Difference Between a Framework (Document Type) and a Plugin Extension

Question
What is the difference between a Framework (on page 2643) and a Plugin (on page 2646) Extension?

Answer
There are two possible ways to customize the application:

1. Implement a plugin.

   A plugin serves a general purpose and influences any type of XML file that you open in Oxygen XML Editor.

   For the Oxygen XML Editor Plugins API, Javadoc, samples, and documentation, go to https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins

2. Create or modify the document type (on page 1772) that is associated to your specific XML vocabulary.

   This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

   For example, if the end users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA framework. If you look in the Document Type Association preferences page (on page 85) there is a DITA document type. If you edit that document type you will see that it has an Author tab in the Document Type Configuration dialog box (on page 87). The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

   For information about developing your own document types (frameworks), see the Advanced Framework Customization (on page 1772) section.
If you look on disk in the \{OXYGEN_INSTALL_DIR\}/frameworks/dita folder, there is a file called dita.framework. That file gets updated when you edit a document type from the Document Type Association preferences page (on page 85). Then you can share that updated file with all users.

The same folder contains some JAR (on page 2644) libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.

The Oxygen SDK contains the Java sources from all the DITA Java customizations:

https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK

Important: It is possible for a plugin to share the same classes with a framework. For further details, go to How to Share the Classloader Between a Framework and a Plugin (on page 2034).

Disable Context-Sensitive Menu Items for Custom Author Actions

Question

Is there a way to disable menu items for custom Author mode actions depending on the cursor context?

Answer

By default, Oxygen XML Editor does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain Author mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own ro.sync.ecss.extensions.api.ExtensionsBundle implementation you can overwrite the method:

ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()

and when the extension state listener gets activated, you can use the API like this:

```java
/**
 * @see ro.sync.ecss.extensions.api.AuthorExtensionStateListener#activated
 */

public void activated(final AuthorAccess authorAccess) {

    // Add a caret listener to enable/disable extension actions:
    authorAccess.getEditorAccess().addAuthorCaretListener(new AuthorCaretListener()
    {
        @Override
        public void caretMoved(AuthorCaretEvent caretEvent) {
            try {
```
Map<String, Object> authorExtensionActions = 
authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();

    //Get the action used to insert a paragraph. It's ID is "paragraph"
AbstractAction insertParagraph = (AbstractAction) authorExtensionActions.get("paragraph");
    //Evaluate an XPath expression in context of the current node
Object[] evaluateXPath = authorAccess.getDocumentController().evaluateXPath("*[ancestor-or-self::p]", false, false, false, false);
    if(evaluateXPath != null && evaluateXPath.length > 0 && 
evaluateXPath[0] != null) {
      //We are inside a paragraph, disable the action.
      insertParagraph.setEnabled(false);
    } else {
      //Enable the action
      insertParagraph.setEnabled(true);
    }
    } catch (AuthorOperationException e) {
      e.printStackTrace();
    }
};

When the extension is deactivated, you should remove the CaretListener to avoid adding multiple listeners that perform the same functionality.

Dynamically Add Form Controls Using a Styles Filter

Question

How do I add form controls using an API?

Answer

Usually, a form control is added from the CSS using one of the built-in form controls (on page 1891). However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically ro.sync.ecss.extensions.api.StylesFilter.

For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:

```java
public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT 
        && "before".equals(authorNode.getName())) {
```
authorNode = authorNode.getParent();

if ("country".equals(authorNode.getName())) {
    // This is the BEFORE pseudo element of the "country" element.
    // Read the supported countries from the configuration file.
    Map<String, Object> formControlArgs = new HashMap<String, Object>();
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDIT, "#text");
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_TYPE, InplaceEditorArgumentKeys.TYPE_COMBOBOX);
    // This will be a comma separated enumeration: France, Spain, Great Britain
    String countries = readCountriesFromFile();
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDITABLE, "false");

    // We also add a label in form of the form control.
    Map<String, Object> labelProps = new HashMap<String, Object>();
    labelProps.put("text", "Country: ");
    labelProps.put("styles", "* {width: 100px; color: gray;}");
    StaticContent[] mixedContent = new StaticContent[]{
        new LabelContent(labelProps), new EditorContent(formControlArgs)};
    styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);
}

// The added form control is the only way the element can be edited.
if ("country".equals(authorNode.getName())) {
    styles.setProperty(Styles.KEY_VISIBILITY, "-oxy-collapse-text");
}

return styles;
}

If the execution of the formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries); line consumes too much execution time (for example, if it connects to a database or if it needs to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called lazy evaluation and can be implemented as follows:

formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, new LazyValue<List<CIValue>>() {
    public java.util.List<CIValue> get() {
        // We avoid reading the possible values until they are actually requested.
        // This will be a List with CIValues created over countries:
        France, Spain, Great Britain
        return readCountriesFromFile();
    }
});
The lazy evaluation approach can be used for the following form controls properties:

- InplaceEditorArgumentKeys.PROPERTY_VALUES
- InplaceEditorArgumentKeys.PROPERTY_LABELS
- InplaceEditorArgumentKeys.PROPERTY_TOOLTIPS

The full source code for this example is available inside the Oxygen SDK.

**Dynamically Modify the Content Inserted by the Author**

**Question**

Is there a way to insert typographic quotation marks instead of double quotes?

**Answer**

By using the API you can set a document filter to change the text that is inserted in the document in Author mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```java
authorAccess.getDocumentController().setDocumentFilter(new AuthorDocumentFilter() {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText(ro.sync.ecss.extensions.api.AuthorDocumentFilterBypass, int, java.lang.String)
     */
    @Override
    public void insertText(AuthorDocumentFilterBypass filterBypass, int offset, String toInsert) {
        if (toInsert.length() == 1 && "".equals(toInsert)) { // User typed a quote but he actually needs a smart quote.
            // So we either have to add \u201E (start smart quote)
            // Or we add \u201C (end smart quote)
            // Depending on whether there's already a start smart quote inserted in the current paragraph.
            try {
                AuthorNode currentNode = authorAccess.getDocumentController().getNodeAtOffset(offset);
                int startOfTextInCurrentNode = currentNode.getStartOffset();
                if (offset > startOfTextInCurrentNode) {
                    Segment seg = new Segment();
                    authorAccess.getDocumentController().getChars(startOfTextInCurrentNode,
```

offset - startOfTextInCurrentNode, seg);  
String previosTextInNode = seg.toString();

    boolean insertStartQuote = true;

    for (int i = previosTextInNode.length() - 1; i >= 0; i--) {
        char ch = previosTextInNode.charAt(i);
        if ('\u201C' == ch) {
            //Found end of smart quote, so yes, we should insert a start one
            break;
        } else if ('\u201E' == ch) {
            //Found start quote, so we should insert an end one.
            insertStartQuote = false;
            break;
        }
    }

    if (insertStartQuote) {
        toInsert = "\u201E";
    } else {
        toInsert = "\u201C";
    }

    try {
        super.insertText(filterBypass, offset, toInsert);
    } catch (BadLocationException e) {
        e.printStackTrace();
    }

    System.err.println("INSERT TEXT |" + toInsert + "|");
}

You can find the online Javadoc for AuthorDocumentFilter API here: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorDocumentFilter.html

An alternative to using a document filtering is the use of a ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).

**Extend the Java Functionality of an Existing Framework (Document Type)**

**Question**

How can I change the way a DocBook 4 `<xref>` displays in Author mode based on what element is at the `@linkend`?
Answer

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Editor classes:

   ```xml
   <dependency>
     <groupId>com.oxygenxml</groupId>
     <artifactId>oxygen-sdk</artifactId>
     <version>${oxygen.version}</version>
   </dependency>
   ```

   where `${oxygen.version}` is the version of Oxygen XML Editor.

   Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the `{OXYGEN_INSTALL_DIR}\frameworks\docbook\docbook.jar` to the class path of the project.

4. For your custom resolver implementation you can start from the Java sources of the `ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver` (the Java code for the entire DocBook customization is present in a subfolder in the Oxygen SDK).

5. Pack your extension classes in a JAR (on page 2644) file. Copy the JAR to:

   `{OXYGEN_INSTALL_DIR}\frameworks\docbook\custom.jar`.

7. Open the Preferences dialog box (Options > Preferences) (on page 72) and go to Document Type Association. Edit the DocBook 4 document type. In the Classpath list add the path to the new JAR. In the extensions list select your custom extension instead of the regular DocBook one.

8. You can rename the document type and the docbook framework folder to something else (such as `custom_docbook`) and share it with others. A document type can also be installed using the add-on support (on page 1817).

Impose Custom Options for Authors

Question

How to enable Track Changes (on page 2648) at startup?

Answer

There are two ways to enable Track Changes for every document that you open:

1. You could customize the default options (on page 237) that are used by your authors and set the Track Changes - Initial State option (on page 125) to Always On.

2. Use an API to toggle the Track Changes state after a document is opened in Author mode:

   ```java
   // Check the current state of Track Changes
   ```
boolean trackChangesOn = authorAccess.getReviewController().isTrackingChanges();
if (!trackChangesOn) {
    // Set Track Changes state to On
    authorAccess.getReviewController().toggleTrackChanges();
}

**Insert an Element with all the Required Content**

**Question**
I am inserting a DITA `image` element using the API that points to a certain resource and has required content. Can the required content be automatically inserted by the application?

**Answer**
The API `ro.sync.ecss.extensions.api.AuthorSchemaManager` can propose valid elements that can be inserted at the specific offset. Using the method `AuthorSchemaManager.createAuthorDocumentFragment(CIElement)`, you can convert the proposed elements to *document fragments* (on page 2643) (which have all the required content filled in) that can then be inserted in the document.

```java
AuthorSchemaManager schemaManager =
    this.authorAccess.getDocumentController().getAuthorSchemaManager();

WhatElementsCanGoHereContext context =
    schemaManager.createWhatElementsCanGoHereContext(
        this.authorAccess.getEditorAccess().getCaretOffset());

List<CIElement> possibleElementsAtCaretPosition =
    schemaManager.whatElementsCanGoHere(context);

loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
    CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
    List<CIAttribute> attrs = possibleElement.getAttributes();
    if (attrs != null) {
        for (int j = 0; j < attrs.size(); j++) {
            CIAttribute ciAttribute = attrs.get(j);
            if (ciAttribute.getName().equals("class")) {
                if (ciAttribute.getDefaultValue() != null
                        && ciAttribute.getDefaultValue().contains("  topic/image ")) {
                    //Found a CIElement for image
                    //Create a fragment that contains all required child elements already built.
                    AuthorDocumentFragment frag =
                        schemaManager.createAuthorDocumentFragment(possibleElement);
                    //Now set the @href to it.
                    //Ask the user and obtain a value for the @href
                    //Then:
```
String href = "test.png";
List<AuthorNode> nodes = frag.getContentNodes();
if (!nodes.isEmpty()) {
    AuthorElement imageEl = (AuthorElement) nodes.get(0);
    imageEl.setAttribute("href", new AttrValue(href));
}
//And insert the fragment.
this.authorAccess.getDocumentController().insertFragment((this.authorAccess.getEditorAccess().getCaretOffset(), frag);
break loop;
}
}
}

Modify the XML Content on Open

Question

I have a bunch of DITA documents that have a fixed path the `src` attributes. These paths are not valid and I am trying to move away from this practice by converting it in to relative paths. When an XML document is opened, can I trigger the Java API to change the fixed path to a relative path?

Answer

The Plugins SDK contains a sample plugin type called WorkspaceAccess. Such a plugin is notified when the application starts and it can do what you want in a couple of ways:

1. Add a listener that notifies you when the user opens an XML document. Then if the XML document is opened in the Author visual editing mode you can use the Author API to change attributes:

```java
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
    /**
     * @see WSEditorChangeListener#editorOpened(java.net.URL)
     */
    @Override
    public void editorOpened(URL editorLocation) {
        WSEditor openedEditor = pluginWorkspaceAccess.getCurrentEditorAccess(StandalonePluginWorkspace.MAIN_EDITING_AREA);
```
if(openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {
    WSAuthorEditorPage authPage = (WSAuthorEditorPage) openedEditor.getCurrentPage();
    AuthorDocumentController docController = authPage.getDocumentController();
    try {
        //All changes will be undone by pressing Undo once.
        docController.beginCompoundEdit();
        fixupImageRefs(docController, docController.getAuthorDocumentNode());
    } finally {
        docController.endCompoundEdit();
    }
}

private void fixupImageRefs(AuthorDocumentController docController, AuthorNode authorNode) {
    if(authorNode instanceof AuthorParentNode) {
        //Recurse
        List<AuthorNode> contentNodes = ((AuthorParentNode)authorNode).getContentNodes();
        if(contentNodes != null) {
            for(int i = 0; i < contentNodes.size(); i++) {
                fixupImageRefs(docController, contentNodes.get(i));
            }
        }
    }
    if(authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement elem = (AuthorElement) authorNode;
        if("image".equals(elem.getLocalName())) {
            if(elem.getAttribute("href") != null) {
                String originalHref = elem.getAttribute("href").getValue();
                URL currentLocation = docController.getAuthorDocumentNode().getXMLBaseURL();
                //TODO here you compute the new href.
                String newHref = null;
                docController.setAttribute("href", new AttrValue(newHref), elem);
            }
        }
    }
}
2. An API to open XML documents in the application:

```java
ro.sync.exml.workspace.api.Workspace.open(URL)
```

So you can create a plugin that automatically opens XML documents one at a time from a certain folder in the application, makes modifications to them, and saves the content by calling:

```java
ro.sync.exml.workspace.api.editor.WSEditorBase.save()
```

then closes the editor by calling:

```java
ro.sync.exml.workspace.api.Workspace.close(URL)
```

Modifying the XML Content on Save

**Question**

Is it possible to get Oxygen XML Editor to update the revised date on a DITA document when it is saved?

**Answer**

The Plugins SDK contains a sample plugin type called `WorkspaceAccess`. Such a plugin is notified when the application starts.

You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the Author visual editing mode you can use the Author API to change attributes before the save takes place:

```java
@override
public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener
    (new WSEditorChangeListener() {
        //An editor was opened
        @Override
        public void editorOpened(URL editorLocation) {
            final WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
            if (editorAccess != null) {
                editorAccess.addEditorListener
                (new ro.sync.exml.workspace.api.listeners.WSEditorListener() {
                    //Editor is about to be saved
                    @Override
                    public boolean editorAboutToBeSavedVeto(int operationType) {
                        if (EditorPageConstants.PAGE_AUTHOR.equals(editorAccess.getCurrentPageID())) {
                            WSAuthorEditorPage authorPage = (WSAuthorEditorPage) editorAccess.getCurrentPage();
                            return false;
                        }
                        return true;
                    }
                });
            }
        }
    });
}
```
AuthorDocumentController controller =
authorPage.getDocumentController();

try {
    //Find the revised element
    AuthorNode[] nodes = controller.findNodesByXPath
("//revised", true, true, true);
    if(nodes != null && nodes.length > 0){
        AuthorElement revised = (AuthorElement) nodes[0];
        //Set the modified attribute to it...
        controller.setAttribute("modified",
        new AttrValue(new Date().toString()), revised);
    }
    }
} catch (AuthorOperationException e) {
    e.printStackTrace();
}

//And let the save continue..
return true;
}};

}, PluginWorkspace.MAIN_EDITING_AREA);

Multiple Rendering Modes for the Same Document in Author Mode

Question

How can I add multiple buttons, each showing a different visualization mode of the same document in Author mode?

Answer

In the toolbar in Author mode, there is a Styles drop-down menu that contains alternate CSS styles (on page 2641) for the same document. To add an alternate CSS stylesheet, open the Preferences dialog box (Options > Preferences) (on page 72), go to Document Type Association, select the document type associated with your documents and click Edit. In the Document Type configuration dialog box (on page 87) that appears, go to the Author tab, and in the CSS subtab add references to alternate CSS stylesheets.

For example, one of the alternate CSS stylesheets offered for the DITA document type is located here (by default):

[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideColspec.css

If you open it, you will see that it imports the main CSS (on page 2645) and then adds selectors of its own.
Obtain a DOM Element from AuthorNode or AuthorElement

**Question**

Can a DOM Element be obtained from an AuthorNode or an AuthorElement?

**Answer**

No, a DOM Element cannot be obtained from an AuthorNode or an AuthorElement. The AuthorNode structure is also hierarchical but the difference is that all the text content is kept in a single text buffer instead of having individual text nodes.

There is an image in the Javadoc documentation that explains this situation: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/node/AuthorDocumentFragment.html

Obtain the Currently Selected Element Using the Author API

**Question**

In Author mode, if an element is fully selected, I want to perform an action on it. If not, I want to perform an action on the node that is located at the cursor position. Is this possible via the API?

**Answer**

When an element is fully selected by the user the selection start and end offsets are actually outside of the node's offset bounds. So using `AuthorDocumentController.getNodeAtOffset` will actually return the parent of the selected node. A special API is available that makes it easier for you to determine this situation: `WSAuthorEditorPageBase.getFullySelectedNode()`.

```java
AuthorDocumentController controller = authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();
int caretOffset = authorAccess.getEditorAccess().getCaretOffset();

AuthorElement nodeAtCaret = (AuthorElement) authorAccess.getEditorAccess().getFullySelectedNode();
if (nodeAtCaret == null) {
    // We have no fully selected node. We can look at the cursor offset.
    nodeAtCaret = (AuthorElement) authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    // Or we could look at the selection start and end, see which node is the parent of each offset and get the closest common ancestor.
}
```

Open a Document in Oxygen from Another Application

⚠️ **Restriction:** This feature is currently only available for Mac OS X users.
The Oxygen XML Editor installation kit for Mac OS X comes with a special protocol handler that can be used if you want to open remote resources in the application (for example, opening a file from a CMS). The protocol is **edit-in-oxygen** and you can use it from a command line like this:

```
open edit-in-oxygen:protocol://host/path/file.xml
```

For example, if you start the following from the command line:

```
```

Oxygen XML Editor will start and open the HTML content from the URL `http://www.oxygenxml.com/index.html`.

**Tip:** You can also use anchors on the URL to point to specific lines or elements inside the open document: **Opening a Document at a Specific Location Using a Command-Line Interface (on page 300)**.

### Run XSLT or XQuery Transformations

**Question**

Can I run XSL 2.0 / 3.0 transformation with Saxon EE using the Oxygen SDK?

**Answer**

The API class `ro.sync.exml.workspace.api.util.XMLUtilAccess` allows you to create an XSLT Transformer that implements the JAXP interface `javax.xml.transform.Transformer`. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an `AuthorAccess` API available:

```java
InputSource is = new org.xml.sax.InputSource
(URLUtil.correct(new File("test/personal.xsl"))).toString();
    xslSrc = new SAXSource(is);
    javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer
(xslSrc, null, AuthorXMLUtilAccess.TRANSFORMER_SAXON_ENTERPRISE_EDITION);
    transformer.transform(new StreamSource(new File("test/personal.xml")),
new StreamResult(new File("test/personal.html")));
```

If you want to create the transformer from the plugin side, you can use this method instead: `ro.sync.exml.workspace.api.PluginWorkspace.getXMLUtilAccess()`.

### Save a New Document with a Predefined File Name Pattern

**Question**

Is it possible to get Oxygen XML Editor to automatically generate a file name comprising a UUID plus file extension using the SDK?

**Answer**

This could be done implementing a **plugin (on page 2646)** for Oxygen XML Editor using the **Plugins SDK**.
There is a type of plugin called Workspace Access that can be used to add a listener to be notified before an opened editor is saved. The implemented plugin would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```java
private static class CustomEdListener extends WSEditorListener{
    private final WSEditor editor;
    private final StandalonePluginWorkspace pluginWorkspaceAccess;
    private boolean saving = false;

    public CustomEdListener(StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {
        this.pluginWorkspaceAccess = pluginWorkspaceAccess;
        this.editor = editor;
    }

    @Override
    public boolean editorAboutToBeSavedVeto(int operationType) {
        if(! saving &&
                editor.getEditorLocation().toString().contains("Untitled")){
            File chosenDir = pluginWorkspaceAccess.chooseDirectory();
            if(chosenDir != null) {
                final File chosenFile =
                        new File(chosenDir, UUID.randomUUID().toString() + ".dita");
                SwingUtilities.invokeLater(new Runnable() {
                    @Override
                    public void run() {
                        try {
                            saving = true;
                            editor.saveAs(new URL(chosenFile.toURI().toASCIIString()));
                        } catch (MalformedURLException e) {
                            e.printStackTrace();
                        }
                        finally {
                            saving = false;
                        }
                    }
                });
            }
            //Reject the original save request.
            return false;
        }
        return true;
    }
```
@Override
public void applicationStarted(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
        @Override
        public void editorOpened(URL editorLocation) {

            final WSEditor editor = pluginWorkspaceAccess.getEditorAccess(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);

            if (editor != null && editor.getEditorLocation().toString().contains("Untitled")) {

                //Untitled editor
                editor.addEditorListener(new CustomEdListener(pluginWorkspaceAccess, editor));
            }
        }
    }, PluginWorkspace.MAIN_EDITING_AREA);

    ................................................

Split Paragraph on Enter (Instead of Showing Content Completion List)

**Question**

Is it possible to split the paragraph on **Enter** instead of showing the content completion list?

**Answer**

Yes, it is possible by creating your own custom operation.

To obtain this behavior, follow this procedure:

1. Create a custom Author mode operation *(on page 1947)* that handles the split. You can use the **AuthorDocumentController.split** API to achieve this.
2. Create a JAR library that contains its compiled version.
3. Open the *Preferences* dialog box *(Options > Preferences) *(on page 72)*, go to Document Types Association, and select your framework.
4. Click *Edit* and in the Document Type configuration dialog box *(on page 87)*, go to the Classpath tab *(on page 91)* and add a reference to the JAR library for your custom operation.
5. Go to the Author tab, then go to the Actions subtab.
6. Click the  **New** button and use the Action dialog box *(on page 93)* to create your own paragraph split action.
7. Make sure you assign **Enter** as the Shortcut Key and specify your custom operation in the Operations section.
Result: Now, when you press Enter, your Java operation will be invoked to split the paragraph instead of opening the Content Completion Assistant.

Tip: The Content Completion Assistant can still be invoked by using the Ctrl+Space keyboard shortcut.

Use Custom Rendering Styles for Entity References, Comments, or PIs

Problem

Is there a way to display entity references in the Author mode without the distinct gray background and tag markers?

Solution

There is a built-in CSS stylesheet in the Oxygen XML Editor libraries that is used when styling content in the Author mode, no matter what CSS you use. This CSS has the following content:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
    display:block !important;
}

oxy|cdata {
    display:morph !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|processing-instruction {
    display:block !important;
    color: rgb(139, 38, 201) !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|comment {
    display:morph !important;
}
color: rgb(0, 100, 0) !important;
background-color: rgb(255, 255, 210) !important;
white-space: pre-wrap !important;
border-width: 0px !important;
margin: 0px !important;
padding: 0px !important;
}

oxy|reference:before,
oxy|entity[href]:before{
    link: attr(href) !important;
    text-decoration: underline !important;
    color: navy !important;

    margin: 2px !important;
    padding: 0px !important;
}

oxy|reference:before {
    display: morph !important;
    content: url(../images/editContent.gif) !important;
}

oxy|entity[href]:before{
    display: morph !important;
    content: url(../images/editContent.gif) !important;
}

oxy|reference,
oxy|entity {
    editable: false !important;
    background-color: rgb(240, 240, 240) !important;
    margin: 0px !important;
    padding: 0px !important;
}

oxy|reference {
    display: morph !important;
}

oxy|entity {
    display: morph !important;
}
In the CSS used for rendering the XML in **Author** mode, do the following:
1. Import the special **Author** mode namespace.
2. Use a special selector to customize the `entity` node.

**Example:**

```xml
@namespace oxy url('http://www.oxygenxml.com/extensions/author');

oxy|entity {
    background-color: inherit !important;
    margin: 0px !important;
    padding: 0px !important;
    -oxy-display-tags:none;
}
```

You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and `CData` sections. You can also customize the way `<xi:include>` elements are rendered.
19. Add-ons

Oxygen XML Editor offers various default add-ons (on page 2646) that can be installed to provide additional functionality to Oxygen XML Editor. Some additional community submissions are also available, although community add-ons are not officially supported or endorsed. For more information see the Oxygen XML SDK Add-on Repositories web page.

This chapter contains information about the default add-ons that are available to install directly from Oxygen XML Editor.

To install one of the default add-ons, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the add-on you want to install and click Next.
4. Restart the application.

Batch Converter Add-on

Oxygen XML Editor offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats. You can convert between the following formats:

- HTML to XHTML
- HTML to DITA
- Markdown to XHTML
- Markdown to DITA
- XML to JSON
- JSON to XML
- HTML to DocBook4
- HTML to DocBook5
- Markdown to DocBook4
- Markdown to DocBook5
- Excel to DITA

To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the **Batch Converter** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** A **Batch Converter** submenu will now be available in the **Tools** menu and in the contextual menu of the **Project** view. This submenu will contain a list of the various types of available conversions. Selecting one of the types of conversions will open a dialog box where you can configure options for the conversion.

