DITA Map Completeness Check dialog box by using the Export Settings action. If this parameter is missing, the default options for the validation will be used.

**reportFile**

The file where the validation report will be saved. If this parameter is missing, the report will be displayed in the console.

**Note:** When using this script, some of the options that appear in the DITA Map Completeness Check dialog box are ignored. The ignored options include:

- Batch validate referenced DITA resources
- Use DITAVAL filters: From the current condition set
- Use DITAVAL filters: From all available condition sets
- Use DITAVAL filters: From the associated transformation scenario
- Report attributes and values that conflict with profiling preferences

**Tip:** You can use DITAVAL filter files with the script by specifying one or more ditaval files in the Use DITAVAL filters: Other DITAVAL files option in the DITA Map Completeness Check dialog box.

**Result:** The validation result is displayed in the command line interface. This includes whether or not the validation was successful, the number of issues, and the path to the report file (if the reportFile parameter was used), or the actual content of the validation result if the reportFile parameter was not used.

**Restriction:** When using this script, the Saxon 9 XSLT processor used to apply custom Schematron checks is not licensed and therefore the Schematron cannot call external Java extensions.
DITA Map Author Mode Actions

A variety of actions are available in the DITA map (on page 3281) framework (on page 3282) that can be added to the DITA menu, the Author Custom Actions toolbar, the contextual menu, and the Content Completion Assistant (on page 3280).

DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map Author Custom Actions toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  
  Opens a New DITA file dialog box (on page 3050) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  
  Opens the Insert Reference dialog box (on page 3017) where you can configure a topic reference and inserts it at the current position within the map.

- **Reuse Content**
  
  Opens the Reuse Content dialog box (on page 3135) that allows you to insert and configure a content reference (conref), or a content key reference (conkeyref) at the cursor position.

- **Insert Topic Heading**
  
  Opens the Insert Reference dialog box (on page 3017) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  
  Opens the Insert Reference dialog box (on page 3017) that allows you to insert a topic group at the cursor position.

- **Insert Relationship Table**
  
  Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

- **Relationship Table Properties**
  
  Allows you to change the properties of rows in relationship tables.

- **Insert Relationship Row**
Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

**Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

**Delete Relationship Column**

Deletes the table column where the cursor is located.

**Delete Relationship Row**

Deletes the table row where the cursor is located.

**Move Up**

Moves the selected node up one position on its same level.

**Move Down**

Moves the selected node down one position on its same level.

**Promote (Alt + LeftArrow)**

Moves the selected node up one level to the level of its parent node.

**Demote (Alt + RightArrow)**

Moves the selected node down one level to the level of its child nodes.

**DITA Menu Actions**

The following additional actions can be found in the DITA menu when editing a DITA map in Author mode:

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced resources.

**Tags display mode Submenu**

**Full Tags with Attributes**

Displays full tag names with attributes for both block (on page 3280) and inline elements (on page 3283). Oxygen XML Editor

**Full Tags**

Displays full tag names without attributes for both block and inline elements.
Block Tags
Displays full tag names for block elements and simple tags without names for inline elements.

Inline Tags
Displays full tag names for inline elements, while block elements are not displayed.

Partial Tags
Displays simple tags without names for inline elements, while block elements are not displayed.

No Tags
No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode
Use this option to go to the Author preferences page (on page 131) where you can configure the Tags Display Mode options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes
Allows you to configure the profiling attributes (on page 969) and their values.

Show Profiling Colors and Styles
Select this option to turn on conditional styling.

Show Profiling Attributes
Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content
When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type
You can click a listed condition set (on page 975) to activate it.

Profiling Settings
Opens the profiling options preferences page (on page 144), where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page (on page 146) and the attributes rendering preferences page (on page 148).

**ID Options**

Opens the ID Options dialog box that allows you to configure options for generating IDs in Author mode. The dialog box includes the following:

**ID Pattern**

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables (on page 276).

**Element name or class value to generate ID for**

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the Add, Edit, or Remove buttons.

**Auto generate IDs for elements**

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in Author mode.

**Remove IDs when copying content in the same document**

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

**Note:** This option does not have an effect on content that is cut and pasted.

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
• When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

### DITA Map Contextual Menu Actions

In addition to many of the DITA Map toolbar actions (on page 1598) and the general Author mode contextual menu actions (on page 1065), the following DITA map framework-specific actions are also available in the contextual menu when editing in Author mode:

**Add File to Review Task**

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 3027).

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

• When invoked on a single selection, an ID is generated for the selected element at the cursor position.

• When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.
Finds the references to the `href` or `keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 2990)). The current topic/map reference element must have an `href` or `keys` attribute defined to complete the search.

**Show Key Definition**

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the DITA map (on page 3281) that contains the definition of the key with the element that defines that key selected.

**DITA Map Drag/Drop Actions**

Dragging a file from the Project view (on page 333) or DITA Maps Manager view (on page 2990) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a `topicref` element, chapter, part, etc.) at the drop location.

**Open Topic from DITA Map in Author Mode**

When a DITA map is opened in Author mode, you can click the icon to the left of a topic to open that particular topic in the editor.

**Tip:** For information about customizing Author mode actions for a particular framework (on page 3282) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 2323) section.

**Related Information:**

- Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 2323)

**Working with DITA Topics**

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

**Information Types**

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that
contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `p`, `ol`, and `simpletable`. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A `task` element specifies that a block of content contains the description of a task.
- A `codeblock` element specifies that a block of text consists of programming code.
- A `uicontrol` element specifies that a word is the name of a control in a computer GUI.
- The `platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.
Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (\texttt{wintitle}), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an \texttt{audience} element to capture audience metadata.

Creating Topic Structures

Oxygen XML Editor provides a number of tools to help you create topic structures:

- \textit{Content Completion Assistant (on page 3280)} - Shows you which elements can be created at the current position.
- \textit{Model view (on page 353)} - Shows you the complete structure supported by the current element.
- \textit{Outline view (on page 347)} - Shows you the current structure of your document.
- \texttt{DITA toolbar} - Helps you to easily insert many common structures.

Related Information:

- Getting Started with DITA (on page 13)
- DITA Topics Document Type (Framework) (on page 1573)

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- \texttt{Topic} - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- \texttt{Task} - For procedural information such as how to use a dialog box.
- \texttt{Concept} - For general, conceptual information such as a description of a product or feature.
- \texttt{Reference} - For reference information.
Oxygen XML Editor also supports numerous other specialized topic types that you will find templates for in the various folders in the New DITA file dialog box (on page 3051). They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and DITA map (on page 3281) types such as Glossentry, Troubleshooting, Bookmap (on page 3280), and Subject Scheme Map (on page 3288).

To create a new DITA topic and add a reference to it in your DITA map (on page 3281), follow these steps:

1. In the DITA Maps Manager (on page 2990), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - Append Child > New - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - Insert Before > New - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - Insert After > New - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 3051) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - Duplicate - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

   **Step Result:** The new topic is now referenced (as a topicref) in the DITA map at the location where you inserted it and the new topic is opened in the editor.
3. Save the DITA map.

**New DITA File Dialog Box**

The New DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

Figure 858. New DITA File Dialog Box
Note: The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates (on page 683).

The New DITA file dialog box includes the following features and options:

Choose a file template

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

Tip: You can use the text filter field at the top of the dialog box to search for a specific template.

Title

Depending on the selected file template, the value of the Title field is set in:

- The title element of a DITA topic file. The title element needs to be the first child of the root element.
- The glossterm element of a Glossentry file.
New Topics Preferences

Pressing this button opens the DITA New Topics preference page (on page 227)

Save as

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the · Browse drop-down menu.

Create

When you click this button, a reference (topicref) to the new topic is added to the current DITA map and the new topic is opened in the editor.

Related Information:

- Getting Started with DITA (on page 13)
- Adding Topics to a DITA Map (on page 3010)
- Working with Markdown Documents in DITA (on page 1520)
- Fast Create Multiple DITA Topics (on page 3053)

Fast Create Multiple DITA Topics

The DITA Maps Manager (on page 2990) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 3281). A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

Note: The Fast Create Topics feature works for the following types of local and remote resource protocols: file, http, https, ftp, ftps.

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

Figure 859. Fast Create Topics Dialog Box
The **Fast Create Topics** dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (Tab or Space). Topic references will be created in the DITA map according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the [File name generation rules](on page 227) link to configure the rules for how those file names will be generated.

**Tip:** If you have added a file name prefix or suffix to the properties file for DITA document templates, the generated file name will include that prefix or suffix.

**File name prefix**

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file for DITA document templates, the prefix you enter here will override the one from the properties file.
File name suffix

Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (on page 686) for DITA document templates, the suffix you enter here will override the one from the properties file.

Topic type

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the Change button to select a different type from a list of possible DITA templates.

Tip: You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (on page 3059).

Add created topic hierarchy relative to the selection as

By default, the hierarchy of topics will be added to the DITA map as the First Child of the node where the action was invoked. You can change this to Last Child, Preceding Sibling, or Following Sibling if the selected node allows topics to be inserted as such.

Create

When you click Create, the specified hierarchy is added as topic references in the DITA map. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

Tip: You can easily change the order of the topics in the DITA map (on page 3010) at a later time,

Related Information:

- Adding Topics to a DITA Map (on page 3010)
- Converting DITA Topics to Another Type (on page 3059)

Editing DITA Topics

Oxygen XML Editor provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents also apply to DITA topics. Oxygen XML Editor also provides extensive additional support specifically for DITA.
Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the DITA Maps Manager (on page 2990) (or right-click the topic and select Open).
- Double-click the file in the Project view (on page 333) (or right-click the file and select Open).
- If you have a DITA map (on page 3281) opened in the XML editor, you can click the icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an XML format (on page 8), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor provides a graphical view of your topics in Author mode (on page 402). Your topics will likely open in Author mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in Author mode, just click Author at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- **Author** mode is not a WYSIWYG view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat Author mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. **Author** mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to Text mode (on page 303). You, or someone in your organization, can change how the **Author** view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. **Author** mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the Author view (though there are some exceptions) and cannot be edited directly in the Author view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press Alt+Enter to bring up the attribute editor. Alternatively, you can use the Attributes view (on page 426) to edit attributes.

Tip: You can select Hints from the Styles drop-down menu (available on the Author Styles toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles (on page 2348) section.

Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differ from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor has a number of Content Completion Assistant (on page 3280) features.

• The Enter key: In Author mode, the Enter key does not create line breaks, it brings up the Content Completion Assistant to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element p in DITA) and tools insert the line breaks in the output and on-screen.

Figure 860. Content Completion Assistant

The Content Completion Assistant not only suggests new elements you can add. If you press Enter at the end of a block element (on page 3280) (such as a paragraph) it suggests creating a new element of the same type. If you press Enter in the middle of a block element, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting Enter twice (just as you might in a text editor).
As you highlight an element name, a basic description of the element is displayed. Select the desired element and press Enter to create it.

To wrap an element around an existing element or piece of text, simply select it and press Enter and use the Content Completion Assistant to choose the wrapper element.

- The Model view: You can see the entire model of the current element by opening the Model view (Window > Show View > Model, if the view is not already open). The Model view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

Tip: You can also select Inline actions from the Styles drop-down menu (available on the Author Styles toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles (on page 2348) section.

**DITA Editing Actions**

A variety of actions are available in the DITA framework (on page 3282) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the DITA menu, the DITA (Author Custom Actions) toolbar, or the Content Completion Assistant.

The DITA toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the DITA toolbar is not displayed, right-click anywhere on the toolbar area, select Configure Toolbars, and select it from the displayed dialog box.

Note: The DITA toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press Enter to open the Content Completion Assistant.

Whenever the current document in the editor is a DITA document, the DITA menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA framework-specific actions (on page 1575), the contextual menu also includes various general Author mode contextual menu actions (on page 1065).
Converting DITA Topics to Another Type

Oxygen XML Editor includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

**DITA Conversion Refactoring Operations for DITA**

The following conversion operations are available:

- **Convert Nested Topics to New Topics** *(Available from the contextual menu of editable maps/nodes in the DITA Maps Manager on page 2990)*
  
  Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert Sections to New Topics** *(Available from the contextual menu of editable maps/nodes in the DITA Maps Manager on page 2990)*
  
  Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

- **Convert to Concept**
  
  Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

- **Convert to General Task**
  
  Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

- **Convert to Reference**
Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Methods for Accessing the DITA Conversion Refactoring Operations**

To access the conversion operations, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2990)), go to the Refactoring submenu, and choose whichever operation is appropriate for your needs.

**Multiple Documents At Once Method**

Select XML Refactoring from the Tools menu (or from the Refactoring submenu when you right-click one or more documents in the Project view (on page 333) or the DITA Maps Manager view (on page 2990)). Then select whichever operation is appropriate for your needs.

**XML Refactoring Wizard Dialog Box**

When you select any of the operations, Oxygen XML Editor proceeds to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 3060), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, Selected reference, and others depending on the context.
- **Filters section**
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
- **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
- **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method** *(on page 3060)*, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

⚠️ **Warning**: It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, behind the scenes Oxygen XML Editor maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

**Handling Special Characters When Generating New File Names**

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Ä is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character (_). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

`{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/utils/character-map.xsl`.

**Converting To and From DITA Specialization Document Types**

If you use your own **DITA specialization document type** *(on page 3260)*, you can modify the predefined conversion operations to work with your specialization by customizing the values of particular variables.

To use the conversion operations with your DITA specialization, follow these steps:
1. Locate the conversion stylesheets in the following directory: \{OXYGEN_INSTALL_DIR\}/frameworks/dita/refactoring/dita-files-conversion-system-stylesheets.
2. Each conversion operation has a stylesheet with the word entrypoint at the end of its name. Edit the appropriate *-entrypoint.xsl file (for example, to modify the Convert to Task operation, edit the convert-resource-to-task-entrypoint.xsl file).
3. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
   a. Modify the values of the declared root-element, public-literal-target, and system-literal-target variables to match your specialization's DTD information.
   b. Modify the value of the declared schema-location variable to match the location of your specialization's XML schema.
   c. Modify the value of the declared xml-model-location variable to match your Relax NG specialization.
4. Save your changes to the stylesheet.
5. If you want to change the name of the operation that will be displayed in Oxygen XML Editor, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory: \{OXYGEN_INSTALL_DIR\}/frameworks/dita/refactoring/ (for example, for the Convert to Task operation, it is convertResource2Task.xml).
   b. Edit that XML file and change the name attribute to match whatever you want to be displayed for that operation (for example, name="Convert to My DocType").
   c. Save your changes to the XML file.
6. Restart Oxygen XML Editor

**Result:** You should now see your changes when accessing the conversion operations (on page 3060).

**Tip:** You can also create your own customized refactoring operations. For more information, see Custom Refactoring Operations (on page 1153).

**Related Information:**
- Editing DITA Topics (on page 3055)
- Refactoring XML Documents (on page 1139)

**Working with Images in DITA Topics**

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of
a graphic depending on the situation. For instance, you might want to use a specific image for each
different product version or output media.

**Adding an Image Inline with the Insert Image Dialog Box**

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.
2. Select the ![Insert Image](image-insert.png) action. The Insert Image dialog box appears.

![Insert Image Dialog Box](image-insert-box.png)

3. Configure the options in this dialog box and click **Insert**.

The Insert Image dialog box includes the following options and features for inserting images into
a DITA document:

### Location

Use this option to specify a URL for the image as the value of an @href attribute
inside the `<image>` element. You can type the URL of the image you want to insert
or use browsing actions in the ![Browse](image-browse.png) drop-down menu (there is also a history
drop-down).

### Key

Use this option to insert the selected key as the value of a @keyref attribute inside
the `<image>` element. All keys that are presented in the dialog box are gathered
from the *root map (on page 3287)* of the current *DITA map*. You can use the
Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.

Note: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Root map option in the toolbar of the DITA Maps Manager.

Figure title

Use this text box to insert a <title> and <image> element inside a <fig>.

Alternate text

Use this text box to insert an <alt> element inside the <image>.

Size

Use this section to configure the Width and Height of the image, or Scale the image. Specifying a value in these options inserts a @width, @height, and @scale attribute, respectively.

Layout

Use the options in this section to insert @placement and @align attributes into the <image> element.

Preview

The Preview box shows a thumbnail of the selected image so that you can see a preview of the image before clicking Insert.

Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions

You can drag images from your system explorer or the Project view (on page 333) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the @href attribute in a DITA <image> element:

```xml
<image href="../images/image_file.png"/>
```

Tip: To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

Adding an Image in a Figure Element

To add an image in a figure:

1. Add a <fig> element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.

3. Add an `<image>` element (on page 3063) to the `<fig>` element.

**Note:** The `<fig>` element has a number of other child elements that may be appropriate to your content. See the DITA documentation for complete information about `<fig>`.

**Note:** The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

### Floating Images in DITA Topics for PDF or XHTML Output

Oxygen XML Editor provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `@outputclass` attribute on the `<image>` element. The possible values are:

- `float-left`
- `float-right`

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```
<p><image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/>
  <b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

Figure 862. Image Floated to the Right

### Searching for References to Images

You can search for all references to an image by selecting **Search References** from the contextual menu. The result depends on how the image is defined, as follows:
• If the action is invoked on an `<image>` element that contains an `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.

• If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.

---

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button ( görüntü ) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project view (on page 333) and drop them into your documents (or copy and paste them).

Table 80. Supported Media Types

</table>
### Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the **Insert Media Resource** action from the toolbar. The **Insert Media** dialog box appears.

   **Note:** You can also drag media files from your system explorer or the [Project view](on page 333) and drop them into your documents (or copy and paste them). Note that this method will bypass the **Insert Media** dialog box, so if you need to adjust the size you will need to adjust the @width or @height attributes manually.

   ![Insert Media Dialog Box](image)

3. Configure the options in this dialog box and click **Insert**.

   The **Insert Media** dialog box includes the following options:

   **Location**

   Use this option to specify a URL for the media resource as the value of a @data attribute inside the `<object>` element. You can type the URL of the resource you want to insert or use browsing actions in the  · **Browse** drop-down menu (there is also a history drop-down).
Key

Use this option to insert the selected key as the value of a `@datakeyref` attribute inside the `<object>` element. All keys that are presented in the dialog box are gathered from the root map (on page 3287) of the current DITA map. You can use the `Choose Key Reference` button to open the Choose Key dialog box that presents the list of keys available in the selected root map.

**Note:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Root map option in the toolbar of the DITA Maps Manager.

Type

Oxygen XML Editor detects and automatically selects the media type based upon the specified resource in the URL field (on page 3067). You can manually change the type, but keep in mind that in the publishing stage the object element is converted to an HTML5 element (on page 3068) based upon the type selected here. You can choose between: audio, video, or iframe.

Size

Use this section to configure the Width and Height of the frame for the media resource. Specifying a value in these options inserts a `width` and `height` attribute, respectively. For audio clips, only the Width can be adjusted.

**Result in Author Mode:** A reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

⚠️ **Attention:**

- On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the `libavformat57` library.

**Result in Output:** In the publishing stage, the object element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The object element is converted to an HTML5 `video` element.
- **Audio Clips** - The object element is converted to an HTML5 `audio` element.
- **Embedded HTML Frames** - The object element is converted to an HTML5 `iframe` element.

**Tip:** There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video
and select **Copy embed code**), you can then paste the contents of the clipboard in the **URL field (on page 3067)** and the **Type (on page 3068)** will automatically be set on **iframe**, while the **Width and Height (on page 3068)** will be populated according to the detected size, and an **allowfullscreen** parameter will automatically be added (set the value of this parameter to **true** to allow videos to play in full screen mode once the document is converted to XHTML output).

**Inserting Media in HTML Outputs That Do Not Support Embedded Media**

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. **Edit the DITA transformation scenario (on page 3196)** for the output type that does not support embedded objects (for example, **DITA Map CHM**).
2. Go to the **Parameters tab (on page 3205)** and click the **New** button to add a new parameter.
3. For the **Name**, enter: **com.oxygenxml.xhtml.linkToMediaResources**.
4. For the **Value**, enter: **true**.
5. Click **OK** and continue on to run the transformation.