For more information, see the details for this **Batch Converter** add-on in GitHub.

---

**CGM Image Support Add-on**

Oxygen XML Editor offers two add-ons that provide experimental support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste [https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml) in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **Oxygen CGM support** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** You should be able to see CGM images in **Author** mode.

For more information, see the details about this **CGM Support** add-on in GitHub.

---

**Alternate Method Using the ISOView Active X Component**

⚠️ **Restriction:** This support will only work on 32-bit versions of Oxygen XML Editor.

If you already have the **ISOView Active X** component for Internet Explorer installed, you may want to use it to render CGM images instead of the components provided in the plugin described above.

To use your existing **ISOView Active X** component to render CCM images, follow these steps:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste [https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml](https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml) in the **Show add-ons from** field or select it from the drop-down menu.
3. Select **CGM Form control (Active X-based)** plugin and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

6. The **CGM Form Control** plugin automatically renders CGM files in DITA, DocBook, and XHTML, so for those **frameworks**, this step is not necessary. For other **frameworks (on page 2643)**, modify your CSS according to your particular **framework**.

If you have an XML:
You need a CSS rule like this:

```css
image[href$=".cgm"],
image[href$=".CGM"]{
    content: oxy_editor(
        saHeavyFormControlClassName , "com.oxygenxml.activex.fctrl.ActiveXFormControl",
        href, oxy_url(oxy_base-uri(), attr(href)));
}
```

**Result:** After performing these steps, you should now be able to see CGM images in Author mode.

## Content Fusion Connector Add-on

Oxygen XML Editor includes an **Oxygen Content Fusion Connector** add-on that comes bundled and pre-installed. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to virtually any type of workflow that a collaborative team may use for their documentation review process. The add-on provides access to the ![Show Content Fusion Tasks Manager](image) toolbar button. Clicking this button will open the **Content Fusion Tasks Manager** view where you can create tasks, manage them, attach documents, and upload them to the **Content Fusion** server. You can also go to **Window > Show View > Content Fusion Tasks Manager** to open the view. If the button is not displayed on the toolbar or the view is not listed in the **Show View** menu, see **Re-installing the Content Fusion Connector Add-on**.

To fully take advantage of all of the benefits and features, your organization will need an **Oxygen Content Fusion Enterprise Server**. This solution allows you to host, setup, and configure your own server and control your data. With this model, you are also able to upload custom frameworks and plugins, and to configure various settings. It is possible to evaluate **Content Fusion** free of charge, for a limited time. For more information, see the **Oxygen Content Fusion website**.

For more information about using **Content Fusion** in Oxygen XML Editor, see the **Oxygen Content Fusion User Guide**.

## DITA Prolog Updater Add-on

Oxygen XML Editor offers an add-on that contributes a preferences page (**Options > Preferences > Plugins > DITA Prolog Updater**) that includes various options for updating the **prolog** section of a DITA topic or map.

### Installing the Add-on

To install it the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste **https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml** in the **Show add-ons from** field or select it from the drop-down menu.
3. Select the **DITA Prolog Updater** add-on and click **Next**.
4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.
5. Restart the application.

**Result:** The **DITA Prolog Updater** preferences page will now be available in **Options > Preferences > Plugins**.

### DITA Prolog Updater Preferences Page

The contributed preferences page includes the following general options:

**Author**

Specifies the name of the author. By default, it is the system user name.

**Date format**

Specifies the format of the date that will be added in the prolog section. If the date format entered is invalid, the **yyy/MM/dd** format is used by default.

These options are followed by the following options that can be set for DITA topics or maps (or both):

**Enable automatic prolog update on save**

When this option is selected, the prolog is updated anytime the document is saved.

**Set creator name**

When this option is selected, the author is set as the document's **creator** in the prolog when the document is saved. This option is only applicable for new documents.

**Set created date**

When this option is selected, a **created date** is added to the prolog when the document is saved. This option is only applicable for new documents.

**Update contributor names**

When this option is selected, the author is set as a **contributor** in the prolog when the document is saved. This option is only applicable for already existing documents.

**Update revised dates**

When this option is selected, a **revised date** is added to the prolog when the document is saved. This option is only applicable for already existing documents.

For more information, see the [details for this DITA Prolog Updater add-on in GitHub](https://github.com/). 

### DITA-OT 3.x Publishing Engine Add-on

Oxygen XML Editor offers an add-on that contributes an option in the **DITA** preferences page (**Options > Preferences > DITA**) to provide the ability to publish DITA content using DITA-OT 3.x, by default.

To install it the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA-OT 3.x Publishing Engine add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: The DITA preferences page will now include a radio button where you can select DITA-OT 3.x as the default publishing engine.

For more information, see the details for this DITA-OT 3.x Publishing Engine add-on in GitHub.

DITA Outgoing References View Add-on

Oxygen XML Editor offers an add-on that contributes a DITA References side view that shows all outgoing references for the current DITA topic. The view is available in both Text and Author modes. The types of references that are presented in this view include:

- Image references (referenced with an @href or @keyref attribute)
- References to other media resources (DITA objects pointing to video, audio, or embeddable frames)
- Cross references (referenced in an <xref> element with an @href or @keyref attribute)
- Key references (referenced with a @keyref attribute)
- Content references (referenced with a @conref or @conkeyref attribute)
- Related links (referenced with an @href or @keyref attribute)
- Related links defined in relationship tables

This side-view is synchronized with the main editor to make it easy to locate a reference in the current document. It also includes contextual menu actions for opening the target of an outgoing reference or showing its definition location. You can also double-click a reference to open its target.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://raw.githubusercontent.com/oxygenxml/oxygen-dita-outgoing-references-view/master/build/addon.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DITA Outgoing References View add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: The DITA References side-view will now be available.

For more information, see the details for this DITA Outgoing References View add-on in GitHub.
DITA Translation Package Builder Add-on

Oxygen XML Editor offers an add-on that contributes contextual menu actions that help you build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the Translation Package Builder add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: A Translation Package Builder submenu will now be available in the contextual menu of the DITA Maps Manager. This submenu includes actions to generate a package of modified files that can be sent to translators, as well as an action to extract translated files back into your DITA project.

For more information, see the details for this Translation Package Builder add-on in GitHub.

DocBook Checker Add-on

Oxygen XML Editor offers an add-on that allows you to validate DocBook files. It reports issues such as broken internal and external links, problems with images, or profiling conditions that conflict with profiling preferences.

To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the DocBook Checker add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: A Check DocBook for Completeness action will now be available on the toolbar and in the contextual menu. This action opens a dialog box that offers various validation options for running a completeness check on the current DocBook document.

For more information, see the details for this DocBook Checker add-on in GitHub.

Embed Images Add-on

Oxygen XML Editor offers an add-on that contributes a contextual menu action to embed all images referenced in a DITA, DocBook, or XHTML document as base 64 encoded. This is helpful if you want to
transfer a document with image references over media designed to deal with textual data (for example, uploading as a blog post or sending via email) and you want to ensure the data remains intact.

To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://raw.githubusercontent.com/oxygenxml/oxygen-embed-images/master/addon.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select the Oxygen Embed Images add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: An Embed all referenced images as Base64-encoded action will now be available in the contextual menu when editing DITA, DocBook, or XHTML documents in Author mode.

Excel XLSX Libraries Add-on

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Editor needs additional libraries from the Apache POI project. Oxygen XML Editor offers an add-on that provides this support.

To add this support, follow this procedure:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the Show add-ons from field or select it from the drop-down menu.
3. Select Excel XLSX libraries add-on and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: You can now use the Import wizard (on page 1734) to import data from Excel 2007 or newer.

Related Information:
- Exporting XML Content to Excel (on page 482)

Git Support Add-on

Oxygen XML Editor offers an add-on that contributes a built-in Git client directly into Oxygen XML Editor. Once this add-on is installed, a Git Staging view is available that includes various actions that perform common Git commands, such as push, pull, change branch, commit, and more. It also includes a built-in tool for comparing and merging changes.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.

3. Select the **Git Support (Experimental)** add-on and click **Next**.

4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.

5. Restart the application.

**Result:** A **Git Staging** view will now be available in Oxygen XML Editor. If it is not visible, go to **Window > Show View** and select **Git Staging**. This view acts as a basic Git client integrated directly into Oxygen XML Editor and it provides support for committing changes to a Git repository, comparing and merging changes, and other Git commands.

For more information, see the details for this **Git Support** add-on in GitHub.

### ICU4J Library Add-on

Oxygen XML Editor offers an add-on that provides the entire **ICU4J** JAR library used for sorting and collations with XSLT processors. The Saxon 9 XSLT processor has an `<xsl:sort>` element that can be used to sort elements based on their text content. If the XML elements contain text in exotic languages, Saxon needs a more powerful sort algorithm and this JAR library adds this capability.

To install it the add-on, follow these instructions:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.

2. Enter or paste `https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml` in the **Show add-ons from** field or select it from the drop-down menu.

3. Select the **Contribute ICU4J Library** add-on and click **Next**.

4. Select the **I accept all terms of the end user license agreement** option and click **Finish**.

5. Restart the application.

**Result:** The ICU4J library is now contributed to the **Oxygen** installation directory.

For more information, see the details for this **Contribute ICU4J Library** add-on in GitHub.

### Oxygen Emmet Plugin

An **Oxygen Emmet Plugin** is available as an add-on and it provides the means for high-speed coding and editing in **Text** mode or **Author** mode via a content assistance mechanism. It can be used for HTML, XSL, and other XML formats. For example, with the Emmet add-on installed, you can type abbreviations (similar to CSS selectors) and expand them into full-fledged HTML code. The add-on contributes a submenu named **Emmet** in the contextual menu and it contains actions for expanding abbreviations or wrapping content with an expanded abbreviation. The two actions can also be invoked using the **Alt + Shift + E (Ctrl + Shift + E on OS X)** or **Alt + Shift + W (Ctrl + Shift + W on OS X)** keyboard shortcuts.

To install this add-on, follow this procedure:
1. Go to Help > Install new add-ons to open an add-on selection dialog box.

2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.

3. Select Oxygen Emmet Plugin add-on and click Next.

4. Select the I accept all terms of the end user license agreement option and click Finish.

5. Restart the application.

Result: The Emmet actions will now be available using the keyboard shortcuts or in the Emmet submenu (located in the contextual menu of Text mode or Author mode).

Emmet Actions

The two contributed actions are:

**Expand abbreviation [Alt + Shift + E (Ctrl + Shift + E on OS X)]**

In Text mode, after entering an abbreviation, invoking this action will expand a valid abbreviation into a code snippet, depending on the document type.

In Author mode, invoking the action opens a dialog box where you can enter an abbreviation. After you click OK, a valid abbreviation is expanded into a code snippet, depending on the document type.

**Wrap with abbreviation [Alt + Shift + W (Ctrl + Shift + W on OS X)]**

It opens a dialog box where you can enter an abbreviation and after clicking OK, the abbreviation is expanded with the selected content added in the last element of the generated snippet.

Abbreviation Expansion Examples

Here are some examples for HTML:

- **Expand abbreviation example:**
  
  ```html
  #page>div.logo+ul#navigation>li*5>a{Item $}
  ```
  
  is expanded into:

  ```html
  <div id="page">
    <div class="logo"></div>
    <ul id="navigation">
      <li><a href="">Item 1</a></li>
      <li><a href="">Item 2</a></li>
      <li><a href="">Item 3</a></li>
      <li><a href="">Item 4</a></li>
      <li><a href="">Item 5</a></li>
    </ul>
  </div>
  ```

- **Wrap with abbreviation example:**
  
  If the following content is selected to be wrapped:
You can also use Emmet abbreviations for other XML documents. Here are some examples of expanded abbreviations for DITA:

- prolog>author {AuthorName}
  is expanded into:
  
  ```xml
  <prolog>
    <author>AuthorName</author>
  </prolog>
  ```

- simpletable>(strow>stentry*4)*4
  is expanded into a 4x4 simple table.

- ul>li*3
  is expanded into an unordered list with 3 list items.

- ol>li[id="item$"]*3
  is expanded into:
  
  ```xml
  <ol id="ol_gff_bjd_mkb">
    <li id="item1"/>
    <li id="item2"/>
    <li id="item3"/>
  </ol>
  ```

**Tip:** To see more examples of Emmet syntax, go to [https://docs.emmet.io/cheat-sheet/](https://docs.emmet.io/cheat-sheet/).

**Related Information:**
- Emmet Syntax Cheat Sheet
PDF Image Rendering Add-on

Starting with Oxygen XML Editor version 20.0, PDF images are rendered in Author mode and PDF output. For previous versions, they are not rendered by default. However, Oxygen XML Editor does provide an add-on that contributes the Apache PDFBox library to offer support for rendering of PDF images.

Installing the PDF Image Rendering Add-on

Oxygen XML Editor offers an add-on that contributes the Apache PDFBox library for you. To install this add-on, follow these steps:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select the PDF Image Rendering add-on and click Next.
4. Select the I accept all terms of the end-user license agreement option and click Finish.
5. Restart the application.

Result: The Apache PDFBox libraries are now contributed to the Oxygen installation directory and you should be able to see PDF images in Author mode.

For more information, see the details about this PDF Image Rendering add-on in GitHub.

Saxon XSLT and XQuery Transformer Add-on

Oxygen XML Editor offers an add-on that installs an external Saxon XSLT and XQuery processor and allows you to validate and transform XSLT and XQuery documents with that external processor. The default add-on update site includes versions for Saxon 9.6, 9.7, 9.8, and 9.9.

To install it the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Enter or paste https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml in the Show add-ons from field or select it from the drop-down menu.
3. Select one of the versions of the Saxon XSLT and XQuery Transformer add-on (9.6, 9.7, 9.8, or 9.9) and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: When you configure the validation or transformation scenario, you will now have the option to choose the particular Saxon transformer.

Restriction: Debugging XSLT/XQuery transformations based on this engine is NOT supported.
XSpec Helper View Add-on

Oxygen XML Editor offers an add-on that contributes an XSpec Test Results view, that provides the ability to run XSpec test scenarios and view the results directly in the application.

To install the add-on, follow these instructions:

1. Go to Help > Install new add-ons to open the add-on selection dialog box.
2. Paste https://www.oxygenxml.com/InstData/Addons/community/updateSite.xml in the Show add-ons from field (or select it from the drop-down menu).
3. Select the XSpec Helper View and XSpec Framework add-ons (both are required), and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

The add-on contributes a Run XSpec test scenarios button on the main toolbar. Click that button to execute an XSpec file and open its results in the XSpec Test Results view. At this point you can do the following:

- Switch to the XSLT and use the Run buttons in this view to execute a particular scenario.
- For each test, there is also a Show button that selects the corresponding test in the main editing area.
- For failed tests, you can click a particular test to open a diff comparison between the expected and actual results.

For more information, see the details for this Oxygen XSpec Helper View add-on in GitHub.
20.

Tools

Oxygen XML Editor includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the Tools menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional Find/Replace tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized XML Refactoring tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The XML Refactoring tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the XML Refactoring action from one of the following locations:

- The Tools menu.
- The Refactoring submenu from the contextual menu in the Project view (on page 316).
- The Refactoring submenu from the contextual menu in the DITA Maps Manager view (on page 2381).

Note: The built-in refactoring operations are also available from the Refactoring submenu in the contextual menu of Author or Text mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (on page 707) or previewed (on page 707) also appear in the Refactoring submenu of the contextual menu in the Project view and the DITA Maps Manager.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

- Refactoring operations
The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

**Figure 568. XML Refactoring Wizard**

![XML Refactoring Wizard](image)

**Configure Operation Parameters**

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Figure 569. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Figure 570. XML Refactoring - Scope and Filters Wizard Page

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Scope section

In the Scope section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 2643) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 2649).

Filters

The Filters section includes the following options:
• **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.

• **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

• **Look inside archives** - When selected, the resources inside archives will also be affected.

**Preview**

You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

**Finish**

After clicking the Finish button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any Undo action will only revert changes on the current document.

💡 **Troubleshooting:** If an operation fails, a notification will be displayed in the Results panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

💡 **Tip:** If an operation takes longer than expected you can use the Stop button in the progress bar to cancel the operation.

⚠️ **Restriction:** XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

### Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the Refactoring operations wizard page. You can also access the operations from the Refactoring submenu in the contextual menu of Author or Text mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

💡 **Tip:** Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

#### Refactoring Operations for Attributes

- Add/Change attribute
Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**Value**

The value for the affected attribute.

**Options section**

You can choose between one of the following options for the Operation mode:

**Add the attribute in the parent elements where it is missing**

Adds the attribute to all instances of the specified parent element.

**Change the value in the parent elements where the attribute already exists**

Replaces the value of the already existing attribute in all instance of the specified parent element.

**Both**

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

**Convert attribute to element**

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.
**Namespace**

The namespace of the affected attribute.

**New element section**

**Local name**

The local name of the new element.

**Namespace**

The namespace of the new element.

**Delete attribute**

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be deleted.

**Rename attribute**

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

**Element**

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**

The name of the attribute to be renamed.

**New local name**

The new local name of the attribute.

**Replace in attribute value**

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

**Target attribute section**

**Element**

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute**
The name of the attribute to be modified.

**Find / Replace section**

**Find**

The text fragments to find. You can use Perl-like regular expressions.

**Replace with**

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

**Refactoring Operations for Comments**

**Delete comments**

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

**Element**

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:** Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

**Refactoring Operations for DITA**

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS tables to simple tables**

Use this operation to convert DITA CALS tables to simple tables.

**Convert conrefs to conkeyrefs**

Use this operation to convert @conref attributes to @conkeyref attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs (on page 2512).

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2381))**

Use this operation on topics that contain nested <topic> elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2381))**
Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see [Converting DITA Topics to Another Type](on page 2446).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see [Converting DITA Topics to Another Type](on page 2446).

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see [Converting DITA Topics to Another Type](on page 2446).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see [Converting DITA Topics to Another Type](on page 2446).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see [Converting DITA Topics to Another Type](on page 2446).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see [Converting DITA Topics to Another Type](on page 2446).

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

**Filters section**

Include files
Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Look inside archives**

If this option is selected, the scope of the operation will include files inside archives.

**Refactoring Operations for Elements**

**Delete element**

Use this operation to delete elements. This operation requires you to specify the following parameter:

**Element**

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Delete element content**

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

**Element**

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**

Use this operation to insert new elements. This operation allows you to specify the following parameters:

**Element section**

**Local name**

The local name of the element to be inserted.

**Namespace**

The namespace of the element to be inserted.

**Location section**

**XPath**

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any
namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: *After*, *Before*, *First child*, or *Last child*.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

**Local name**

The local name of the *Wrapper element*.

**Namespace**

The namespace of the *Wrapper element*.

**Wrap element content**

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:
Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the Wrapper element that will surround the content of the target.

Namespace

The namespace of the Wrapper element that will surround the content of the target.

Refactoring Operations for Fragments

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment

The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: After, Before, First child, or Last child.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.
Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the target element.

Refactoring Operations for JATSKit

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, or just the Current file.

**Filters section**

- **Include files**
  
  Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

- **Restrict to known XML file types only**
  
  Excludes non-XML file types from the operation.

- **Look inside archives**
  
  If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for Publishing Template

These operations are for those who use Oxygen Publishing Templates for WebHelp Responsive output customization.
Migrate HTML Page Layout Files to v21

Use this operation to convert custom HTML page layout files (on page 1356) that are included in a custom Publishing Template that was created in Oxygen XML Editor version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor version 21.0.

Update HTML Pages

⚠️ Attention: This operation is only used by Oxygen XML Editor and should not be used manually.

Additional Notes

⚠️ Note: There are some operations that allow <ANY> for the local name and namespace parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the <NO_NAMESPACE> value can be used to select nodes that do not belong to a namespace.

⚠️ Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the Options > Preferences > XML > XSLT-FO-XQUERY > XPath (on page 191) page. This preferences page can be easily opened by clicking the link in the note (Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section) at the bottom of the Configure Operation Parameters wizard page.

Custom Refactoring Operations

While Oxygen XML Editor includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An XQuery Update script or XSLT stylesheet that Oxygen XML Editor will run to refactor the XML files.
- An XML Operation Descriptor file that contains information about the operation (such as the name, description, and parameters).
All the defined custom operations are loaded by the XML Refactoring Tool and presented in the Refactoring Operations wizard page (on page 705), along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a safe mode, which implies the following:

- **When loading the document:**
  - The XInclude mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- **When saving the updated XML document:**
  - The DOCTYPE will be preserved.

  **Note:** This can be changed using Saxon extension functions in XSLT (on page 732).
  - The DTD entities will be preserved as they are in the original document when the document is saved.
  - The attribute values will be kept in their original form without being normalized.
  - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:** To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into
account when processing the input XML document since they are discarded when the transformed document is serialized.

⚠️ **Restriction:** Comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method (*on page 732*) to implement the new custom XML refactoring operation.

**Creating a Custom Refactoring Operation**

To create a custom refactoring operation, follow these steps:

1. Create an XQuery Update script (*on page 723*) or XSLT stylesheet file (*on page 727*).
2. Create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (*on page 725*) or XSLT stylesheet (*on page 730*).
3. Store both files in one of the locations that Oxygen XML Editor (*on page 734*) scans when loading the custom operations.

**Result:** Once you run the XML Refactoring tool again, the custom operation appears in the Refactoring Operations wizard page (*on page 705*).

**Related Information:**
- Storing and Sharing Refactoring Operations (*on page 734*)

**Custom Refactoring Script**

The first step in creating a custom refactoring operation is to create an XQuery Update script (*on page 723*) or XSLT stylesheet (*on page 727*) that is needed to process the refactoring operations. The easiest way to create this script file is to use the New document wizard to create a new XQuery or XSLT file and you can use the XQuery method example (*on page 723*) or XSLT method example (*on page 727*) to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script (*on page 723*) or XSLT stylesheet (*on page 727*). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the refactoring operation descriptor file that is associated with this operation.

⚠️ **Note:** The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario (*on page 1279*) and choose Saxon EE as the transformation engine. Also, you need to make sure the Enable XQuery update option is selected in the Saxon processor advanced options (*on page 1234*).
Note: If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the XML/XSLT-FO-XQuery /XPath preferences page.

The next step in creating a custom refactoring operation is to create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (on page 725) or XSLT stylesheet (on page 730).

Related Information:
- XQuery Update Script for Creating a Custom Operation (on page 723)
- XSLT Stylesheet for Creating a Custom Operation (on page 727)

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the New document wizard and choose the XML Refactoring Operation Descriptor template.

Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script (on page 723) or XSLT stylesheet (on page 727) that is associated with the particular operation through the <script> element.

You can specify a category for your custom operations to logically group certain operations. The <category> element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is Other operations.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation Descriptor File.xsd.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the parameters section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the XML Refactoring tool within the Configure Operation Parameters wizard page (on page 706) for that particular operation.

The value of the first <description> element in the <parameters> section will be displayed at the top of the Configure Operation Parameters wizard page.

To declare a parameter, specify the following information:

- label - This value is displayed in the user interface for the parameter.
- name - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- type - Defines the type of the parameter and how it will be rendered. There are several types available:
  - TEXT - Generic type used to specify a simple text fragment.
• **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.

**Note:** The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

**Note:** A relative XPath expression is converted to an absolute XPath expression by adding `//` before it ( `//XPathExp` ). This conversion is done before transferring the XPath expression to the XML refactoring engine.

**Note:** When writing XPath expressions, you can only use prefixes declared in the Options > Preferences > XML > XSLT-FO-XQUERY > XPath (on page 191) options page.

• **NAMESPACE** - Used for editing namespace values.

• **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.

• **REG_EXP_REPLACE** - Used along with **REG_EXP_FIND** to specify the replacement string.

• **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.

• **NC_NAME** - The parameter for NC_NAME values. It is useful when you want to specify the local part of a QName (on page 2647) for an element or attribute.

• **BOOLEAN** - Used to edit boolean parameters.

• **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.

• **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.

• **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
  <value name="lastChild">Last child</value>
</possibleValues>
```

### Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

**elementLocation**

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute

is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `useCurrentContext` attribute is set to true, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```xml
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `label` attributes is displayed in the application as the label of the associated text fields. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to true, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```xml
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
    <description>Element path description.</description>
  </element>
  <attribute label="Attribute">
    <description>Attribute path description.</description>
  </attribute>
</attributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `label` attribute is displayed in the application as label of the associated combo. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `allowsAny` attribute, the application will propose `<ANY>` as a possible value for the `Name` and `Namespace` combo boxes. You can also use the `useCurrentContext` attribute and if its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.
Example of an `<elementParameter>`:

```xml
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

**attributeParameter**

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

**Note:** An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `<attributeParameter>`:

```xml
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

**Note:** All built-in operations are loaded from the `OXYGEN_INSTALL_DIR/refactoring` folder.

- Example of an Operation Descriptor File with an XSLT Stylesheet (on page 730)
- Example of an Operation Descriptor File with an XQuery Update script (on page 725)

**XSLT Stylesheet for Creating a Custom Operation**

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description...
and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 572. Example: Custom XML Refactoring Operation

An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file (on page 730) that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
    version="2.0">

    <xsl:param name="element_localName" as="xs:string" required="yes"/>

```
<xsl:param name="element_namespace" as="xs:string" required="yes"/>
<xsl:param name="attribute_localName" as="xs:string" required="yes"/>
<xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
<xsl:param name="new_element_localName" as="xs:string" required="yes"/>
<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @*">
  <xsl:copy>
    <xsl:apply-templates select="node() | @*"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="/ *[xr:check-local-name($element_localName, ., true())
and
xr:check-namespace-uri($element_namespace, .)]">
  <xsl:variable name="attributeToConvert" select="@*[xr:check-local-name($attribute_localName, ., true())
and
xr:check-namespace-uri($attribute_namespace, .)]"/>
  <xsl:choose>
    <xsl:when test="empty($attributeToConvert)">
      <xsl:copy>
        <xsl:apply-templates select="node() | @*"/>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <xsl:copy>
        <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
          <xsl:copy-of select="."/>
        </xsl:for-each>
      </xsl:copy>
    </xsl:otherwise>
  </xsl:choose>
  <!-- The new element namespace -->
  <xsl:variable name="nsURI" as="xs:string">
    <xsl:choose>
      <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
        <xsl:value-of select="'"/>
      </xsl:when>
      <xsl:otherwise>
        <xsl:value-of select="$new_element_namespace"/>
      </xsl:otherwise>
    </xsl:choose>
  </xsl:variable>
</xsl:template>
**Note:** The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML Catalog (on page 2649) set in the XML Refactoring framework (on page 2643).

### Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
  id="convert-attribute-to-element"
  name="Convert attribute to element">
  <description>Converts the specified attribute to an element. The new element will be inserted as first child of the attribute's parent element.</description>
  <!-- For the XSLT stylesheet option uncomment the following line and comment the line referring the XQuery Update script -->
  <!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
  <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
  <parameters>
    <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
      <elementParameter id="elemID">
        <localName label="Name" name="element_localName" allowsAny="true">
          <description>Local name of the parent element.</description>
        </localName>
        <namespace label="Namespace" name="element_namespace" allowsAny="true">
          <description>Local name of the parent element</description>
        </namespace>
      </elementParameter>
    </section>
  </parameters>
</refactoringOperationDescriptor>
```
Note: If you are using an XSLT file, the line with the `<script>` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor when it loads the custom operation (on page 734). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:
Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script (on page 723) in that refactoring operations can only be performed on comments or processing instructions that are inside the root element. Thus, using the XQuery method, comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

- **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```xml
<!-- comment after root -->
<?pi after root ?>
```
• **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

    The function call `set-content-after-root(' <!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

    ```xml
    <?xml version="1.0" encoding="UTF-8"?>
    <!-- comment before root -->
    <?pi before root ?>
    <root>
        <child>
        </child>
    </root>
    <!-- Inserted comment -->
    </root><!-- Inserted comment -->
    ```

• **get-content-before-root()** - Returns the content before root as `xs:string`.

    For the XML above, the call of this function will return the following string value:

    ```xml
    <?xml version="1.0" encoding="UTF-8"?>
    <!-- comment before root -->
    <?pi before root ?>
    ```

• **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

    The function call `set-content-before-root(' <!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

    ```xml
    <!-- Inserted comment -->
    <root>
        <child>
        </child>
    </root>
    <!-- comment after root -->
    <?pi after root ?>
    ```

**XSLT Example:**

To process content after the root node, the XSLT would look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsi="http://www.w3.org/1999/XSL/Transform"
    xmlns:x=
    <xsl:template match="/">
        <!-- The comment content that will be inserted after the root element -->
        <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->
        </xsl:variable>
        <!-- Retrieve the content after the root element as is -->
        <xsl:variable name="after-root-content" as="xs:string"
            select="xrf:get-content-after-root()"/>
    </xsl:template>
</xsl:stylesheet>
```
<xsl:variable name="processedContent">
        <xsl:value-of select="concat($after-root-content, $commentAsText)"/>
    </xsl:variable>

    <!-- Update the content after the root element -->
    <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>

    <xsl:apply-templates/>
</xsl:template>

<xsl:template match="node() | @*">
    <xsl:copy>
        <xsl:apply-templates select="node() | @*"/>
    </xsl:copy>
</xsl:template>
</xsl:stylesheet>

[Note:] The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

**Storing and Sharing Refactoring Operations**

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A **refactoring** folder, created inside a directory that is associated to a *framework* you are customizing. To associate the parent directory to the framework, you need to add it in the **Classpath** tab of the **Document type** configuration dialog box (*on page 91*).
- A folder that you specify in the **Load additional refactoring operations from** text box (*on page 201*) in the **XML Refactoring** preferences page (*on page 201*).

[Note:] If you share a project with your team, you can also share the custom operation by doing the following:

1. Save the custom operation in a folder that is part of your project.
2. Switch the **XML Refactoring** option page to **project level** (*on page 2647*):
   a. Open the **Preferences** dialog box (**Options > Preferences**) (*on page 72*) and go to **XML > XML Refactoring** (*on page 201*).
   b. Select **Project Options** (*on page 2647*) at the bottom of the dialog box.
3. In the **Load additional refactoring operations from** text box (*on page 201*), use the **${pd}** editor variable (*on page 255*) so that the folder path is declared relative to the project.
- A folder specified by the **XML Refactoring Operations Plugin Extension** (*on page 2022*).
- The **refactoring** folder from the Oxygen XML Editor installation directory (`{OXYGEN_INSTALL_DIR}/refactoring/`).
Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as framework (on page 2643) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in \[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The \(<description>\) of the \(<parameters>\) element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

\${i18n(translation_key)}

Oxygen XML Editor scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactor\ing/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.
- An i18n folder inside any specified folder. In this case, you need to open the Preferences dialog box (Options > Preferences) (on page 72), go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.
- An i18n folder located in directories specified through the XML Refactoring Operations Plugin Extension (on page 2022).
- The refactor\ing/i18n folder from the Oxygen XML Editor installation directory \([OXYGEN_INSTALL_DIR]/refactoring/i18n\).

Example: Refactoring Operation Descriptor File with i18n Support

```xml
<refactoringOperationDescriptor
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
    name="${i18n(Remove_text_content)}">
    <description>${i18n(Remove_text_content_description)}</description>
</refactoringOperationDescriptor>
```
Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page (on page 172).

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the Tools menu. This action is also available in the contextual menu of the schema Design mode (on page 802). The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page (on page 175). You can also run the tool from the command line using exported options.

Schema Tab

The first set of options for the Generate Sample XML Files tool are found in the Schema tab.
This tab includes the following options:

**URL**

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

**Namespace**

Displays the namespace of the selected schema.

**Root Element**

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**

Path to the folder where the generated XML instances will be saved.

**Filename prefix and Extension**

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

**Number of instances**

The number of XML files to be generated.

**Open first instance in editor**

When selected, the first generated XML file is opened in the editor.

**Namespaces section**
You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

**Options Tab**

The **Options** tab allows you to set specific options for namespaces and elements.

**Figure 575. Generate Sample XML Files Dialog Box (Options Tab)**

This tab includes the following options:

**Namespace / Element table**

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces ( `<ANY>` - `<ANY>` ). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

**Settings subtab**
Namespace
Displays the namespace specified in the table at the top of the dialog box.

Element
Displays the element specified in the table at the top of the dialog box.

Generate optional elements
When selected, all elements are generated, including the optional ones (having the minOccurs attribute set to 0 in the schema).

Generate optional attributes
When selected, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

Values of elements and attributes
Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an xs:string with the xs:maxLength facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

**Important**: If all of the following are true, the Generate Sample XML Files tool outputs invalid values:
  - At least one of the restrictions is a regexp.
  - The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions
Allows you to set the preferred number of repeating elements related to minOccurs and maxOccurs facets defined in the XML Schema.

- If the value set here is between minOccurs and maxOccurs, then that value is used.
- If the value set here is less than minOccurs, then the minOccurs value is used.
- If the value set here is greater than maxOccurs, then maxOccurs is used.
Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xs:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xs:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xs:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xs:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xs:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab

The **Advanced** tab allows you to set some options regarding output values and performance.
This tab includes the following options:

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

**Tip:** This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

### Converting Schema to Another Schema Language

The **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses the Trang multiple format converter to perform the actual schema conversions.

To use this tool, select the **Generate/Convert Schema (Alt + Shift + C (Command + Alt + C on OS X))** action from the Tools menu or from the Open with submenu when invoking the contextual menu in the Project view.
This action opens the Generate/Convert Schema dialog box that allows you to configure various options for conversion.

Figure 577. Generate/Convert Schema Dialog Box

The Generate/Convert Schema dialog box includes the following options:

**Input section**

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the XML Documents option and use the file selector to add the XML files involved in the conversion.

**Output section**

Allows you to select the language of the target schema.

**Options**

You can choose the Encoding, the maximum Line width, and the Indent size (in number of spaces) for one level of indentation.

**Output file**

Specifies the path for the output file that will be generated.

**Close dialog when finished**

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

**Advanced options**

If you select XML 1.0 DTD for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:
**XML 1.0 DTD Input section**

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a
  
  @prefix:defaultValue  
  
  annotation attribute where prefix is the specified value and is bound to http://relaxng.org/ns/compatibility/annotations/1.0 as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select W3C XML Schema for the output.
• **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.

• **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `@processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).

• **any-attribute-process-contents** - Specifies the value for the `@processContents` attribute of `<anyAttribute>` elements. The default is skip (corresponding to RELAX NG semantics).

## Converting Database to XML Schema

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.
   
   **Result:** The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources** preferences page (on page 206) where you can configure data sources and connections.

3. In the **Format for generated schema** section, select one of the following formats:
   
   • **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
   
   • **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.
   
   **Result:** The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
   
   a. Select the database column you want to configure.
   
   b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
   
   c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.
   
   **Result:** The database structure is converted to an XML Schema and it is opened for viewing and editing.
Flatten an XML Schema

You can organize an XML schema linked by `<xs:include>` and `<xs:import>` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The Flatten Schema operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the `<xs:include>` and `<xs:import>` statements.

The Flatten Schema action is available from the Tools menu or the contextual menu in Text mode. The action opens the Flatten Schema dialog box that allows you to configure the operation.

Figure 578. Flatten Schema Dialog Box

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

Note: If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the `<xs:include>`, `<xs:redefine>`, and `<xs:override>` elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the Flatten Schema dialog box:

- **File name**
  
The name of the output file.

- **Output directory**
The path of the output directory where the flattened schema file will be saved.

**Open the flattened XML Schema file in editor**

Opens the main flattened schema in the editing area after the operation completes.

**Use the XML Catalogs when collecting the referenced XML Schemas**

Enables the imported and included schemas to be resolved through the available XML Catalogs (on page 2649).

**Note:** Changing this option triggers the recalculation of the dependencies graph for the main schema.

**Process the imported XML Schemas resolved through the XML Catalogs**

Specifies whether or not the imported schemas that were resolved through an XML Catalog (on page 2649) are also processed.

**Flatten the imported XML Schema(s)**

Specifies whether or not the imported schemas are flattened.

**Note:** For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

**Tip:** This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

---

**Compiling an XSL Stylesheet for Saxon**

As of Saxon 9.7, it is possible to export a compiled form of a stylesheet as an XML file (called a stylesheet export file or SEF). Oxygen XML Editor includes a simple tool called Compile XSL Stylesheet for Saxon (found in the Tools menu) that does this for you.

**Use-Cases for a Stylesheet Export File (SEF)**

- **Use Saxon-JS to run transformations in a browser** - A stylesheet export file (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```xml
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
    window.onload = function() {
        SaxonJS.transform({
            stylesheetLocation: "books.sef",
            sourceLocation: "books.xml"
        });
    }
</script>
```
• **Use SEF to run transformations in Oxygen XML Editor** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Editor to apply an XSLT transformation over an XML file. This requires Saxon-EE or Saxon-PE versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file *(on page 785).* When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field *(on page 1215).*

### Compiling an SEF File

The **Compile XSL Stylesheet for Saxon** tool can be found in the **Tools** menu and it compiles a specified stylesheet as an XML file *(stylesheet export file* with a file extension of *.sef*).

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

![Figure 579. Compile XSL Stylesheet for Saxon Dialog Box](image)

This dialog box includes the following options:

**XSL URL**

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

**Target**

Allows you to select the type of Saxon product that the export file will be used with. You can choose Saxon-JS, Saxon-EE, Saxon-PE, or Saxon-HE.

**Relocatable**

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a *relocatable* export package (SEF) that can be deployed to a different location, with a different base URI.

**Output file**

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

**Open in Editor**
Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Editor editing pane.

**Use a configuration file ("-config")**

Select this option if you want to use a Saxon 9.9.1.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

**Compile**

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

**JSON Tools**

Oxygen XML Editor includes some useful tools for converting JSON to and from XML, converting XSD to JSON Schema, and generating JSON instances or a JSON Schema.

**JSON to XML Converter**

Oxygen XML Editor includes a useful and simple tool for converting JSON files to XML. The **JSON to XML** action for invoking the tool can be found in the **Tools > JSON Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **Tools > JSON Tools** menu.

   The **JSON to XML** dialog box is displayed:

   **Figure 580. JSON to XML Dialog Box**

   ![JSON to XML Dialog Box](image)

2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

**Result:** The original JSON document is now converted to an XML document.
Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```json
{
    "personnel": {
        "person": [
            {
                "name": "Boss"
            },
            {
                "name": "Worker"
            }
        ],
        "id": "personnel-id"
    }
}
```

it is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>
    <person>
      <name>Boss</name>
    </person>
  </personnel>
</JSON>
```
If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```json
[
  {"name": "Boss"},
  {"name": "Worker"}
]
```

It is converted to:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
  <array>
    <name>Worker</name>
  </array>
</array>
```

If the name of a JSON property contains characters that are not valid in XML element names (for example, `$`), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```json
{"$id": "personnel-id"}
```

Is converted to:

```xml
<_X24_id>personnel-id</_X24_id>
```

**Online JSON to XML Converter**

For a simple ONLINE tool for converting a single JSON file to XML, or vice versa, go to: [https://www.oxygenxml.com/xml_json_converter.html](https://www.oxygenxml.com/xml_json_converter.html).

**Related Information:**
- XML to JSON Converter (on page 969)

**XML to JSON Converter**

Oxygen XML Editor includes a useful and simple tool for converting XML files to JSON. The XML to JSON action for invoking the tool can be found in the Tools > JSON Tools menu.
To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **Tools > JSON Tools** menu.

   **Step Result:** The **XML to JSON** dialog box is displayed:

   **Figure 582. XML to JSON Dialog Box**

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

**Result:** The original XML document is now converted to a JSON document.

**Figure 583. Example: XML to JSON Operation Result**
Conversion Details

• If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```xml
<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
```

it is converted to:

```json
{
  "personnel": {
    "person": [
      {
        "id": "person.one",
        "name": "Boss"
      },
      {
        "id": "person.two",
        "name": "Worker"
      }
    ]
  }
}
```

• If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a `#text` property with its value set as the text content. If there are multiple text nodes, the subsequent `#text` properties will contain a number (i.e. `#text1`, `#text2`).

```xml
<person>
  <name>Boss <i>One</i>!</name>
</person>
```

is converted to:

```json
{
  "person": { 
    "name": { 
      "#text": "Boss",
```
If the XML document contains element names that contain hexadecimal codes (for example, if they were escaped during a JSON to XML conversion (on page 968)), it will be converted to the normal character value in the converted JSON document.

```xml
 XElement personell-id</XElement>
```

is converted to:

```
{"$id": "personnel-id"}
```

### Online XML to JSON Converter

For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

**Related Information:**
- JSON to XML Converter (on page 967)

### XSD to JSON Schema Converter

Oxygen XML Editor includes a tool for converting an XML Schema file (XSD) to a JSON Schema file. The **XSD to JSON Schema** action for invoking the tool can be found in the **Tools > JSON Tools** menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor and the **XSD to JSON Schema** action will invoke the tool.

To convert an XML Schema (XSD) to a JSON Schema, follow these steps:

1. Select the **XSD to JSON Schema** action from the **Tools > JSON Tools** menu.
   
   **Step Result:** The **XSD to JSON Schema** dialog box is displayed:

   ![XSD to JSON Schema Dialog Box](image)

2. Choose or enter the **XSD URL** of the XML Schema document. The conversion supports XSD versions 1.0 and 1.1.
3. Choose the path for the **Output file**.
4. Select the **Open in Editor** option to open the resulting JSON Schema document in the main editing pane.
5. Click the **Convert** button.

**Result:** The original XSD document is now converted to a JSON Schema document. The resulting JSON Schema will be *draft-07* and will contain:

- The `$id` of the schema, generated from XSD `targetNamespace`.
- The `$definitions` section, which declares complex and *enum* types.
- The `anyOf` section, which lists possible top-level elements as an array of objects.

**Other Possible Results:**

- If an XSD type extends another type, then its schema is combined with the schema of the base type using the `allOf` keyword.
- If an extension in XSD defines an element with the same name as an attribute in the base, a property named `rest` is generated to avoid name conflicts in JSON.
- If a property of a complex type is a collection property, the schema of the collection items will be wrapped in the JSON array schema.

**Conversion Mappings**

The following table lists the specific conversion mapping details.

<table>
<thead>
<tr>
<th>XML Schema Type</th>
<th>JSON Schema Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>anySimpleType</td>
<td>string, number, integer, boolean, null</td>
</tr>
<tr>
<td>anyType</td>
<td>string, number, integer, boolean, null, object, array</td>
</tr>
<tr>
<td>string</td>
<td>string</td>
</tr>
<tr>
<td>normalizedString</td>
<td>string</td>
</tr>
<tr>
<td>token</td>
<td>string</td>
</tr>
<tr>
<td>language</td>
<td>string</td>
</tr>
<tr>
<td>Name</td>
<td>string</td>
</tr>
<tr>
<td>NCName</td>
<td>string</td>
</tr>
<tr>
<td>ID</td>
<td>string</td>
</tr>
<tr>
<td>IDREF</td>
<td>string</td>
</tr>
<tr>
<td>IDREFS</td>
<td>array of strings</td>
</tr>
<tr>
<td>ENTITY</td>
<td>string</td>
</tr>
<tr>
<td>ENTITIES</td>
<td>array of strings</td>
</tr>
</tbody>
</table>
### Conversion Limitations
In most cases, the conversion creates an equivalent schema, but there are some limitations:

<table>
<thead>
<tr>
<th>XML Schema Type</th>
<th>JSON Schema Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>NMTOKEN</td>
<td>string</td>
</tr>
<tr>
<td>NMTOKENS</td>
<td>array of strings</td>
</tr>
<tr>
<td>boolean</td>
<td>boolean</td>
</tr>
<tr>
<td>base64Binary</td>
<td>array of integers</td>
</tr>
<tr>
<td>hexBinary</td>
<td>array of integers</td>
</tr>
<tr>
<td>float</td>
<td>number</td>
</tr>
<tr>
<td>decimal</td>
<td>number</td>
</tr>
<tr>
<td>integer</td>
<td>integer</td>
</tr>
<tr>
<td>nonPositiveInteger</td>
<td>integer</td>
</tr>
<tr>
<td>negativeInteger</td>
<td>integer</td>
</tr>
<tr>
<td>long</td>
<td>integer</td>
</tr>
<tr>
<td>int</td>
<td>integer</td>
</tr>
<tr>
<td>short</td>
<td>integer</td>
</tr>
<tr>
<td>byte</td>
<td>integer</td>
</tr>
<tr>
<td>nonNegativeInteger</td>
<td>integer</td>
</tr>
<tr>
<td>unsignedLong</td>
<td>integer</td>
</tr>
<tr>
<td>unsignedInt</td>
<td>integer</td>
</tr>
<tr>
<td>unsignedShort</td>
<td>integer</td>
</tr>
<tr>
<td>unsignedByte</td>
<td>integer</td>
</tr>
<tr>
<td>positiveInteger</td>
<td>integer</td>
</tr>
<tr>
<td>double</td>
<td>number</td>
</tr>
<tr>
<td>anyURI</td>
<td>string with &quot;format&quot;:&quot;uri&quot;</td>
</tr>
<tr>
<td>QName</td>
<td>object with &quot;namespaceURI&quot;, &quot;localPart&quot;, &quot;prefix&quot;</td>
</tr>
<tr>
<td>duration</td>
<td>string</td>
</tr>
<tr>
<td>dateTime</td>
<td>string with &quot;format&quot;:&quot;date-time&quot;</td>
</tr>
<tr>
<td>date</td>
<td>string with &quot;format&quot;:&quot;date&quot;</td>
</tr>
<tr>
<td>time</td>
<td>string with &quot;format&quot;:&quot;time&quot;</td>
</tr>
</tbody>
</table>
• Restrictions/facets are not taken into consideration when converting (\textit{fractionDigits, pattern, totalDigits, whiteSpace, minInclusive, maxInclusive}, and the restrictions for length, except \textit{enumeration}). However, extensions and indicators are properly converted (\textit{minOccurs, maxOccurs, group, sequence, choice}).

• The \texttt{<documentation>} element is not converted into \texttt{<description>}. 

• The \texttt{@substitutionGroup} attribute for an element that has no declared type becomes a reference to the element that can substitute it.

• The \texttt{@block} attribute is not taken into consideration during the conversion.

Generating Sample JSON Files

Oxygen XML Editor includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select \textbf{Generate Sample JSON Files} from the \texttt{Tools > JSON Tools} menu. The action opens a dialog box where you can configure a variety of options for generating the files.

\textbf{Figure 585. Generate Sample JSON Files Dialog Box}

The \textbf{Generate Sample JSON Files} dialog box includes the following fields and options:

\textbf{Schema URL}

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the \texttt{Browse} drop-down list.

\textbf{Associate schema in the document}

If enabled, the specified schema will be associated with the generated files.

\textbf{Output folder}

Path to the folder where the generated JSON instances will be saved.

\textbf{File name}

The name of the instance(s) that will be generated. By default, \texttt{instance.json} is used.

\textbf{Number of instances}
The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

**Property value**

You can specify the way the values of the properties are generated. The following options are available:

- **None** - Assigns empty values for properties (a template file will be generated). This is the default value.
- **Default** - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- **Random** - Assigns random values according to schema restrictions.

**Generate optional properties**

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

**Generate additional content**

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

**Choice strategy**

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either `oneOf` or `anyOf`). The following options are available:

- **First** - The first defined schema in `oneOf` or `anyOf` will be used.
- **Random** - A random schema defined in `oneOf` or `anyOf` will be used.

**Recursion level**

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

**Open first instance in editor**

If selected, the first generated instance is opened in the editor.

You can click OK at any point to generate the sample JSON files.

**Generating JSON Schema from a JSON File**

Oxygen XML Editor includes a tool for generating a sample JSON Schema from a JSON file. To generate a sample JSON Schema, select **Generate JSON Schema** from the Tools > JSON Tools menu. The action opens a dialog box where you can configure a variety of options for generating the JSON Schema file.
The **Generate JSON Schema** dialog box includes the following fields and options:

### JSON Document URL
The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the *Browse* drop-down list.

### Output JSON Schema
Path to the folder where the generated JSON Schema will be saved.

### Extract matching format for strings
If selected, the generator will try to find a format that matches the string values from the JSON Document.

### Add default values for simple types
If selected, the *default* values (0 for number, "" for string, *false* for boolean) and *examples* for string will be added.

### Restrict additional content
If selected, *additionalProperties* (for objects) and *additionalItems* (for arrays) will be set to *false* in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

### Open in Editor
If selected, the generated JSON Schema is opened in the editor.

You can click **Generate** at any point to generate the JSON Schema.

### Format and Indent (Pretty-Print) Multiple Files
Oxygen XML Editor provides support for formatting and indenting (*pretty-print* (on page 2646)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.
To format and indent multiple files, use the Format and Indent Files action that is available in the contextual menu of the Project view (on page 316) or from the Tools menu. This opens the Format and Indent Files dialog box that allows you to configure options for the action.

The **Scope** section allows you choose from the following scopes:

- **All opened files** - The pretty-print (on page 2646) is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the current edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the pretty-print (on page 2646) is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the pretty-print (on page 2646) is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to All opened files.
- **Include hidden files** - When selected, the pretty-print (on page 2646) is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Editor makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

**Generate Documentation**

Oxygen XML Editor includes a tool for generating documentation for XSLT, XML Schema, XQuery, and WSDL documents.
Generating Documentation for an XML Schema

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note: You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select XML Schema Documentation from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view (on page 316).