**Result:** The media object will appear in the output as a plain link instead of an embedded object.

For more information, see the following video demonstration:

- How to Add Video and Audio Objects in DITA WebHelp Output (on page 1964)

**Image Maps in DITA**

Oxygen XML Editor includes support for **image maps** in DITA documents through the use of the **imagemap** element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 864. Image Map Editor in DITA
Image Map Editor Interface in DITA

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  
  Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **New Free Form Shape**
Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate
Use this button to create a duplicate of the currently selected shape.

Delete
Use this button to delete the currently selected shape.

Undo
Use this button to undo the last action.

Redo
Use this button to redo the last action that was undone.

Show/Hide Numbers
Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front
Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward
Use this button to bring the currently selected shape forward one layer.

Send Shape Backward
Use this button to send the currently selected shape back one layer.

Send Shape to Back
Use this button to send the currently selected shape back to the bottom layer.

Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.
Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

+ Add Point

Add a point to Polygon or Free Form shapes.

× Remove Point

Removes the current point from Polygon or Free Form shapes.

_duplicate

Create a duplicate of the currently selected shape.
- **Delete**
  Delete the currently selected shape.

- **New Rectangle**
  Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

**Properties**

- **Type**
  Displays information about the selected coordinate.

- **Target**
  Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in
DITA (on page 3164) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an xref element will be inserted with either an href attribute or a keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor (on page 3164).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the Image Map Details section (on page 1036) in Author mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.

   **Result:** This action will apply an image map to the current image and open the Image Map Editor dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ New Rectangle, ☺ New Circle, or ☠ New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar (on page 1031) to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions (on page 1033). For example, the easiest way to remove a point is to right-click the point and select ✗ Remove Point.

4. With the shape selected, use one of the linking options (on page 1034) in the Link drop-down menu to select a target resource (or enter its path in the Target (on page 1034) text field).

5. (Optional) Enter a Description (on page 1035) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click OK to process your changes.

   **Result:** The image map is applied on the image and the appropriate elements and attributes are automatically added. In Author mode, the image map is now rendered over the image. If the image
includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Figure 865. Image Map Details

![Image Map Details](image)

**How to Edit an Existing Image Map in DITA**

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the ✉️ Show/Hide Numbers button on the **Image Map Editor** toolbar *(on page 1031)*). To change the layer
order for a shape, use the layer buttons on the **Image Map Editor toolbar** (*on page 1031*) *(‡‡‡‡) .

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Related Information:**

- DITA 'imagemap' Element Specifications
- Working with Images in DITA Topics (*on page 3062*)

### Adding Tables in DITA Topics

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- **DITA Simple table model** (*on page 999*) - This is the most commonly used model for basic tables.
- **CALS table model (OASIS Exchange Table Model)** (*on page 1001*) - This is used for more advanced functionality.
- **DITA Choice table model** (*on page 1004*) - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- **DITA Properties table model** (*on page 1005*) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.
Inserting a Simple Table Model

To insert a Simple DITA table, select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select Simple for the table Model.

The dialog box allows you to configure the following options when you select the Simple table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the relcolwidth attribute are
automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The Insert Table dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the **Simple** model.

Figure 867. Insert Table Dialog Box - CALS Model
The dialog box allows you to configure the following options when you select the CALS table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, colwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog
box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the `colspecs` (column specifications) section above the table or in Text mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

**Frame**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Row separator**

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Column separator**

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Alignment**

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in Author mode, so you will only see it in the output.
• **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.

• **-dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (on page 402), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 868. CALS Table in DITA

---

**Inserting a Choice Table Model**

To insert a Choice table within a step element in a DITA Task document, select the **Insert Table** action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select **choicetable** from the Content Completion Assistant (on page 3280). The Insert Table dialog box appears. Select **Simple** for the table Model.

Figure 869. Insert Table Dialog Box - Choice Model
The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths (**colwidth** attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a **relcolwidth** attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, **relcolwidth="1* 2* 3*"** causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the **relcolwidth** attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the **relcolwidth** attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the **frame** attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.
• `-dita-use-conref-target` - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a *step* element).

**Inserting a Properties Table Model**

To insert a *Properties* table within a *refbody* element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the **Content Completion Assistant** *(on page 3280)*. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

Figure 870. Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.
Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- none - No border will be added.
- all - A border will be added to all frames.
- top - A border will be added to the top frame.
- topbot - A border will be added to the top and bottom frames.
- bottom - A border will be added to the bottom frame.
- sides - A border will be added to the side frames.
- -dita-use-conref-target - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click Insert, a Properties table is inserted into your DITA Reference document at the current cursor position (within a refbody element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode.

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor includes a Smart Paste feature that preserves certain style and structure information when pasting content.
Tip: When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:

- Editing Tables in Author Mode (on page 985)

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- **CALS table model** (on page 1008)
- **Simple table model** (on page 1008)
- **Choice table model** (on page 1008)
- **Properties table model** (on page 1009)

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (**colwidth** attribute) or the text alignment (**align** attribute). Although they appear as part of the **Author mode** (on page 402), the **colspecs** link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 871. CALS Table in DITA
Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

<td>d4</td>
<td>d5</td>
</tr>
</tbody>
</table>

| Vertical Span   |   |
| Spans > Both 4 directions |

Choice Table Model Layout

A Choice table model is used within a step element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The choicetable element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (on page 3280) (within a step element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

Figure 873. DITA Choice Table

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Opt A</td>
<td></td>
</tr>
<tr>
<td>Opt B</td>
<td></td>
</tr>
<tr>
<td>Opt C</td>
<td></td>
</tr>
</tbody>
</table>
Properties Table Model Layout

A Properties table model is used within a refbody element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference documents either by selecting properties(wizard) from the Content Completion Assistant (on page 3280) (within a refbody element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 874. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Table Validation in DITA

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (on page 3281) with the Validate and Check for Completeness action, if the Report table layout problems option is selected in the DITA Map Completeness Check dialog box (on page 3040), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table cols attribute.
- A row has more cells than the number of columns detected from the table cols attribute.
- A cell has a vertical span greater than the available rows count.
- The number of(colspecs) is different than the number of columns detected from the table cols attribute.
- The number of columns detected from the table cols attribute is different than the number of columns detected in the table structure.
- The value of the cols, rowsep, or colsep attributes are not numeric.
- The namest, nameend, or colname attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.
Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the `Ctrl + T (Command + T on OS X)` action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:

- `<not set>` - Use this value if you want to remove a property.
- `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a CALS table model, the Table properties dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

Figure 875. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)
The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (align attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:** The justify value cannot be rendered in Author mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the char attribute for alignment.
- **dita-use-conref-target** - Normally, when using a conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (valign attribute). The allowed values are as follows:
- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame (Available only in the Table tab)**

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Edit Table Properties for a Simple, Choice, or Properties Table Model**

For a *Simple, Choice, Properties* table model, the *Table properties* dialog box only allows you to edit a few options.

**Table tab**

**Frame**
Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

### Row tab (not available for Properties tables)

#### Row type

Allows you to change the row to a body or header type of row.

**Related Information:**

- Adding Tables in DITA Topics *(on page 999)*
- Editing Tables in Author Mode *(on page 985)*

### Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document using one of the following methods:

- Embed MathML directly into a DITA topic. You can use **Insert > Σ Insert Equation** from the contextual menu to insert a MathML equation. Clicking on the equation will open a MathML Editor where you can edit the code.
- Reference an external MathML file as an image, using the **Insert Image** action that is available on the DITA toolbar (or from the DITA > Insert menu).

**Publishing Notes:**
• MathML equations contained in DITA topics can be published out-of-the-box in PDF using the DITA PDF transformation scenario.
• The DITA Map PDF - based on HTML5 & CSS transformation scenario (on page 2013) support MathML equations (on page 2145).
• For details about HTML output, see MathML Equations in HTML Output (on page 1059).
• For other publishing formats, you might need to employ additional customizations for handling MathML content.

Adding LaTeX Equations in DITA Topics

LaTeX is a high-quality typesetting system that includes features designed for the production of technical and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format. By default, web browsers and PDF readers do not have support to show mathematical equations written in LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.

Adding support for writing LaTeX equations in a DITA topic implies three stages:

1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD specialization and add a new element (for example, called `<latex>` and it extends the DITA `<foreign>` element). Alternatively, you can directly use the DITA `<foreign>` element with a specific `@outputclass` attribute value:

```xml
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="testEquation">
  <title>Test equation</title>
  <body>
    <p><foreign outputclass="embed-latex">L' = \( L\sqrt{1-\frac{v^2}{c^2}} \)</foreign></p>
  </body>
</topic>
```

2. If you want Oxygen XML Editor to properly present the LaTeX equation when editing in the Author visual mode, you need a plugin that converts the equation content to an image. There is a sample plugin that does that here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support. You can download and copy the plugin folder `latex-images-support` to the Oxygen XML Editor plugins folder, then restart Oxygen XML Editor.

3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: https://github.com/oxygenxml/dita-latex.
DITA Topic Author Mode Actions

A variety of actions are available for the DITA framework (on page 3282) that can be found on the toolbar, the contextual menu, or the DITA menu.

DITA Toolbar Actions

The following default actions are readily available on the DITA (Author Custom Actions) toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

- **Bold**
  
  Surrounds the selected text with a `b` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  
  Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  
  Surrounds the selected text with a `u` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**

  The following link actions are available from this menu:

  - **Cross Reference**
    
   Opens the Cross Reference (xref) dialog box (on page 3164) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 3281) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 3163).

  - **File Reference**
    
    Opens the File Reference dialog box (on page 3164) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 3163).

  - **Web Link**
Opens the **Web Link** dialog box *(on page 3164)* that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. For more information, see Linking in DITA Topics *(on page 3163)*.

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box *(on page 3165)* that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 3163)*.

**Tip:** You can use the Find Similar Topics action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box *(on page 3165)* that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 3163)*.

**Related Link to Web Page**

Opens the **Web Link** dialog box *(on page 3165)* that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(on page 3163)*.

**Insert Image**

Opens the **Insert Image** dialog box *(on page 3062)* that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.
Insert Media Resource

Opens the Insert Media dialog box (on page 3066) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an object element and it is rendered in Author mode so that it can be played directly from there.

Insert Section Drop-Down Menu

The following insert actions are available from this menu:

- **Insert Section**
  Inserts a new section element in the document, depending on the current context.

- **Insert Concept**
  Inserts a new concept element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

- **Insert Task**
  Inserts a new task element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

- **Insert Topic**
  Inserts a new topic element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

- **Insert Reference**
  Inserts a new reference element, depending on the current context. A reference is a top-level container for a reference topic.

- **Insert Paragraph**
  Inserts a new paragraph at current cursor position.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 3135) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (on page 3136), content key
references (conkeyref) (on page 3137), or key references to metadata (keyref) (on page 3141).

- **Insert step or list item**
  Inserts a new list or step item in the current list type.

- **Insert Unordered List**
  Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

- **Insert Ordered List**
  Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

- **Sort**
  Sorts cells or list items in a table.

- **Insert Table**
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 3280)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Row Below**
  Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

- **Delete Row(s)**
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Column After**
  Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

- **Delete Column(s)**
Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells
Joins the content of the selected cells (both horizontally and vertically).

Split Cell
Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Contextual Menu Actions
In addition to many of the DITA toolbar actions (on page 1575) and the general Author mode contextual menu actions (on page 1065), there are numerous DITA-specific actions that are available in the contextual menu when editing DITA documents in Author mode (most of them are also available in the DITA menu at the top of the interface):

Add File to Review Task
This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on (on page 2679). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Edit Attributes
Displays an in-place attributes editor (on page 429) that allows you to manage the attributes of an element.

Edit Profiling Attributes
Allows you to change the profiling attributes (on page 969) defined on all selected elements.

Cut (Ctrl + X (Command + X on OS X))
Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))
Places a copy of the current selected content in the clipboard.

⚠️ **Paste (Ctrl + V (Command + V on OS X))**

*Inserts the current clipboard content into the document at the cursor position.*

#### Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

**Paste as content reference**

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

**Paste as content key reference**

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (on page 3281)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 2995) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an `xref` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map combo box** *(on page 2995)* points to the correct map that stores the keys.

3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**

  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a **block element** *(on page 3280)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

- **Insert Image**

  Inserts an image reference *(on page 1021)* at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**

  Opens a **Choose Media** dialog box *(on page 1055)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author mode** so that it can be played directly from there.

- **Insert Equation**

  Opens the **XML Fragment Editor** that allows you to insert and edit **MathML notations** *(on page 1057)*.

- **Insert Paragraph**

  Inserts a new paragraph at current cursor position.
**Insert Section**

Inserts a new `section` element in the document, depending on the current context.

**Insert Topic**

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range $\texttt{x10000}$ to $\texttt{x10FFFF}$) are also accepted. Character entities can be entered in one of the following forms:

- `$<$decimal value$>$` - e.g. $\texttt{#65}$
- `&$<$decimal value$>$;` - e.g. $\texttt{&\#65}$
- `$\texttt{x<hexadecimal value>}$` - e.g. $\texttt{x41}$
- `&#x<hexadecimal value>;` - e.g. $\texttt{&\#x41}$

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an `image map` to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (`Above` or `Below` the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (`Above` or `Below` the current column).
Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the Cross Reference (xref) dialog box (on page 3164) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 3281) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 3163).

File Reference

Opens the File Reference dialog box (on page 3164) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 3163).

Web Link
Opens the **Web Link** dialog box (on page 3164) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. For more information, see Linking in DITA Topics (on page 3163).

**Related Link to Topic**

Opens the **Cross Reference (xref)** dialog box (on page 3165) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 3163).

**Tip:** You can use the **Find Similar Topics** action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box (on page 3165) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 3163).

**Related Link to Web Page**

Opens the **Web Link** dialog box (on page 3165) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your **DITA map** structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 3163).

**Sort**

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.
Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the ID Options dialog box that are found in the current selection.

**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

- **Reuse Content**
  
  This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box (on page 3135) that allows you to insert several types of references to reusable content at the cursor position.
  
  The types of references that you can insert using this dialog box include content references (`conref`) (on page 3136), content key references (`conkeyref`) (on page 3137), or key references to metadata (`keyref`) (on page 3141).

- **Push Current Element**
  
  Opens the **Push current element** dialog box (on page 3144) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**
  
  This action is available for elements with a `conref` or `conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref` / `conkeyref` and `conrefend` attributes). For more information, see **Reuse Content Dialog Box** (on page 3135).

- **Replace Reference with Content**
  
  Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content from its source. This action is useful if you
want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

**Replace All References with Content**

Replaces all referenced fragments (*keyref*, `conref`, or `conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For `keyrefs` inside `xref` or `link` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the `keyref` is replaced with its source content.

If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component *(on page 3147).*

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component *(on page 3148).*
Search References (Ctrl + Shift + G)

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 3281) (opened in the DITA Maps Manager view (on page 2990)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Figure 876. Search References to Ancestors Dialog Box

Tip: If you are invoking the action on an image, see Searching for References to Images (on page 3065) for details about what will be reported.

Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the DITA map (on page 3281) that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 3280).

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu
This submenu allows you to select the following:

**Element**
Selects the entire element at the current cursor position.

**Content**
Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**
Selects the entire parent element at the current cursor position.

**Text submenu**
This submenu contains the following actions:

**To Lower Case**
Converts the selected content to lower case characters.

**To Upper Case**
Converts the selected content to upper case characters.

**Capitalize Sentences**
Converts to upper case the first character of every selected sentence.

**Capitalize Words**
Converts to upper case the first character of every selected word.

**Count Words**
Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:** The content marked as deleted with *change tracking (on page 3288)* is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))**
Converts a sequence of hexadecimal characters to the corresponding Unicode character (*on page 770*). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters.
and may or may not be preceded by the \texttt{0x} or \texttt{0X} prefix. Examples of valid sequences and the characters they will be converted to:

- \texttt{0x0045} will be converted to \texttt{E}
- \texttt{0X0125} to \texttt{#}
- \texttt{265} to \texttt{#}
- \texttt{2190} to \texttt{#}

\begin{itemize}
\item \texttt{0x0045} \texttt{will be converted to} \texttt{E}
\item \texttt{0X0125} \texttt{to} \texttt{#}
\item \texttt{265} \texttt{to} \texttt{#}
\item \texttt{2190} \texttt{to} \texttt{#}
\end{itemize}

\begin{itemize}
\item \texttt{Refactoring submenu}
\end{itemize}

Contains a series of actions designed to alter the XML structure of the document:

\begin{itemize}
\item \texttt{\textbullet} \texttt{Toggle Comment}
\end{itemize}

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

\begin{itemize}
\item \texttt{Move Up (Alt + UpArrow)}
\end{itemize}

Moves the current node or selected nodes in front of the previous node.

\begin{itemize}
\item \texttt{Move Down (Alt + DownArrow)}
\end{itemize}

Moves the current node or selected nodes after the subsequent node.

\begin{itemize}
\item \texttt{\textbullet} \texttt{Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))}
\end{itemize}

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

\begin{itemize}
\item \texttt{\textbullet} \texttt{Join Elements}
\end{itemize}

Joins two adjacent \texttt{block elements (on page 3280)} that have the same name. The action is available only when the cursor position is between the two adjacent \texttt{block elements}. Also, joining two \texttt{block elements} can be done by pressing the \texttt{Delete} or \texttt{Backspace} keys and the cursor is positioned between the boundaries of these two elements.

\begin{itemize}
\item \texttt{\textbullet} \texttt{Surround with Tags (Ctrl + E (Command + E on OS X))}
\end{itemize}

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.
• If the **Position cursor between tags** option *(on page 167)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.

• If the **Position cursor between tags** option *(on page 167)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If
it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert `conref` attributes to `conkeyref` attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**
Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions
Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute
Allows you to change the value of an attribute or insert a new one.

Convert attribute to element
Allows you to change an attribute into an element.

Delete attribute
Allows you to remove one or more attributes.

Rename attribute
Allows you to rename an attribute.

Replace in attribute value
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments
Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
Allows you to delete elements.

Delete element content
Allows you to delete the content of elements.

Insert element
Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

**Track Changes**

Enables or disables the *Track Changes (on page 3288)* support for the current document.

**Accept Change(s) and Move to Next**

Accepts the *Tracked Change (on page 3288)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

**Accept All Changes**
Accepts all Tracked Changes (on page 3288) in the current document.

Reject Change(s) and Move to Next
Rejects the Tracked Change (on page 3288) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes
Rejects all Tracked Changes (on page 3288) in the current document.

Comment Change
Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 3288). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight
Enables the highlighting tool that allows you to mark text in your document.

Colors
Allows you to select the color for highlighting text.

Stop highlighting
Use this action to deactivate the highlighting tool.

Remove highlight(s)
Use this action to remove highlighting from the document.

Add Comment
Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment
Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment
Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.
Manage Reviews

Opens the Review view (on page 964).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view (on page 439) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 131) where you can configure various options in regards to the Author editing mode.

DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project view (on page 333) or DITA Maps Manager view (on page 2990) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project view (on page 333) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA image element with an `href` attribute).
Tip: For information about customizing Author mode actions for a particular framework (on page 3282) (document type), see the Configuring Actions, Menus, Toolbars, Content Completion for a Framework (on page 2323) section.

Working with Markdown Documents in DITA

Oxygen XML Editor includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the topic will look after conversion.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (on page 2990). The following features are available for Markdown documents in the DITA Maps Manager view:

- Insert Reference to Markdown Document - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.
• **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

• **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

• **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

Figure 877. Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.
Preview

Select this button to display a preview of the changes Oxygen XML Editor is about to make.

Convert

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a LightWeight DITA topic.

Tip: Oxygen XML Editor comes with a sample ditamap project for converting Markdown to DITA. Go to the Project view (on page 333), open the sample.xpr project, and navigate to the dita/markdown-dita folder.

Converting Multiple Markdown Documents to DITA

Oxygen XML Editor offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats, including Markdown to DITA. For more information and instructions for installing the add-on, see Batch Converter Add-on (on page 2677).

Working with Keys in DITA

DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.
You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

**Defining Keys in DITA Maps**

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 3287). This makes it easier to manage since they’re all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a *keyword*. To define this type of key, follow these instructions: [Key Definition with a Keyword Value](on page 3026).
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: [Key Definition with a Target](on page 3026).

**Using Keys for Values**

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see [Working with Variable Text in DITA](on page 3148).

**Assigning Keys to Topics**

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the `topicref` element:

```xml
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```
The easiest way to assign keys to a topic (and insert the `topicref` element in its DITA map (on page 3281)) is to use the Keys tab in the Edit Properties dialog box (on page 3029). In the DITA Maps Manager (on page 2990), invoke the contextual menu on the topic for which you want to assign a key and select Edit Properties. Go to the Keys tab and enter the name of the key in the Define keys field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link (on page 3163) to it using `<xref keyref="feature.quick-heat"/>`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic (on page 3010) by key: `<topicref keyref="feature.quick-heat"/>`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to insert a content reference (on page 3130). In this case, the content reference uses the key to locate the topic to pull content from. It uses a `conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure"/>`. In this example, `feature.quick-heat` is the key, and `preheat-procedure` is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

### Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file (on page 3026)) and then insert the image using the key (on page 3062).

Example of a key definition for a targeted image file:

```xml
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="image1" href="../img/image1.png" format="png"/>
</map>
```

- Creating a DITA Content Key Reference (on page 3130)
Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (on page 3287). The actual glossary terms are small glossary entry topics that are referenced in the glossary map. You can add links to the glossary terms (on page 3120) in the output and you can even define abbreviated forms (on page 3121) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Editor

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. Create a new submap (on page 3008) for your glossary and embed it in your main map.
2. Create a glossary entry topic ( `<glossentry>` ) for each glossary term. The `<glossentry>` element may contain numerous optional glossentry elements, but every glossentry topic must contain a `<glossterm>` and `<glossdef>` element. The `<glossterm>` is the name of the term while the `<glossdef>` is its definition.

Here is an simple example:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>
```

The easiest way to create a glossentry topic in Oxygen XML Editor:

a. Click the New file wizard button on the toolbar.
b. Type `glossentry` in the search field at the top of the dialog box.
c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.
3. Reference each glossary entry topic in your glossary submap using the `<glossref>` element. This element requires a `@keys` attribute.

```xml
<glossref keys="gloss_ddl" href="ddl.dita"/>
```

The easiest way to reference a glossentry in Oxygen XML Editor:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select **Append Child > Reference to the currently edited file** (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select **Insert After > Reference to the currently edited file**).

   **Step Result:** This opens the **Insert Reference** dialog box *(on page 3017).*

b. Go to the **Keys** tab and enter a name in the **Define keys** field.

c. Go to the **Attributes** tab and select **Glossary Reference** from the **Reference type** drop-down list at the top of the dialog box.

d. Click **Insert and Close**.

**Tip:** You could also group multiple glossentry topics into a single collection by using the `<glossgroup>` element.

### How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the `<term>` element (or `<abbreviated-form>` element as described in the next section *(on page 3121)*) with a `@keyref` attribute that references the corresponding key specified in the `<glossref>` element. Of course, the glossref points to the glossentry topic where the glossary term is defined.

```xml
<term keyref="gloss_ddl"/>
```

In the output, the text specified in the `<glossterm>` element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a `<term>` element and reference the glossary term in Oxygen XML Editor:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the **DITA Reusable Components view** *(on page 3154)*, go to the **Keys** tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select **Insert as Keyref > More > Term**.
Using Abbreviated Forms (Acronyms) with Glossary Terms

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```xml
<abbreviated-form keyref="gloss_ddl"/>
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: [http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc](http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc).

Reusing DITA Content

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Editor provides support for each of these methods.

**Reusing Topics in DITA Maps**

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (on page 3125).

**Reusing Content with References and Keys**

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (on page 3126) (conref, conkeyref, coderef). A **conref** (content reference) (on page 3128) creates a direct reference to a specific element of another topic. A **conkeyref** (content key reference) (on page 3130) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a conkeyref is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A **coderef** references an external file that contains literal code.

Oxygen XML Editor provides support for all of these mechanisms.

While the conref and conkeyref mechanisms can be used to reference any content element, it is considered best practice to only conref or conkeyref content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by conref. Oxygen XML Editor can help you create a reusable component from your current content.

**Reusing Content with Reusable Components**

DITA allows you to select content in a topic, create a reusable component (on page 3146) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

**Reusing Content with Variables**

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (on page 3148),
which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

**Reusing Content with DITA 1.3 Concepts**

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. *Key Scopes (or scoped keys) (on page 3151)* allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. *Branch Filtering (on page 3152)* allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

**DITA Reusable Components View**

If you use a large amount of keys or reusable components in your DITA project, the DITA Reusable Components view (on page 3154) can be quite helpful. It collects all of the keys and reusable components that are defined in the root map (on page 3287) and presents them in a dynamic table where you can easily locate and insert references to them.

**Reuse Actions in Oxygen XML Editor**

Oxygen XML Editor includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the DITA menu, and some are available on the toolbar.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 3135) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (conref) (on page 3136), content key references (conkeyref) (on page 3137), or key references to metadata (keyref) (on page 3141).

**Push Current Element**

Opens the Push current element dialog box (on page 3144) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

**Edit Content Reference**

This action is available for elements with a conref or conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference
Replace Reference with Content

Replaces the referenced fragment (conref or conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

Replace All References with Content

Replaces all referenced fragments (keyref, conref, or conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

For keyrefs inside xref or link elements, the keyref attribute is changed to an href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component (on page 3147).

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 3148).
Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map (on page 3013)) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the DITA map (on page 3281) is opened in the DITA Maps Manager (on page 2990).
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this DITA map, do one of the following:
      • Simply drag the topic and press Ctrl (or Alt on OS X) at the new location within the map (or use the Copy and Paste contextual menu actions).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2990)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   b. If the topic already exists in another DITA map, do one of the following:
      • Open the other map in the DITA Maps Manager (on page 2990), right-click the topic, select Copy, switch back to the original DITA map in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2990)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
      • Right-click the topic in the Project view (on page 333) (or the file system), select Copy, switch to the DITA Maps Manager (on page 2990) view, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the currently opened document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2990)), right-click a parent or
sibling topic, and select **Append Child** > **Reference to the currently edited file** or **Insert After** > **Reference to the currently edited file**.

3. If your topic uses a **key reference** (on page 3116), set up the appropriate **key definition in your map** (on page 3024).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can **add a relationship table to your map** (on page 3169).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this **validation**, click the ✉️ **Validate and Check for Completeness action** (on page 3036) on the toolbar in the **DITA Maps Manager**.

### Reuse Topics Using Author Mode Editor

1. **Open the DITA map** (on page 2989) in the **Author** mode editor.

2. **Add a reference to an existing topic** by dragging it from the **Project view** (on page 333) (or the file system) and dropping it in the desired location in the **DITA map** opened in **Author** mode. You can also accomplish the same thing by using the ✉️ **Copy** and ✉️ **Paste** contextual menu actions.

3. If your topic uses a **key reference** (on page 3116), set up the appropriate **key definition in your map** (on page 3024).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can **add a relationship table to your map** (on page 3169).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this **validation**, click the ✉️ **Validate and Check for Completeness action** (on page 3036) on the toolbar in the **DITA Maps Manager**.

### Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager** (on page 2990), an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the current topic is referenced in the **DITA map**. It also includes navigation arrows that allow you to jump to the next or previous reference in the **DITA Maps Manager**.

![References in map: 1 of 6](image)

### Working with Content References

The DITA `conref` feature (short for **content reference**) lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place.
There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.

- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.

- **Arbitrary content references** - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

Oxygen XML Editor creates a reference to the external content by adding a `conref` attribute to an element in the local document. The `conref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Editor displays it in **Author** mode as if it is there in the referencing file. If you do not want referenced content displayed, open the **Preferences** dialog box (**Options > Preferences**) (on page 79), go to **Editor > Edit modes > Author**, and deselect the **Display referenced content** option (on page 132).

**Note:** A reference also displays tracked changes (on page 3288) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select **Edit Reference**.

**Tip:** To search for references made through a direct content reference, use the **Search References** action from the contextual menu.

**Related Information:**

- [Working with Keys in DITA](on page 3116)
Creating a DITA Content Reference

DITA Content Reference

A DITA content reference, or conref, is one of the main content reuse features of DITA. It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a conref to be created, the source content must have an id attribute that the conref can reference. Therefore, creating a conref requires that you add an id to the content to be reused before inserting a conref into the topic that reuses the referenced content.

Assigning an ID to the Referenced Content

To add an id to a DITA element in a topic, place the cursor on the element and select `Edit Attributes` from the contextual menu (or simply press `Alt+Enter`) to open the in-place attribute editor. Enter id as the Name of the attribute and a value of your choice in the Value field. You can also use the Attributes view (on page 426) to enter a value in the id attribute.

Note: The element may already have an id, since in some cases, Oxygen XML Editor automatically generates an ID value when the id attribute is created.

Creating a Content Reference

To create a content reference (conref), follow these steps:

1. Make sure the element you want to reference has an ID assigned to it (on page 3128).
2. In Author mode (on page 402), place the cursor at the location where you want the reused content to be inserted.
3. Select the Reuse Content action on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 3135) is displayed.
4. In the Location field of the Reuse Content dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the **Target ID** of the element (or elements) from which you want to insert the content, and verify the content in the **Preview** pane. The \_id\_ value of the element that you select is automatically added to the **Reference to (conref)** field.

6. Make any other selections you need in the **Reuse Content** dialog box (on page 3135). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the \_id\_ value of the last element in your selection.

7. Click **Insert** or **Insert and close** to create the content reference.

### Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop option** (on page 138) is selected in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (\_conref\_) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the **Paste as Content Reference** action from the **Paste Special** submenu from the contextual menu.

### Other Ways to Reuse Content

- You can use the **Components** tab in the **DITA Reusable Components** view (on page 3158) to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Editor **Create Reusable Component** (on page 3147) and **Insert Reusable Component** (on page 3148) actions (available in the **DITA** menu and the **Reuse** submenu of the contextual menu). They handle the details of creating an \_ID\_ and \_conref\_ and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.
- You can also insert reusable content using content key references (on page 3130). This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as **code references** (on page 3143), the **conref push mechanism** (on page 3144), **variable text** (on page 3148), **key scopes** (on page 3151), and **branch filtering** (on page 3152).
Creating a DITA Content Key Reference

**DITA Content Key Reference**

A DITA content key reference, or `conkeyref`, is a mechanism for inserting a piece of content from one topic into another. It is a version of the DITA content reference mechanism (on page 3128) that uses keys (on page 3116) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a `conref`, a `conkeyref` requires that the element to be reused has an `id` attribute. It also requires the topic that contains the reusable content to be assigned a `key` (on page 3116) in a map. As with all uses of keys, you can substitute multiple maps or use profiling (on page 3225) to create multiple definitions of keys in a single map. This allows the same `conkeyref` to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

**Creating a Content Key Reference**

To create a content key reference (conkeyref), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an `id` assigned to it.
2. In Author mode (on page 402), place the cursor at the location where you want the reused content to be inserted.
3. Select Reuse Content (on page 402), place the cursor at the location where you want the reused content to be inserted. The Reuse Content dialog box (on page 3135) is displayed.
4. Select the Key radio button for the content source and use the Choose Key Reference button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the Key field). The elements that you can reference from the source are presented in the table in the middle of the Reuse Content dialog box.

5. Select the Target ID of the element (or elements) that you want to insert, and verify the content in the Preview pane. The id value of the element that you select is automatically added to the Reference to (conkeyref) field.

6. Make any other selections you need in the Reuse Content dialog box. If you select multiple elements, the Expand to (conrefend) field is automatically filled with the id value of the last element in your selection.

7. Click Insert or Insert and close to create the content reference.

Note: If you are using Text mode (on page 303), when you insert a conkeyref attribute, after you enter the first quote (conkeyref="), the Content Completion Assistant will list all the defined keys that you can select from. Also, after you select the key, the Content Completion Assistant will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 138) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (conkeyref) using copy/paste actions, follow these steps:

1. In the DITA Maps Manager view (on page 2990), make sure that the Root map combo box (on page 2995) points to the correct map that stores the keys.

2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 2990), select Edit Properties, and enter a value in the Keys field.

3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.

4. Place the cursor at a location where the copied element will be valid.

5. Select the Paste as Content Key Reference action from the Paste Special submenu from the contextual menu.
Other Ways to Reuse Content

- You can use the **Components** tab in the **DITA Reusable Components** view (on page 3158) to easily insert content key references.
- You can also insert reusable content using content references (**conref**) (on page 3128).
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as **code references** (on page 3143), the **conref push mechanism** (on page 3144), **variable text** (on page 3148), **key scopes** (on page 3151), and **branch filtering** (on page 3152).

Related Information:

- **Reuse Content Dialog Box** (on page 3135)
- **Working with Reusable Components** (on page 3146)
- **Editing DITA Content References** (on page 3132)
- **DITA Reusable Components View** (on page 3154)
- **Creating a DITA Content Reference** (on page 3128)

Editing DITA Content References

Oxygen XML Editor also includes some actions that allows you to quickly edit existing content references. When the element that contains a content reference (**conref** or **conkeyref**) is selected, the following actions are available in the **DITA** menu and the **Reuse** submenu of the contextual menu:

**Edit Content Reference**

This action is available for elements with a **conref** or **conkeyref** attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (**conref** / **conkeyref** and **conrefend** attributes). For more information, see **Reuse Content Dialog Box** (on page 3135).

**Replace Reference with Content**

Replaces the referenced fragment (**conref** or **conkeyref**) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in
its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

**Replace All References with Content**

Replaces all referenced fragments (keyref, conref, or conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for id attributes.

For keyrefs inside xref or link elements, the keyref attribute is changed to an href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (conref or conkeyref) inside the element at the cursor position.

**Converting Conrefs to Conkeyrefs**

Oxygen XML Editor includes a DITA refactoring operation called Convert conrefs to conkeyrefs that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the Convert conrefs to conkeyrefs operation, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2990)), go to the Refactoring submenu, and choose Convert conrefs to conkeyrefs.

**Multiple Documents At Once Method**
Select **XML Refactoring** from the **Tools** menu (or from the **Refactoring** submenu when you right-click a document in the **Project view (on page 333)** or the **DITA Maps Manager view (on page 2990)**). Then select **Convert conrefs to conkeyrefs** from the **DITA section** and click **Next**.

Either method will proceed to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method (on page 3133)**, the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, All opened files, Current DITA map hierarchy, or just the Current file.

- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  - **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method (on page 3133)**, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Warning:** It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, the operation will be processed and all content references will be converted to content key references (either all content references in the current document or all content references in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the **DITA Map (on page 3281)**, so you still need to manually define each key in your **DITA map (on page 3024)**.

Related Information:
Reuse Content Dialog Box

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `conref`, `conkeyref`, and `keyref` attributes can be used to insert references to reusable content. The `conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `conkeyref` attribute uses `keys (on page 3116)` to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `keyref` attribute also uses `keys (on page 3116)` and can be used to indirectly reference metadata that may have different values in various circumstances.

**Note:** For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `conref` and `conkeyref` attributes, go to [https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html).

**Note:** For the purposes of using a `keyref`, keys are defined at map level and referenced afterwards. For more information about the DITA `keyref` attribute, go to [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html).

Oxygen XML Editor displays the referenced content (on page 900) of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA-OT transformation needs an `XML Catalog (on page 3289)` to map the URIs to local paths, you need to [add the catalog in Oxygen XML Editor (on page 1123)](https://www.oxygenxml.com/dita/1.3/specs/...). If the URIs can be resolved, the referenced content is displayed in **Author** mode and in the transformation output.

In **Author** mode, a reference to reusable content ( `conref`, `conkeyref`, or `keyref` ) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Click the ![Reuse Content](https://www.oxygenxml.com/dita/1.3/specs/tools/authority/dialogs/...)
- In the contextual menu of the editing area, go to **Reuse > ![Reuse Content](https://www.oxygenxml.com/dita/1.3/specs/tools/authority/dialogs/...)**.
- Go to **DITA > ![Reuse Content](https://www.oxygenxml.com/dita/1.3/specs/tools/authority/dialogs/...)**.
Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor will insert a `conref`, `conkeyref`, or `keyref`.

If you select **Location** for the content source, a **content reference** (`conref`) will be inserted. If you select **Key** for the content source, keys will be used to insert a **content key reference** (`conkeyref`) or a **key reference** (`keyref`).

**Content Reference** (`conref`) Options Using the Reuse Content Dialog Box

Figure 878. Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)

Choose the content source Section

When **Location** is selected for the content source, a **content reference** (`conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:
Select an element from the content source Section

**Show elements of type**
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**
You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**
Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

**Preview Pane**
Displays the content that will be referenced. If you select multiple elements in the element table, the content from all the selected elements is displayed.

**Source Pane**
Displays the source code of the element to be referenced.

**Reference details Section**

**Reference to (conref)**
Oxygen XML Editor automatically fills this text field with the value of the `conref` attribute to be inserted. However, you can edit this value if need be.

**Reference to range end (conrefend)**
If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the `id` value of the last element in your selection. This value will be inserted as a `conrefend` attribute, defining the end of the `conref` range.

**Content Key Reference (conkeyref) Options Using the Reuse Content Dialog Box**

Figure 879. Insert Content Key Reference Options
Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 3287) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 3154) for similar purposes.

Figure 880. Choose Key Dialog Box
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 3007).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 3281) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the `Definition Location` column.

To insert a **content key reference** (`conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the `Href` column. Keys that do not have a value in the `Href` column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `conkeyref`, you need to select a key that does have a value (file path) in the `Href` column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a **content key reference** has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `conkeyref`:

- **Select an element from the content source Section**

  - **Show elements of type**
You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that conkeyref value is automatically selected.

Reference to

Oxygen XML Editor automatically fills this text field with the value of the conkeyref attribute to be inserted. However, you can edit this value if need be.

Fallback to (conref)

You can select this option to define a conref attribute to be used as a fallback to determine the content reference relationship if the specified conkeyref cannot be resolved.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the id value of the last element in your selection. This value will be inserted as a conrefend attribute, defining the end of the conkeyref range.
Key Reference to Metadata (keyref) Options Using the Reuse Content Dialog Box

Figure 881. Insert Key Reference Options

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 3287) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 3154) for similar purposes.

Figure 882. Choose Key Dialog Box
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 3007).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 3281) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a **key reference** to metadata (keyref), select the key you want to reference. Keys that do not have a value in the **Href** column are for referencing metadata with a keyref attribute. Therefore, to insert a keyref, you need to select a key that does not have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a keyref:

- **Select an element from the content source Section**
  - This section is not used when referencing metadata.

- **Reference details Section**
**Reference type**

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that **keyref** value is automatically selected.

**Reference to**

Oxygen XML Editor automatically fills this text field with the value of the **keyref** attribute to be inserted.

**Element name**

Oxygen XML Editor automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

---

**Finalizing Your Content Reference Configuration**

Once you click **Insert** or **Insert and close**, the configured content reference is inserted into your document.

**Tip:** You can easily insert multiple content references by keeping the **Reuse Content** dialog box opened, using the **Insert** button.

---

**Working with Code References**

**Code References**

The DITA **coderef** element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the **coderef** is processed, the referenced code file is imported and delimiting characters (such as `<` or `>` ) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.

---

**Example of using a Coderef**

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```
Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (conref push).

The conref push mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements before or after a named element, or replaces the named element. Assuming the source topic is included in the DITA map (on page 3281), the conref push will be processed during publishing stage for the DITA map.

Example of a Conref Push Scenario

An example of a scenario in which a conref push would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a conref push technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor includes an action that allows you to easily reference content with a conref push mechanism. The Push Current Element action is available in the DITA menu and in the Reuse subfolder of the contextual menu when editing in Author mode. Selecting this action opens the Push current element dialog box that allows you to select a target resource and element, and where to insert the current element content.

Figure 883. Push Current Element Dialog Box
This dialog box allows you to configure the following options for the `conref push` action:

**Choose the target resource**

Allows you to select a **Location** URL or a **Key** for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

**Select the target element**

The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

**Push action**

Allows you to choose one of the following options for where you want to insert the current element content:

- **replace the target element**
  
The target element will be replaced with the current element content.
  
  On the technical side, the value of the `conaction` attribute in the current element will be set to `pushreplace` and the `conref` or `conkeyref` attribute will be set to the specified reference.

- **push before**
  
The current element content will be inserted before the specified target element in the target resource.
On the technical side, the value of the `conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the `conref push` mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the **DITA map**.

**Related Information:**

For more technical details about the conref push mechanism, refer to "The Conref Push Technique" section of The DITA Style Guide Best Practices for Authors.