Figure 588. XML Schema Documentation Dialog Box

The Schema URL field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab
The following options are available in the Output tab:

- Format - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format (on page 862).
  - PDF - The documentation is generated in PDF output format (on page 865).
- **DocBook** - The documentation is generated in [DocBook output format](on page 865).
- **DITA** - The documentation is generated in [DITA output format](on page 865).
- **Custom** - The documentation is generated in a [custom output format](on page 866), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor (in the current editor).

**Note**: To set the browser or system application that will be used, open the **Preferences** dialog box ([Options > Preferences](on page 72)), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us, en-uk`, etc.).

**Settings Tab**

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.
The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties](on page 137) page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - **xs:all** - Its children will be separated by space characters.
  - **xs:sequence** - Its children will be separated by comma characters.
  - **xs:choice** - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
• **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.

• **Properties** - Displays some of the component’s properties.

• **Facets** - Displays the facets for each simple type.

• **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).

• **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.

• **Asserts** - Displays the `assert` elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.

• **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.

• **Source** - Displays the text schema source for each component.

• **Generate index** - Displays an index with the components included in the documentation.
  ◦ **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  ◦ **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

**Tip:** This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

**Related Information:**

• Customizing PDF or DocBook Output of Generated XML Schema Documentation (on page 866)

### Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom output format (on page 783), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project view** (on page 316).
The XSL URL field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

**Output Tab**

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format (on page 781).
  - Custom - The documentation is generated in a custom output format (on page 783), allowing you to control the output. Click the Options button to open a Custom format options dialog box (on page 784) where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 72), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.
Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

Figure 591. Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The Settings tab allows you to choose whether or not to include the following components: Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist.
  - A subset of DITA elements. The recognized elements are: concept, topic, task, codeblock, p, b, i, ul, ol, pre, sl, sli, step, steps, li, title, xref.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  - DOXSL documentation framework (on page 2643). Supported elements are: codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listitem, module, parameter, template, attribute-set.
Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML pre element. You can change this behavior by using a custom format (on page 783) instead of the built-in HTML format (on page 781) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the xsl:stylesheet element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.

- **Namespace** - Shows the namespace for named XSLT elements.

- **Location** - Shows the stylesheet location for each XSLT element.

- **Parameters** - Shows parameters of templates and functions.

- **References** - Shows the named XSLT elements that are referenced from within an element.

- **Used by** - Shows the list of all the XSLT elements that reference the current named element.

- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.

- **Overriding** - Shows the list of all the XSLT elements that override the current element.

- **Return type** - Shows the return type of the function.

- **Source** - Shows the text stylesheet source for each XSLT element.

- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.

- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XSLT documentation.

**Tip:** This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

**Related Information:**

- XSLT Stylesheet Component Documentation Support (on page 767)

**Generating HTML Documentation for an XQuery Document**

To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view (on page 316).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.
The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - **URL** - The URL of the file to be used for generating the documentation.
  - **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.

- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  **Note:** To set the browser or system application that will be used, open the Preferences dialog box (**Options > Preferences**) (on page 72), go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

### Generating Documentation for WSDL Documents

You can use Oxygen XML Editor to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format (on page 911) by using a custom stylesheet.
Note: The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select WSDL Documentation from the Tools > Generate Documentation menu or from the Generate Documentation submenu in the contextual menu of the Project view (on page 316).

Figure 593. WSDL Documentation Dialog Box

The Input URL field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab

The following options are available in the Output tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format (on page 910).
  - **Custom** - The documentation is generated in a custom output format (on page 911), allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.
• **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, open the Preferences dialog box (Options > Preferences) (on page 72), go to Global, and set it in the Default Internet browser field. This will take precedence over the default system application settings.

• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us, en-uk`, etc.).

**Setting Tab**

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

Figure 594. Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

• **Components**
  ◦ **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  ◦ **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  ◦ **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  ◦ **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
  ◦ **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
Only global elements and types - Specifies whether or not the generated documentation includes only global elements and types.

Component Details
- **Namespace** - Presents the namespace information for WSDL or XML Schema components.
- **Location** - Presents the location information for each WSDL or XML Schema component.
- **Used by** - Presents the list of components that reference the current one.
- **Documentation** - Presents the component documentation. If you choose Escape XML Content, the XML tags are presented in the documentation.
- **Source** - Presents the XML fragment that defines the current component.
- **Instance** - Generates a sample XML instance for the current component.

Note: This option applies to the XML Schema components only.
- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.

Generate index - Displays an index with the components included in the documentation.
- **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
- **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Tip: This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

Canonicalizing Files

You can select the canonicalization (on page 2642) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode or from the Tools menu.
Figure 595. Canonicalization Settings Dialog Box

The Canonicalize dialog box allows you to set the following options:

- **Input URL** - Available if the Canonicalize action was selected from the Tools menu. It allows you to specify the location of the input file.

- **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2642) method is used.

  Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2642) method is used.

- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2642) method is used.

  Note: Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2642) method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
• **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.

• **Open in editor** - If selected, the output file will be opened in the editor.

### Related Information:

- [Digital Signatures Overview (on page 736)](#)

### Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

**Figure 596. Signature Settings Dialog Box**

The following options are available:

**Note:** If Oxygen XML Editor could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page (on page 200)](#) where you can configure a valid certificate.
• **Input** - Available if the *Sign* action was selected from the *Tools* menu. Specifies the location of the input URL.

• **Transformation Options** - See the Digital Signature Overview (on page 736) section for more information about these options.
  - **None** - If selected, no canonicalization (on page 2642) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2642) method is used.

*Note:* Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

  - **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2642) method is used.
  - **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2642) method is used.

*Note:* Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

  - **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2642) method is used.

• **XPath** - The XPath expression provides the fragments of the XML document to be signed.

• **ID** - Provides ID of the XML element to be signed.

• **Envelope** - If selected, the enveloped signature is used. See the Digital Signature Overview (on page 736) for more information.

• **Detached** - If selected, the detached signature is used. See the Digital Signature Overview (on page 736) for more information.

• **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.

• **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.

• **Output** - Available if the *Sign* action was selected from the *Tools* menu. Specifies the path of the output file where the signed XML document will be saved.

• **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor.
Related Information:

- Digital Signatures Overview (on page 736)
- Verifying Signature (on page 742)
- Example of How to Digitally Sign XML Files or Content (on page 743)

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Related Information:

- Example of How to Digitally Sign XML Files or Content (on page 743)

WSDL SOAP Analyzer Tool

**WSDL SOAP Analyzer** is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **Tools** menu).

Oxygen XML Editor provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the **WSDL SOAP Analyzer** toolbar button.
- Use the **WSDL SOAP Analyzer** action from the **Tools** menu.
- Go to **Open with > WSDL SOAP Analyzer** in the contextual menu of the **Project (on page 316)** view.
This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is http://schemas.xmlsoap.org/soap/envelope/ for SOAP 1.1 or http://www.w3.org/2003/05/soap-envelope for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content**
Completion Assistant (on page 2642) is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.

- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the Testing Remote WSDL Files (on page 914) section.

**Note:** SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

### Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools > WSDL SOAP Analyzer**.
2. On the **WSDL File** tab enter the URL of the remote WSDL file.
3. Click the **OK** button.

   This will open the **WSDL SOAP Analyzer tool (on page 912)**. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.
XML Schema Regular Expressions Builder Tool

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting XML Schema Regular Expressions Builder from the Tools menu.

Figure 598. XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing Ctrl + Space (Command + Space on OS X).

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (←) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the Available expressions table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous Category combo box.
You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

### Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

### Test

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode** (on page 274) or **schema Design mode** (on page 275). Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

### Note:

Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

---

**Large File Viewer**

XML files tend to become larger and larger mostly because they are frequently used as a format for database export or for porting between multiple database formats. Traditional XML text editors simply cannot handle opening these huge export files, some having sizes exceeding one gigabyte, because all of the file content must be loaded in memory before the user can actually view it.

The best performance of the viewer is obtained for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding, the rendering performance is higher for files consisting of long lines (up to few thousands characters) and may degrade for short lines. In fact, the maximum size of a file that can be rendered in the Large File Viewer decreases when the total number of the text lines of the file increases. Trying to open a very large file (for example, a file of 4 GB) with a very high number of short lines (100 or 200 characters per line) may produce an out of memory error (**OutOfMemoryError**) that would require either increasing the Java heap memory with the **-Xmx** startup parameter or decreasing the total number of lines in the file.

The powerful **Large File Viewer** is available from the **Tools** menu or as a standalone application. You can also right-click a file in your project and choose to open it with the viewer. It uses an efficient structure for indexing
the open document. No information from the file is stored in the main memory, just a list of indexes in the file. In this way the viewer can open very large files, up to 10 gigabytes. If the open file is XML, the encoding used to display the text is detected from the XML prolog of the file. For other file types, the encoding is taken from the Oxygen XML Editor options. See Encoding for non-XML files (on page 110).

Figure 599. Large File Viewer

![Large File Viewer](image)

Large File Viewer components:

- The menu bar provides menu driven access to all the features and functions that are available in Large File Viewer:
  - **File > Open**
    
    Opens files in the viewer (also available in the contextual menu).
  
  - **File > Exit**
    
    Closes the viewer.
  
  - **Edit > Copy**
    
    Copies the selected text to clipboard (also available in the contextual menu).
  
  - **Find > Find**
    
    Opens a reduced Find dialog box that provides some basic search options, such as:
    1. **Case sensitive** - When selected, operations are case-sensitive.
    2. **Regular Expression** - When selected, allows you to use any regular expression in Perl-like syntax (on page 353).
Wrap around - Continues the find operation from the start/end of the document after reaching the end/, depending on whether the search is in forward or backward direction.

Help > Help

Provides access to the User Manual.

- The status bar provides information about the current open file path, the Unicode representation of the character at cursor position and the line and column in the open document where the cursor is located.

⚠️ **Attention:** For faster computation the **Large File Viewer** uses a fixed font (plain, monospace font of size 12) to display characters. The font is not configurable from the **Preferences page (on page 72)**.

ℹ️ **Tip:** The best performance of the viewer is accomplished for encodings that use a fixed number of bytes per character (such as UTF-16 or ASCII). The performance for UTF-8 is very good for documents that use mostly characters of the European languages. For the same encoding the rendering performance is high for files consisting of short lines (up to a few thousand characters) and may degrade for long lines.

**Hex Viewer**

When the Unicode characters that are visible in a text viewer or editor are not enough and you need to see the byte values of each character of a document, you can start the **Hex Viewer** that is available on the **Tools** menu. It has two panels: the characters are rendered in the right panel and the bytes of each character are displayed in the left panel. There is a 1:1 correspondence between the characters and their byte representation: the byte representation of a character is displayed in the same matrix position of the left panel as the character in the matrix of the right panel.

**Figure 600. Hex Viewer**
To open a file in Hex Viewer use the File > Open action. Alternatively, you can drag a file and drop it in the Hex Viewer panel.

**Standalone SVG Viewer**

Oxygen XML Editor includes a simple SVG Viewer that allows you to work with SVG images.

To open the viewer, select SVG Viewer from the Tools menu.

![SVG Viewer](image)

You can browse for and open any SVG file that has the .svg or .svgz extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the Project view (on page 316) and selecting Open with > SVG Viewer.

**Actions Available in the SVG Viewer**

The following actions are available in the SVG Viewer:

**Zoom in**

To zoom in on an image, use any of the following methods:

- Scroll forward with the mouse wheel.
- Select Zoom in from the contextual menu.
- Use the Ctrl + I (Command + I on OS X) keyboard shortcut.

**Zoom out**

To zoom in on an image, use any of the following methods:

- Scroll backward with the mouse wheel.
- Use the Ctrl + O (Command + O on OS X) keyboard shortcut.
- Select Zoom out from the contextual menu.

**Rotate**
To rotate an image, use either of the following methods:

- Use the `Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)` shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

**Refresh**

To refresh (or reset) an image, use either of the following methods:

- Use the `Ctrl + T (Command + T on OS X)` keyboard shortcut.
- Select **Refresh** from the contextual menu.

**Move**

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

**Pan**

To pan an image, **click and drag** the image with your mouse.

**Related Information:**

- Editing SVG Files *(on page 1023)*

---

**Tree Editor**

The **Tree Editor** *(Tools > Tree Editor)* is used for editing the content of a document displayed as an XML tree. The workspace offers the following functional areas:

- **Main menu** - Provides access to all the features and functions available in Oxygen XML Editor **Tree Editor**.
- **Toolbar** - Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function.
- **Editor panel** - Easy editing of structured mark-up documents. Each token has an associated icon for easier visual identification.
- **Message panel** - Displays messages returned from user operations.
- **Model view** - Shows the detailed information about the attribute or element that you are working on.
- **All Elements panel** - Presents a list of all defined elements that can be inserted within your document.

The tree editor does not offer entity support. Entities are not presented with a special type of node in the tree and new entity nodes cannot be inserted in the document.
Compare Files Tool

The **Compare Files** tool can be used to compare files or XML file fragments. The tool provides a mechanism for comparing two files or fragments, as well as the mechanism for a three-way comparison. The utility is available from the **Tools** menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (`diffFiles.exe`).

**Figure 602. Compare Files Tool**

---

### Two-Way Comparisons

The **Compare Files** tool can be used to compare the differences between two files or XML fragments.

**Compare Files**

To perform a two-way comparison, follow these steps:

1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down menu.

   **Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. To highlight the differences between the two files, click the **Perform File Differencing** button from the toolbar.

3. You can use the drop-down menu on the left side of the toolbar to change the **algorithm (on page 381)** for the operation.
4. You can also use the Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

5. If you are comparing XML documents using the XML Fast or XML Accurate algorithms, you can enter an XPath 2.0 expression in the Ignore nodes by XPath text field to ignore certain nodes from the comparison.

The resulting comparison will show you differences between the two files. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes. This layout allows you to easily identify and focus on a group of related changes.

**Figure 603. Two-Way Differences**

Highlighting Colors

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 217), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Comparing Fragments (Copy/Paste)

To compare XML file fragments, you need to copy and paste the fragments you want to compare into each side, without selecting a file. If a file is already selected, you need to close it using the Close (Ctrl + W (Command + W on OS X)) button, before pasting the fragments. Other notes for pasting fragments:

- As long as the fragment is more than 10 characters, the application will attempt to automatically detect the content type. It can detect the following types: XML, DTD, CSS, JSON, and Markdown (if it starts with #). If one of those content types is detected, the fragments will be displayed with syntax highlights.
- If you save modified fragments, a dialog box opens that allows you to save the changes as a new document.

Navigate Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
• Select a block of differences by clicking its small colored marker in the overview ruler located in the rightmost part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.

• Click a colored area in between the two text editors.

**Editing Actions**

You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the **Perform File Differencing** button.

A variety of actions are available on the toolbar (on page 390) and in the various menus (on page 393) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right** and **Append right change to left**
  
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right** and **Copy change from right to left**
  
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
  
  Rejects the change on the particular side and preserves the particular content on the other side.

**Two-Way Diff Algorithms**

Oxygen XML Editor offers the following two-way diff algorithms to compare files or fragments:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in **Author** mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in **Author** mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **Syntax Aware** - Computes differences for known file types or fragments. This algorithm splits the files or fragments into sequences of *tokens* and computes the differences between them. The meaning of a *token* depends on the type of compared files or fragments.

Known file types include those listed in the **New** dialog box, such as XML file types (XSLT files, XSL-FO files, XSD files, RNG files, NVDL files, etc.), XQuery file types (**.xquery**, **.xq**, **.xqy**, **.xqm** extensions),
DTD file types (.dtd, .ent, .mod extensions), TEXT file type (.txt extension), or PHP file type (.php extension).

For example:

◦ When comparing XML files or fragments, a token can be one of the following:
  • The name of an XML tag
  • The < character
  • The /> sequence of characters
  • The name of an attribute inside an XML tag
  • The = sign
  • The " character
  • An attribute value
  • The text string between the start tag and the end tag (a text node that is a child of the XML element corresponding to the XML tag that encloses the text string)

◦ When comparing plain text, a token can be any continuous sequence of characters or any continuous sequence of whitespaces, including a new line character.

• **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
• **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Three-Way Comparisons**

Oxygen XML Editor also includes a three-way comparison feature to help you solve conflicts and merge changes between multiple modifications. It is especially helpful for teams who have multiple authors editing and committing the same documents. It provides a comparison between a local change, another change, and the original base revision. Some additional advantages include:

• Visualize and merge content that was modified by you and another member of your team.
• Marks differences correctly even when the document structure is rearranged.
• Allows you to merge XML-relevant modifications.

**Figure 604. Three-Way Comparison**

Compare Files

To perform a three-way comparison, follow these steps:
1. Open a file in the left panel and the file you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the browsing actions in the 🗃️ - Browse drop-down menu.

**Step Result:** The selected files are opened in the two side-by-side editors. A text editing mode is used to offer a better view of the differences.

2. Click the 🡽 Three-Way Comparison button on the toolbar and select the base (original) file in the Base field. You can specify the path by using the text field, the history drop-down, or the browsing actions in the 🗃️ - Browse drop-down menu.

3. To highlight the differences, click the 🔎 Perform File Differencing button on the toolbar.

4. You can use the drop-down menu on the left side of the toolbar to change the algorithm *(on page 381)* for the operation.

5. You can also use the ⚙️ Diff Options button to access the Files Comparison preferences page where you can choose to ignore certain types of markup and configure various options.

The resulting comparison will show you differences between the two files, as well as differences between either of them and the base (original) file. The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

![Three-Way Differences](image)

**Highlighting Colors**

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page *(on page 217)*, but the default colors and their shades mean the following:

- **Pink** - Identifies blocks of changes that include conflicts.
- **Gray** - Identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

**Navigate Differences**

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar (or in the Compare menu).
- Select a block of differences by clicking its small colored marker in the overview ruler located in the rightmost part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.
• Click a colored area in between the two text editors.

Editing Actions
You can edit the files directly in either editing pane. The two editors are constantly synchronized and the differences are refreshed when you save the modified document or when you click the Perform File Differencing button.

A variety of actions are available on the toolbar (on page 390) and in the various menus (on page 393) (these same actions are also available in the contextual menu in both editing panes). The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append left change to right and Append right change to left**
  Copies the content of the selected change from one side and appends it on the other, according to the content of the corresponding change. As a result, the side where the arrow points to will contain the changes from both sides.

- **Copy change from left to right and Copy change from right to left**
  Replaces the content of a change from one side with the content of the corresponding change from the other side.

- **Remove change**
  Rejects the change on the particular side and preserves the particular content on the other side.

Three-Way Diff Algorithms
Oxygen XML Editor offers the following three-way diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in Author mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than XML Accurate.
- **XML Accurate** - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Second-Level Comparisons
For both two-way and three-way comparisons, Oxygen XML Editor automatically performs a second-level comparison for the Lines, XML Fast, and XML Accurate algorithms. After the first comparison is finished, the second-level comparison for the Lines algorithm is processed on text nodes using a word level comparison, meaning that it looks for identical words. For the XML Fast and XML Accurate algorithms, the second-level comparison is processed using a syntax-aware comparison (on page 381), meaning that it looks for identical tokens. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.
Figure 606. Second-Level Diff Comparison

Note: If a modified text fragment contains XML markup (such as processing instructions, XML comments, CData, or elements), the second-level comparison will not automatically be performed. In this case you can manually select a second-level comparison by doing a word level or character level comparison.

To do a word level comparison, select Show word level details from the contextual menu or Compare menu.

Figure 607. Word Level Comparison

To do a character level comparison, select Show Character Level details from the contextual menu or Compare menu.

Figure 608. Character Level Comparison

Author Visual Mode

The Compare Files tool includes an Author mode that displays the files in a visual mode similar to the Author editing mode in Oxygen XML Editor/Author. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool’s Text or Author mode, it detects the Initial Edit Mode in the Document Type Association configuration (on page 88) and the mode the files were last opened in Oxygen XML Editor/Author.
Note: This mode is not available if the Enable file comparison in Author mode option (on page 215) is not selected in the Diff > Files Comparison preferences page.

This visual mode includes unique features such as a Tags Display Mode drop-down button (on page 391) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the Track Changes feature (although the Track Changes feature is not available in the comparison tool).

Author Mode Algorithms
The visual Author mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second-Level Comparisons
The visual Author mode automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word-level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.
Starting File Comparison Tool from a Command Line

The file comparison tool can be started by using command-line arguments. In the installation folder there is an executable shell (diffFiles.bat on Windows, diffFiles.sh on OS X and Linux). To specify the files to compare, you can pass command-line arguments using the following construct: `diffFiles.bat/ diffFiles.sh [path to left file] [path to right file] [path to 3-way base file].`

If three files are specified, the tool will start in the 3-way comparison mode (on page 382). If only two files are specified, the tool will start in the 2-way comparison mode (on page 379). The first specified file will be added to the left panel in the comparison tool, the second file to the right panel, and the optional third file will be the base (ancestor) file used for a 3-way comparison. If you pass only one argument, you are prompted to manually choose another file.

If you want to launch the file comparison tool from an external application with specified files and you want the file browsing buttons at the top of both panels to be hidden, you should use the `-ext` argument as the first command. There are some additional arguments that are allowed and to see all the details for the command-line construct, type `diffFiles.bat --help` in the command line.