---

**Working with Reusable Components**

In DITA, the content of almost any element can be made reusable simply by adding an `id` attribute to the element. The DITA content reference mechanism can reuse any element with an `ID`. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.
Oxygen XML Editor allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the Create Reusable Component and Insert Reusable Component actions.

Related Information:

- DITA Reusable Components View (on page 3154)

Creating a Reusable Content Component

Oxygen XML Editor makes it easy to create reusable content components from existing topic content.

Note: To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Editor creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In **Author** mode, select the content you want to make into a reusable component.

2. Select the Create Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu. The Create Reusable Component dialog box is displayed.

3. Use the Reuse Content drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.

4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.

5. If you want to replace the extracted content with a reference to the new component you should leave the Replace selection with content reference option selected. This is recommended, since the point of reuse is to maintain only one copy of the content.

6. Select a file name and location to save the topic containing the reusable component and click **Save**. It is considered best practice to save or store reusable components in an area set aside for that purpose.

If the Replace selection with content reference option was selected, Oxygen XML Editor replaces the current content with a conref attribute. The content of the content reference will be displayed in your current topic with a gray background, but it will no longer be editable since it is
stored in a separate file. To edit the source of the reusable component, click the Edit Content icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu. You can also reference this new reusable component by using a content reference (on page 3128) or content key reference (on page 3130).

Inserting a Reusable Content Component

Oxygen XML Editor includes an Insert Reusable Content action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (on page 3147).

⚠️ CAUTION: This action is only designed to insert reusable components created using the Oxygen XML Editor Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The Insert Reusable Content action creates a DITA conref to insert the content, and creates a parent element for the conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.

2. Select the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Insert Reusable Component dialog box is displayed.

3. Locate the reusable content file in which you want to insert its content.

4. If you select Content reference in the Insert as drop-down list, the action will add a conref attribute to the DITA element at the current location. If you select Copy in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).

5. Click Insert to perform the action.
Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

```
The quick-heat feature allows [product-name] to come up to temperature quickly.
```

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the `product` profiling attribute, as in the following example:

```
<p>The quick-heat feature allows
  <ph product="basic">Basic Widget</ph>
  <ph product="pro">Pro Widget</ph>
  to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```
<p>The quick-heat feature allows <ph keyref="product"/> to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>

<keydef keys="product" product="pro">
  <topicmeta>
    <keywords>
      <keyword>Pro Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
```
When the content is published, the value defined in the `product` key will be inserted for each product.

**Inserting a Keyref**

To insert a defined key reference (on page 3024) into a document in Oxygen XML Editor Author mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Editor feature you prefer):

- **DITA Reusable Components View Method**

  Use the DITA Reusable Components view (on page 3154) to insert a variable reference to the defined key (on page 3024). For example, in the Keys tab, find a key defined as a variable and double-click it. Oxygen XML Editor will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

- **Code Template Method**

  Add the source code pattern of the defined key (on page 3024) to a code template (on page 172) so that it appears in the list of proposals in the Content Completion Assistant (on page 3280). For example, the code pattern could be something like `<ph keyref="product"/>` for defined `product` key.

- **Reuse Content Dialog Box Method**

  Use the Reuse Content action on the main toolbar to open the Reuse Content dialog box (on page 3135). Use the Key option to select a key that is defined as a variable (key reference to metadata) (on page 3141) and Oxygen XML Editor will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

- **Manual Method**

  Manually insert the `keyref` attribute using the attributes editor as follows:

  1. Press Enter and select a DITA element (for example, `<ph>`) that supports the `keyref` attribute.
  2. Select `Edit Attributes` from the contextual menu (or simply press Alt+Enter) to bring up the attributes editor (on page 429).
  3. In the Name field, select `keyref`.
  4. In the Value field, select or enter the name of the defined key (on page 3024).

**Related Information:**
Working with DITA 1.3 Key Scopes

DITA 1.3 includes the possibility of using a concept called Key Scopes (or scoped keys). It allows you to reuse a topic in multiple places within the same DITA map (on page 3281), but with slightly different content in each instance.

Key Scopes Use-Case

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 Key Scopes mechanism, you can define multiple values for the same key depending on the context.

How to Use Key Scopes in Oxygen XML Editor

To use DITA 1.3 key scopes in Oxygen XML Editor, follow these steps:

1. Define the keys (on page 3116) to be used in multiple places within your DITA map.
2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the DITA Maps Manager (on page 2990) and select Edit properties.
   b. In the Keys tab (on page 3029), enter a value (or multiple values) in the Key scopes field.
   c. Click OK to save your changes.
3. Save the DITA map.

Result: In the DITA Maps Manager (on page 2990), you can now see the key scopes in brackets and when you open each topic reference.
The content will also be expanded in Author mode according to the context of the key scope you defined for that particular topic. Also, when you transform the DITA map, the scoped keys will be reflected in the published content.

Resources

• You can find a more detailed example and download samples for reuse possibilities based on key scopes in the DITA 1.3 Key Scopes - Next Generation of Reuse blog post.
• You can also watch our DITA 1.3 video tutorial to see how key scopes can be used in Oxygen XML Editor.

Related Information:

• Working with DITA 1.3 Branch Filtering (on page 3152)
• Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse
• Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called Branch Filtering that enables you to set filtering conditions for specific branches of a DITA map (on page 3281). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 Branch Filtering mechanism, you can reuse content multiple times within the same map, each time using different filters.
How to Use Branch Filtering in Oxygen XML Editor

To use DITA 1.3 branch filtering in Oxygen XML Editor, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (on page 225).
2. Assuming you have already defined your profiling attributes (on page 970), create a DITAVAL filter file (on page 3249).
3. Insert a reference to the DITAVAL filter file in the DITA map:
   a. Right-click the DITA map reference in the DITA Maps Manager (on page 2990) and select Append Child > DITAVAL Reference.
   b. Select the DITAVAL file.
   c. Click Insert and Close.
4. Save the DITA map.

Result: You can now see the ditaval files referenced in the DITA Maps Manager (on page 2990) and when you transform the DITA map, filtered content will be reflected in the published output.

Figure 885. Branch Filtering in DITA Maps Manager

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the DITA 1.3 Branch Filtering - Next Generation of Reuse blog post.
- You can also watch our DITA 1.3 video tutorial to see how branch filtering can be used in Oxygen XML Editor.

- Working with DITA 1.3 Key Scopes (on page 3151)
- Oxygen XML Blog: DITA 1.3 Branch Filtering - Next Generation of Reuse
DITA Reusable Components View

The **DITA Reusable Components** view is helpful if you use a large amount of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the root map ([page 3287](#)) and presents them in a side view where you can easily locate and insert references to them. It re-collects the keys anytime the root map is changed ([page 3007](#)) or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from **Window > Show View**. By default, it will appear in the bottom-right section of the editor.

**Tip:** You can also assign a keyboard shortcut to open the view using the **Menu Shortcut Keys** preference page ([page 248](#)).

It includes two tabs:

- **Keys** ([page 3154](#)) - Displays all the keys that are defined in the root map ([page 3287](#)) and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.

- **Components** ([page 3158](#)) - Displays all the reusable components found in the root map ([page 3287](#)) and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Editor looks for any `topicref` in the root map ([page 3287](#)) that is marked as `resource-only` and then looks for elements with an assigned `@id` attribute value. This tab includes a search field, some filtering options, and some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

**Keys Tab**

The **DITA Reusable Components** view collects all the keys that are defined in the current root map ([page 3287](#)) and displays them in the **Keys** tab. This tab has two view modes. The default tiles style view mode and a table style view mode.

**Tiles Mode**

The default tiles mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small
width. Each block (card) displays the name of the key (the value of the `keys` attribute), followed by its description and/or `href` value, followed by the name of the DITA map file where the key is defined.

Figure 886. DITA Reusable Components View - Keys Tab (Default tiles mode)

Table Mode

You can switch to a `table` style display mode by selecting the `Table mode` toggle action from the ✨ Settings menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in the `Description` column, while keys that are defined with a value in an `href` attribute have that href value listed in the `Href` column.

Figure 887. DITA Reusable Components View - Keys Tab (Table mode)

Both display modes in the `Keys` tab include a variety of features and options:

**Search Filter**
You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

**Sorting**

**Tiles Mode:** In the default *tiles* display mode, to sort the keys alphabetically in ascending order, select *Sort by key name* from the 🛠 Settings menu.

**Table Mode:** In the *table* display mode, the following columns can be sorted by clicking on the heading:

- **Key** - The name of the key (the value of the `keys` attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
- **Definition Location** - The name of the DITA map *(on page 3281)* where the key is defined.

**Double-Click Mechanism**

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `href` value, it is inserted as a cross reference link *(xref)* *(on page 3163).*
- If the selected key is a reference to an image, it is inserted as an `image` element.
- If the selected key does not have an associated `href`, it is inserted as a variable reference *(ph)* *(on page 3148).*

**Drag and Drop Mechanism**

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an `href` value, it is inserted as a cross reference link *(xref)* *(on page 3163).*
- If the selected key is a reference to an image, it is inserted as an `image` element.
- If the selected key does not have an associated `href`, it is inserted as a variable reference *(ph)* *(on page 3148).*

**Contextual Menu Actions**

**Insert as Link**
Inserts a cross reference link (\texttt{xref}) (on page 3163) to the selected key at the current cursor position or surrounding the current selection.

**Insert as Variable**

Inserts a variable reference (\texttt{ph}) (on page 3148) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an \texttt{image} element.

**Insert as Keyref**

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a \texttt{keyref} attribute and its value set to the selected key.

**Rename Key**

Opens a refactoring wizard (on page 1142) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

**Notes:**

- This action does not work on DITA 1.3 key scopes.
- This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

**Go to Definition**

Opens the DITA map where the key is defined.

**Search References**

Searches for all references to the selected key in the entire DITA map structure.

**Group by Definition Location (Available in Table mode only)**

A toggle action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

**Settings Menu**

This menu includes the following options:

**Filtering Options**

- **Show all** - Shows all defined keys found in the current root map (on page 3287).
- **Show only variables** - Filters the keys to show only those defined as variable references *(on page 3148).*
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

**Sort by key name (Available in Tiles mode only)**

Sorts the keys alphabetically in ascending order.

**Table mode**

A toggle action that switches between the *table* and *tiles* display modes.

## Components Tab

The **DITA Reusable Components** view collects all the topics from the current root map *(on page 3287)* that are marked as resource-only, then collects the reusable components from those topics, and displays them in the Components tab. To set a topic as resource-only, the topicref in the DITA map file needs to have a processing-role attribute set like this:

```
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The **DITA Reusable Components** view considers topic references that contain processing-role="resource-only" to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an ID specified. These reusable components are displayed in the Components tab along with the file name and the specific names of the elements that contain an ID attribute.

Figure 888. DITA Reusable Components View - Components Tab
The Components tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards (∗, ?), boolean operators (AND, OR, NOT), fuzzy searches (~), boosting searches (^), and more.

**Settings Menu**

This menu includes the following options:

**Compact Mode**

You can use this toggle action to switch the display for the Components tab to a compact visualization mode. When switched to Compact mode, fewer details are shown for each component, but more components are displayed in the view.

**Reindex**

You can use this action force a re-indexing of the reusable components.

**Show Elements of Type**

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.

**Source File(s)**
You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

**Double-Click Mechanism**

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (*conkeyref* *(on page 3130)*).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (*conref* *(on page 3128)*).

**Drag and Drop Mechanism**

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (*conkeyref* *(on page 3130)*).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (*conref* *(on page 3128)*).

**Hover and Click Actions**

If you hover over a component shown in the preview window, you have access to the following link actions:

- **Insert**
  
  Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (*conkeyref* *(on page 3130)*). Otherwise, it is inserted as a content reference (*conref* *(on page 3128)*).

- **Open**
  
  Opens the source file that contains the reusable component.

**Contextual Menu Actions**

**Insert Content Reference**
Inserts the component as a content reference (conref) (on page 3128) at the current cursor position or replaces the current selection.

**Insert Content Key Reference**

Inserts the component as a content key reference (conkeyref) (on page 3130) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

**Go to Definition**

Opens the source file that contains the reusable component.

**Search References**

Searches for all references to the selected component in the entire DITA map (on page 3281) structure.

**Related Information:**

- Working with Reusable Components (on page 3146)
- Linking in DITA Topics (on page 3163)
- Working with Variable Text in DITA (on page 3148)
- Working with Keys in DITA (on page 3116)
- Creating a DITA Content Reference (on page 3128)
- Creating a DITA Content Key Reference (on page 3130)

**Linking in DITA**

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor provides support for all forms of linking in DITA.

**Linking Between Parent, Child, and Sibling Topics**

A DITA map (on page 3281) creates a hierarchical relationship between topics. That relationship expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since
there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA collection-type attribute (on page 3030).

**In-Line Linking in the Content of a Topic**

DITA supports linking within the text of a topic using the `xref` element. The destination of the link can be expressed directly using the `href` attribute or indirectly using the `keyref` attribute. If you use the `keyref` attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

**Linking Between Related Topics**

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the Related Links section of a topic and relationship tables in maps. To add related links, select Related Link to Topic, Related Link to File, or Related Link to Web Page from the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu).

**Tip:** You can use the Find Similar Topics action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Managing Links**

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The [DITA Maps Manager](on page 2990) provides a way to
validate all the links in the documents that are included in the map (on page 3036). This can include validating all the profiling conditions that are applied.

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a DITA map (on page 3281), you set the appropriate value of the collection-type attribute on the map. See the DITA documentation for the meaning of each of the values of the collection-type attribute.

**Note:** Publishing scripts determine when and how to create hierarchical links. The collection-type attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the linking attribute.

To add the collection-type to an item in a map:

1. Right-click the topic and choose **Edit Properties**. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the linking attribute.

Linking in DITA Topics

**Direct Links**

Inline links can be created DITA topics using the xref element. The destination of the link can be expressed directly by using the href attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the related-links element.

**Indirect Links Using Keys**

The destination of the link can also be expressed indirectly by using keys (on page 3116) to create either inline links or related links (with the keyref attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.
Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps (on page 3024).
- Key Reference - Created in an `xref` element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the `topicref` element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

### Inserting a Link in Oxygen XML Editor

To insert a link in Author mode (on page 402), use the actions available in the - Link drop-down menu from the toolbar (or the - Link submenu in the contextual menu or DITA menu). You can choose between the following types of inline links:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 3166) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `xref` - Used to link to other topics or another location within the same topic and points to the target using the `href` or `keyref` attribute.
- `fragref` - A logical reference to a fragment element within a syntax diagram and points to the target using the `href` or `keyref` attribute.

**File Reference**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute. If you select Location for the target, the link is expressed in an `href` attribute. If you select Key for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 3167).

**Web Link**
Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute. If you select URL for the target resource, the link is expressed in an `href` attribute. If you select Key for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 3167).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (on page 3166) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a `related-links` element.

Tip: You can use the Find Similar Topics action that available in the DITA menu to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `title`, `shortdesc`, `keyword`, and `indexterm` elements.

Related Link to File

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a `related-links` element. If you select Location for the target, the link is expressed in an `href` attribute. If you select Key for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 3167).

Related Link to Web Page

Opens the Web Link dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link`
element inside a `related-links` element. If you select `URL` for the target resource, the link is expressed in an `href` attribute. If you select `Key` for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the `Choose Key Reference` button to use the `Choose Key` dialog box (on page 3167).

**Cross Reference (xref) Dialog Box**

The Cross Reference (xref) dialog box is displayed when you insert a Cross Reference or Related Link to Topic (from the Link drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.

![Cross Reference (xref) Dialog Box](image)

This dialog box includes the following sections and fields:

- **Choose the Target Resource Section**
Location

If you select Location for the target, the link is expressed in an `href` attribute.

Key

If you select Key for the target, keys will be used to express the link in a `keyref` attribute. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 3287) (you can also select one from the drop-down list in the Key field).

Tip: You can also use the DITA Reusable Components view (on page 3154) for similar purposes.

Figure 890. Choose Key Dialog Box

![Choose Key Dialog Box](image)

The Choose Key dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 3007).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `navtitle` or `keyword` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
Definition Location - The name of the DITA map (on page 3281) where the key is defined.

Group by Definition Location - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference.

Preview Pane

Displays the content that will be references.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click Insert or Insert and close, the configured cross reference is inserted into your document.

Tip: You can easily insert multiple cross references by keeping the dialog box opened, using the Insert button.

Using Copy/Paste Actions to Insert a Cross Reference

Oxygen XML Editor also includes support for inserting cross references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute or a topicref. Also, the location in the document where you paste the link must be valid, although as long as the Smart paste and drag and drop option (on page 138) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it. You can paste the link as a cross reference with the link expressed in an href attribute or in a keyref attribute.
To insert a cross reference link (expressed in an `href` attribute) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it or a `topicref`.
2. Place the cursor at a location, where you want to insert the link.
3. Select the **Paste as Link** action from the **Paste Special** submenu from the contextual menu.

To insert a cross reference link (expressed in a `keyref` attribute) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager view** (**on page 2990**), make sure that the **Root map combo box** (**on page 2995**) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager** (**on page 2990**), select **Edit Properties**, and enter a value in the **Keys** field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a `topicref` from a **DITA map**.
4. Place the cursor at a location, where you want to insert the link.
5. Select the **Paste as Link (keyref)** action from the **Paste Special** submenu from the contextual menu.

**Related Information:**

- Defining Keys in DITA Maps (**on page 3024**)
- DITA Reusable Components View (**on page 3154**)

**Linking with Relationship Tables in DITA**

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.
To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:

1. If the map is currently open in the DITA Maps Manager (on page 2990), double-click the map icon (_toolbar) to open the map in Author mode. If it opens in Text mode, click Author at the bottom left to switch to Author mode.

2. Move the insertion point inside the map root element (usually _map_, but it might be _bookmap_, or another specialization of the _map_ element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the _map_ root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the _map_ root element.

3. Select the Insert Relationship Table action on the toolbar or from the Relationship Table submenu of the contextual menu. The Insert Relationship Table dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click Insert.

5. Enter the type of the topics in the header of each column.
   
   The header of the table (the relheader element) already contains a relcolspec element for each table column. You should set the value of the attribute type of each relcolspec element to a value such as concept, task, or reference. When you click in the header cell of a column (that is a relcolspec element), you can see all the attributes of that relcolspec element, including the type attribute in the Attributes view (on page 426). You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select Insert Reference (on page 3050) from the contextual menu or the DITA Map toolbar.

7. To add a new row to the table or remove an existing row use Insert Relationship Row>Delete Relationship Row from the contextual menu or the DITA Map toolbar.

8. To add a new column to the table or remove an existing column, use Insert Relationship Column>Delete Relationship Column contextual menu or the DITA Map toolbar. If you double-click the relationship table (or select it and press Enter, or choose Open from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.
9. To add topic references to your relationship table, drag and drop topics from the DITA Maps Manager (on page 2990) or the Project (on page 333) view into the appropriate cell in the relationship table. See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the Relationship Table submenu of the contextual menu) or by editing the underlying XML in Text mode.

10. Save the DITA map.

Relationship tables are also displayed in the DITA Maps Manager view (on page 2990), along with the other elements in its DITA map.

Figure 891. Relationship Table

You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the DITA Maps Manager (on page 2990).
- Select the relationship table in the DITA Maps Manager (on page 2990) and press Enter.
- Select Open from the contextual menu of the relationship table in the DITA Maps Manager (on page 2990).

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (on page 3281) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Editor publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Editor using a
transformation scenario or you can run it directly from a command line: http://www.dita-ot.org/dev/topics/building-output.html.

The DITA-OT that comes bundled with Oxygen XML Editor contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output: http://blog.oxygenxml.com/2017/03/useful-dita-ot-plugins.html.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (on page 3281) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor also includes a special Run DITA-OT Integrator (on page 1665) that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1762).

A variety of transformations scenarios are available for DITA maps (on page 3281):

• Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.

• **Run DITA-OT Integrator (on page 1665)** - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 3256). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.

• **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  ◦ The number of processed maps and topics.
  ◦ Content reuse percentage.
  ◦ Number of elements, attributes, words, and characters used in the entire DITA map structure.
  ◦ DITA conditional processing attributes used in the DITA maps.
  ◦ Processing instructions.
  ◦ External links.
  ◦ All @outputclass attribute values gathered from the DITA project.

⚠️ **Important:** If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.
DITA Map to WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 1858) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1935).

WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 3281) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2990) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab (on page 3199) - This tab contains a set of built-in publishing templates (on page 1892) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1935).
- Parameters Tab (on page 3205) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1645) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- Filters Tab (on page 3207) - This tab allows you to filter certain content elements from the generated output.
- Advanced Tab (on page 3208) - This tab allows you to specify some advanced options for the transformation scenario.
- Output Tab (on page 3210) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.
When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Transformation Scenario

To publish a DITA map (on page 3281) as a WebHelp Responsive with Feedback system, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 2990) toolbar.
2. Select the DITA Map WebHelp Responsive with Feedback scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 3199)** - This tab contains a set of built-in publishing templates (on page 1892) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1935).
- **Parameters Tab (on page 3205)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1645) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 3207)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 3208)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 3210)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to begin the transformation.
5. Enter the documentation product ID (value for the webhelp.product.id parameter) and the documentation version (value for the webhelp.product.version parameter).

When the DITA Map WebHelp Responsive with Feedback transformation is complete, your default browser opens the installation.html file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (on page 1873).
Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the DITA map. The default value is **en-us**.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only **no** and **yes** values are valid and the default value is **no**).

**editlink.remote.ditamap.url**

Use this parameter in conjunction with **editlink.web.author.url** to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap.

**editlink.web.author.url**

This parameter needs to be used in conjunction with **editlink.remote.ditamap.url** to add an Edit link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/.

**editlink.present.only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the **editlink.remote.ditamap.url** and **editlink.web.author.url** parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: **true** or **false** (default).

**force.unique**
When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see [https://ant.apache.org/manual/dirtasks.html#patterns](https://ant.apache.org/manual/dirtasks.html#patterns).

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be `UTF8`.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).
webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

Parameters Specific to WebHelp Responsive Output

webhelp.default.collection.type.sequence

Specifies if the `sequence` value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have `Next` and `Previous` navigational buttons generated for all HTML pages. Allowed values are `no` (default) and `yes`.

webhelp.enable.search.autocomplete

Specifies if the `Autocomplete` feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title
In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo_and_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.top_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the <head> element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if,for,is).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

webhelp.show.main.page.toc
Specifies if the table of contents will be presented in the main page of the output. The default value is \textit{yes}.

\texttt{webhelp.show.navigation.links}

Specifies if navigation links will be presented in the output. The default value is \textit{yes}.

\texttt{webhelp.show.print.link}

Specifies if a print link or icon will be presented within each topic in the output. The default value is \textit{yes}.

\texttt{webhelp.show.related.links}

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is \textit{yes}. The \texttt{webhelp.merge.nested.topics.related.links} parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

\texttt{webhelp.show.publication.toc}

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is \textit{yes}.

\texttt{webhelp.show.topic.toc}

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each \texttt{<section>} within the current topic that contains an \texttt{id} attribute and the section corresponding to the current scroll position is highlighted. The default value is \textit{yes}.

\texttt{webhelp.show.top.menu}

Specifies if a menu will be presented at the topic of the main page in the output. The default value is \textit{yes}.

\texttt{webhelp.publication.toc.hide.chunked.topics}

Specifies if the table of contents will contain links for \textit{chunked} topics. The default value is \textit{yes}.

\texttt{webhelp.publication.toc.links}

Specifies which links will be included in the table of contents. The possible values are:

- \texttt{chapter} (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- \texttt{topic} - The TOC will only include links for the current topic and its direct children.
- \texttt{all} - The TOC will include all links.

\texttt{webhelp.publication.toc.tooltip.position}
By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

**webhelp.top.menu.depth**

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

**webhelp.topic.collapsible.elements.initial.state**

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are **collapsed** or **expanded** (default value).

- WebHelp Responsive Output Layout and Features *(on page 1858)*

---

**DITA Map to WebHelp Classic Transformation**

DITA content can be transformed into several types of WebHelp Classic systems (with or without a feedback section). The WebHelp Classic layout and features *(on page 1773)* are designed for desktop systems and include a familiar classical style. Oxygen XML Editor also provides numerous possibilities for customizing the WebHelp Classic output *(on page 1806)*.

**WebHelp Classic Transformation Scenario**

To publish a DITA map *(on page 3281)* as a WebHelp Classic system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the DITA Maps Manager *(on page 2990)* toolbar.
2. Select the DITA Map WebHelp Classic scenario from the DITA Map section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab (on page 3197)** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab (on page 3205)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1654) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 3207)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 3208)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 3210)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

### WebHelp Classic with Feedback Transformation Scenario

To publish a **DITA map (on page 3281)** as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the 🔄 **Configure Transformation Scenario(s)** action from the **DITA Maps Manager (on page 2990)** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Skins Tab (on page 3197)** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab (on page 3205)** - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section (on page 1654) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Filters Tab (on page 3207)** - This tab allows you to filter certain content elements from the generated output.
• **Advanced Tab (on page 3208)** - This tab allows you to specify some advanced options for the transformation scenario.

• **Output Tab (on page 3210)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

When the DITA Map WebHelp Classic with Feedback transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment (on page 1873).

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

**Parameters for Customizing WebHelp Classic Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  
  This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

- **clean.output**
  
  Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

- **fix.external.refs.com.oxygenxml** (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)
  
  The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

- **force.unique**
  
  When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.
use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is false).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <body> section of every WebHelp page.

webhelp.copyright

Adds a small copyright text that appears at the end of the Table of Contents pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a favicon in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate div or span element, and the code for each script element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code excerpt is an example for adding a Facebook™ widget:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = '//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0';
        fjs.parentNode.insertBefore(js, fjs); }
    (document, 'script', 'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
</div>
```

webhelp.footer.include
Specifies whether or not to include footer in each WebHelp page. Possible values: yes, no. If set to no, no footer is added to the WebHelp pages. If set to yes and the webhelp.footer.file parameter has a value, then the content of that file is used as footer. If the webhelp.footer.file has no value then a default Oxygen footer is inserted in each WebHelp page.

**webhelp.google.search.results**

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element gcse:searchresults-only. You can use all supported attributes for this element. It is recommend to set the linkTarget attribute to frm for frameless (iframe) version of WebHelp or to contentWin for the frameset version of WebHelp. The default value for this attribute is _blank and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used: `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

**webhelp.google.search.script**

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

**webhelp.head.script**

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the <head> section of every WebHelp page.

**webhelp.logo.image.target.url**

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

**webhelp.logo.image**

Specifies a path to an image displayed as a logo in the left side of the output header.

**webhelp.reload.stylesheet**

Set this parameter to true if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is false.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

**webhelp.search.japanese.dictionary**
The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

**webhelp.sitemap.base.url**

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the DITA map, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), always, hourly, daily, weekly, monthly, yearly, never.

**webhelp.sitemap.priority**

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF - based on HTML5 and CSS Transformation

Oxygen XML Editor includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a **DITA-OT CSS-based PDF Publishing plugin** that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with **xsl:fo** customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor. For more information, see the **Oxygen PDF Chemistry User Guide**. This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from [http://www.princexml.com](http://www.princexml.com).
- **Antenna House Formatter** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from [http://www.antennahouse.com/antenna1/formatter/](http://www.antennahouse.com/antenna1/formatter/).

**How to Create the Transformation Scenario**

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** ([on page 2990](#)) toolbar.
2. Select **DITA Map PDF - based on HTML5 & CSS**.
3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** ([on page 3199](#)) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.
- **CSS Processor Tab** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
- **Parameters Tab** ([on page 3205](#)) - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters Tab (on page 3207)** - This tab allows you to filter certain content elements from the generated output.

- **Advanced Tab (on page 3208)** - This tab allows you to specify some advanced options for the transformation scenario.

- **Output Tab (on page 3210)** - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

   - **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.

   - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the **CSS-based Processors** preferences page (on page 220).

   - **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

   - **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

   - **show.changes.and.comments** - When set to **yes**, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is **no**.

   - **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

### Customizing the Output

For information about customizing the output, see **CSS-based DITA to PDF Customization (on page 2013)**.

**Related Information:**

- Editing a Transformation Scenario (on page 1758)

- Configure Transformation Scenario(s) Dialog Box (on page 1762)
DITA Map to PDF - based on DITA and CSS (WYSIWYG) (Deprecated)

⚠️ Attention: This transformation scenario was deprecated starting with version 21.0. If you have configured scenarios associated to your project based on this transformation scenario, you will still be able to use them, but for new transformations, it is recommended to use the DITA Map PDF - based on HTML5 & CSS transformation scenario (on page 1657) instead.

Oxygen XML Editor includes a built-in DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that convert DITA maps to PDF using a CSS-based processing engine. Oxygen XML Editor also comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsf:fo customizations. Oxygen XML Editor also supports some third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor. For more information, see the Oxygen PDF Chemistry User Guide.
- **Prince XML** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation Scenario

To create a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2990) toolbar.
2. Select DITA Map to PDF - based on DITA & CSS (WYSIWYG).
3. If you want to configure the transformation, click the Edit button.
Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- **CSS Processor Tab** - This is where you choose the processor type. You can select between Oxygen PDF Chemistry, Prince XML, or Antenna House.
- **Parameters Tab** *(on page 3205)* - This tab includes numerous parameters that can be set to customize your WebHelp system output.
- **Filters Tab** *(on page 3207)* - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** *(on page 3208)* - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** *(on page 3210)* - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

   - **args.css** - Specifies a path to a custom CSS *(on page 2041)* to be used in addition to those specified in the `dita.css.list` parameter OR in addition to the CSS that is currently selected in the Styles drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the Styles drop-down menu.

   - **dita.css.list** - Specifies a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the Styles drop-down menu is used.

   - **css.processor.path.chemistry** *(if you are using the Oxygen PDF Chemistry processor)* - Specifies the path to the Oxygen PDF Chemistry executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the CSS-based Processors preferences page *(on page 220).*

   - **css.processor.path.prince** *(if you are using the Prince Print with CSS processor)* - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

   - **css.processor.path.antenna-house** *(if you are using the Antenna House Formatter processor)* - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

   - **show.changes.and.comments** - When set to yes, user comments, replies to comments, and tracked changes are published in the PDF output. The default value is no.

   - **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.
Customizing the Output

The DITA-OT CSS-based PDF Publishing plugin makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information about customizing the output, see: CSS-based DITA to PDF Customization (on page 2013).

Changing the Style of an Element

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

• Specify the path to your custom CSS using the args.css parameter:
  1. Edit a DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario.
  2. In the Parameters tab, specify the path to your custom CSS files in the args.css parameter.
  3. Click OK and run the transformation scenario.

This method is appropriate if you just want to apply the styling customization to the output.

• Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in Customizing Author Mode Using CSS Files Associated with a Framework (on page 2346).
  2. Once you have configured your CSS as an additional layer, you can select it from the Styles drop-down menu (on the toolbar) (on page 2348).
  3. Run the DITA Map to PDF - based on DITA & CSS (WYSIWYG) transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in Author mode.

• Configure Transformation Scenario(s) Dialog Box (on page 1762)

• Configuring and Managing Multiple CSS Styles for a Framework (on page 2348)
DITA Map to PDF - based on XSL-FO Transformation

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 3281) to PDF output.

Creating a DITA Map to PDF - based on XSL-FO Transformation Scenario

To create a DITA Map to PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2990) toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework (on page 3282) is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - show.changes.and.comments - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
   - customization.dir - Specifies the path to a customization directory.
   - editlink.remote.ditamap.url - When this parameter is set to “true”, the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click OK and then the Apply Associated button to run the transformation scenario.

Related Information:

- XSL FO-based DITA to PDF Customization (on page 2167)

DITA Map to MS Office Word Transformation

Oxygen XML Editor comes bundled with a transformation scenario that allows you to convert DITA maps (on page 3281) to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named Normal.docx (located in:
Tip: You can make general modifications to the Normal.docx template file to alter the published output.

Configuring the Transformation Scenario

To configure a DITA Map to MS Office Word transformation scenario, follow these steps:

1. Open the DITA map in the DITA Maps Manager (on page 2990).
2. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2990) toolbar.
3. Select DITA Map MS Office Word.
4. For advanced customizations, in the Parameters tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - dotx.file - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the Normal.docx file that is used by default.
   - document.flat.xsl - Specifies the path to a pre-process clean-up stylesheet.
   - core.xsl - Specifies the path to a core metadata stylesheet.
   - custom.xsl - Specifies the path to a custom metadata stylesheet.
   - document.xsl - Specifies the path to a main document stylesheet.
   - comments.xsl - Specifies the path to a comments stylesheet.
   - numbering.xsl - Specifies the path to a list and title numbering stylesheet.
   - footnotes.xsl - Specifies the path to a footnote stylesheet.
   - document.xml.xsl - Specifies the path to a document relations metadata stylesheet.
   - inkscape.exec - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click OK and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

Related Information:

- Editing a Transformation Scenario (on page 1758)
DITA Map to CHM (Compiled HTML Help) Transformation

To perform a Compiled HTML Help (CHM) transformation, Oxygen XML Editor needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Editor automatically detects HTML Help Workshop and uses it.

**Note:** HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.

Changing the Output Encoding

Oxygen XML Editor uses the htmlhelp.locale parameter to correctly display specific characters of different languages in the output of the Compiled HTML Help (CHM) transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Editor has the htmlhelp.locale parameter set to en-US.

To customize this parameter, follow this procedure:

1. Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the htmlhelp.locale parameter and change its value to the desired language tag.

**Note:** The format of the htmlhelp.locale parameter is LL-CC, where LL represents the language code (en, for example) and CC represents the country code (us, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

DITA Map to Kindle Transformation

Oxygen XML Editor requires KindleGen to generate Kindle output from DITA maps (on page 3281). To install KindleGen for use by Oxygen XML Editor, follow these steps:
1. Go to [www.amazon.com/kindleformat/kindlegen](http://www.amazon.com/kindleformat/kindlegen) and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor and open a DITA map in the DITA Maps Manager view (on page 2990).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and press the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.

Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:

1. Click the Configure Transformation Scenario(s) button on the DITA Maps Manager toolbar (on page 2992). The Configure Transformation Scenario(s) dialog box (on page 1762) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.
2. Select the transformation scenario you want to run and click Apply Associated. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor while the transformation is running. If there are errors or warnings, Oxygen XML Editor displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor opens the output in the appropriate application.
3. To rerun the same scenario again, click the Apply Transformation Scenario(s) button.

Creating or Editing a DITA OT Transformation

Creating a DITA OT Transformation Scenario

To create a DITA OT Transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu. Then click the New button and select DITA OT Transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view. Click the New Scenario drop-down menu button and select DITA OT Transformation.
Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.

Figure 892. DITA Transformation Type Dialog Box

Select the desired type of output and click OK. This opens the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

- **Project Options (on page 3286)** - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

- **Global Options (on page 3283)** - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a Skins tab is only available for WebHelp Classic and WebHelp Classic with Feedback output types, a Templates tab is available only for WebHelp Responsive and WebHelp Responsive with Feedback, and a FO Processor tab is available for PDF output).

**Editing a DITA OT Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.
To configure an existing transformation scenario, follow these steps:

1. Select the `Configure Transformation Scenario(s)` action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1762) is opened.

2. Select the particular transformation scenario and click the Edit button at the bottom of the dialog box or from the contextual menu.

   **Note:** Since transformation scenarios that are associated with built-in frameworks (on page 3282) are read-only, these scenarios will prompt you to use the Duplicate button and then edit the duplicated scenario (on page 1760).

   **Result:** This will open an Edit scenario configuration dialog box (on page 1758) that contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a Skins tab is only available for WebHelp Classic and WebHelp Classic with Feedback output types, a Templates tab is available only for WebHelp Responsive and WebHelp Responsive with Feedback, and a FO Processor tab is available for PDF output).

**Skins Tab (DITA OT Transformations)**

When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Skins tab is available for DITA OT transformations with WebHelp Classic or WebHelp Classic with Feedback output types and it provides a set of built-in skins that you can use as a base for your WebHelp system output.
A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

Figure 893. Skins Tab

The **Skins** tab includes the following sections:

**Built-in Skins**

This sections presents the built-in skins that are included in Oxygen XML Editor. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Editor website, press the **Online preview** link.

**Custom Skins**

You can use this section to customize the look of the output.

**CSS File**

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

**Note:** The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.
Create custom skin

Use this link to open the WebHelp Skin Builder (on page 1806) tool.

Templates Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA OT transformations with WebHelp Responsive, WebHelp Responsive with Feedback, or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1892). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 894. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.
Built-in Templates Locations

Oxygen XML Editor scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Editor scans the locations specified in the **DITA > Publishing preferences page** (on page 228) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 1938) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the **DITA > Publishing preferences page** (on page 228) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 2029). Clicking this button will open a template package configuration dialog box (on page 1707) that contains some options and displays the parameters that will be exported to your template package.
Template Errors

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Some templates could not be loaded. More details](image)

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 228) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

Related Information:

- Publishing Templates (on page 1892)
- Publishing Template Package Contents for PDF Customizations (on page 2023)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1895)
Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 2029). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `name` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `description` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only relevant parameters are exported. The parameters and their values will be inserted in the `parameters` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive (on page 1643) or DITA Map to PDF - based on HTML5 & CSS (on page 1657)). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For WebHelp Responsive customizations, select this option if you want to copy the default HTML Page Layout Files (on page 1909) into your
template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1643) or [DITA Map to PDF - based on HTML5 & CSS](on page 1657)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

**Figure 895. Template Package Configuration Dialog Box**

FO Processor Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure 896. FO Processor Configuration Tab

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Editor.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (on page 216).
- The system property com.oxygenxml.xep.location was set to point to the XEP executable file for the platform (for example: xep.bat on Windows).
- XEP was installed in the DITA-OT-DIR/plugins/org.dita.pdf2/lib directory of the Oxygen XML Editor installation directory.

**Antenna House**
The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters tab (on page 3205).**
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

**Related Information:**

- FO Processors Preferences (on page 216)
- XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 1738)

**Parameters Tab (DITA OT Transformations)**

When you **create a new transformation scenario (on page 1674) or edit an existing one (on page 1758),** a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the **DITA OT Documentation.** You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
A file chooser and an editor variable (on page 276) selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the ask editor variable (on page 277) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the ➤ Insert Editor Variables (on page 276) button or the ➡ Browse button.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

### Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an Oxygen Publishing Template (on page 2021) descriptor file are displayed in italics. After creating a publishing template (on page 2029) and adding it to the templates gallery (on page 1938), when you select the template in the Templates tab (on page 3199), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

**Related Information:**

- DITA Open Toolkit Documentation
Feedback Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), a configuration dialog box allows you to customize the transformation with various options in several tabs.

⚠️ **Attention:** This tab is for a feature that has not yet been implemented. To check the progress of the feature, see [https://feedback.oxygenxml.com/](https://feedback.oxygenxml.com/).

The **Feedback** tab is available for the **WebHelp Responsive** transformation type and can be used to connect the published WebHelp Responsive output to an **Oxygen Feedback** server to provide a comment section in the output where users can offer feedback and ask questions.

When you configure the **Oxygen Feedback** server, you will retrieve an HTML fragment during site creation procedure. Click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the HTML fragment (using keyboard shortcut keys or contextual menu actions).

Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

Figure 897. Edit Filters Tab
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 3281), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 276) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

⚠️ **Attention:** If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 3205)), that file takes precedence over a DITAVAL file specified here.

**Use profiling condition set**

Sets the profiling condition set (on page 3234) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)

When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.

Figure 898. Advanced Settings Tab
You can specify the following parameters:

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the Parameters tab (on page 3205) is used. You can specify the path by using the text field, the Insert Editor Variables (on page 276) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as `-verbose`).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page (on page 221).

**Java Home**
You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the Java Home text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (`OutOfMemoryError`).

**Libraries**

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR files or additional class paths) to be used by the transformer.

**Tip:** You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

**Output Tab (DITA OT Transformations)**

When you create a new transformation scenario (on page 1674) or edit an existing one (on page 1758), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

Figure 899. Output Settings Tab
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the `Insert Editor Variables (on page 276)` button, or the `Browse` button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the `Insert Editor Variables (on page 276)` button, or the `Browse` button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the `Insert Editor Variables (on page 276)` button, or the `Browse` button.

**Note:** If the DITA map (on page 3281) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**
If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Adobe Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation.