**Example:**

To do a 3-way comparison, the command line might look like this:

**Windows**

```bash
diffFiles.bat "c:\docs\file 1" "c:\docs\file 2" c:\docs\basefile
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

**Linux**

```bash
diffFiles.sh home/file1 home/file2 home/basefile
```

**Mac OS X**

```bash
diffFiles.sh documents/file1 documents/file2 documents/basefile
```

How to Integrate the File Comparison Tool with Git

The file comparison tool can be integrated with Git clients. It requires that you configure your `.gitconfig` file and then you can simply start the tool from the command line.

To integrate the **Compare Files** tool with your Git client, follow this procedure:

1. Use one of the following methods to instruct your Git client to use the *Oxygen Compare Files* tool:
• **Manual Configuration** - Locate your Git user-specific configuration file (.gitconfig) and edit it with a text editor (for example, in Windows, the .gitconfig file is most likely located in your user home directory). Add (or replace) the following lines:

```diff
[diff]
tool = oxygendiff

[merge]
tool = oxygendiff

[difftool "oxygendiff"]
cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $REMOTE $LOCAL $LOCAL

[mergetool "oxygendiff"]
cmd = '[pathToOxygenInstallDir]/diffFiles.exe' -ext $LOCAL $REMOTE $BASE $MERGED
trustExitCode = true

[difftool]
prompt = false
```

**Note:** For Mac OS X, the cmd lines would start with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, the cmd lines would start with something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

**Tip:** On Redhat 7, the following command would work, where the whole command is quoted and then inside that, the path to diffFiles.sh is quoted:

```diff
[difftool "oxygendiff"]
cmd = '"/home/user/Oxygen XML Editor 21/diffFiles.sh"' -ext $REMOTE $LOCAL $LOCAL
[mergetool "oxygendiff"]
cmd = '"/home/user/Oxygen XML Editor 21/diffFiles.sh"' -ext $LOCAL $REMOTE $BASE $MERGED
$MERGED trustExitCode = true
```

• **Command Line Configuration** - To automatically configure the .gitconfig file, you can run the following commands from a command line:

```bash
git config --global diff.tool oxygendiff
git config --global difftool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe -ext $REMOTE $LOCAL $LOCAL'
git config --global merge.tool oxygendiff
git config --global mergetool.oxygendiff.cmd '[Oxygen install dir]/diffFiles.exe -ext $LOCAL $REMOTE $BASE $MERGED'
git config --global mergetool.oxygendiff.trustExitCode true
```

**Note:** For Mac OS X, the Oxygen file comparison tool would be specified in the second and fourth commands with something like: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`. For Linux, it would be something like: `sh "/Oxygen XML Editor/diffFiles.sh"`.

2. To start the Compare Files tool and see a comparison of changes for a particular file, run the following command from a command line:

```bash
git difftool [PathToFile]
```
Tip: If the file you want to compare has conflicts, you can start the **Compare Files** tool as a *merge conflict resolution* tool by running the following command:

```
git mergetool [PathToFile]
```

For more information about the Git **difftool** syntax, see [https://git-scm.com/docs/git-difftool](https://git-scm.com/docs/git-difftool).

For more information about the Git **mergetool** syntax, see [https://git-scm.com/docs/git-mergetool](https://git-scm.com/docs/git-mergetool).

**How to Integrate the File Comparison Tool with Sourcetree**

The file comparison tool can be integrated with Sourcetree so that you can use it to compare changes. The advantages of doing this include:

- The **Oxygen Compare Files** tool presents the files side-by-side and makes it much easier to determine real changes.
- The **Oxygen Compare Files** tool includes XML comparison algorithms.
- The **Oxygen Compare Files** tool includes various options for configuring the comparison.
- The **Oxygen Compare Files** tool allows you to navigate through changes.

To integrate the **Compare Files** tool with Sourcetree, follow this procedure, depending on your operating system:

**Windows**

1. In Sourcetree, go to **Tools > Options**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
   - **External Diff Tool** - Select **Custom**.
   - **Diff Command** - Enter the path of the **Oxygen** **diffFile.exe** file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
   - **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
   - **Merge Tool** - Select **Custom**.
   - **Diff Command** - Enter the path of the **Oxygen** **diffFile.exe** file (for example: `c:\Programs\Oxygen XML Editor 19\diffFiles.exe`).
   - **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.
4. Click **OK**.

**Result:** In Sourcetree, you can now compare file changes with the **Oxygen Compare Files** tool by simply selecting **External Diff** from the contextual menu, **Actions** menu, or **Ctrl+D**.

**Mac OS X**

1. In Sourcetree, go to **Sourcetree > Preferences**.
2. Go to the **Diff** tab.
3. In the **External Diff/Merge** section, configure the settings as follows:
• **External Diff Tool** - Select Custom.
• **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
• **Arguments** - Enter `-ext $REMOTE $LOCAL $LOCAL`.
• **Merge Tool** - Select Custom.
• **Diff Command** - Enter a command-line argument to launch the *Oxygen diffFiles.sh* file (for example: `sh "/Applications/Oxygen XML Editor/diffFiles.sh"`).
• **Arguments** - Enter `-ext $LOCAL $REMOTE $BASE $MERGED`.

4. Close the preferences dialog box.

**Result:** In Sourcetree, you can now compare file changes with the *Oxygen Compare Files* tool by simply selecting External Diff from the contextual menu or Actions menu.

**Toolbar and Contextual Menu Actions of the Compare Files Tool**

The toolbar of the Compare Files tool contains operations that can be performed on the source and target files or XML fragments. Many of the actions are also available in the contextual menu.

**Figure 610. Compare Toolbar**

![Compare Toolbar Image]

The following actions are available:

**Algorithm**

This drop-down menu allows you to select one of the following diff algorithms (depending on whether it is a two-way or three-way comparison):

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters. This algorithm is not available when the file comparison is in Author mode.
- **Words** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words. This algorithm is not available when the file comparison is in Author mode.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in Author mode.
- **Syntax Aware** - Computes differences for the file types or fragments known by Oxygen XML Editor, taking the syntax (the specific types of tokens) into consideration. This algorithm is not available when the file comparison is in Author mode.
XML Fast - Comparison that works well on large files or fragments, but it is less precise than XML Accurate.

XML Accurate - Comparison that is more precise than XML Fast, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options

Opens the Files Comparison preferences page (on page 215) where you can configure various options.

Three-Way Comparison

Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling

Toggles synchronized scrolling on or off so that a selected difference can be seen on both sides of the application window. This option is on by default.

Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in Author mode.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences. This option is not available when the file comparison is in Author mode.

Note: When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.

Tags Display Mode

Allows you to select the amount of markup to be displayed in the Author visual mode (on page 385). You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Inline Tags, Partial Tags, or No Tags.

Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.
Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Copy All Changes from Left to Right

Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Left to Right

Copies the selected difference from the file in the left panel to the file in the right panel.

Ignore Nodes by XPath

You can use this text field to enter an XPath expression (on page 1645) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

Note: If an XPath expression is specified in the Ignore nodes by XPath option (on page 217) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Base
Available for three-way comparisons (on page 382). It is the base file that will be compared with the files opened in the left and right editors. You can specify the path to the file by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

**Left-Side (Source) File**

You can specify the path to the file to be compared on the left side (source) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

- Save
  - Saves the changes made in the source (left-side) file.

- Reload
  - Reloads the source (left-side) file.

- Close
  - Closes the source (left-side) file.

**Right-Side (Target) File**

You can specify the path to the file to be compared on the right side (target) by using the text field, its history drop-down, or the browsing actions in the Browse drop-down menu.

- Save
  - Saves the target (right-side) file.

- Reload
  - Reloads the target (right-side) file.

- Close
  - Closes the target (right-side) file.

**Compare Files Tool Menus**

The menus in the Compare Files tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

**File Menu**

- Source > Open
  - Browses for a file that will be displayed in the left panel.

- Source > Open URL
  - Browses for a remote file that will be displayed in the left panel.

- Source > Open File from Archive
Browses an archive for a file that will be displayed in the left panel.

**Source > Reload**

Reloads the file in the left panel.

**Source > Save**

Saves the changes made to the file in the left panel.

**Source > Save As**

Allows you to choose a destination to save the file in the left panel.

**Source > Close**

Closes the file in the left panel.

**Target > Open**

Browses for a file that will be displayed in the right panel.

**Target > Open URL**

Browses for a remote file that will be displayed in the right panel.

**Target > Open File from Archive**

Browses an archive for a file that will be displayed in the right panel.

**Target > Reload**

Reloads the file in the right panel.

**Target > Save**

Saves the changes made to the file in the right panel.

**Target > Save As**

Allows you to choose a destination to save the file in the right panel.

**Target > Close**

Closes the file in the right panel.

**Base > Open**

Browses for a file that will be compared with both files in a three-way comparison (on page 382).

**Base > Open URL**

Browses for a remote file that will be compared with both files in a three-way comparison (on page 382).

**Base > Open File from Archive**

Browses an archive for a file that will be compared with both files in a three-way comparison (on page 382).

**Close (Ctrl + W (Command + W on OS X))**
Closes the application.

**Edit Menu**

- **Cut**
  Cut the selection from the currently focused editor panel to the clipboard.

- **Copy**
  Copy the selection from the currently focused editor panel to the clipboard.

- **Paste**
  Paste content from the clipboard into the currently focused editor panel.

- **Select all**
  Selects all content in the currently focused editor panel.

- **Undo**
  Undo changes in the currently focused editor panel.

- **Redo**
  Redo changes in the currently focused editor panel.

**Find Menu**

- **Find/Replace**
  Perform find/replace operations in the currently focused editor panel.

- **Find Next**
  Go to the next match using the same options as the last find operation. This action runs in both editor panels.

- **Find Previous**
  Go to the previous match using the same options as the last find operation. This action runs in both editor panels.

**Compare Menu**

- **Three-Way Comparison**
  Toggle action that allows you to perform a three-way comparison between the two files displayed in the two editing panes and a base (ancestor) file.

- **Perform Files Differencing**
  Looks for differences between the two files displayed in the left and right side panels.

- **Next Block of Changes (Ctrl + Period (Command + Period on OS X))**
  Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.
Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Last Change (Ctrl + E (Command + E on OS X))
Jumps to the last change.

First Change (Ctrl + B (Command + B on OS X))
Jumps to the first change.

Copy All Changes from Right to Left
Copies all changes from the file in the right panel to the file in the left panel.

Copy All Changes from Left to Right
Copies all changes from the file in the left panel to the file in the right panel.

Copy Change from Right to Left
Copies the selected difference from the file in the right panel to the file in the left panel.

Copy Change from Left to Right
Copies the selected difference from the file in the left panel to the file in the right panel.

Show Word Level Details
Provides a word-level comparison of the selected change.

Show Character Level Details
Provides a character-level comparison of the selected change.

Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))
Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.
**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Options Menu**

**Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**

Opens the **Menu Shortcut Keys** option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**

**Help (F1)**

Opens a **Help** dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Editor Support Center web page in a browser.
Compare Directories Tool

The Compare Directories tool can be used to compare and manage changes to files and folders within the structure of your directories. The utility is available from the Tools menu or can be opened as a stand-alone application from the Oxygen XML Editor installation folder (diffDirs.exe).

**Figure 611. Compare Directories Tool**

Starting the Tool from a Command Line

The directory comparison tool can also be started by using command-line arguments. In the installation folder there is an executable shell (diffDirs.bat on Windows, diffDirs.sh on OS X and Linux). To specify the directories to compare, you can pass command-line arguments using the following construct: 

```
diffDirs.bat/ diffDirs.sh [directory path 1] [directory path 2].
```

If you pass only one argument, you are prompted to manually choose the second directory or archive.

**Example:**

To do a comparison between two directories, the command line would look like this:

**Windows**

```
diffDirs.bat "c:\documents new" "c:\documents old"
```

**Tip:** If there are spaces in the path names, surround the paths with quotes.

**Linux**