You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Open in editor**

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the Console options preferences page that contains options to control the display of the console output received from the publishing engine.

**Customizing DITA Transformations**

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Editor allows you to set parameters on a transformation scenario and you can save and share them with others. You can also use the $ask editor variable in the Parameters tab to instruct Oxygen XML Editor to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file. Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor provides
full editing and debugging support from XSLT and CSS stylesheets (on page 2290), which you can use to modify transformation code.

- You can also write your own transformation code (and execute it using a custom build file (on page 3214)) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

- **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section (on page 1772).
- **PDF** - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (on page 2167).

**Publishing Customizations**

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually $OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT3.x) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (on page 3256).
2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Editor at anytime without affecting the publishing system.
3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

**Customizing XHTML-based Output**

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you edit an XHTML transformation scenario (on page 3195), there is a parameter called args.css that can be set to point to your custom CSS and a parameter called args.copy.css that can be set to yes to copy the CSS to the output folder.
You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For more information, see: http://blog.oxygenxml.com/2013/12/creating-simple-dita-open-toolkit.html. A list with all DITA-OT XSLT extension points can be found here: http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html.

**Customizing WebHelp-based Output**

The DITA-OT that comes bundled in Oxygen XML Editor includes specific plugins that provide the ability to publish DITA content to WebHelp Classic (on page 1773) and WebHelp Responsive (on page 1857) output.

For information about customizing WebHelp Classic output, see Customizing WebHelp Classic Output (on page 1806).

For information about customizing WebHelp Responsive output, see Customizing the WebHelp Responsive Output (on page 1935).

**Customizing PDF-based Output**

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (on page 2167).

There is also a book called DITA For Print that contains details about how to customize various aspects.

**Customizing PDF Output with CSS**

Oxygen XML Editor also includes a transformation scenario called DITA Map PDF - based on HTML5 and CSS (on page 1657) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (on page 3281) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (on page 2041).

**Related Information:**

- DITA Open Toolkit Documentation
Using a Custom Build File

You can use a Custom Build File to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the Configure Transformation Scenario(s) action to open the Configure Transformation Scenario(s) dialog box (on page 1762).
2. Select the transformation scenario and click Edit.
3. Go to the Advanced (on page 3208) tab and change the Custom build file path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">
  <!-- The DITA OT default build file-->
  <import file="build.xml"/>
  <target name="dist">
    <!-- You could run your script here -->
    <!-- Call the DITA OT default target-->
    <antcall target="init"/>
  </target>
</project>
```

Note: If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor, it is located in the [OXYGEN_INSTALL_DIR]/tools/ant directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor Ant lib directory.

Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a DITA map (on page 3281) transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

```css
body {
  background-image: url(MyWatermarkImage.png);
}
```
2. Edit a DITA Map XHTML transformation scenario and in the Parameters tab set the value of the args.css parameter as the path to your watermark image.

3. Set the value of the args.copycss parameter to yes.

4. Apply the transformation scenario.

5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:

- Adding a Watermark to PDF Output (on page 2172)

Adding Syntax Highlights for Codeblocks in the Output

*Syntax Highlighting* makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. Oxygen XML Editor provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the @outputclass attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the @outputclass attribute on the `<codeblock>` element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the @outputclass attribute in Text mode but there are also two very simple ways to set the value in Author mode:

- Select the `<codeblock>` element in the editor and in the Attributes view, click on the Value cell for the outputclass attribute and select one of the predefined values (for example, language-xml).
- Select the `<codeblock>` element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-css
- language-ini
- language-java
Attention: It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

Example:

This codeblock:

```xml
<codeblock outputclass="language-xml">
  <p>This code is an example of how to use a coderef.</p>
  <codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
</codeblock>
```

would look like this in the output:

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Troubleshooting DITA Transformation Problems

This section contains some topics to help you troubleshoot DITA transformation issues.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

*DITA map (on page 3281)* transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.
DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique `copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA OT Transformation Takes a Long Time to Process

**Problem**

A DITA transformation takes an extremely long time to process (over an hour, for example).

**Cause**

Large delays in DITA OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA OT processing is very disk-intensive, each stage takes the
entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Editor (on page 2946). Sometimes, just increasing the amount of memory available to the DITA OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2960).
Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 3036). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 3281), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:

• How to Enable Debugging for FO Processor Transformations (on page 1742)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask – Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
Failed to open C:\samples\dita\out\pdf\test.pdf
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop]  at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop]  at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
..........  
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the `XSL-FO` file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2990)) to find the original DITA topic for which the table was generated.
Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2990) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2990)) to find the original DITA topic for which the table was generated.

Related Information:

- How to Enable Debugging for FO Processor Transformations (on page 1742)

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.
Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 3281) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 3036). Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1664)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 3281) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page
Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map to CHM (Compiled HTML Help) Transformation (on page 1664)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 3036) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 2990) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 1702).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 357) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - Informational - The transformation encountered a condition of which you should be aware.
     - Warning - The transformation encountered a problem that should be corrected.
     - Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - You can click the See More icon to open a web page that contains details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
   d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Related Information:

- Troubleshooting DITA Transformation Problems (on page 3217)

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. The profiling configuration can also be shared between content authors through the project file and there is no need for coding or editing configuration files.

Oxygen XML Editor includes a Profiling/Conditional Text preferences page (on page 144) where you can create and manage profiling attributes and condition sets. Oxygen XML Editor also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (on page 3243) or DITAVAL file (on page 3248).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (product, platform, audience, rev, props, and otherprops). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the platform profiling attribute:

```xml
<section platform="windows">
```
For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (on page 3226) (for information about sharing them, see Sharing Profiling Attribute Configurations (on page 3229)).

**Profiling Conditions**

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (on page 3232) (for information about sharing them, see Sharing Condition Set Configurations (on page 3234)).

For more information about DITA profiling, watch our video demonstration:

https://www.youtube.com/embed/Gfyd4TkRQAw

**Creating and Editing Profiling Attributes in DITA**

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (on page 3232).

**Defining Profiling Attributes for DITA Content**

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling / Conditional Text.

   **Information:** The Profiling Attributes section (on page 145) is used to define the attributes and their values. For DITA documents, the default attributes are included (audience, platform, product, props, otherprops, and rev), but if a Subject Scheme Map (on page 3243) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.

2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
Figure 900. Profiling Attribute Dialog Box

The following options are available in this dialog box:

**Document type**

Select the document type *(framework (on page 3282))*.

ℹ️ Tip: You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (New, Edit, Delete).

The columns are as follows:

- **Value**: The attribute value. You can also define profiling attribute groups using the following format: ParentAttrValue(SubAttrValue1 SubAttrValue2). For more information, see Conditional Profiling Attribute Groups (on page 3242).

- **Label**: You can specify a label for the attribute value that will be rendered as its name in various components in Author mode *(Edit Profiling Attributes)* dialog
box (on page 3229), **Condition Set** dialog box (on page 3232), **Profiling** tab in the **Edit Properties** dialog box (on page 3032), **DITA Maps Manager** (on page 2990). If the **Label** is not specified, the **Value** will be used as its rendered name.

- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

3. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
4. Click **Apply** to save the changes.

**Result:** You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets** section to apply more complex filters on your DITA content.

### Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the **In-Place Attributes Editor** (on page 915) in **Author** mode, the **Attributes view** (on page 426), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the **Profiling / Conditional Text** preferences page (on page 144) where you can edit the profiling configuration.

**Note:** If the **Allow contributing extra profiling attribute values** (on page 146) option is not selected in the **Profiling / Conditional Text** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this automatically adding value not be possible.

Figure 901. Profiling Values Conflict Dialog Box
Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select Project Options (on page 3286) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 723).

- Conditional Profiling Attribute Groups (on page 3242)
Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes (on page 3226) as follows:

**DITA Topics**

To profile DITA topics, right-click a topic reference in the DITA Maps Manager (on page 2990), select Edit Properties from the contextual menu, go to the Profiling tab, and select the appropriate values.

**DITA Content**

To profile DITA content in Author mode, highlight the content and select Edit Profiling Attributes from the contextual menu and select the appropriate values in the Edit Profiling Attributes dialog box.

**DITA Elements**

To profile specific XML elements in Author mode, position the cursor inside the element, right-click, select Edit Profiling Attributes (you can also right-click the element in the breadcrumb (on page 907) or Outline (on page 347) view), and select the appropriate values in the Edit Profiling Attributes dialog box. You can also use the Attributes view (on page 426) to set the profiling attributes on the element at the current cursor position.

Figure 902. Edit Profiling Attributes Dialog Box
The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your root map (on page 3287) references a DITA subject scheme map (on page 3288) that defines values for the profiling attributes (on page 3243), those values are used. Oxygen XML Editor collects all the profiling values from the subject scheme map that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2990) (or set as the root map (on page 3007)). In the image above (on page 3230) (taken from the Oxygen XML Editor documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.

- If you have defined profiling attribute values (on page 3226) for the DITA document type in the Profiling/Conditional Text preferences page (on page 144) and you store them at project-level (on page 3286), those values are displayed in the dialog box.

- If you have defined profiling attribute values (on page 3226) for the DITA document type in the Profiling/Conditional Text preferences page (on page 144) and you store them at global-level (on page 3283), those values are displayed in the dialog box.

- If you have defined profiling attribute values (on page 3226) for the DITA document type in the Profiling/Conditional Text preferences page (on page 144), those values are displayed in the dialog box.

- Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements in which the profiling attributes are set.

If the Show Profiling Attributes option (on page 981) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 903. Profiling Attribute Value Form Control Pop Up
Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

Information: The Profiling Condition Sets section (on page 146) is used to define condition sets.
2. To add new condition set, click the **New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

**Step Result:** In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

Figure 904. Condition Set Configuration Dialog Box

![Condition Set Configuration Dialog Box](image)

The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type (*framework* on page 3282) for which you have defined profiling attributes.

**Use DITAVAL file**

For DITA projects, select this option if you want the **Profiling Condition Set** to reference a **DITAVAL file** on page 3248. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 276) button, or the browsing actions in the **Browse** drop-down list.

**Include the content matching the following conditions**
You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

**Shortcut key**

You can click the Choose button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

3. After defining or configuring the condition sets according to your needs, click OK to confirm your selections and close the **Condition Set** configuration dialog box.

4. Click Apply to save the condition set.

**Result:** All saved profiling condition sets are available in the Profiling / Conditional Text toolbar drop-down menu *(on page 980)*.

### Sharing Condition Set Configurations

Your condition set configuration can be shared with other users through a project file. If you select Project Options *(on page 3286)* at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration *(on page 723)*.

**Related Information:**

- Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 3240)*
Applying Profiling Condition Sets in DITA

All defined Profiling Condition Sets (on page 3232) are available as shortcuts in the Profiling / Conditional Text toolbar menu (on page 980). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode, Outline view (on page 347), and DITA Maps Manager view (on page 2990). Your selection will also be used as the default condition set (on page 3251) in transformation scenarios (this can be changed in the Filters tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:

Suppose that you have the following document:

```
<table>
<thead>
<tr>
<th>Spray painting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.</td>
</tr>
<tr>
<td>Context: The garage is a good place to spray paint.</td>
</tr>
<tr>
<td>Step 1</td>
</tr>
<tr>
<td>Step 2</td>
</tr>
<tr>
<td>Step 3</td>
</tr>
<tr>
<td>Step 4</td>
</tr>
<tr>
<td>Step 5</td>
</tr>
</tbody>
</table>
```

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the expert value for the @audience attribute and content that has the prop1 value for the @other attribute.
This is how the document looks in **Author** mode after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.
Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object Audience [novice] Other [prop1]
```

Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the DITA Maps Manager toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**
Select this option to show colors and styles for profiled content in Author mode and the DITA Maps Manager. You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page.

**Show Profiling Attributes**
Select this option to display the values of the profiling attributes at the end of profiled content in Author mode and next to the nodes in the DITA Maps Manager. You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page.

**Show Excluded Content**
Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager, and the Outline view. When this option is selected and a condition set is selected in this drop-down menu, the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu, the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page.

**Choose Condition Set (Available if more than 15 condition sets are defined)**
This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

**List of Defined Condition Sets**
Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager (on page 2990) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 3237) to access a dialog box that presents all of them.

### Profiling Settings

Opens the Profiling/Conditional Text preferences page (on page 144) where you can add and edit profiling attributes and condition sets.

Figure 905. Example: Profiling Controls in Author Mode

If the Show Profiling Attributes option is selected, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 906. Profiling Attribute Value Form Control Pop Up
Also, the following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:

- ■ - The topic contains profiling attributes.
- □ - The topic inherits profiling attribute from its ancestors.
- ◼ - The topic contains and inherits profiling attributes.
- - (dash) - The topic neither contains, nor inherits profiling attributes.

Figure 907. Rendering Profiled Topics in DITA Maps Manager

Related Information:

Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode and the **DITA Maps Manager** so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode and excluded nodes are grayed-out or hidden in the **DITA Maps Manager**.

Figure 908. Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

**Styling Profiling Attribute Values**

To set colors and styles for profiling attribute values, follow these steps:
1. Select the **Show Profiling Colors and Styles** option *(on page 980)* from the **Profiling / Conditional Text** toolbar drop-down menu.

2. Select **Profiling Settings** *(on page 981)* from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text** preferences page *(on page 144)*.

3. Go to the **Colors and Styles preferences page** *(on page 146)* to configure the colors and styling for the profiling attributes.

4. Go to the **Attributes Rendering preferences page** *(on page 148)* to configure how you want the profiling attributes to appear in Oxygen XML Editor.

**Result:** The styling is now applied in the **Author** editing mode, the **Outline view** *(on page 347)*, and in the **DITA Maps Manager** view *(on page 2990)*. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box *(on page 970)* and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Figure 909. Profiling Attribute Value Form Control Pop Up

**Alternate Method with a DITAVAL File:** If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the **Styling the Rendering of Profiled Content Using a DITAVAL File** *(on page 3250)* topic.

Conditional Profiling Attribute Groups

Overview

Conditional processing attributes can be specified using grouped values. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (operations and support) and they use the @audience attribute with the values ops and support, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (L1, L2, and L3) as subcategories for the support value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as @product, @audience, @otherprops) and specify multiple attribute subcategories.

Creating a Conditional Profiling Attribute Group

To create a group in Oxygen XML Editor:

1. Open the Preferences dialog box (Options > Preferences) (on page 79) and go to Editor > Edit modes > Author > Profiling / Conditional Text.
2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.
   
   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
3. Specify the appropriate values for the Document type, Attribute name, and Display name.
   
   For information about the Profiling Attribute configuration dialog box, see Defining Profiling Attributes for DITA Content (on page 3226).
4. Click the New button at the bottom of the attribute values table.
5. In the Value field of the resulting dialog box, define groups using the following format:
   
   ParentAttrValue(SubAttrValue1 SubAttrValue2). For example:
   
   support(L1 L2 L3)
6. Click OK and Apply to save and apply the changes.
Using Conditional Groups in Conjunction with a DITAVAL File

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 3248) the values. For example, suppose the company described in the example in the Overview section (on page 3242) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```xml
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 3232) to filter content in Author mode or during the transformation stage to filter content in the output (on page 3251) and content profiled with the L1 and L2 values would be included while content with the L3 value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (L1, L2, L3) by simply excluding the support value (since L1, L2, and L3 are subcategories of it).

```xml
<val>
  <prop action="exclude" att="support"/>
</val>
```

For more information about creating conditional profiling attribute groups, watch our video demonstration:

https://www.youtube.com/embed/YRi9XP6CcY

Customizing Profiling Values with a Subject Scheme Map

Overview

A subject scheme map (on page 3288) allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.

The highest level of map (main DITA map (on page 3287)) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the type attribute needs to be set to subjectScheme for the reference, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:

1. Use the New Document wizard (on page 676) to create a new Subject Scheme document (Framework templates > DITA Map > map > Subject Scheme).
2. Use the controls in Author mode to define the hierarchical tree of values for your subject scheme (see the Author mode example below (on page 3246)) or switch to Text mode and define it there if you prefer (see the Text mode example below (on page 3246)).

  **Note:** The pre-defined subject scheme template includes Navigation Titles (navtitle element). This element is not required, but if you use it, the text that you enter for the navtitle will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Editor (on page 3247). An example of when this might be helpful is if
3. Bind the particular attribute to the key you define for the tree of values using the `<attributedef>` and `<subjectdef>` elements inside the `<enumerationdef>` element. Notice that in the examples below (on page 3246), the `audience` attribute is bound to the `audienceKey` value.

Tip: By default, attributes can accept multiple values, but you can use `outputclass="single_value"` to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Editor with radio buttons instead of checkboxes. For example:

```xml
<enumerationdef outputclass="single_value">
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>
```

4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the examples below (on page 3246)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Editor (on page 3247).

5. Save your `subject scheme` file.

6. Reference your `subject scheme` in the highest level of map (main DITA map (on page 3287)) that will use the set of profiling values and set its type to `subjectScheme`. The easiest way to do this is:
   a. With your `subject scheme` file opened in the editor, go to the DITA Maps Manager view, right-click the `main DITA map`, and select Append Child > Reference to the currently edited file.
   b. In the Insert Topic Reference dialog box, go to the Attributes tab and in the Type field, enter or select `subjectScheme`.
   c. Click the Insert and Close button and save your main DITA map.

Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 3248) the entire tree of values. For example, suppose one of the values for the `audience` attribute in a hierarchical subject scheme is `surgeon` and it has two subordinate values of `neuro-surgeon` and `plastic-surgeon` (see the examples below (on page 3246)). You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```
That DITAVAL file could then be used for a condition set (on page 3232) to filter content in Author mode or during the transformation stage to filter content in the output (on page 3251) and the neuro-surgeon and plastic-surgeon values would be excluded by the filter since the subject scheme defines them as subordinate values of the surgeon value.

**Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute**

This example uses typical audience values for medical personnel (therapist, oncologist, physicist, radiologist, surgeon, and so on). The audience attribute is bound to the audienceKey value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (props and otherprops) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Editor (on page 3247).

**Example using Author mode controls:**

![Subject Scheme Controls](image)

**Example code in Text mode:**
Where the Profiling Attributes are Available in Oxygen XML Editor

When you edit a DITA topic in the Text or Author mode, Oxygen XML Editor collects all the profiling values from the subject scheme map (on page 3288) that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2990) (or set as the root map (on page 3007)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Editor (regardless of their mapping in the Profiling/Conditional Text preferences page (on page 144)):

- The Profiling tab of the Edit Properties dialog box (on page 3032).
- The Edit Profiling Attribute dialog box (on page 3230).
• The inline profiling controls in **Author mode (on page 3238)**.
• The proposals for the attribute values in the **Content Completion Assistant (on page 3280)**.

For more information about using a DITA subject scheme map, watch our video demonstration:

https://www.youtube.com/embed/RgkVRg6k6zo

**Related Information:**
• **Filtering Profiling Values with a DITAVAL File (on page 3248)**
• DITA 1.3 Specifications: Subject Scheme Maps

**Filtering Profiling Values with a DITAVAL File**

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

**DITAVAL Filtering Use-Case**

Suppose that a medical publication uses the **audience** attribute to profile the content for the following types of users: **therapist**, **physician**, and **surgeon**. Suppose that in the output, you want to exclude any content that is profiled as **surgeon** value for the **audience** attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as **surgeon**:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main **DITA map (on page 3281)** and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as **surgeon**.

**DITAVAL Filter File Editor in Author Mode**

The **Author** editing mode in Oxygen XML Editor offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

Figure 911. DITAVAL File Editor in Author Mode
Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the DITAVAL FILTER File title, allows you to insert the following elements:

- **Style Conflict** - Inserts a `style-conflict` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `foreground-conflict-color` and `background-conflict-color` attributes.

- **Filter** - Inserts a `prop` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are `include`, `exclude`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `style`, `color`, and `background` attributes.

- **Flag** - Inserts a `revprop` element that identifies a value in the `rev` attribute that should be flagged in some manner. The allows actions are `include`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `style`, `color`, `background`, and `changebar` attributes.

See the DITAVAL Element Specifications for more details about the allowed filters and flags.

**How to Create a DITAVAL Filter File**

To create a DITAVAL filter file, follow these steps:

1. Go to File > New.
2. Scroll to the Framework templates > DITAVAL folder.
3. Select the Filter template file and click Create.
4. Define your filters in the DITAVAL file (in Text or Author mode).
5. Save the DITAVAL file.
Result: The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a Profiling Condition Set using the Use DITAVAL File option in the Condition Set configuration dialog box (on page 3232).
- You can use the Import from DITAVAL option (on page 145) in the Profiling/Conditional Text preferences page (on page 144) to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the DITAVAL file in the transformation scenario (on page 3208).
- You can use the filter file in the DITA Map Completeness Check dialog box (on page 3037) when validating your DITA map (on page 3281).
- DITAVAL files are also used when working with the DITA 1.3 Branch Filtering mechanism. For more details, see: Working with DITA 1.3 Branch Filtering (on page 3152).
- You can define the colors and styles to be used for rendering profiled condition sets (on page 3250) in Author mode and the DITA Maps Manager (on page 2990) view by using a Flag filter in the DITAVAL file.

Related Information:

- DITAVAL Element Specifications
- Working with DITA 1.3 Branch Filtering (on page 3152)
- Customizing Profiling Values with a Subject Scheme Map (on page 3243)
- Styling the Rendering of Profiled Content Using a DITAVAL File (on page 3250)
- Conditional Profiling Attribute Groups (on page 3242)

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager (on page 2990) by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:
1. Create or edit your DITAVAL file (on page 3249) to define your profiling condition set (on page 3232).
2. In Author mode, define the filters for your condition set (on page 3248).
3. Select Flag from the drop-down menu on in a particular Filter or Flag Revision to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

Result: Test your changes by opening profiled content in Author mode or the DITA Maps Manager (on page 2990) and use the options in the Profiling / Conditional Text drop-down menu to see how the changes in your DITAVAL flag are rendered.

EXAMPLE:

Using a Flag on a Filter to define the styling for a condition set like this:

![DITAVAL Filter file](image)

will render the styling of the profiled content in Author mode to look like this:

![Shortcut Keys - Many of the shortcut keys](image)

and will render the styling in the DITA Maps Manager view (on page 2990) to look like this:

Related Information:

- Filtering Profiling Values with a DITAVAL File (on page 3248)
Publishing Profiled DITA Content

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current profiling condition set (on page 3234) into account during the transformation, as defined in the Filters tab (on page 3207) when creating a DITA transformation (on page 1702). You can also specify a DITAVAL file (on page 3248) that defines filters for your profiled content.

Figure 912. Profiling Option in the Filters Tab (DITA OT Transformations)

DITA Open Toolkit Support

The DITA Open Toolkit is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Editor includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA OT plugin (on page 3285), and how to use an external instance of the DITA Open Toolkit.

Related Information:

- DITA Open Toolkit Documentation

DITA-OT Plugins

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Editor already has lots of plugins pre-installed but you can also install additional plugins (on page 3285) or create your own.
Creating a DITA OT Plugin

Oxygen XML Editor provides the ability to install additional DITA Open Toolkit plugins (on page 3256) that can be found from various sources (for example, Oxygen’s public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the plugins folder located in your DITA OT directory (for example, if you are using DITA 3.3.1, the path would look like this: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/MyNewPlugin`).
2. Create a plugin.xml file in that same folder. This file will contain the extension points for the plugin. For example, references to the XSLT stylesheets that will be used to style the output.

   **Note:** You can easily create this file by using the DITA OT Plugin new document template that is included in Oxygen XML Editor (from the New document wizard (on page 676) you can find this template in Framework templates > DITA > plugin.

   **Example:**

   ```xml
   <plugin id="org.metadita.specialization.music">
     <feature extension="dita.specialization.catalog.relative"
              file="catalog-dita.xml"/>
     <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl"/>
   </plugin>
   ```

   **Tip:** Oxygen XML Editor includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press Ctrl+Space, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Install the newly created DITA-OT plugin (on page 3256) by running the built-in transformation scenario called Run DITA-OT Integrator (on page 1665) from the Apply Transformation Scenario(s) (on page 1641) or Configure Transformation Scenario(s) dialog box (on page 1762).

   **Note:** If the integrator is not visible, select the Show all scenarios option in the Settings drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions (on page 3256).

Related Information:
Example: Creating a DITA OT Plugin for Embedding Video Resources

To offer a detailed example of the steps required to create a new DITA Open Toolkit plugin (on page 3285), this topic uses an example of creating an XSLT customization plugin that provides support for referencing video and audio content using the DITA object element and then publishing to HTML and PDF output formats. This plugin (com.oxygenxml.media) is available in the DITA Open Toolkit distribution that comes bundled with the latest version of Oxygen XML Editor, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA OT plugins folder (DITA-OT-DIR/plugins/).
2. Create a plugin.xml file (in the same plugin folder) that contains the extension points of the plugin.

Note: You can easily create this file by using the DITA OT Plugin template that is included in Oxygen XML Editor (from the New document wizard (on page 676) you can find this template in Framework templates > DITA > plugin).

Example: Media Plugin File

```xml
<plugin id="com.oxygenxml.media">
  <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
  <feature extension="package.support.email" value="support@oxygenxml.com"/>
  <feature extension="package.version" value="21.0"/>
  <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
  <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
</plugin>
```

The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other DITA OT plugin extension points here: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.
3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called `xhtmlMedia.xsl` (in the same plugin folder).

**Tip:** You can use the Find/Replace in Files action (on page 745) to find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. For example, suppose you want to overwrite HTML content produced from a DITA `codeblock` element. Since a DITA `object` element has the class attribute value `- topic/object`, you can take part of the class attribute value (`topic/object`) and search the DITA OT resources for a similar stylesheet. The search might find the XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xslhtml/xsl/xslhtml/dita2htmlImpl.xsl`.

You can use it as a starting point to overwrite the `xhtmlMedia.xsl` stylesheet. For example, the results might be:

```xml
<xsl:template
    match="*[contains(@class, ' topic/object ')]*[contains(@outputclass, 'video')]">
    <video class="embed-responsive-item">
        <xsl:call-template name="commonattributes" />
        <xsl:call-template name="setidaname" />
        <xsl:call-template name="copySource" />
    </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called `pdfMedia.xsl` (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl` to use as a starting point to overwrite the `pdfMedia.xsl` stylesheet, with results looking something like this:

```xml
<!--Treat video, audio or iframe objects as links-->
<xsl:template
    match="*[contains(@class, ' topic/object ')][@outputclass = 'video']">
    <xsl:variable name="target" select="@data" />
    <xsl:variable name="baseDir">
        <xsl:call-template name="substring-before-last">
            <xsl:with-param name="text" select="@xtrf" />
            <xsl:with-param name="delim" select="'/'" />
        </xsl:call-template>
    </xsl:variable>
</xsl:template>
```
5. To install the created plugin in the DITA OT, run the built-in transformation scenario called Run DITA-OT Integrator (on page 1665) by executing it from the Apply Transformation Scenario(s) dialog box (on page 1641). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu. For more information, see Installing a DITA-OT Plugin (on page 3256).

Results of running the integrator using the media plugin example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl, a new import automatically appeared:

```xml
<xsl:import href="../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: http://www.w3.org/TR/xslt#import.

b. Likewise, for the PDF output, in the top-level stylesheet DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl, a new import statement appeared:

```xml
<xsl:import href="../../../com.oxygenxml.media/pdfMedia.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA OT distribution to the other.

Related Information:

- DITA Open Toolkit Documentation
Installing a DITA-OT Plugin

Oxygen XML Editor comes bundled with various DITA-OT plugins [on page 3285], but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen’s public GitHub repository includes some DITA-OT plugins).

⚠ Warning: Oxygen XML Editor has only been tested with DITA-OT plugins that come bundled with the product. Be aware that installing additional plugins or modifying the bundled plugins may affect the default functionality of the application.

Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional plugin to the location of the DITA OT version you are using (by default, DITA-OT-DIR\plugins directory).

   Note: If the plugin is only supported in DITA-OT 3.3.1 version, make sure that you copy the plugin to the [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x directory.

2. Select the Configure Transformation Scenario(s) (on page 1762) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1768)).

3. Select the Run DITA-OT Integrator transformation scenario (on page 1665). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu.

   Important: The folder where the DITA OT is located needs to have full write access permissions set to it. For example, in Windows, if you are integrating plugins in the DITA OT folder bundled with Oxygen XML Editor and your application is installed in the Program Files folder, you can start the Oxygen XML Editor main executable with administrative rights for the integrator process to be able to modify resources in the DITA OT folder.

4. Apply the scenario (on page 1761).

5. Check the Results panel at the bottom of the application to make sure the build was successful.

Note: Starting with version 17.0, if the DITA-OT plugin declares a transtype (transformation type), Oxygen XML Editor detects that transformation type declaration from the DITA OT plugin and presents descriptions in the DITA Transformation Type dialog box (on page 1702). Oxygen XML Editor also shows the contributed parameters from the plugin in the transformation scenario's Parameters tab (on page 3205).

Tip: You can declare the transformation type and allowed parameters by following the procedure found in: Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 3258).
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin

Custom DITA-OT plugins may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a transtype, Oxygen XML Editor detects that transformation type declaration and presents descriptions in the DITA Transformation Type dialog box (on page 1702) and the contributed parameters in the transformation scenario's Parameters tab (on page 3205).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, create a DITA-OT plugin.xml file (on page 3252) (you can easily create this file by using the DITA OT Plugin new document template in the New document wizard (on page 676)).
2. In the plugin.xml file, define the transformation type details by using the <transtype> element to specify a name, description, and the transtype it extends.
   ```xml
   <transtype name="xhtml" extends="base-html" desc="HTML">
   </transtype>
   ```
3. Define allowed parameters by using the <param> element to specify the name, description, and information about the default and allowed set of values. For more information, see: https://www.dita-ot.org/3.1/topics/plugin-configfile.html.
   ```xml
   <param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
     <val>yes</val>
     <val default="true">no</val>
   </param>
   ```
Depending on the type declared for a parameter, Oxygen XML Editor will help you pick values for each parameter edited in the Parameters tab of the transformation scenario dialog box. For example, for parameters of type "enum", Oxygen XML Editor will present a combo box for choosing the proper value for the parameter.

4. Extend various extension points in your plugin.xml. For more information, see: https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html.

5. Install the plugin (on page 3256).

**Note:** If the plugin is installed using an external command line, you may need to restart Oxygen XML Editor to properly re-detect the newly contributed transtypes and parameters.

**Complete plugin.xml example:**