```
diffDirs.sh home/documents1 home/documents2
```

**Mac OS X**

Directory Comparisons

To perform a directory comparison, follow these steps:

1. Select a folder in the left panel and the folder you want to compare it to in the right panel. You can specify the path by using the text field, the history drop-down, or the **Browse for local directory** action in the **Browse** drop-down menu.

   **Step Result:** The selected directory structures are opened in the two side-by-side panels.

2. To highlight the differences between the two folders, click the **Perform Directories Differencing** button from the toolbar.

3. You can also use the **Diff Options** button to access the **Directories Comparison preferences page** (on page 218) where you can configure various options.

To compare the content of two archives, follow these steps:

1. Use the **Browse for archive file** action in the **Browse** drop-down menu to select the archives in the left and right panels.

2. By default, the supported archives are not treated as directories and the comparison is not performed on the files inside them. To make Oxygen XML Editor treat supported archives as directories, select the **Look in archives** option (on page 219) in the **Directories Comparison** preferences page.

3. To highlight the differences, click the **Perform Directories Differencing** button from the toolbar.

The directory comparison results are presented using two tree-like structures showing the files and folders, including their name, size, and modification date. A column that contains graphic symbols separates the two tree-like structures. The graphic symbols can be one of the following:

- An **X** symbol, when a file or a folder exists in only one of the compared directories.
- A **≠** symbol, when a file exists in both directories but the content differs. The same sign appears when a collapsed folder contains differing files.

The color used for the symbol and the directory or file name can be customized in the **Directories Comparison / Appearance** preferences page (on page 219). You can double-click lines marked with the **≠** symbol to open a **Compare Files** window, which shows the differences between the two files.

The directories that contain files that differ are expanded automatically so that you can focus directly on the differences. You can merge the contents of the directories by using the copy actions. If you double-click (or press **Enter**) on a line with a pair of files, Oxygen XML Editor starts a **file comparison** (on page 378) between the two files, using the **Compare Files** tool.

**Related Information:**

- **Compare Files Tool** (on page 378)
Toolbar and Contextual Menu Actions of the Compare Directories Tool

The toolbar of the Compare Directories tool contains operations that can be performed on the compared directory structure. Some of the toolbar actions are also available in the contextual menu.

Figure 612. Compare toolbar

| Include files: * | Exclude files: CVS_store | Exclude folders: CVS_store | CVS_store |

**Toolbar Actions**

- **Perform Directories Differencing**
  Looks for differences between the two directories displayed in the left and right side of the application window.

- **Perform Files Differencing**
  Opens the Compare Files tool (on page 378) that allows you to compare the currently selected files.

- **Copy Change from Right to Left**
  Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

- **Copy Change from Left to Right**
  Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

- **Binary Compare**
  Performs a byte-level comparison on the selected files.

- **Diff Options**
  Opens the Directory Comparison preferences page (on page 218) where you can configure various options.

- **Show Only Modifications**
  Displays a more uncluttered file structure by hiding all identical files.

**File and folder filters**

Differences can be filtered using three combo boxes: Include files, Exclude files, and Exclude folders. They come with predefined values and are editable to allow custom values. All of them accept multiple comma-separated values and the * and ? wildcards. For example, to filter out all JPEG and GIF image files, edit the Exclude files filter box to read *.jpeg, *.png. Each filter includes a drop-down menu with the latest 15 filters applied.
Contextual Menu Actions

- **Perform Files Differencing**
  - Opens the Compare Files tool *(on page 378)* that allows you to compare the currently selected files.

- **Binary Compare**
  - Performs a byte-level comparison on the selected files.

- **Copy Change from Right to Left**
  - Copies the selected difference from the file in the right panel to the file in the left panel.

- **Copy Change from Left to Right**
  - Copies the selected difference from the file in the left panel to the file in the right panel.

- **Open**
  - If the action is invoked on a file, the selected file is opened in Oxygen XML Editor. If the action is invoked on a directory, the selected directory is opened in the default file browser for your particular operating system.

- **Open in System Application**
  - Opens the selected file in the system application that is associated with that type of file. The action is available when launching the Compare Directories tool from the Tools menu in Oxygen XML Editor.

- **Show in Explorer**
  - Opens the default file browser for your particular operating system with the selected file highlighted.

Compare Directories Tool Menus

The menus in the Compare Directories tool contain some of the same actions that are on the toolbar, as well as some common actions that are identical to the same actions in the Oxygen XML Editor menus. The menu actions include:

**File Menu**

- **Close (Ctrl + W (Command + W on OS X))**
  - Closes the application.

**Compare Menu**

- **Perform Directories Differencing**
  - Looks for differences between the two directories displayed in the left and right side of the application window.

- **Perform Files Differencing**
Opens the Compare Files tool *(on page 378)* that allows you to compare the currently selected files.

**Copy Change from Right to Left**

Copies the selected change from the right side to the left side (if there is no file/folder in the right side, the left file/folder is deleted).

**Copy Change from Left to Right**

Copies the selected change from the left side to the right side (if there is no file/folder in the left side, the right file/folder is deleted).

**Options Menu**

**Preferences**

Opens the preferences dialog box that includes numerous pages of options that can be configured.

**Menu Shortcut Keys**

Opens the Menu Shortcut Keys option page where you can configure keyboard shortcuts available for menu items.

**Reset Global Options**

Resets options to their default values. Note that this option appears only when the tool is executed as a stand-alone application.

**Import Global Options**

Allows you to import an options set that you have previously exported.

**Export Global Options**

Allows you to export the current options set to a file.

**Help Menu**

**Help (F1)**

Opens a Help dialog box that displays the User Manual at a section that is appropriate for the context of the current cursor position.

**Use Online Help**

If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Report problem**

Opens a dialog box that allows the user to write the description of a problem that was encountered while using the application. You can change the URL where the reported problem
is sent by using the \texttt{com.oxygenxml.report.problems.url} system property. The report is sent in XML format through the \texttt{report} parameter of the POST HTTP method.

**Support Center**

Opens the Oxygen XML Editor Support Center web page in a browser.

**Compare Images**

You can use the \textbf{Compare Directories} tool to compare images. If you double-click a line that contains two different images, the \textbf{Compare images} window is displayed. This dialog box presents the images in the left and right sides, scaled to fit the available view area. You can use the contextual menu actions to scale the images to their original size or scale them down to fit in the view area.

The supported image types are: \textit{GIF, JPG, JPEG, PNG, and BMP}.

**Compare Directories Against a Base (3-Way) Tool**

The \textbf{Compare Directories Against a Base (3-way)} tool allows you to perform three-way comparisons on directories to help you identify and merge changes between multiple modifications of the same directory structure. It is especially helpful for teams that have multiple authors contributing documents to the same directory system. It offers information about conflicts and changes, and includes actions to easily merge, accept, overwrite, or ignore changes to the directory system.

**How to Perform 3-Way Directory Comparisons**

To perform a 3-way directories comparison, follow these steps:

1. Select \textbf{Compare Directories Against a Base (3-way)} from the \textbf{Tools} menu.

   \textbf{Step Result}: This opens a dialog box that allows you to select the 3 file sets that will be used for the comparison.

   \textbf{Figure 613. Compare Directories Against a Base File Set Chooser}

   ![Compare Directories Against a Base File Set Chooser](image)

2. Select the file sets to be compared:
• **Base directory** - This is the original (base) file set before any modifications were made by you or others.

• **Directory with your changes** - This is the file set with changes that you have made. This file set will be displayed in the left panel in the comparison tool.

• **Directory with changes made by others** - This is the file set with changes made by others that you want to merge with your changes. This file set will be displayed in the right panel in the comparison tool.

3. Click the **Compare** button to compare the file sets and open the comparison and merge tool.

4. Use the features and actions described in the next section to identify and merge the changes.

### 3-Way Directory Comparison and Merge Tool

**Figure 614. Comparison and Merge Tool**

The 3-way directory comparison and merge tool includes the following information, features, and actions:

#### Number of Changes and Conflicts

The first thing you see in the top-left corner of the tool is a grand total of all the changes made by others, changes made by you, and the number of conflicts.

#### Filter Buttons

In the top-right corner you can use the toggle buttons to filter the list of modifications:

- **Show all files**

  Use this button to show all modified and unmodified files, as well as conflicts.
Show only files modified by you and others
Filters the list to show all files that have been modified, including conflicts.

Show only files modified by others
Filters the list to only show the files that were modified by others.

Show only files modified by you
Filters the list to only show the files that were modified by you.

Show only conflicting files
Filters the list to only show files that contain conflicts.

List of Files Panel
This panel shows the list of files in the compared file sets based upon the filter button that is selected. This panel includes the following sortable columns:

- **Name** - The file names.
- **Status** - An icon that represents the file status. Red icons indicate some sort of conflict. Gray icons indicate modifications made by you. Blue icons indicate modifications made by others.
- **Description** - A description of the file status.
- **Merge Action** - This column provides a drop-down menu for each file that allows you to choose some merge actions depending upon its status. A default action is always set to *Automatically merge* the changes made by others with your changes. If there is a conflict, the default is `<Select action>` and you are required to make a selection. Click this column to access the drop-down menu where you can make a selection. The same actions are available in the contextual menu.

You can click a file to open it in the file comparison panel (the file from your file set is shown in the left panel while the file from the file set with changes made by others is shown in the right panel). For image files, the comparison panel shows a preview of the image. For other binary files, a preview is not available and you will just see its status.

File Comparison Panels
If you click a file in the top panel, the file is opened in this file comparison section. The file from your file set is shown in the left panel and the file from the other file set is shown in the right panel.

**Note:** If Oxygen XML Editor does not recognize the file type, a dialog box will be displayed that allows you to select the type of editor you want it to be associated with for this comparison (if you want Oxygen XML Editor to remember this association, you can select the **Associate file type with editor** option at the bottom of the dialog box).

This panel includes the following information and toolbar actions:

File Path
The first thing you see in this panel is the file path where merge actions will be applied if you make changes.

× Close
Closes the file comparison panel.

Algorithm Drop-Down Menu

This drop-down menu allows you to select one of the following diff algorithms to be used for file comparisons:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Diff Options
Opens the Files Comparison preferences page (on page 215) where you can configure various options.

Perform Files Differencing
Looks for differences between the two files displayed in the left and right side panels.

Synchronized scrolling
Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

Ignore Whitespaces
Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces. This option is not available when the file comparison is in **Author** mode.

Tags Display Mode
Allows you to select the amount of markup to be displayed in the Author visual mode. You can choose between: Full Tags with Attributes, Full Tags, Block Tags, Inline Tags, Partial Tags, or No Tags.
Copy Change from Right to Left

Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Left-Side File (Your changes)

Above the panel you can see the file path and the following two buttons:

Save

Saves changes made to the file.

Reload

Reloads the file.

Right-Side File (Changes made by others)

Above the panel you can see the file path and the following two buttons:
Displaying Changes in the File Comparison Panels

The line numbers on each side and colored marks on the right-side vertical stripe help you to quickly identify the locations of the differences. Adjacent changes are grouped into blocks of changes.

The differences are also highlighted in several colors, depending on the type of change, and dynamic lines connect the compared fragments in the middle section between the two panes. The highlighting colors can be customized in the Files Comparison / Appearance preferences page (on page 217), but the default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes).
- **Blue** - Identifies an addition of a node in the right side (incoming changes).
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Direct Editing Actions in the File Comparison Panels

In addition to selecting merge actions from the drop-down menus in the Merge Action column in the top panel, you can also edit the files directly in the left pane (your local changes). The two editors are constantly synchronized and the differences are refreshed when you save the modified document (Save button or Ctrl+S) or when you click the Perform File Differencing button.

A variety of actions are available in the contextual menu in both editing panes. The tool also includes some inline actions to help you merge, copy, or remove changes. When you select a change, the following inline action widgets are available, depending on the type of change:

- **Append right change to left**
  
  Copies the content of the selected change from the right side and appends it on the left side.

- **Copy change from right to left**
  
  Replaces the content of a change in the left side with the content of the change in the right side.

- **Remove change**
Removes the change from the left side.

Any time you save manual changes (Save button or Ctrl+S), the selection in the Merge Action column in the top panel automatically changes to Use merged and a copy of the original file is kept so that you can revert to the original file if necessary. To discard your manual changes and revert to your original changes, select a different action in the Merge Action drop-down menu.

**Open Merged Files**

If you select this option, all the files that will be modified by the merge operation will be opened in the editor after the operation is finished.

**Applying Changes**

When you click the Apply button, all the merge actions you have selected and the changes you have made will be processed.

If there are unresolved conflicts (conflicts where no merge action is selected in the Merge Action drop-down menu), a dialog box will be displayed that allows you to choose how to solve the conflicts. You can choose between the following:

- **Keep your changes** - If you select this option and then click Apply, your local changes will be preserved for the unresolved conflicts.
- **Overwrite your changes** - If you select this option and then click Apply, your local changes will be overwritten with the changes made by others, for the unresolved conflicts.
- **Cancel** - You can click the Cancel button to go back to the merge tool to resolve the conflicts individually.

**Cancelling Changes**

If you click the Cancel button at the bottom of the merge tool, all the changes you made in the tool will be lost.

**Author Visual Mode**

The Comparison and Merge tool includes an Author mode that displays the files in a visual mode similar to the Author editing mode in Oxygen XML Editor/Author. This makes it easier to see how the compared changes will look in the final output. This visual mode is available when the compared files are detected as being XML. To determine whether the files are initially opened in the merge tool’s Text or Author mode, it detects the Initial Edit Mode in the Document Type Association configuration (on page 88) and the mode the files were last opened in Oxygen XML Editor/Author.

**Note:** This mode is not available if the Enable file comparison in Author mode option (on page 215) is not selected in the Diff > Files Comparison preferences page.

This visual mode includes unique features such as a Tags Display Mode drop-down button (on page 406) on the toolbar that allows you to select the amount of tags to display in this visual mode. This mode also presents differences that were made using the Track Changes feature (although the Track Changes feature is not available in the comparison tool).
Author Mode Algorithms
The visual Author mode offers the following diff algorithms to compare files:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Author Mode Second Level Comparisons
The visual Author mode automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparison is processed on text nodes using a word level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

Syncro SVN Client (Deprecated)
The Syncro SVN Client is a client application for the Apache Subversion™ version control system, compatible with Subversion 1.6, 1.7, and 1.8 servers. It manages files and directories that change over time and are
stored in a central repository. The version control repository is much like an ordinary file server, except that it remembers every change ever made to your files and directories. This allows you to access older versions of your files and examine the history of how and when your data changed.

To start Syncro SVN Client, go to **Tools > SVN Client**.

⚠️ **Attention:** The Syncro SVN Client that comes bundled with Oxygen XML Editor is considered deprecated as of version 21.0.

### Main Window

This section explains the main window of Syncro SVN Client.

### Views

The main window consists of the following views:

- **Repositories view (on page 2299)** - Allows you to define and manage Apache Subversion™ repository locations.
- **Working Copy view (on page 2304)** - Allows you to manage with ease the content of the working copy.
- **History view (on page 2317)** - Displays information (author name, revision number, commit message) about the changes made to a resource during a specified period of time.
- **Editor view (on page 2323)** - Allows you to edit various types of text files, with full syntax-highlight.
- **Annotations view (on page 2323)** - Displays a list with information regarding the structure of a document (author and revision for each line of text).
- **Compare view (on page 2326)** - Displays the differences between two revisions of a text file from the working copy.
- **Image Preview panel (on page 2329)** - Allows you to preview standard image files supported by Syncro SVN Client: JPG, GIF and PNG.
- **Compare Images view (on page 2330)** - Displays two images side by side.
- **Properties view (on page 2330)** - Displays the SVN properties of a resource under version control.
- **Console view (on page 2331)** - Displays information about the currently running operation, similar with the output of the Subversion command-line client.
- **Dynamic Help view (on page 2332)** - Shows information about the currently selected view.

The main window's status bar presents in the left side the operation in progress or the final result of the last performed action. In the right side there is a progress bar for the running operation and a stop button to cancel the operation.

### SVN Main Menu

The main menu of the Syncro SVN Client is composed of the following menus:

- **File Menu**
  
  **New submenu:**
New File

This operation creates a new file as a child of the selected folder from the Repositories view (on page 2299) tree or the Working Copy view (on page 2304) tree, depending on the view that was last used. Note that for the Working Copy view (on page 2304), the file is added to version control only if the selected folder is under version control.

New Folder (Ctrl + Shift + F (Command + Shift + F on OS X))

This operation creates a new folder as a child of the selected folder from the Repositories view (on page 2299) tree or the Working Copy view (on page 2304) tree, depending on the view that was last used. Note that for the Working Copy view (on page 2304), the file is added to version control only if the selected folder is under version control.

New External Folder (Ctrl + Shift + W (Command + Shift + W on OS X))

This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (on page 2337), and ideally a particular revision, stored in the svn:externals property of the selected folder.

Tip: You can specify a particular revision of the external item by using a peg revision (on page 2339) at the end of the URL (for example, URL@rev1234). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- ../../../ - Relative to the URL of the directory that the svn:externals property is set.
- ../../ - Relative to the root of the repository where the svn:externals property is versioned.
- ../../../ - Relative to the scheme of the URL of the directory that the svn:externals property is set.
- ../../../ - Relative to the root URL of the server that has the svn:externals property versioned.

Important: To change the target URL of an external definition, or to delete an external item, do the following:
1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.

2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:** Syncro SVN Client does not support definitions of local relative external items.

**Open (Ctrl + O (Command + O on OS X))**

This action opens the selected file in an editor where you can modify it. The action is active only when a single item is selected. The action opens a file with the internal editor or the external application associated with that file type. This action works on any file selection from the Repositories view (on page 2299), Working Copy view (on page 2304), History view (on page 2317), or Directory Change Set view (on page 2321), depending on the view that was last used to invoke it. In the case of a folder, the action opens the selected folder with the system application for folders (for example, Windows Explorer on Windows or Finder on OS X). Note that opening folders is available only for folders selected in the Working Copy view (on page 2304).

**Open with (Ctrl + Shift + O (Command + Shift + O on OS X))**

Displays the Open with dialog box for specifying the editor where the selected file is opened. If multiple files are selected only external applications can be used to open the files. This action works on any file selection from Repositories view (on page 2299), Working Copy view (on page 2304), History view (on page 2317), or Directory Change Set view (on page 2321), depending on the view that was last used to invoke it.

**Show in Explorer/Show in Finder**

Opens the parent directory of the selected working copy file and selects the file.

**Save (Ctrl + S (Command + S on OS X))**

Saves the local file currently opened in the editor or the Compare view.

**Save as**

Saves any file selected in the Repositories, History, or Directory Change Set view.

**Copy URL Location (Ctrl + Alt + U (Command + Alt + U on OS X))**

Copies the URL location of the resource currently selected in the Repositories view to clipboard.

**Copy to**

Copies the currently selected resource, either in Repositories or Working copy view, to a specified location.
Note: This action can also be used from History and Directory Change Set views to recover older versions of a repository item.

Move to (Ctrl + M (Command + M on OS X))

Moves the currently selected resource, either in Repositories or Working copy view, to a specified location.

Rename (F2)

Renames the resource currently selected, either in Repositories or Working copy view.

Delete (Delete)

Deletes the resource currently selected either, in Repositories or Working copy view.

Locking:

- Scan for locks (Ctrl + L (Command + L on OS X)) - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under version control. For more details see Scanning for locks (on page 2247).
- Lock (Ctrl + K (Command + K on OS X)) - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under version control. For more details on the use of this action see Locking a file (on page 2248).
- Unlock (Ctrl + Alt + K (Command + Alt + K on OS X)) - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).

Show SVN Properties (Ctrl + P (Command + P on OS X))

Opens the Properties view (on page 2330) and displays the SVN properties for a selected resource from Repositories view (on page 2299) or Working Copy view (on page 2304), depending on the view that was last used to invoke it.

Show SVN Information (Ctrl + I (Command + I on OS X))

Provides additional information for a selected resource. For more details, go to Obtain information for a resource (on page 2262).

Exit (Ctrl + Q (Command + Q on OS X))

Closes the application.

Edit Menu

Undo (Ctrl + Z (Command + Z on OS X))
Undo edit changes in the local file that is currently opened in the editor or the Compare view.

**Redo (Ctrl + Y (Command + Y on OS X))**

Redo edit changes in the local file that is currently opened in the editor or the Compare view.

**Cut (Ctrl + X (Command + X on OS X))**

Cut selection from the local file that is currently opened in the editor view or the Compare view to clipboard.

**Copy (Ctrl + C (Command + C on OS X))**

Copy selection from the local file that is currently opened in the editor or the Compare view to clipboard.

**Paste (Ctrl + V (Command + V on OS X))**

Paste selection from clipboard into the local file that is currently opened in editor or the Compare view.

**Find/Replace (Ctrl + F (Command + F on OS X))**

Perform find and replace operations in the local file that is currently opened in the editor or the Compare view.

**Find Next (F3)**

Go to the next match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the Console view).

**Find Previous (Shift + F3)**

Go to the previous match using the same find options of the last find operation. This action runs in the editor panel and in any non-editable text area (for example, the Console view).

**Repository Menu**

**New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))**

Displays the Add SVN Repository dialog box. This dialog box allows you to define a new repository location.

**Figure 617. Add SVN Repository Dialog Box**
If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

**Edit Repository Location (Ctrl + Alt + E (Command + Alt + E on OS X))**

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

**Change the Revision to Browse (Ctrl + Alt + B (Command + Alt + B on OS X))**

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

**Remove Repository Location (Ctrl + Alt + R (Command + Alt + R on OS X))**

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

**Refresh (F5)**

Refreshes the resource selected in the **Repositories** view.

**Check out (Ctrl + Alt + O (Command + Alt + O on OS X))**

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see *Check out a working copy (on page 2239)*.

**Export**

Opens the **Export** dialog box *(on page 2295)* that allows you to configure options for exporting a folder from the repository to the local file system.

**Import:**

**Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))**

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section *Importing resources into a repository (on page 2293)*.

**Note:** The difference between the **Import folder** and **Share project** actions is that the latter also converts the selected directory into a working copy.

**Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))**

Imports the files selected from the files system into the selected folder in the repository.

**Working Copy Menu**
Working Copies Manager (on OS X)

Opens a dialog box with a list of working copies that the Apache Subversion™ client is aware of. In this dialog box you can add existing working copies or remove those that are no longer needed.

Switch to

Selects one of the following view modes: All Files, Modified, Incoming, Outgoing, or Conflicts.

Refresh (F5)

Refreshes the state of the selected resources or of the entire working copy (if there is no selection).

Synchronize (Ctrl + Shift + S (Command + Shift + S on OS X))

Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to Modified view mode if the Always switch to 'Modified' mode option (on page 212) is selected.

Update (Ctrl + U (Command + U on OS X))

Updates all the selected resources that have incoming changes to the HEAD revision. If one of the selected resources is a directory then the update for that resource will be recursive.

Update to revision/depth

Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update depth for the current folder. You can find out more about the depth term in the sparse checkouts (on page 2298) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the Commit dialog box you can also enter a comment before sending your changes to the repository.

Update all(Ctrl + Shift + U (Command + Shift + U on OS X))

Updates all resources from the working copy that have incoming changes. It performs a recursive update on the synchronized resources.

Commit all

Commits all the resources with outgoing changes. It is disabled when Incoming mode is selected or the synchronization result does not contain resources with outgoing changes. It performs a recursive commit on the synchronized resources.
Revert (Ctrl + Shift + V (Command + Shift + V on OS X))

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes (on page 2255) for more information.

Edit conflict (Ctrl + E (Command + E on OS X))

Opens the Compare editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see Edit conflicts (on page 2253).

Mark Resolved (Ctrl + Shift + R (Command + Shift + R on OS X))

Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts (on page 2256).

Mark as Merged (Ctrl + Shift + M (Command + Shift + M on OS X))

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the Merge conflicts (on page 2256) section for more information about how you can solve the pseudo-conflicts.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2255) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2257).

Mark as copied

You can use this action to mark an item from the working copy as a copy of another item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.
Mark as renamed

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The Mark as renamed action is available when you select two items from the same directory (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Add to "svn:ignore" (Ctrl + Alt + I (Command + Alt + I on OS X))

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the svn:ignore property in the parent directory of the resource. Read more about this in the Ignore Resources Not Under Version Control (on page 2244) section.

Add to version control (Ctrl + Alt + V (Command + Alt + V on OS X))

Allows you to add resources that are not under version control. For further details, see Add Resources to Version Control (on page 2242) section.

Remove from version control

Schedules the selected items for deletion from repository upon the next commit. The items are not removed from the file system after committing.

Clean up (Ctrl + Shift + C (Command + Shift + C on OS X))

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under version control.

Expand All (Ctrl + Alt + X (Command + Alt + X on OS X))

Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

Collapse all (Ctrl + Alt + Z (Command + Alt + Z on OS X))

Collapses all descendants of the selected folder. The same behavior is obtained by double-clicking an expanded folder.

Compare Menu

Perform Files Differencing

Looks for differences between the two files displayed in the left and right side panels.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.
**Note:** A change block groups one or more consecutive lines that contain at least one change.

**Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))**

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

**Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))**

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

**Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))**

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

**Last Change (Ctrl + E (Command + E on OS X))**

Jumps to the last change.

**First Change (Ctrl + B (Command + B on OS X))**

Jumps to the first change.

**Copy All Changes from Right to Left**

Copies all changes from the file in the right panel to the file in the left panel.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.

**Show Word Level Details**

Provides a word-level comparison of the selected change.

**Show Character Level Details**

Provides a character-level comparison of the selected change.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.
Ignore Whitespaces

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

History Menu

Show History (Ctrl + H (Command + H on OS X))

Displays the history for an SVN resource at a given revision. The resource can be one selected from the Repositories view, Working Copy view, or from the Affected Paths table from the History view, depending on which view was last focused when this action was invoked.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2323), along with the history of the file in the History view.

Repositories

This operation is available for any resource selected from view, Working Copy view, History view or Directory Change Sets view, depending on which view was last focused when this action was invoked.

Revision Graph (Ctrl + G (Command + G on OS X))

This action allows you to see the graphical representation of a resource's history. For more details about a resource's revision graph see the section Revision Graph (on page 2332). This operation is available for any resource selected in the Repositories view or Working Copy view.

Tools Menu

Share project

Allows you to share a new project (on page 2236) using an SVN repository. The local project is automatically converted into an SVN working copy.

Branch / Tag

Allows you to copy the selected resource from the Repositories view or Working Copy view to a branch or tag into the repository. To read more about this operation, see the section Creating a Branch / Tag (on page 2264).

Merge (Ctrl + J (Command + J on OS X))

Allows you to merge the changes made on one branch back into the trunk, or vice versa, using the selected resource from the working copy. To read more about this operation, see the section Merging (on page 2266).

Switch (Ctrl + Alt + W (Command + Alt + W on OS X))
Allows you to change the repository location of a working copy, or only of a versioned item of the working copy, within the same repository. It is available when the selected item of the working copy is a versioned resource, except for external items. To read more about this action, see the Switching the Repository Location section.

Relocate

Allows you to change the base URL of the root folder of the working copy to a new URL when the base URL of the repository changed. For example, if the repository itself was moved to a different server. This operation is only available for the root item of the working copy. To read more about this operation, see the Relocate a Working Copy section.

Create patch (Ctrl + Alt + P (Command + Alt + P on OS X))

Allows you to create a file containing all the differences between two resources, based on the svn diff command. To read more about creating patches, see the section about patches.

Working copy format

This submenu contains the following two operations:

Upgrade

Upgrades the format of the currently loaded working copy to the newest one known by Syncro SVN Client. This allows you to benefit of all the new features of the client.

Downgrade

Downgrades the format of the currently loaded working copy to SVN 1.7 format. This is useful if you want to use older SVN clients with the current working copy, or, by mistake, you have upgraded the format of an older working copy to SVN 1.8.

Note: SVN 1.7 working copies cannot be downgraded to older formats.

See the section Working Copy Format to read more about this subject.

Options Menu

Preferences

Opens the Preferences dialog box.

Menu Shortcut Keys
Opens the **Menu Shortcut Keys preferences page (on page 223)**, where users can configure in one place the keyboard shortcuts available for menu items available in Syncro SVN Client.

**Global Run-Time Configuration**

Allows you to configure SVN general options, that should be used by all the SVN clients you may use:

- **Edit ‘config’ file** - In this file you can configure various SVN client-side behaviors.
- **Edit ‘servers’ file** - In this file you can configure various server-specific protocol parameters, including HTTP proxy information and HTTP timeout settings.

**Export Options**

Allows you to export the current options to an XML file.

**Import Options**

Allows you to import options you have previously exported.

**Reset Options**

Resets all your options to the default ones.

**Reset Authentication**

Resets the Subversion authentication information.

**Window Menu**

**Show View**

Allows you to select the view you want to bring to front.

**Show Toolbar**

Allows you to select the toolbar you want to be visible.

**Enable flexible layout**

Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

**Reset Layout**

Resets all the views to their default position.

**Help Menu**

**Help (F1)**

Opens the Help dialog box.

**Use online help (selected by default)**
If this option is selected, when you select Help or press F1 while hovering over any part of the interface, Oxygen XML Editor attempts to open the help documentation in online mode. If this option is not selected or an internet connection fails, the help documentation is opened in offline mode.

**Show Dynamic Help view**

Displays the Dynamic Help view.

**Report Problem**

Opens a dialog box that allows you to write the description of a problem that was encountered while using the application.

**Support Center**

Opens the Support Center web page in a browser.

**About**

Opens the About dialog box.

## SVN Main Toolbar

The toolbar of the Syncro SVN Client SVN Repositories window contains the following actions:

### Check out

Checks out a working copy from a repository. The repository URL and the working copy format must be specified.

### Synchronize

Synchronizes the current working copy with the repository.

### Update All

Updates all resources of the working copy that have an older revision than the repository.