```xml
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
  <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
  <feature extension="dita.conductor.target.relative" value="integrator.xml" type="file"/>
  <feature extension="dita.transtype.print" value="pdf-prince"/>
  <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
    <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
  </transtype>
</plugin>
```

For more information, watch this DITA-OT Day 2015 presentation:

https://www.youtube.com/embed/LcrR0YUFfQ4

**Built-in Third-Party DITA Open Toolkit Plugins**

The DITA Open Toolkit 3.3.1 distribution that is bundled with Oxygen XML Editor includes some pre-installed third-party open-source plugins (on page 3285) that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Editor include:

- **DITA For Publishers** - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** - This plugin allows users to publish DITA content to MS Word.
- **DITA Community** - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.
Using an External DITA Open Toolkit in Oxygen XML Editor

Oxygen XML Editor comes bundled with a DITA Open Toolkit, located in the `DITA-OT-DIR` directory. Starting with Oxygen XML Editor version 17, if you want to use an external DITA OT for all transformations and validations, you can open the Preferences dialog box (Options > Preferences) (on page 79) and go to the DITA page (on page 224), where you can specify the DITA OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the Parameters tab change the value for the `dita.dir` parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the Advanced tab, click the Libraries button and deselect Allow Oxygen to add high priority libraries to classpath.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Document Type Association preferences page (on page 92), edit the DITA and DITA Map document types and modify the catalog entry in the Catalogs tab to point to the custom catalog file `catalog-dita.xml`.

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see DITA 4 Practitioners: DITA Configuration and Specialization Tutorials.
In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following:

- **DTD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).

- **XSD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).

- **Relax NG** - For more information, see the following presentation: Creating DITA-OT Constraint/Specialization Plugins. For Relax NG coding requirements, see [https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html).

A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the `class` attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor, use one of the following methods:

**DITA-OT Plugin Method**

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional `plugin` to the location of the DITA OT version you are using (by default, `DITA-OT-DIR\plugins` directory).

   **Important:** The application needs to have full write access permissions to the DITA OT directory.

2. If Oxygen XML Editor was installed in the default location, you may need to restart and run it as an administrator.

3. Select the 🔄 Configure Transformation Scenario(s) ([on page 1762](#)) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view ([on page 1768](#))).

4. Select the Run DITA-OT Integrator transformation scenario ([on page 1665](#)).

   **Tip:** If you don't see that scenario in the 🔄 Configure Transformation Scenario(s) ([on page 1762](#)) dialog box or Transformation Scenarios view ([on page 1768](#)), click the 📋 Settings button and select the Show all scenarios option, but don't forget to change it back to Show only the scenarios available for the editor after you are finished with this procedure.

5. Apply the scenario ([on page 1761](#)).
6. Check the **Results** panel at the bottom of the application to make sure the build was successful.
7. Restart Oxygen XML Editor with your normal permissions.

**Tip:** Oxygen XML Editor detects new document templates *(on page 683)* contributed by the DITA OT plugin as long as you do the following:

1. Create a new folder called `template_folders` inside the `DITA-OT-DIR\plugins` directory.
2. Create one or more subfolders inside the `template_folders` directory that contain the new document templates. The new document templates found in those subfolders will be available in the **New** document wizard.

### Alternative Methods

If the DITA specialization is not available as a DITA OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the **DITA maps** or topics. The DITA OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.
- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA OT, these new stylesheets must be called from the DITA OT Ant build scripts.

**Important:** If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** option in the **Document Type Association preferences page** *(on page 92).*

- You could create your own document templates *(on page 683)*, store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Editor uses by adding the directory to the list in the **Document Templates Preferences** *(on page 123)* page.

### Related Information:

- DITA Configuration and Specialization Tutorials
Editing DITA Map Specializations

In addition to recognizing the default DITA map (on page 3281) formats (map and bookmap), the DITA Maps Manager view (on page 2990) can also be used to open and edit specializations of DITA maps.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the DITA Maps Manager view (on page 2990) are collected from the target files by matching the class attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the DITA Map document type from the Document Type Association preferences page (on page 92) and edit the actions to insert the element names as specified in your specialization. See Creating/Extending a Custom Framework (on page 2322) for more details.

Related Information:

- DITA Configuration and Specialization Tutorials
- Integrating a DITA Specialization (on page 3261)

Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (on page 92) and edit the actions to insert the element names, as specified in your specialization. See Creating/Extending a Custom Framework (on page 2322) for more details.
Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (on page 3121).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

Note: If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, https://www.maxprograms.com/products/fluenta.html).

Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: https://lists.oasis-open.org/archives/dita/201301/msg00029.html.
3. Avoid profiling/filtering content at inline level, for similar reasons.
General DITA Project Structure

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

General Translation Workflow

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The DITA Translation Package Builder Add-on (on page 2681) could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as "localization service provider").
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder (on page 3265).

Publishing Translated Content

All of your translated DITA maps and topics should have the xml:lang attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain various static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA <note> element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages: Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language (on page 1975).

Liability

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.

Other Resources

Here are some links to other resources that might help you with translating DITA projects:
Master Files Support in DITA

Oxygen XML Editor includes a feature that allows you to define Master Files (on page 3284) at project level. This feature is typically used in Oxygen XML Editor for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (on page 2990), the root map (on page 3287) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Master Files support in DITA to update all the references to moved or renamed resources in the scope of the Master Files, and since the root map (on page 3287) will be set as the Master File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Project view (on page 333), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Master Files Support in DITA

To use the Master Files support in DITA, follow these steps:

1. Go to the Project view (on page 333) and enable Master Files support with one of the following methods:
   - Select Enable Master Files Support from the ☰ Settings menu in the top-right corner.
   - Select Enable Master Files Support from the contextual menu of the project root folder. If a disabled Master Files folder exists, you can also select that option from its contextual menu.
   - Click the Enable button in the tooltip located at the bottom. This tooltip window is displayed when the Master Files support is disabled. Clicking the Read more link takes you to the user guide. Clicking the Enable button opens the Enable Master Files dialog box. This dialog box contains general information about the Master Files Support and allows you to enable it.
Warning: Once you close this window tip, Oxygen XML Editor hides it for all projects. You can make the window tip reappear by resetting Oxygen XML Editor to its default settings (on page 268). However, doing so will result in you losing your customized options.

2. Add the main DITA map (root map) (on page 3287) to the Master Files folder by doing one of the following:
   - Right-click the project root folder and select Detect Master Files.
   - Right-click the Master Files folder and select Detect Master Files from Project.
   - If you enabled the Master Files support from the tooltip at the bottom of the Project view, you can also use the Detect and Enable button in the resulting dialog box to detect the master files from the current project.
   - Manually add the root map (on page 3287) to the Master Files folder by doing one of the following:
     - Right-click a file from your project and select Add to Master Files from the contextual menu (or simply drag and drop it into the Master Files folder).
     - Select Add Files or Add Edited File from the contextual menu of the Master Files folder.

Tip: You can set multiple maps in the Master Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (on page 2995).

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Master Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the Project view (on page 333) and Oxygen XML Editor will offer the option of updating all the references to the moved or renamed resources in the scope of the Master Files (in this case, the main DITA map (root map) (on page 3287)).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable Master Files support and add your root DITA map (on page 3287) to the Master Files folder as described in the How to Enable Master Files Support in DITA (on page 3266) section above.
2. Go to the Project view (on page 333), and use one of the following methods to move or rename the resources:

   Moving Resources

   To move resources in the Project view (on page 333), do one of the following:
• Simply drag and drop the resource to the new location in the tree structure (the Enable drag-and-drop in Project view option must be selected in the View preferences page (on page 259)).
• Use the Cut, Copy, and Paste actions from the contextual menu.
• Right-click the resource and select Refactoring > Move resource action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the Move resource dialog box.

Result: In all cases, a Move resource dialog box will be presented.

Renaming Resources

To rename resources in the Project view (on page 333), do one of the following:
• Select the resource and press F2, or simply left-click again, until the in-place editor allows you to change the file name.
• Right-click the resource and select Rename or Refactoring > Rename resource.

Result: In all cases, a Rename resource dialog box will be presented.

3. Make sure the Update references of the moved resource(s) option is selected in the resulting Move or Rename dialog box and keep the scope as master files to make sure all the references to the moved or renamed resource are updated.

DITA Resource Hierarchy/Dependencies View

The Resource Hierarchy/Dependencies view displays the hierarchy or dependencies for an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the hierarchy or dependencies for a DITA resource (maps or topics), right-click a resource in the Project view (on page 333) and either select Resource Hierarchy or Resource Dependencies.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the Show Dependencies button on the toolbar of the Resource Hierarchy/Dependencies view, select the All files filter in the file browser, find the particular resource, and double-click it.

Figure 913. Resource Hierarchy/Dependencies View
The following actions are available on the toolbar of the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies from computing.

- **Show Hierarchy**
  Compute the hierarchy structure.

- **Show Dependencies**
  Compute the dependencies structure.

- **Configure dependencies search scope**
  Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple working sets (on page 3288). If the Use only Master Files, if enabled checkbox is selected, the scope of the search is restricted to the Master Files directory (on page 3266).

- **History**
  Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu for a resource listed in the Resource Hierarchy/Dependencies view contains the following actions:

- **Open**
Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

**Go to reference**

Opens the source document where the resource is referenced.

**Copy location**

Copies the location of the resource.

**Move resource**

Opens the **Move resource** dialog box where the following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - As long as **Master Files support is enabled** *(on page 3266)*, you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

**Rename resource**

Opens the **Rename resource** dialog box where the following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - As long as **Master Files support is enabled** *(on page 3266)*, you can select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

**Show Resource Hierarchy**

Shows the hierarchy for the selected resource.

**Show Resource Dependencies**

Shows the dependencies for the selected resource.

**Add to Master Files**

Adds the currently selected resource in the **Master Files** directory.

**Expand All**
Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

ℹ️ Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon 🟢.

**Metadata**

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

**Topic Metadata**

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `prolog` element of a topic or inside the `topicref` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

**Taxonomy and Subject Scheme**

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using `subject scheme maps (on page 3288)`. When you are authoring, many of the values you choose from have been defined in `subject scheme maps`.

**Migrating MS Office Documents to DITA**

Oxygen XML Editor integrates the entire DITA for Publishers plugins suite and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see Migrating Various Document Formats to DITA (on page 3274).
Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

**Method 1 (Single Document)**

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor and create a new DITA topic.
3. Paste the selected content in Author mode. The *Smart Paste functionality (on page 918)* will attempt to convert the content to DITA.

**Method 2 (Single Document)**

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   - In Oxygen XML Editor, select **File > Import > HTML File** to import it as XHTML. Then, open the XHTML in Oxygen XML Editor and use one of the **XHTML to DITA Transformation Scenarios (on page 1605)** to convert the content to DITA.
   - Open the HTML file in any Web browser, select all of its content, and copy it. Then, open Oxygen XML Editor, create a new **DITA topic** and paste the selected content in Author mode. The *Smart Paste functionality (on page 918)* will attempt to convert the HTML content to DITA.

**Method 3 (Single Document)**

1. Open the document in the free *LibreOffice* application and save it as **DocBook**.
2. Open the **DocBook** document in Oxygen XML Editor.
3. Run the built-in transformation scenario called **DocBook to DITA (on page 1671)**.
4. You may need to make some manual adjustments for elements that couldn't be mapped.

**Method 4 (Single Document)**

1. Save the document in the MS Word DOCX format.
2. Open it in the **Archive Browser view (on page 2191)** in Oxygen XML Editor and then open the **document.xml** file contained in the archive.
3. Run the built-in transformation scenario (on page 3195) called **DOCX DITA**. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a **DITA map** and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content.
Method 5 (Multiple Documents)

1. Use a tool to convert the documents to **DocBook**. For example, *Pandoc* is a free document converter engine that can convert **DOCX** documents to **DocBook** and according to *Pandoc’s manual*, you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted **DocBook** documents somewhere in your project.
3. Perform a **batch transformation** *(on page 1767)* on all the newly converted **DocBook** documents:
   a. Select all the **DocBook** documents in the **Project view** *(on page 333)*.
   b. Right-click the selected files and choose **Transform > Configure Transformation Scenario(s)**.
   c. Apply the built-in transformation scenario called **DocBook to DITA** *(on page 1671)*.
4. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Method 6 (Multiple Documents)

1. Use a tool to convert the documents to **HTML** or **Markdown**. For example, *Pandoc* is a free document converter engine that can convert **DOCX** documents to those formats.
2. Use **Oxygen’s Batch Converter add-on** *(on page 2677)* to convert the documents to **DITA**.
3. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating Excel and Other Types of Spreadsheets to DITA

There are two possibilities for converting Microsoft Excel (or other similar types of documents) to DITA:

- Copy the spreadsheet content and paste it in an opened DITA topic in **Author** mode. The **Smart Paste functionality** *(on page 918)* will attempt to convert the content to DITA.
- Use **Oxygen’s Batch Converter add-on** *(on page 2677)* to convert one or more spreadsheet documents to **DITA**.

Related Information:

- Migrating Various Document Formats to DITA *(on page 3274)*
- Smart Paste Mechanism *(on page 918)***
Migrating Various Document Formats to DITA

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Migrating Microsoft Office and Other Similar Types of Documents to DITA

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see Migrating MS Office Documents to DITA (on page 3271).

Migrating DocBook Content to DITA.

Since DocBook content is already in XML format, migrating it to DITA is more straightforward than with other non-XML formats:

1. Convert the DocBook content to a single large DITA composite file by performing a batch transformation (on page 1767) on all the DocBook documents:
   a. Select all the DocBook documents in the Project view (on page 333).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (on page 1671).
2. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Tip: There is also a utility XSLT stylesheet available on the Oxygen XML GitHub account that can be used convert a DITA composite file to a DITA map with separate DITA topic files. It can be found here: https://github.com/oxygenxml/old-userguide-docbookbased/blob/master/split-DITA-topic.xsl.
Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:

- Copy the content from Google Docs and paste it in an opened DITA topic in Author mode. The Smart Paste functionality (on page 918) will attempt to convert the content to DITA.
- Save the Google document as OpenDocumentFormat (ODF), then open it in the free LibreOffice application and save it as DocBook. Next, open the DocBook document in Oxygen XML Editor and run the built-in transformation scenario called DocBook to DITA (on page 1671).
- If you want to convert multiple Google documents at once, save the documents as HTML, then use Oxygen's Batch Converter add-on (on page 2677) to convert the documents to DITA.

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating Markdown Content to DITA

There are several possibilities to convert Markdown content to DITA:

- The DITA Open Toolkit publishing engine bundled with Oxygen XML Editor allows you to reference Markdown files directly in a DITA map and either publish them directly or export the Markdown files to DITA one by one. For details, see Working with Markdown Documents in DITA (on page 1520).
- If you want to convert multiple Markdown files at once, you can use Oxygen's Batch Converter add-on (on page 2677) to convert the documents to DITA.

Migrating HTML Content to DITA

There are several possibilities to convert HTML content to DITA:

- Copy the HTML content and paste it in an opened DITA topic in Author mode. The Smart Paste functionality (on page 918) will attempt to convert the content to DITA.
- Convert the HTML file to XHTML by selecting File > Import > HTML File. Then, open the XHTML file and use one of the XHTML to DITA Transformation Scenarios (on page 1605) to convert the content to DITA.
- If you want to convert multiple HTML files at once, you can use Oxygen's Batch Converter add-on (on page 2677) to convert the documents to DITA.
Migrating Unstructured FrameMaker to DITA

There is a FrameMaker plugin that can be used for this type of conversion: http://leximation.com/tools/info/fm2dita.php.

Migrating MadCap Content to DITA

Some recent MadCap versions seem to have facilities to export content directly to DITA. Otherwise, you will need to convert XHTML content to DITA with a custom XSLT stylesheet to preserve variable references.

Migrating Other Formats to DITA

You may find third-party applications (such as Pandoc) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor includes support for some DITA 1.3 features.

The Oxygen XML Editor publication of the full DITA 1.3 specifications can be found at https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor:

Table 81. DITA 1.3 Features Implementation Status

<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 3.3.1 is used]</th>
</tr>
</thead>
<tbody>
<tr>
<td>DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.</td>
<td>New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3</td>
<td>N/A</td>
</tr>
<tr>
<td>Feature</td>
<td>Editing</td>
<td>Publishing [DITA Open Toolkit 3.3.1 is used]</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Learning Object and Group maps</td>
<td>New document templates</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>Troubleshooting specialization</td>
<td>Create and edit new troubleshooting topics</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>XML markup domain</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Equation and MathML domain</td>
<td>Validation and content completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>SVG domain</td>
<td>Validation and content completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Other new DITA 1.3 elements (div, strike-through, overline, etc)</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Release management domain</td>
<td>Validation and Content Completion</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>Scoped keys (on page 3151)</td>
<td>Define key scopes</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td>Branched filtering (on page 3152)</td>
<td>Display, create, and edit ditavalref elements</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td>Key-based cross deliverable addressing</td>
<td>Special display for references to DITA maps with scope=&quot;peer&quot; and a defined keyscope</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>Feature</td>
<td>Editing</td>
<td>Publishing [DITA Open Toolkit 3.3.1 is used]</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>--------------------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Shorthand to address syntax that identifies elements in the same topic</td>
<td>Properly resolved for validation, links, and conrefs</td>
<td>Implemented</td>
</tr>
<tr>
<td>Various table attributes (orientation, rotation, scope, and headers on cells)</td>
<td>Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view</td>
<td>Not implemented</td>
</tr>
<tr>
<td>New Map topicref attributes (cascade, deliveryTarget)</td>
<td>Allow setting new attributes, propose proper values for them</td>
<td>Implemented</td>
</tr>
</tbody>
</table>

**Related Information:**

- Watch our DITA 1.3 video tutorial for more information about key scopes and branch filtering.
Active Cell

Active cell refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Alternate CSS Style

The Alternate CSS Style refers to the choices in the bottom half of Styles drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in Author mode and the output without having to edit the CSS stylesheets. By default, the alternate styles are applied like layers, they are merged sequentially with the main CSS style (on page 3284), and you can activate any number of them. However, if you deselect the Enable multiple selection of alternate CSSs option (on page 101) in the CSS subtab of the Document Type configuration dialog box (on page 95), the alternate styles are treated like main CSS styles (on page 3284) and you can only select one at a time.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 2348).

Anchor

An Anchor is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the href attribute with a # symbol followed by the anchor that is defined in a target ID (for example href="MyTopic.dita#anchor").

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.
Block Element

A *block element* is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.

Bookmap

A *bookmap* is a specialized *DITA map* used for creating books. A *bookmap* supports book divisions such as chapters and book lists such as indexes.

Callout

A *callout* is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor uses callouts to present comments and other types of review modifications.

Canonicalize

To *canonicalize* something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The *Content Completion Assistant* refers to a very helpful mechanism in Oxygen XML Editor that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode *(on page 921)*
- Content Completion Assistant in Text Mode *(on page 844)*
- Content Completion Assistant in Grid Mode *(on page 891)*
- Content Completion in XSLT Stylesheets *(on page 1190)*
- Content Completion in Ant Build Files *(on page 1238)*
- Content Completion in XML Schema *(on page 1288)*
• Content Completion in XQuery (on page 1338)
• Content Completion Assistance in WSDL Documents (on page 1356)
• Content Completion in CSS Stylesheets (on page 1382)
• Content Completion in LESS Stylesheets (on page 1387)
• Content Completion in Relax NG Schemas (on page 1395)
• Content Completion in NVDL Schemas (on page 1412)
• Content Completion in JavaScript Documents (on page 1457)
• Content Completion in Schematron Documents (on page 1467)
• Content Completion in SQF (on page 1495)

Dockable

A Dockable window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A document fragment represents a portion of an XML document’s tree of nodes or content.

Document Type Association

In general terms, a Document Type Association is a set of rules that associate a document type with a framework (on page 3282). In Oxygen XML Editor, Document Type Association also specifically refers to a preferences page (on page 92) where you can create new custom frameworks or edit existing ones. Note that frameworks (document types) that come built-in with Oxygen XML Editor are read-only, but you can Extend (on page 93) or Duplicate (on page 93) them to configure them as custom frameworks.

DITA Map

A DITA map is a component of the DITA framework (on page 3282) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension .ditamap.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or bookmark (on page 3280) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.
DITA Open Toolkit

**DITA Open Toolkit** is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the Apache License, Version 2.0.

The toolkit supports all versions of the OASIS DITA specification, including 1.0, 1.1, 1.2, and 1.3.

### DITA-OT

**Related Information:**

### DITA-OT-DIR

**DITA_OT_DIR** refers to the default directory that is specified for your DITA Open Toolkit distribution in the **Options > Preferences > DITA preferences page** *(on page 225).*

For example, if you are using DITA OT 3.3.1 that comes bundled with Oxygen XML Editor, the default directory is: `{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x`. You can also specify a custom directory.

### Foldable Element

A **foldable element** refers to elements that can be collapsed and expanded in Oxygen XML Editor. Foldable elements are marked with a small triangle (`,` `)` on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (**Collapse Other Folds**, **Collapse Child Folds**, **Expand Child Folds**, **Expand All**).

### Framework

A **framework** refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. A framework is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Editor includes a **Document Type Configuration**
**Dialog Box (on page 95)** that allows you to define the set of rules and customize various authoring mechanisms for new or existing *frameworks*.

For advanced details about customizing your own *framework*, see the *Creating and Configuring Custom Frameworks (on page 2322)* section.

### Global Options

**Global Options** refers to the *storage option (on page 265)* in the Oxygen XML Editor preference pages (Options > Preferences). If you select **Global Options (on page 265)**, the options in that particular preferences page are stored locally on your computer and are not accessible to other users (unless you *export them into an XML options file (on page 267)* that can then be shared).

### IDML

**IDML** is an abbreviation for Adobe InDesign Markup files.

### Inline Element

An *inline element* is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are *inline elements*. It is distinct from a *block element*, which is visually separated from its siblings.

### Java Archive

**Java Archive (JAR)** is an archive file format. *JAR* files are built on the ZIP file format and have the `.jar` file extension. Computer users can create or extract *JAR* files using the `jar` command or an archive tool.

### Key Space

The concept of a *Key Space* in DITA refers to a set of all possible keys that can be used in a *DITA map* structure. A *Key Space* is established when a *root map (on page 3287)* defines a set of effective key bindings. When Oxygen XML Editor processes key references, it determines the effective binding of a given key to a resource in the context of the *specified root map (on page 3007)*.

### Keystore

A *Keystore* is an encrypted file that contains private keys and certificates. There are two types of *keystores* that are supported in Oxygen XML Editor:
- Java Key Store (JKS)
- Public-Key Cryptography Standards version 12 (PKCS-12)

Main CSS Style

The **Main CSS Style** refers to the selection in the top half of the **Styles** drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in **Author** mode and the output without having to edit the CSS stylesheets. The main CSS applies to the whole document and you can also select one or more alternate styles (on page 3279) (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the main CSS style.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 2348).

Master File

A **Master File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the Master Files Support (on page 726) section.

Named User

**Named User** is defined as an individual full or part-time employee who is authorized by **You** (the individual or entity who owns the rights for Oxygen XML Editor) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, **Named User** licenses cannot be shared among multiple individuals and separate **Named User** licenses must be purchased for each individual user.

A **Named User** license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the **Named User’s** employment with your company.
- (b) Permanent reassignment of a **Named User** to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an **Oxygen** license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the **Named User** license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.
**Note:** This definition is taken from the Oxygen XML Editor End User License Agreement.

### Oxygen Publishing Template

*Oxygen Publishing Template* defines all the aspects related with the **look and feel**(*layout and styles*) for the *WebHelp Responsive* output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the *WebHelp Responsive* output.

**Related Information:**

- Publishing Template Package Contents for WebHelp Responsive Customizations *(on page 1895)*

### Perspective

In Oxygen XML Editor, a *perspective* refers to an interface layout geared towards a specific editing environment. Each *perspective* includes a unique set of interface objects, toolbars, views, and features. You can change the *perspective* by selecting the respective icon (▲ ▼) in the top-right corner of Oxygen XML Editor or by selecting the *perspective* from the *Window > Open Perspective* menu.

The *perspectives* that are available in Oxygen XML Editor are:

- ▲ **Editor** *(on page 295)* - The most commonly used *perspective* and it is used to edit XML documents.
- ▶ **XSLT Debugger** *(on page 297)* - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.
- ▶ **XQuery Debugger** *(on page 299)* - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment
- ▼ **Database** *(on page 300)* - Used to browse and manage databases.

### Plugin

A *plugin* (also referred to as *add-on* or *extension*) is a component that adds specific features to an existing application. Oxygen XML Editor supports *plugins* to enable numerous customizations.
For more information, see the following topics:

- Installing and Updating Add-ons *(on page 75)*
- Automatic and Manual Methods for Installing Plugins *(on page 2582)*
- Packing and Deploying Plugins as Add-ons *(on page 2612)*
- Add-ons Preferences *(on page 92)*
- Extending Oxygen XML Editor with Plugins *(on page 2580)*
- General Configuration of an Oxygen XML Editor Plugin *(on page 2580)*

Pretty-Print

Pretty-print refers to formatting and indenting the source code in Text mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor include:

- **Format and Indent Element** - Available in the Source submenu of the contextual menu for the current element.
- **Format and Indent** - Available on the toolbar for the entire currently opened document.
- **Format and Indent Files** - Available in the contextual menu of the Project view *(on page 333)* for one or more selected files.

Project Options

Project Options refers to the storage option *(on page 265)* in the Oxygen XML Editor preference pages *(Options > Preferences)*. If you select Project Options *(on page 266)*, the options in that particular preferences page are stored at project level in the project file (*.xpr*), which can easily be shared with other users *(on page 266)*.

QName

QName stands for "qualified name" and defines a valid identifier for elements and attributes. QNames are used as URI references to reference particular elements or attributes within XML documents.

Quick Assist

The Quick Assist feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (🔍) placed at the current line in the stripe on the left side of the editor in Text mode. You can also invoke the quick assist menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.
Quick Fix

The Quick Fix support in Oxygen XML Editor helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. Quick Fixes are available in Text mode and Author mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the Quick Fix proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in Author mode, the Quick Fix proposals are presented in a small drop-down menu.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a Quick Fix icon (👋) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you to select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the Quick Fix menu by pressing Alt + 1 (Command + Alt + 1 on OS X) on your keyboard.

Oxygen XML Editor also provides support for defining and customizing a library of Quick Fixes using the Schematron language (on page 1482).

Root Map

A Root Map (or master map) specifies a DITA map (on page 3281) that defines a hierarchical structure of submaps that are contained within the root map. Essentially, the root map defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a key space (on page 3283)).

In Oxygen XML Editor, the DITA Maps Manager includes an option on its toolbar where you can easily specify the root map (on page 2995), but there are also several other ways to select or change the root map (on page 3007).

Space-Preserved Element

A spaced-preserved element refers to elements that require white spaces and line endings to be preserved (for example, DITA codeblock and pre elements).
Subject Scheme Map

A **Subject Scheme Map** allows you to create custom controlled attribute values and to manage metadata. *Subject scheme maps* use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the *subject scheme map* in which those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include *therapist*, *oncologist*, *surgeon*, *radiologist*, and so on). In a *subject scheme map*, you can define a list of these audience values and you can then use these values to profile your content. For more information, see *Customizing Profiling Values with a Subject Scheme Map* *(on page 3243)*.

Track Changes

The **Track Changes** feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review** view *(on page 964)*.

For more information about this feature, see *Managing Tracked Changes* *(on page 943)*.

WebHelp Output Directory

**WebHelp_OUTPUT_DIR** refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

Working Set

A **Working Set** refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the
scope for the operation and you can choose one or more working sets to restrict the scope to that specified set of files.

XML Catalog

An XML Catalog maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an XML Catalog becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor includes default global catalogs as well as default catalogs for each of the built-in frameworks (on page 3282), and you can also create your own. Oxygen XML Editor uses these XML Catalogs to resolve references for document validation and transformations. For more information, see Working with XML Catalogs (on page 1123).

No parts of this work may be reproduced in any form or by any means - graphic, electronic, or mechanical, including photocopying, recording, taping, or information storage and retrieval systems - without the written permission of the publisher. Products that are referred to in this document may be either trademarks and/or registered trademarks of the respective owners. The publisher and the author make no claim to these trademarks.

Trademarks. Many of the designations used by manufacturers and sellers to distinguish their products are claimed as trademarks. Where those designations appear in this document, and Syncro Soft SRL was aware of a trademark claim, the designations have been rendered in caps or initial caps.

Notice. While every precaution has been taken in the preparation of this document, the publisher and the author assume no responsibility for errors or omissions, or for damages resulting from the use of information contained in this document or from the use of programs and source code that may accompany it. In no event shall the publisher and the author be liable for any loss of profit or any other commercial damage caused or alleged to have been caused directly or indirectly by this document.

Link disclaimer. Syncro Soft SRL is not responsible for the contents or reliability of any linked Websites referenced elsewhere within this documentation, and Syncro Soft SRL does not necessarily endorse the products, services, or information described or offered within them. Syncro Soft cannot guarantee that these links will work all the time and has no control over the availability of the linked pages.

Warranty. Syncro Soft SRL provides a limited warranty on this product. Refer to your sales agreement to establish the terms of the limited warranty. In addition, Oxygen XML Editor End-User License Agreement, as well as information regarding support for this product, while under warranty, is available through the Oxygen XML Editor End-User License Agreement.

Third-party components. Certain software programs or portions thereof included in the Product may contain software distributed under third-party agreements ("Third-Party Components"), which may contain terms that expand or limit rights to use certain portions of the Product ("Third-Party Terms"). Information identifying Third-Party Components and the Third-Party Terms that apply to them is available on the Third-party License Agreements webpage.

Terms and conditions. For the terms and conditions for using Oxygen XML Editor, see Oxygen XML Editor End-User License Agreement.
**Documentation.** For the most current versions of documentation, see the *Oxygen XML Editor User Manual.*

**Contact Syncro Soft SRL.** Syncro Soft SRL provides telephone numbers and e-mail addresses for you to report problems or to ask questions about your product, see the *Oxygen support webpage.*