### Commit All

Commits all resources of the working copy that have a newer version compared to that of the repository.

### Refresh

Refreshes the whole content of the current working copy from disk starting from the root folder. At the end of the operation, the modified files and folders that were not committed to the repository yet, are displayed in the Working Copy view.

### Compare

The selected resource is compared with:
• The BASE revision, when the selected resource is:
  ◦ Locally modified and the All Files view mode is currently selected (no matter if there are incoming changes).
  ◦ Locally modified and there are no incoming changes when any other view mode is selected.
• The remote version of the same resource, when remote information is available after a Synchronize operation (only when one of Modified, Incoming, Outgoing and Conflicts view modes is selected).
• The working copy revision, when the selected resource is from the History view.

Show History
Displays the history of the selected resource (from the Working Copy or Repository views) in the History view.

Show Annotation
Displays the annotations of the selected resource. The selected resource can be in the Working Copy or the History views.

Revision Graph
Displays the revision graph of the selected resource. The selected resource can be in the Working Copy or the Repositories views.

Enable/Disable flexible layout
Toggles between a fixed and a flexible layout. When the flexible layout is enabled, you can move and dock the internal views to adapt the application to various viewing conditions and personal requirements.

Status Bar
The status bar of the Syncro SVN Client window displays important details of the current status of the application. This information is available only in the Working Copy view.

Figure 618. Status bar
The status bar is composed of the following areas:
• The path of the currently processed file from the current working copy (during an operation such as Check out or Synchronize) or the result of the last operation.
• The current status of the following working copy options:
  ◦ Show ignored files ( ).
  ◦ Show deleted files ( ).
Get the options for ignored and deleted files are switched on and off from the Settings menu (on page 2309) of the Working Copy panel:

- The format of the currently loaded working copy.
- The current numbers of incoming changes (👉), outgoing changes (quivo) and conflicting changes (➡️).
- A progress bar for the currently running SVN operation and a button (■) that allows you to stop it.

Getting Started

This section explains the basic operations that can be done in Syncro SVN Client.

SVN Repository Location

This section explains how to add and edit the repository locations in Syncro SVN Client.

Add / Edit / Remove Repository Locations

Usually, team members do all of their work separately, in their own working copy, and then must share their work by committing their changes. This is done using an Apache Subversion™ repository. Oxygen XML Editor supports versions 1.4, 1.5, 1.6, 1.7, and 1.8 of the SVN repository format.

Before you can begin working with a Subversion repository, you must define a repository location in the Repositories view (on page 2299).

To create a repository location, use the New Repository Location action that is available in the Repository menu, the Repositories view toolbar, and in the contextual menu. This action opens the New Repository Location dialog box, which prompts you for the URL of the repository (on page 2337) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2339) (for example, URL@rev1234) to browse only that specific revision. No authentication information is requested at the time the location is defined. It is left to the Subversion client to request the user and password information when it is needed. The main benefit of allowing Subversion to manage your password is that it prompts you for a new password only when your password changes.

Once you enter the repository URL, Oxygen XML Editor tries to contact the server to get the content of the repository for displaying it in the Repositories view (on page 2299). If the server does not respond in the timeout interval set in the preferences, an error is displayed. If you do not want to wait until the timeout expires, you can use the Stop button from the toolbar of the view.

To edit a repository location, use the Edit Repository Location action that is available in the Repository menu and in the contextual menu. This action opens the Edit Repository Location dialog box, which prompts you for the URL of the repository (on page 2337) you want to connect to. You can also use peg revisions at the end of the URLs (on page 2339) (for example, URL@rev1234) to browse only that specific revision.

To remove a repository location, use the Remove Repository Location action that is available in the Repository menu and in the contextual menu. A confirmation dialog box is displayed to make sure that you do not accidentally remove the wrong locations.
The order of the repositories can be changed in the **Repositories** view at any time with the **Up** arrow and **Down** arrow buttons on the toolbar of the view. For example, pressing the up arrow once moves the selected repository in the list up one position.

To set the reference revision number of an SVN repository use the **Change the Revision to Browse** action that is available in the **Repository** menu and in the contextual menu. The revision number of the repository is used for displaying the contents of the repository when it is viewed in the **Repositories** view (on page 2299). Only the files and folders that were present in the repository at the moment when this revision number was generated in the repository are displayed as contents of the repository tree. Also, this revision number is used for all the operations executed directly from the **Repositories** view (on page 2299).

**Authentication**

Five protocols are supported: **HTTP**, **HTTPS**, **SVN**, **SVN + SSH** and **FILE**. If the repository that you are trying to access is password protected, the **Enter authentication data** dialog box requests a user name and a password. If the **Store authentication data** checkbox is selected, the credentials are stored in the Apache Subversion™ default directory:

- **Windows** - `%HOME%\Application Data\Subversion\auth`. Example: `C:\Documents and Settings\John\Application Data\Subversion\auth`
- **Linux and OS X** - `$HOME/.subversion/auth`. Example: `/home/John/.subversion/auth`

There is one file for each server that you access. If you want to make Subversion forget your credentials, you can use the **Reset authentication** command from the **Options** menu. This causes Subversion to forget all your credentials. When you reset the authentication data, restart Oxygen XML Editor for the change to take effect.

⚠ **Tip:** The **FILE** protocol is recommended if the SVN repository and Oxygen XML Editor are located on the same computer as it ensures faster access to the SVN repository compared with other protocols.

For HTTPS connections where client authentication is required by your SSL server, you must choose the certificate file and enter the corresponding certificate password that is used to protect your certificate.

When using a secure HTTP (HTTPS) protocol for accessing a repository, a **Certificate Information** dialog box is displayed and asks you whether you want to accept the certificate permanently, temporarily, or simply deny it.

If the repository has SVN+SSH protocol, the SSH authentication can also be made with a private key and a pass phrase.
After the SSH authentication dialog box, another dialog box appears for entering the SVN user name that accesses the SVN repository. The SVN user name is recorded as the *committer* in SVN operations.

When connecting for the first time to a Subversion repository through SVN+SSH protocol, you will be asked to confirm if you trust the SSH host. The same dialog box is also displayed when the server changed the SSH key or when the key was deleted from the local Subversion cache folder.

**Share a Project**

Even if you start developing a new project, or you want to migrate an existing one to Subversion, the Syncro SVN Client allows you to easily share it with the rest of your team. The shared project directory is automatically converted to a working copy and added under Syncro SVN Client management. The **Share project** action is available in the **Tools** menu and the contextual menu of the **Repositories** view.
The following options can be configured in the Share project dialog box:

**Project**

- **The location of the project folder (on page 2337)** on the local disk by using the text box or the Browse button. This folder should not be empty or already under version control.

  **Important:** By default, the SVN system only imports the content of the specified folder, and not the root folder itself. Therefore, it is recommended to use the Browse button to select the project folder so that the client will automatically append the name of it to the specified URL.

**URL**

- **The new location of the project (on page 2337)** (inside the repository) that will be used to access it.

  **Note:** Peg revisions have no effect for this operation since it is used to send information to the repository.

  **Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

**Format**

- The SVN format of the working copy. You can choose between **SVN 1.8** or **SVN 1.7**.

**Share files matching global ignore patterns**

- When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:
  
  - The global-ignores property in the SVN configuration file (on page 2336).
The File name ignore patterns option (on page 214) in the SVN > Working Copy preferences page (on page 212).

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the enable-auto-props runtime configuration directive, defined in the SVN configuration file (on page 2336).

Note: This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the auto-props section). Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

Defining a Working Copy

An Apache Subversion™ working copy is an ordinary directory tree on your local system, containing a collection of files. You can edit these files however you want, your working copy being your private work area. To make your own changes available to others or incorporate changes made by others, you must explicitly tell Subversion to do so. You can even have multiple working copies of the same project.

Figure 622. Working Copy View

A Subversion working copy also contains some extra files, created and maintained by Subversion, to help it keep track of your files. In particular, each directory in your working copy contains a subdirectory named .svn,
also known as the working copy *administrative directory*. This administrative directory contains an unaltered copy of the last updated files from the repository. This copy is usually referred to as the *pristine copy* or the *BASE revision* of the working copy. These files help Subversion recognize which files contain unpublished changes, and which files are out-of-date with respect to others' work.

A typical Subversion repository often holds the files (or source code) for several projects. Usually each project is a subdirectory in the repository's file system tree. In this arrangement, a user's working copy usually corresponds to a particular sub-tree of the repository.

**Check Out a Working Copy**

*Check out* means to make a copy of a project from a repository to your local file system. This copy is called a *working copy*. An Apache Subversion™ working copy is a specially formatted directory structure that contains additional .svn directories that store Subversion information, as well as a pristine copy of each item that is checked out.

To check out a working copy, locate and select the desired directory in the Repositories view and select the *Check out* action from the contextual menu, the toolbar, or the Repository menu.

**Figure 623. Check Out Dialog Box**

The following options can be configured in the **Check out** dialog box:

**URL**

The location of the repository directory *(on page 2337)* to be checked out.

**Note:** To check out an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a *peg revision* *(on page 2339)* at the end (for example, URL@rev1234).

**Revision**

You can choose between the *HEAD* or *Other* revision. If you need to *check out* a specific revision, specify it in the *Other* text box or use the *History* button and choose a revision from the *History* dialog box *(on page 2240)*.

**Check out to**
Specify the location where you want to check out (on page 2337) the new working copy by typing the local path in the text box or by using the Browse button. If the specified local path does not point to an existing directory, it will automatically be created.

**Important:** By default, the SVN system only checks out the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the Browse button to select the check out location so that the client will automatically append the name of the remote directory to the path of the selected directory.

**Warning:** The destination directory should be empty. If files exist, they are skipped (left unchanged) by the check out operation and displayed as modified (on page 2306) after the operation has finished. Also, the destination directory must not already be under version control.

**Format**

The SVN format of the working copy. You can choose between SVN 1.8 or SVN 1.7.

**Depth**

The depth is useful if you want to check out only a part of the selected repository directory and bring the rest of the files and subdirectories in a future update. You can find out more about the checkout depth in the sparse checkouts (on page 2298) section. You can choose between the following depths:

- **Recursive (infinity)** - Checks out all the files and folders contained in the selected folder.
- **Immediate children (immediates)** - Checks out only the child files and folders without recursing subfolders.
- **File children only (files)** - Checks out only the child files.
- **This folder only (empty)** - Checks out only the selected folder (no child file or folder is included).

**Ignore "svn:externals" definitions**

When selected, external items are ignored in the check out operation. This option is only available if you choose the Recursive (infinity) depth.

After a check out, the new working copy is added to the list in the Working Copy view (on page 2304) and loaded automatically.

**History Dialog Box**

The History dialog box presents a list of revisions for a resource. It is opened from the dialog boxes that require setting an SVN revision number, such as the Check Out dialog box (on page 2239) or the Branch / Tag dialog box (on page 2264). It presents information about revision, commit date, author, and commit comment.
The initial number of entries in the list is 50. Additional revisions can be added to the list using the **Get next 50** and **Get all** buttons. The list of revisions can be refreshed at any time with the **Refresh** button. You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

The **Affected Paths** area displays all paths affected by the commit of the revision selected in history. You can see the changes between the selected revision and the file's previous state using the **Compare with previous version** action, available in the contextual menu.

### Use an Existing Working Copy

Using an existing working copy is the process of taking a working copy that exists on your file system and connecting it to the Apache Subversion™ repository. If you have a brand new project that you want to import into your repository, then see the section **Import resources into the repository** (on page 2293). The following procedure assumes that you have an existing valid working copy on your file system.

1. Click the **Working Copies Manager** toolbar button (on Mac OS X) in the **Working Copy** view (on page 2304).

   **Step Result:** This action opens the **Working copies list** dialog box.

2. Click the **Add** button.
3. Select the working folder copy from the file system. The name is useful to differentiate between working copies located in folders with the same name. The default name is the name of the root folder of the working copy.

**Note:** For SVN 1.7 and newer working copies, all the internal information is kept only in the root directory. Thus, Syncro SVN Client needs to load the whole working copy.

4. Click the **OK** button.

The selected working copy is loaded and presented in the **Working Copy view (on page 2304)**.

**Note:** You can add working copies older than SVN 1.7. However, to load any of them, Syncro SVN Client will require to upgrade the working copy to SVN 1.8 format.

### Manage Working Copy Resources

This section explains how to work with the resources that are displayed in the **Working Copy view**.

### Edit Files

You can edit files from the **Working Copy view (on page 2304)** by double clicking them or by right clicking them and choosing **Open** from the contextual menu.

Note that only one file can be edited at a time. If you try to open another file, it is opened in the same editor window. The editor has syntax highlighting for known file types, meaning that a different color is used for each type of recognized token in the file. If the selected file is an image, then it is previewed in the editor, with no access to modifying it.

After modifying and saving a file from a working copy, a modified marker - an asterisk (*) - will be added to the file's icon in the **Working Copy view (on page 2304)**. The asterisk marks the files that have local modifications that were not committed to the repository.

### Add Resources to Version Control

To share new files and folders (created in your working copy), add them to version control using the **Add to version control** option from the **Working Copy view (on page 2304)**.

You can easily spot resources not under version control by the **unversioned** icon displayed in the **Local file status** column. Resources scheduled for addition are displayed with this **added** icon in the **Working Copy view** and are added in the repository after you commit them.

**Note:** Do not make a confusion between and icons. The former icon stands for resources that are actually copies of resources already committed in the repository, meaning they are **scheduled for addition with history**.

When you use the **Add to version control** option on a directory, its entire structure is scanned and all the resources that can be added under version control are presented.
Although it is not mandatory to add resources under version control explicitly, it is recommended. If you forgot to add a resource, when you commit your changes (on page 2258), the resource is presented in the commit dialog box, but not selected. When you commit and unversioned resource, it is automatically added under version control before starting the commit operation.

**Figure 625. Add to Version Control Dialog Box**

![Add to Version Control Dialog Box](image)

**Note:** Ignored items can also be added under version control.

The **Depth** column is displayed only when directories are also presented in the dialog box. For any directory, you can use one of the available values to instruct Subversion to limit the scope of the operation to a particular tree depth.

**Note:** The initial value of the **Depth** field can have the following values, depending on the listing mode of the items in the working copy view (on page 2309):

- *infinity* - When the working copy items are presented as a tree.
- *files* - When the working copy items are presented compressed.
- *empty* - When the working copy items are presented flat.

When you add unversioned or ignored directories, the initial value of the **Depth** field also depends on the state of the **Show unversioned directories content** and **Show ignored directories content** options. If these options are selected, the value is based on the listing mode of the items in the working copy view. When they are not selected, the value is *empty*.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the `config` file of the Subversion configuration directory.
Note: This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the config file of the Subversion configuration directory, in the auto-props section. Based on the value of the enable-auto-props runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

- No ignore - when you select this option, file-name patterns defined to ignore unversioned resources do not apply. Resources that are located inside an unversioned directory selected for addition, and match these patterns, are also scheduled for addition in the repository.

Note: This option is available only when directories are also presented in the dialog box. You can define file-name patterns to ignore unversioned resources in one of the following locations:

- In the config file of the Subversion configuration directory (the global-ignores option from the miscellany section).
- In the Oxygen XML Editor options (open the Preferences dialog box (Options > Preferences) (on page 72) and go to SVN > Working copy > Application global ignores).

Each of the above two options is activated only when you select an item that can have the option applied.

**Ignore Resources Not Under Version Control**

Some resources inside your working copy do not need to be subject to version control. These resources can be files created by the compiler, *.obj, *.class, *.lst, or output folders used to store temporary files. Whenever you commit changes (on page 2258), Apache Subversion™ shows your modified files in the commit dialog box, but the unversioned files are also listed. Since the unversioned files are committed unless otherwise specified, it is difficult to see exactly what you are committing.

The best way to avoid these problems is to add the derived files to the Subversion ignore list. That way they are never displayed in the commit dialog box and only genuine unversioned files that must be committed are displayed.

You can choose to ignore a resource by using the Add to svn:ignore action in the contextual menu of the Working Copy view (on page 2304).

In the Add to svn:ignore dialog box, you can specify the resource to be ignored by name or by a custom pattern. The custom pattern can contain the following wildcard characters:

- * - Matches any string of characters of any size, including the empty string.
- ? - Matches any single character.

For example, you can choose to ignore all text documents by using the pattern: *.txt.

The action Add to svn:ignore adds a predefined Subversion property called svn:ignore to the parent directory of the specified resource. In this property, there are specified all the child resources of that directory that must be ignored. The result is visible in the Working Copy view. The ignored resources are represented with gray icons.
Delete Resources

The **Delete** action is available in the contextual menu of the Working Copy view (on page 2304). When you delete an item from the working copy, it is marked as **deleted** (scheduled for deletion from repository upon the next commit) and removed from the file system. Depending on the state of each item, you are prompted to confirm the operation.

If a resource is deleted from the file system without Subversion's knowledge, the resource is marked as **missing** (●) in your working copy. You can decide what you want to do with a missing item:

- In the case of a commit, any missing item is first automatically deleted and then committed.

  Note: Not any missing item can be committed as deleted, and removed from the repository. For example, you cannot commit an item that no longer exists on the disk and that was scheduled for addition (●) previously, since this item does not exist in the repository, but you can use the Delete action instead.

- If you want to recover missing items, either update (on page 2258) the items themselves or one of their parent directories. This fetches their latest version from the repository.

You can also delete conflicting items (file content conflicts, property conflicts, tree-conflicts) and Syncro SVN Client automatically marks them as resolved.

Note: It is recommended that you resolve conflicts manually to avoid losing any important remote modifications.

Finally, you can change your mind and revert (on page 2255) the deleted items to their initial, pristine, state.

Copy Resources

You can copy resources from various locations of the working copy. You select them in the Working Copy view (on page 2304) and then use Copy to from the contextual menu. This is not a simple file system copy, but an Apache Subversion™ command. It will copy the resource and the copy will also have the original history. This is one of the important features of Subversion, as you can keep track of where the copied resources originated.

Based on the selected items, the Copy to action is available only if it can be performed. Even if the operation would not normally be possible in SVN (due to some invalid local file states against copy), Oxygen XML Editor performs the copy operation as a simple file system operation. This means no SVN versioning meta-data is affected.

Note:

- If you copy an item to a directory that is not under version control (on page 2306) (unversioned or ignored), the history of the item is not preserved. For example, when copying directories, all items inside them will also be copied without history.
• If you copy a directory that contains external (on page 2306) items, these are not copied. This is specific for SVN 1.7 working copies only. To fetch the external items, use the Update operation on the copied directory.

In the Copy to dialog box, you can navigate through the working copy directories to choose a target directory, to copy inside it. If you try to copy a single resource you are also able to change that resource's name. For versioned items, you can select Ignore resource history to copy them without their history (similar to a simple file system copy).

Note: The Copy to dialog box only presents all the local directories that are a valid destination against the copy operation, based on their local file status. Also, the working copy settings (on page 2309) are taken into account.

In the Commit dialog box, only the directory in question will appear without its children.

Move Resources

As in the case of the copy command, you can move several resources at once. Select the resources in the Working Copy view (on page 2304) and choose the Move to action from the contextual menu. The move command actually behaves as if a copy followed by a delete command were issued. You will find the moved resources at the desired destination and also at their original location, but marked as deleted.

Note: External items cannot be moved using the Move to action, because they cannot be deleted. Instead, you should edit the svn:externals property defining the external item and use the Update operation on the item's parent folder for the change to take effect.

Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Rename Resources

The Rename action is available in the contextual menu of the Working Copy view (on page 2304) and can be performed on a single resource. This action acts as a move command with the destination directory being the same as the original location of the resource. A copy of the original item is created with the new name, also keeping its history. The original item is marked as deleted.

Note: External items cannot be renamed using the Rename action because they cannot be deleted. Instead, you should edit the svn:externals property defining the external item, then use the Update operation on the item's parent folder for the change to take effect.

Attention: For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.
Lock / Unlock Resources

The idea of version control is based on the copy-modify-merge model of file sharing. This model states that each user contacts the repository and creates a local working copy (check out). Users can then work independently and modify their working copies according to their needs. When their goal has been accomplished, it is time for the users to share their work with the others, to send them to the repository (commit). When a user has modified a file that has been also modified on the repository, the two files will have to be merged. The version control system assists the user with the merging as much as it can, but in the end the user is the one that must make sure it is done correctly.

The copy-modify-merge model only works when files are contextually mergeable: this is usually the case of line-based text files (such as source code). However this is not always possible with binary formats, such as images or sounds. In these situations, the users must each have exclusive access to the file, ending up with a lock-modify-unlock model. Without this, one or more users could end up wasting time on changes that cannot be merged.

An SVN lock is a piece of metadata that grants exclusive access to a user. This user is called the lock owner. A lock is uniquely identified by a lock token (a string of characters). If someone else attempts to commit the file (or delete a parent of the file), the repository demands two pieces of information:

- User authentication - the user performing the commit must be the lock owner
- Software authorization - the user’s working copy must have the same lock token as the one from the repository, proving that it is the same working copy where the lock originated from.

Scanning for Locks

When starting to work on a file that is not contextually mergeable (usually a binary file), it is better to verify if someone else is not already working on that file. You can do this in the Working Copy view (on page 2304) by selecting one or more resources, then right-clicking them and choosing the Scan for Locks action from the contextual menu.

Figure 626. Locked Items Dialog Box

The Locked items dialog box contains a table with all the resources that were found locked on the repository. For each resource there are specified: resource path, state of the lock, owner of the lock, lock comment, creation and expiration date for the lock (if any).

The state of the lock can be one of the following:
• ‹ - Appears when one of the following conditions apply:
  ◦ Another user has locked the file in the repository.
  ◦ The file was locked by the same user from another working copy.
  ◦ The file was locked from the Repositories view.
• ‡ - Displayed after you have locked a file from the current working copy.
• ‡ - A file already locked from your working copy is no longer locked in the repository (it was unlocked by
  another user).
• ‡ - A file already locked from your working copy is being locked by another user. Now the owner of the file
  lock is the user who stole the lock from you.

You can unlock a resource by selecting it and pressing the Unlock button.

Related Information:
• Working Copy Locks (on page 2307)
• Repository Locks (on page 2299)

Locking a File

By locking a file, you have exclusive write access to it in the repository.

You can lock a file from your working copy or directly from the Repositories view.

Note: You can only lock files (not directories). This is a restriction imposed by Apache Subversion™.

The Lock dialog box allows you to write a comment when you set a lock or when you steal an existing
one. Note that you should steal a lock only after you made sure that the previous owner no longer needs it.
Otherwise, you may cause an unsolvable conflict, which could be the reason the lock was put there in the first
place. The Subversion server can have a policy concerning lock stealing, as it may not allow you to do this if
certain conditions are not met.

The lock stays in place until you unlock the file or until someone breaks it. There is also the possibility that the
lock expires after a period of time specified in the Subversion server policy.

Unlocking a File

A file can be unlocked from the contextual menu of the Working Copy view (on page 2304). A dialog box will
prompt you to confirm the unlocking and it will also allow you to break the lock (unlock it by force).

Synchronize with Repository

In the work cycle you will need to incorporate other people’s changes (update) and to make your own work
available to others (commit). This is what the Incoming and Outgoing modes of the Working Copy view (on
page 2304) was designed for, to help you send and receive modifications from the repository.

The Incoming and Outgoing modes of this view focus on incoming and outgoing changes. The incoming
changes are the changes that other users have committed in the repository since you last updated your
working copy. The outgoing changes are the modifications you made to your working copy as a result of editing, removing or adding resources.

The view presents the status of the working copy resources against the BASE revision after a Refresh operation. You can view the state of the resources versus a repository HEAD revision by using the Synchronize action from the Working Copy view (on page 2304).

View Differences

One of the most common requirements in project development is to see what changes have been made to the files from your Working Copy or to the files from the repository. You can examine these changes after a synchronize operation with the repository, by using the Open in compare editor action from the contextual menu.

The text files are compared using a built-in Compare view (on page 2326) that uses a line differencing algorithm or a specified external diff application (if such an application is set in the SVN Diff preferences page (on page 214)). When a file with outgoing status is involved, the compare is performed between the file from the working copy and the BASE revision of the file. When a file with incoming or conflict status is involved, the differences are computed using a three-way algorithm that means that the local file and the repository file are each compared with the BASE revision of the file. The results are displayed in the same view. The differences obtained from the local file comparison are considered outgoing changes and the ones obtained from the repository file comparison are considered incoming changes. If any of the incoming changes overlap outgoing changes then they are in conflict.

A special case of difference is a diff pseudo-conflict. This is the case when the left and the right sections are identical but the BASE revision does not contain the changes in that section. By default, this type of changes are ignored. If you want to change this, you can go to the SVN preferences page and select the Allow unversioned obstructions option (on page 212).

The right editor of the internal compare view presents either the BASE revision or a revision from the repository of the file so its content cannot be modified. By default, when opening a synchronized file in the Compare view, a compare is automatically performed. After modifying and saving the content of the local file presented in the left editor, another compare is performed. You will also see the new refreshed status in the Working Copy view (on page 2304).
At the top of each of the two editors, there are presented the name of the open file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

There are three types of differences:

- **Incoming changes** - Changes committed by other users and not present yet in your working copy file. They are marked with a blue highlight and on the middle divider the arrows point from right to left.
- **Outgoing changes** - Changes you have done in the content of the working copy file. They are marked with a gray highlight and the arrows on the divider are pointing from left to right.
- **Conflicting changes** - This is the case when the same section of text that you already modified in the local file has been modified and committed by some other person. They are marked with a red highlight and red diamonds on the divider.

There are numerous actions and options available in the Compare View toolbar (on page 2327) or in the Compare menu from the main menu. You can decide that some changes need adjusting or that new ones must be made. After you perform the adjustments, you may want to perform a new compare between the files. For this case there is an action called Perform files differencing. After each files differencing operation the first found change will be selected. You can navigate from one change to another by using the actions Go to first, Go to previous, Go to next and Go to last modification. If you decide that some incoming change needs to be present in your working file you can use the action Copy change from right to left. This is useful also when you want to override the outgoing modifications contained in a conflicting section. The Copy all
non-conflicting changes from right to left action copies all incoming changes that are not contained inside a conflicting section in your local file.

Suppose that only a few words or letters are changed. Considering that the differences are performed taking whole lines of text into account, the change will contain all the lines involved. To find exactly what words or letters have changed, the Word Details and Character Details dialog boxes are available. They present a more detailed comparison result when you double-click the middle divider of a difference.

When you want to examine only the changes in the real text content of the files, while disregarding the changes in the number of white spaces between words or lines, there is an option available in the SVN Preferences (on page 211) that allows you to enable or disable the white space ignoring feature of the compare algorithm.

Conflicts

A file conflict occurs when two or more developers have changed the same few lines of a file or the properties of the same file. As Subversion knows nothing of your project, it leaves resolving the conflicts to the developers. Whenever a conflict is reported, you should open the file in question, and try to analyze and resolve the conflicting situation.

Real Conflicts vs Mergeable Conflicts

There are two types of conflicts:

- **real conflict** (icon in Name column) - Syncro SVN Client considers the following resource states to be real conflicts:
  - **conflicted** state - A file reported by SVN as being in this state is obtained after it was updated/merged while having incoming and outgoing content or property changes at the same time, changes that could not be merged. A content conflict (icon in Local file status column) is reported when the modified file has binary content or it is a text file and both local and remote changes were found on the same line. A properties conflict (icon in Local properties status column) is reported when a property's value was modified both locally and remotely.
  - **tree conflicted** state (icon in Local file status column) - Obtained after an update or merge operation, while having changes at the directory structure level (for example, file is locally modified and remotely deleted or locally scheduled for deletion and remotely modified).
  - **obstructed** state (icon in Local file status column) - Obtained after a resource was versioned as one kind of object (file, directory, symbolic link), but has been replaced outside Syncro SVN Client by a different kind of object.

- **pseudo-conflict** ( icon in Name column) - A file is considered to be in pseudo-conflict when it contains both incoming and outgoing changes. When incoming and outgoing changes do not intersect, an update operation may automatically merge the incoming file content into the existing locally one. In this case, the pseudo-conflict marker is removed. This marker is used only as a warning that should prevent you to run into a real conflict.

Note:
A conflicting resource cannot be committed to repository. You have to resolve it first, by using **Mark Resolved** action (after manually editing/merging file contents) or by using **Mark as Merged** action (for pseudo-conflicts).

**•** icons are presented only when one of the following view modes is selected: Modified, Incoming, Outgoing, Conflicts.

**•** The **folder** icon is used also for folders to signal that they contain a file in real conflict or pseudo-conflict state.

### Content Conflicts vs Property Conflicts

A **Content conflict** appears in the content of a file. A merge occurs for every inbound change to a file that is also modified in the working copy. In some cases, if the local change and the incoming change intersect each other, *Apache Subversion™* cannot merge these changes without intervention. So if the conflict is real when updating the file in question the conflicting area is marked like this:

```
<<<<<<< filename
your changes
-----
code merged from repository
>>>>>> revision
```

Also, for every conflicted file *Subversion* places three additional temporary files in your directory:

**•** `filename.ext.mine` - This is your file as it existed in your working copy before you updated your working copy, that is without conflict markers. This file has your latest changes in it and nothing else.

**•** `filename.ext.rOLDREV` - This is the file that was the BASE revision before you updated your working copy, that is the file revision that you updated before you made your latest edits.

**•** `filename.ext.rNEWREV` - This is the file that *Subversion* client just received from the server when you updated your working copy. This file corresponds to the HEAD revision of the repository.

OLDREV and NEWREV are revision numbers. If you have conflicts with binary files, *Subversion* does not attempt to merge the files by itself. The local file remains unchanged (exactly as you last changed it) and you will get `filename.ext.r*` files also.

A **Property conflict** is obtained when two people modify the same property of the same file or folder. When updating such a resource a file named `filename.ext.prej` is created in your working copy containing the nature of the conflict. Your local file property that is in conflict will not be changed. After resolving the conflict, you should use the **Mark resolved** action to commit the file. Note that the **Mark resolved** action does not really resolve the conflict. It just removes the conflicted flag of the file and deletes the temporary files.
Edit Real Content Conflicts

The conflicts of a file in the conflicted state (a file with the red double arrow icon) can be edited visually with the Compare view (the built-in file comparison tool) or with an external diff application (on page 211). Resolving the conflict means deciding for each conflict if the local version of the change will remain or the remote one instead of the special conflict markers inserted in the file by the SVN server.

The Compare view (or the external diff application set in Preferences (on page 211)) is opened with the Edit Conflict action, which is available on the contextual menus of the Working Copy view (on page 2304) for files in the conflicted state (an update operation was executed but the differences could not be merged without conflicts). The external diff application is called with 3 parameters because it is a 3-way diff operation between the local version of the file from the working copy and the HEAD version from the SVN repository with the BASE version from the working copy as common ancestor.

If the Show warning dialog when edit conflicts option (on page 214) is selected, you will be warned at the beginning of the operation that the operation will overwrite the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<, ========, >>>>>>>) with the original local version of the file that preceded the update operation. If you click the OK button the visual conflict editing will proceed and a backup file of the conflict version received from the SVN server is created in the same working copy folder as the file with the edited conflicts. The name of the backup file is obtained by appending the extension .sync.bak to the file as stored on the SVN server. If you click the Cancel button the visual editing will be aborted.

The usual actions on the differences between two versions of a file are available on the toolbar of this view:

- **Save**
  Saves the modifications of the local version of the file displayed in the left side of the view.

- **Perform Files Differencing**
  Looks for differences between the two files displayed in the left and right side panels.

- **Ignore Whitespaces**
  Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

- **Synchronized scrolling**
  Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

- **Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**
  Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the Format and Indent Both Files action will automatically sort the keys in both files the same to make it easier to compare.
Copy Change from Right to Left
Copies the selected difference from the file in the right panel to the file in the left panel.

Copy All Changes from Right to Left
Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))
Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))
Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))
Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))
Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

First Change (Ctrl + B (Command + B on OS X))
Jumps to the first change.

The operation begins by overwriting the conflict version of the file received from the SVN server (the version that contains the conflict markers <<<<<<<<, =======, >>>>>>>) with the original local version of the file before running the update action that created the conflict. After that the differences between this original local version and the repository version are displayed in the Compare view.

If you want to edit the conflict version of the file directly in a text editor instead of the visual editing offered by the Compare view you should work on the local working copy file after the update operation without running the action Edit Conflict. If you decide that you want to edit the conflict version directly after running the action Edit Conflict you have to work on the .sync.bak file.

If you did not finish editing the conflicts in a file at the first run of the action Edit Conflict you can run the action again and you will be prompted to choose between resuming the editing where the previous run left it and starting again from the conflict file received from the SVN server.

After the conflicts are edited and saved in the local version of the file you should run one of the following:
• The **Mark Resolved** action on the file so that the result of the conflict editing process can be committed to the SVN repository.
• The **Revert** action so that the repository version overwrites all the local modifications.

Both actions remove the backup file and other temporary files created with the conflict version of the local file.

**Revert Your Changes**

If you want to undo changes made in your working copy, since the last update, select the items you are interested in, right-click to display the contextual menu and select **Revert**. A dialog box will open that shows you the files and folders that you have changed and can be reverted. Select those you want to revert and click the **OK** button. Revert will undo only your local changes. It does not undo any changes that have already been committed. If you choose to revert a conflicting item to its pristine copy, then the eventual conflict is solved by losing your outgoing modifications. If you try to revert a resource not under version control, the resource will be deleted from the file system.

**Note:** By default, a directory will be recursively reverted (including any other modified item it contains). However, if the directory has only property changes, you need to explicitly choose if the operation will include any modified items found inside it.

If you want some of your outgoing changes to be overridden you must first open the file in **Compare view** (on page 2326) and choose the sections to be replaced with ones from the repository file. This can be achieved either by editing directly the file or by using the action **Copy change from right to left** from the **Compare view toolbar** (on page 2327). After editing the conflicting file you have to run the action **Mark as merged** before committing it.

If you want to drop all local changes and bring all incoming changes into your working copy resource, you can use the **Override and update** action. It discards the changes in the local file and updates it from the repository. A dialog box will display the files that will be affected.
Figure 628. Override and Update Dialog Box

In the first table of the dialog box you will be able to see the resources that will be overridden. In the second table you will find the list of resources that will be updated. Only resources that have an incoming status are updated.

**Tip:** If you want to roll-back out of your working copy changes that have already been committed to the repository, see [Merge Revisions](on page 2270).

**Merge Conflicted Resources**

Before you can safely commit your changes to the repository you must first resolve all conflicts. In the case of pseudo-conflicts they can be resolved in most cases with an update operation that will merge the incoming modifications into your working copy resource. In the case of real conflicts, conflicts that persist after an update operation, it is necessary to resolve the conflict using the built-in compare view and editor or, in the case of properties conflict, the [Properties view](on page 2330). Before you can commit you must mark as resolved the affected files.

Both pseudo and real conflicts can be resolved without an update. You should open the file in the compare editor and decide which incoming changes need to be copied locally and which outgoing changes must be overridden or modified. After saving your local file you have to use the Mark as merged action from the contextual menu before committing.
Drop Incoming Modifications

In the situation when your file is in conflict but you decide that your working copy file and its content is the correct one, you can decide to drop some or all of the incoming changes and commit afterwards. The action **Mark as merged** proves to be useful in this case too. After opening the conflicting files with **Compare view (on page 2326)**, **Editor (on page 2323)** or editing their properties in the **Properties** view and deciding that your file can be committed in the repository replacing the existing one, you should use the **Mark as merged** action. When you want to override completely the remote file with the local file you should run the **Override and commit** action, which drops any remote changes and commits your file.

In general it is much safer to analyze all incoming and outgoing changes using the **Compare** view and only after to update and commit.

Tree Conflicts

A **tree conflict** is a conflict at the directory tree structure level and occurs when the user runs an update action on a resource that has the following conditions:

- It is locally modified and the same resource was deleted from the repository (or deleted as a result of being renamed or moved).
- It was locally deleted (or deleted as a result of being renamed or moved) and the same resource is incoming as modified from the repository.

The same conflict situation can occur after a merge or a switch action. The action ends with an error and the folder containing the file that is now in the tree conflict state is also marked with a conflict icon.

Such a conflict can be resolved in one of the following ways that are available when the user double clicks on the conflicting resource or when running the **Edit conflict** action:

**Figure 629. Resolve a tree conflict**
• **Keep local change (delete resource)** - Keeps the incoming change that comes from the repository.
• **Keep incoming modified resource** - If there is a renamed version of the file committed by other user that will be added to the working copy too.

**Update the Working Copy**

While you are working on a project, other members of your team may be committing changes to the project repository. To get these changes, you have to **update** your working copy. Updating may be done on single files, a set of selected files, or recursively on entire directory hierarchies. The update operation can be performed from **Working Copy view (on page 2304)**. It updates the selected resources to the last synchronized revision (if remote information is available) or to the **HEAD** revision of the repository.

There are three different kinds of incoming changes:

• **Non-conflicting** - A non-conflicting change occurs when a file has been changed remotely but has not been modified locally.
• **Conflicting, but auto-mergeable** - An auto-mergeable conflicting change occurs when a text file has been changed both remotely and locally (for example, has non-committed local changes) but the changes are on different lines of text. Not applicable to binary resources (for example, multimedia files, PDFs, executable program files)
• **Conflicting** - A conflicting change occurs when one or more of the same lines of a text file have been changed both remotely and locally.

If the resource contains only incoming changes or the outgoing changes do not intersect with incoming ones then the update will end normally and the Subversion system will merge incoming changes into the local file. In the case of a conflicting situation the update will have as result a file with conflict status.

The Oxygen XML Editor allows you to update your working copy files to a specific revision, not only the most recent one. This can be done by using the **Update to revision/depth** action from the **Working Copy view (All Files view mode)** or the **Update to revision** action from the **History view (on page 2317)** contextual menu.

If you select multiple files and folders and then you perform an **Update** operation, all of those files and folders are updated one by one. The Subversion client makes sure that all files and folders belonging to the same repository are updated to the exact same revision, even if between those updates another commit occurred.

When the update fails with a message saying that there is already a local file with the same name Subversion tried to check out a newly versioned file, and found that an unversioned file with the same name already exists in your working folder. Subversion will never overwrite an unversioned file unless you specifically do this with an **Override and update** action. If you get this error message, the solution is simply to rename the local unversioned file. After completing the update, you can check to see if the renamed file is still needed.

**Send Your Changes to the Repository**

Sending the changes you made to your working copy is known as **committing** the changes. If your working copy is up-to-date and there are no conflicts, you are ready to commit your changes.
The **Commit** action sends the changes from your local working copy to the repository. The **Commit** dialog box presents all the items that you can commit.

**Figure 630. Commit dialog box**

Enter a message to associate with the commit, or choose a previous message from the **Previous messages** list (the last 10 commit messages will be remembered even after restarting the SVN client application).

An item that can be committed has one of the following states: *added*, *modified* (content or properties), *replaced*, and *deleted*. All items that have one of these states are selected in the dialog box by default. If you do not want to commit one of the items, deselect it.

⚠️ **Attention:** For SVN 1.8 working copies: when committing items that were moved and/or renamed, make sure you select both the source and the destination. Otherwise, the commit operation will fail.

Besides the items that have one of the mentioned states, Syncro SVN Client also includes the files being **unversioned** or **missing** and these items are handled automatically:

- *Unversioned* items are added under version control.
- *Missing* items are deleted.

❗ **Note:** If the **Show unversioned directories content** option is not selected, the **Commit** dialog box does not display the items inside an **unversioned** directory.
**Unversioned** or **missing** items are not selected by default in the Commit dialog box, unless you have selected them explicitly when issuing the commit command.

**Note:** In some cases, items that have one of the above states are not presented in the Commit dialog box. For example:

- Items that have been *added* or *replaced* previously, but now are presented as *missing* after being removed from the file system, outside of an SVN client. Such items do not exist in the repository and you should use the **Delete** action to remove them from your working copy.
- Items that have incoming changes from the repository, after a synchronization. You need to have your working copy up-to-date before committing your changes.
- Files that, after a synchronization, appear as locked by other users or from other locations than the current working copy.

**Note:** Due to dependencies between items, when you select or clear an unversioned ( ≠ ) or added ( ≠ ) item in the Commit dialog box, other items with one of these states can be selected or cleared automatically.

The modifications that will be committed for each file can be reviewed in the compare editor window by double-clicking a file in the Commit dialog box, or by right-clicking and selecting the **Show Modifications** action from the contextual menu. This option is available to review only file content changes, not property changes.

The **Local file status** column indicates the actual state of the items and the **Local properties status** column indicates whether or not the properties of an item are modified.

The **Lock information** column is displayed if at least one of the files in the Commit dialog box has lock information associated with it, valid against the commit operation.

The following options are available in this dialog box:

- **Enable automatic properties** or **Disable automatic properties** - enables or disables automatic property assignment (per runtime configuration rules), overriding the **enable-auto-props** runtime configuration directive, defined in the **config** file of the Subversion configuration directory.

  **Note:** This option is available only when there are defined properties to be applied automatically for resources newly added under version control. You can define these properties in the **config** file of the Subversion configuration directory, in the **auto-props** section. Based on the value of the **enable-auto-props** runtime configuration directive, the presented option is either **Enable automatic properties**, or **Disable automatic properties**.

- **Keep locks** - selecting the **Keep locks** option preserves any locks you set on various files.

  **Note:** This option is available only when files that you locked are presented in the dialog box.

Each of the above options is activated only when you select an item that can have the option applied.
Your working copy must be up-to-date with respect to the resources you commit. This is ensured by using the **Update** action prior to committing, resolving conflicts and re-testing as needed. If your working copy resources you are trying to commit are out of date you will get an appropriate error message.

### Committing to Multiple Locations

Although Subversion does not support committing to multiple locations at once, Syncro SVN Client offers this functionality regarding *external* items.

If items to be committed belong to different *external* definitions than those found in the working copy, they are grouped under the corresponding item that indicates their repository origin. Each parent item is rendered bold and its corresponding repository location is presented when hovering it. Parent items are decorated with a small arrow ((GUI) if they are *external* definitions. The working copy root directory is never decorated and is not presented if there are no *external* items listed (all items belong to the main working copy). Each child item is presented relative to the parent item.

**Note:** When an *external* directory has modifications of its own, it is presented both as a parent item and as an item that you can select and commit. This is always the case for *external* files.

The sets of items belonging to *external* definitions from the same repository are committed together, resulting a single revision. So, the number of revisions can be smaller than the number of *externals*. External definitions are considered from the same repository if they have the same protocol, server address, port, and repository address within the server.

**Note:** *External* files are always from the same repository as the parent directory that defines them, so they are always committed together with the changes from their parent directory.

### Integration with Bug Tracking Tools

Users of bug tracking systems can associate the changes they make in the repository resources with a specific ID in their bug tracking system. The only requirement is that the user includes the bug ID in the commit message that they enter in the **Commit** dialog box. The format and the location of the ID in the commit message are configured with SVN properties.

To make the integration possible Syncro SVN Client needs some data about the bug tracking tool used in the project. You can configure this using the following SVN properties (*on page 2263*) that must be set on the folder that contains resources associated with the bug tracking system (usually they are set recursively on the root folder of the working copy):

- **bugtraq:message** - A string property. If it is set the **Commit** dialog box (*on page 2258*) will display a text field for entering the bug ID. It must contain the string `%BUGID%`, which is replaced with the bug number on commit.
- **bugtraq:label** - A string property that sets the label for the text field configured with the **bugtraq:message** property.
• **bugtraq:url** - A string property that is the URL pointing to the bug tracking tool. The URL string should contain the substring `%BUGID%` which Syncro SVN Client replaces with the issue number. That way the resulting URL will point directly to the correct issue.

• **bugtraq:warnifnoissue** - A boolean property with the values `true/yes` or `false/no`. If set to `true`, the Syncro SVN Client will warn you if the bug ID text field is left empty. The warning will not block the commit, only give you a chance to enter an issue number.

• **bugtraq:number** - A boolean property with the value `true` or `false`. If this property is set to `false`, then any character can be entered in the bug ID text field. If the property is set to `true` or is missing then only numbers are allowed as the bug ID.

• **bugtraq:append** - A boolean property. If set to `false`, then the bug ID is inserted at the beginning of the commit message. If `yes` or not set, then it is appended to the commit message.

• **bugtraq:logregex** - This property contains one or two regular expressions, separated by a newline. If only one expression is set, then the bug ID's must be matched in the groups of the regular expression string (for example, `[Il]ssue #?(\d+)`). If two expressions are set, then the first expression is used to find a string which relates to a bug ID but may contain more than just the bug ID (for example, `Issue #123` or `resolves issue 123`). The second expression is then used to extract the bug ID from the string extracted with the first expression. An example: if you want to catch every pattern `issue #XXX` and `issue #890`, #789 inside a log message you could use the following strings:

  ◦ `[Il]ssue #?(\d+)(,? ?#?\d+)+`
  ◦ `(\d+)`

The data configured with these SVN properties is stored on the repository when a revision is committed. A bug tracking system or a statistics tool can retrieve the revisions that affected a bug from the SVN server and present the commits related to that bug to the user of the bug tracking system.

If the **bugtraq:url** property was filled in with the URL of the bug tracking system and this URL includes the `%BUGID%` substring as specified above in the description of the **bugtraq:url** property then the **History view** on page 2317 presents the bug ID as a hyperlink in the commit message. Clicking such a hyperlink in the commit message of a revision opens a Web browser at the page corresponding to the bug affected by that commit.

**Obtain Information for a Resource**

This section explains how to obtain information for a SVN resource:

**Request Status Information for a Resource**

While you are working with the SVN Client you often need to know which files you have changed, added, removed, or renamed, or even which files got changed and committed by others. This is where the **Synchronize** action from the **Working Copy view** on page 2304 comes in handy. The **Working Copy** view shows you every file that has changed your working copy, as well as any unversioned files you may have.

If you want more detailed information about a given resource, you can use the **Show SVN Information** action. This action is available from the **File** menu or the contextual menu of the **Working Copy, Repositories, History, or Directory Change Set** views, or from the **Revision Graph** dialog box. The **SVN Information** dialog
box will be displayed, showing information about the selected resource. The information displayed depends on the location of the item (local or remote) and may include the following:

- Local path and repository location
- Revision number
- Last change author, revision and date
- Information about locks
- Local file status
- Local properties status
- Local directory depth
- Repository location and revision number for copied files or directories
- Path information about locally moved items
- Path information about conflict generated files
- Remote file status
- Remote properties status
- File size and other information

The value of a property of the resource displayed in the dialog box can be copied by right-clicking the property and selecting the Copy action.

Request History for a Resource

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the History view that can be accessed from Repositories view (on page 2299), Working Copy view (on page 2304), Revision Graph (on page 2332), or Directory Change Set view (on page 2321). From the Working copy view you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Related Information:
- History View (on page 2317)

Management of SVN Properties

In the Properties view (on page 2330) you can read and set the Apache Subversion™ properties of a file or folder. There is a set of predefined properties with special meaning to Subversion. For more information about properties in Subversion see the SVN Subversion specification. Subversion properties are revision-dependent. After you change, add or delete a property for a resource, you have to commit your changes to the repository.

If you want to change the properties of a given resource you need to select that resource from the Working Copy view (on page 2304) and run the Show properties action from the contextual menu. The Properties view is visible, it will always present the properties of the currently selected resource. There are actions
available in the Properties view toolbar (on page 2331) that allows you to add, change, and delete the properties.

If you choose the Add a new property action, a new dialog box will appear that contains the following:

• Name - Combo box that allows you to enter the name of the property. The drop-down menu of the combo box presents the predefined Subversion properties (such as svn:ignore, svn:externals, svn:needs-lock, etc.)
• Current value - Text area that allows you to enter the value of the new property.

If the selected item is a directory, you can also set the property recursively on its children by selecting the Set property recursively checkbox.

If you want to change the value for a previously set property, you can use the Edit property action, which will display a dialog box with the following information:

• Name - Property name (cannot be changed).
• Current value - The current value (can be changed).
• Base value - The value of the property, if any, from the resource in the pristine copy (cannot be changed).

If you want to completely remove a property previously set you can choose the Remove property action. It will display a confirmation dialog box where you can also choose if the property will be removed recursively.

There is a Refresh action in the Properties view (on page 2330) that can be used when the properties have been changed from outside the view. This can happen, for example, when the view was already presenting the properties of a resource and they have been changed after an Update operation.

Branches and Tags

One of the fundamental features of version control systems is the ability to create a new line of development from the main one. This new line of development will always share a common history with the main line if you look far enough back in time. This line is known as a branch. Branches are mostly used to try out features or fixes. When the feature or fix is finished, the branch can be merged back into the main branch (trunk).

Another feature of version control systems is the ability to take a snapshot of a particular revision, so you can at any time recreate a certain build or environment. This is known as tagging. Tagging is especially useful when making release versions.

In Apache Subversion™, there is no difference between a tag and a branch. On the repository, both are ordinary directories that are created by copying. The trick is that they are cheap copies instead of physical copies. Cheap copies are similar to hard links in Unix, which means that they merely link to a specific tree and revision without making a physical copy. As a result, branches and tags occupy little space on the repository and are created very quickly.

Provided that nobody ever commits to the directory in question, it remains a tag. If people start committing to it, it becomes a branch.
Create a Branch / Tag

To create a branch or tag by copying a directory, use the Branch/Tag action that is available in the Tools menu when an item is selected in the Working Copy view (on page 2304) or Repositories view (on page 2299), or from the contextual menu of the Repositories view.

Figure 631. Branch/Tag Dialog Box

You can configure the following options in this dialog box:

You can specify the source revision of the copy in the Copy from section. You can choose between the following options:

- **HEAD revision in the repository** - The new branch or tag will be copied in the repository from the HEAD revision. The branch will be created very quickly, as the repository will make a cheap copy.
- **Specific revision in the repository** - The new branch will be copied into the repository, but you can specify the exact desired revision. For example, this is useful if you forgot to make a branch or tag when you released your application. If you click the History button you can select the revision number from the History dialog box (on page 2240). This type of branch will also be created very quickly.
- **Working copy** - (Available only if the item is selected from the Working copy view). The new branch will be a copy of your local working copy. If you have updated some files to an older revision in your working copy, or if you have made local changes, that is exactly what goes into the copy. This involves transferring some data from your working copy back to the repository, or more specifically, the locally modified files.

You can specify the location of the new branch or tag in the Destination section:
• **Into repository’s directory** - The URL of the parent directory *(on page 2337)* of the new branch or tag.

  - **Note**: Peg revisions have no effect for this operation since it is used to send information to the repository.

• **Under the name** - You can specify another branch or tag name other than the name of the resource selected in the Repositories or Working copy view.

The new branch or tag will be created as a child of the specified URL of the repository directory and will have the new name.

**Merging**

At some stage during the development process, you will want to merge the changes made on a branch back into the trunk, or vice-versa. The merge is accomplished by comparing two points (branches or revisions) in the repository and applying the obtained differences to your working copy. This process is closely related to the diff concept.

  - **Note**: A branch is a line of development that exists independently of another line, yet still shares a common history if you look far enough back in time. A branch always begins life as a copy of something (such as a trunk, another branch, or tag), and moves on from there, generating its own history.

The ➔ Merge action is available in the Tools menu. The working copy item selected when you issued the command will be the one receiving the generated changes. If there is no item selected, the merge operation will be performed on the entire working copy.
The four types of merging are as follows:

- **Merge revisions** *(on page 2269)* - Port changes from one branch to another. Note that the *trunk* can also be considered a branch, in this context.
- **Synchronize branch** *(on page 2271)* - Fetch all the changes made on a parent branch (or the *trunk*) to a child branch.
- **Reintegrate a branch** *(on page 2272)* - Merge a branch back to its parent branch (can also be the *trunk*).
- **Merge two different trees** *(on page 2274)* - Integrate the changes done on a branch to a different branch.

It is recommended that you enable the following pre-merge check:

**Perform pre-merge best practices checks of the working copy target** *(on page 2268)* - When selected, the SVN Client checks if the working copy target item is ready for the merge operation and displays the pre-merge checks wizard page.

⚠️ **Remember**: It is a good idea to perform a merge into an unmodified working copy. If you have made changes to your working copy, commit them first. If the *merge* does not go as you expect, you may want to revert the changes and revert cannot recover your uncommitted modifications.

⚠️ **Important**: The above recommendation becomes mandatory when reintegrating a branch *(on page 2266).*
Pre-Merge Checks

Before performing a merge, it is recommended to make sure that the working copy target item is ready for the merge operation. The SVN Client includes a best practices step that checks various conditions of the working copy target item to ensure that the merge operation will succeed. By selecting the **Perform pre-merge best practices checks of the working copy target** option in the first page of the **Merge** wizard, the **Pre-merge checks** wizard page is displayed to give you a summary of the verified conditions.

The following conditions are checked in this operation:

**No local modifications**

The working copy item (or any of its children) receiving the merge should not contain uncommitted changes, to make it easier to revert merge-generated changes if you encounter unexpected results.

Tip: If this condition fails, you should commit or revert the local modifications before merging.

**No switched children**

None of the children of the working copy item receiving the merge should be switched, to avoid incomplete merges and subtree mergeinfo.

Tip: If this condition fails, you should switch back all the children before merging.

**Complete working copy tree**
The working copy item receiving the merge should be a complete directory tree structure with an infinite depth, to avoid incomplete merges and \textit{subtree mergeinfo}.

\textbf{Tip:} If this condition fails, you should change the \textit{sticky} depth of the working copy item receiving the merge to \textit{infinity} value.

\section*{No mixed revisions}

To avoid unexpected merge conflicts, the working copy item that is receiving the merge should not contain items that were updated to other revisions.

\textbf{Tip:} If this condition fails, you should \textit{update} the working copy before merging.

Each condition is marked with an icon that represents the state of the condition. The possible states are as follows:

- \( \checkmark \) (Successful) - The condition is fulfilled successfully.
- \( \Delta \) (Warning) - The condition is not fulfilled, but it is not mandatory.
- \( \Box \) (Error) - The condition is not fulfilled and is mandatory (therefore, the operation cannot proceed until you solve the error).

\textbf{Tip:} For each condition state, a message is displayed that gives you additional information about the results and, for warning or errors, a hint that explains how you can solve them.

\textbf{Important:} After solving any of the warnings or errors, it is recommended that you perform the \textit{pre-merge checks} again to make sure your new changes are valid.

\section*{Merge Revisions}

This case is when you have made one or more changes to a branch and you want to duplicate them in another branch. For example, suppose you know that a problem has been fixed by committing revisions 17, 20, and 25 on branch \textit{B1}. These changes are also needed in branch \textit{B2}. Thus, to merge them, you need a working copy of the \textit{B2} branch.

To merge revisions from a different branch, follow these steps:

1. Go to menu \textbf{Tools > Merge}.
   
   The \textit{Merge} wizard is opened.

2. Select the \textit{Merge revisions} option.

3. It is recommended that you select the \textbf{Perform pre-merge best practices checks of the working copy target} option to make sure that the working copy target item is ready for the merge operation.

   a. Click the \textbf{Next} button.

   If the \textbf{Perform pre-merge best practices checks of the working copy target} option is selected, the \textit{Pre-Merge Checks} wizard page \textit{(on page 2268)} is displayed.
Note: If errors are found you need to solve them before proceeding.

4. Click the Next button.
   The Merge revisions wizard page is displayed.

5. In the Merge from (URL) text box, enter the URL of the branch or tag (on page 2337) that contain the changes that you want to duplicate in your working copy.
   You may also click the Browse button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

   Note: If the URL belongs to a different repository than the working copy, the Ignore ancestry / Disable merge tracking option (in the Merge Options wizard page (on page 2276)) will be selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories (on page 2279).

   Tip: You can also specify a peg revision (on page 2339) at the end of the URL (for example, URL@rev1234). The peg revision does not affect the merge range you select. By default, the HEAD revision is assumed.

6. In the Revisions to merge section, choose between the all revisions and specific revision(s) options.
   • all revisions - The operation will include all eligible revisions that were not yet merged.
   • specific revision(s) - You can specify one or more individual revisions and/or revision ranges. Also, you can mix forward ranges (for example, 1-5), backward ranges (for example, 20-15), and subtract specific revisions from a range (for example, 1-5, -3).

   Note: If using the Subversion command-line client, a revision range of the form 1-5 means all changes starting from revision 2 up to revision 5 (the changes necessary to reach revision 5, committed after revision 1). Unlike the Subversion command-line client, in Syncro SVN Client the revision ranges are inclusive, meaning that it will process all revisions, starting with revision 1, up to and including revision 5.

   Attention: The HEAD revision is the only non-numerical revision allowed, and it can only be used when specifying revision ranges as one of the ends of the range (for example, 10–HEAD). Be careful when using it, as it might not refer to the desired revision, if it has recently been committed by another user.

   Tip: If you want to perform a reverse merge and roll-back your working copy changes that have already been committed to the repository, use the negative revisions notation (for example, –7) or backward revision ranges (for example, 20–10).

      a. If you click the History button, the History dialog box (on page 2240) is displayed, which allows you to select one or more revisions to be merged.

7. Optionally, if you want to configure the options (on page 2276) for your merge, click the Next button.
   The Merge Options wizard page (on page 2276) is displayed that allows you to configure options for the operation.
**Warning:** If the Ignore ancestry / Disable merge tracking option is selected and you chose all revisions in the Revisions to merge section, revisions that were previously merged will also be included, which may result in conflicts.

8. Click the Merge button.
   The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2278) after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

### Synchronize a Branch

While working on your own branch, other people on your team might continue to make important changes in the parent branch (which can be the trunk itself or any other branch). It is recommended to periodically duplicate those changes in your branch to make sure your changes are compatible with them. This is done by performing a synchronize merge, which will bring your branch up-to-date with any changes made to its ancestral parent branch since your branch was last created or synchronized. Subversion is aware of the history of your branch and can detect when it split away from the parent branch.

Frequently keeping your branch in sync with the parent branch helps you to prevent unexpected conflicts when the time comes for you to duplicate your changes back into the parent branch. The synchronization uses merge tracking to skip all those revisions that have already been merged, thus a sync merge can be repeated periodically to fetch all the latest changes of the parent branch to keep up-to-date with it.

**Important:** It is recommended to synchronize the whole working copy that was created from the child branch (the root of the working copy), rather than just a part of it.

After running the synchronize merge, your working copy from the child branch now contains new local modifications, and these edits are duplications of all of the changes that have happened on the trunk since you first created your branch. At this point, your private branch is now synchronized with the trunk.

To synchronize your branch with its parent branch, follow these steps:

1. Go to **Tools > Merge**.
   The Merge wizard is opened.

2. Select the **Synchronize branch** option.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
a. Click the **Next** button.
   If the **Perform pre-merge best practices checks of the working copy target** option is selected, the **Pre-Merge Checks wizard page (on page 2268)** is displayed.

   **Note:** If errors are found you need to solve them before proceeding.

4. Click the **Next** button.
   The **Synchronize branch** wizard page is displayed.

5. In the **Parent branch (URL)** text box, enter the **URL of the branch where you created your branch (on page 2337)**. This means that the URL must belong to the same repository as your working copy that was created from the child branch.
   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

   **Tip:** You can also specify a **peg revision (on page 2339)** at the end of the URL (for example, **URL@rev1234**). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the **HEAD** revision is assumed.

6. Optionally, if you want to **configure the options (on page 2276)** for your merge, click the **Next** button.
   The **Merge Options wizard page (on page 2276)** is displayed that allows you to configure options for the operation.

   **Note:** The **Ignore ancestry / Disable merge tracking** option is not available for this merge type, since a synchronization merge should always be recorded in the destination branch.

7. Click the **Merge** button.
   The merge operation is performed.

   If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

   It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, **you may need to resolve conflicts (on page 2278)** after making major changes.

   **Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

**Reintegrate a Branch**

There are some conditions that apply to reintegrate a branch:

- The server must support merge tracking.
• The source branch (to be reintegrated) must be coherently synchronized with its parent branch. This means that all revisions between the branching point and the last revision merged from the parent branch to the child branch must be merged to the latter one (there must be no missing revisions in-between).
• The working copy must not contain the following:
  ◦ Local modifications.
  ◦ A mixture of revisions (all items must point to the same revision).
  ◦ Sparse directories (all directories must be of infinity depth).
  ◦ Switched items.
• The revision of the working copy must be greater than or equal to the last revision of the parent branch with which the child branch was synchronized.

Tip: You can use the pre-merge checks option (on page 2268) to make sure these conditions are fulfilled.

This method is useful when you have a feature branch on which the development has concluded and it should be merged back into its parent branch. Since you have kept the feature branch synchronized with its parent, the latest versions of them will be absolutely identical except for your feature branch changes. These changes can be reintegrated into the parent branch by using a working copy of it and the Reintegrate a branch option.

This method uses the merge-tracking features of Apache Subversion™ to automatically calculate the correct revision ranges and to perform additional checks that will ensure that the branch to be reintegrated has been fully updated with its parent changes. This ensures that you do not accidentally undo work that others have committed to the parent branch since the last time you synchronized the child branch with it. After the merge, all branch development will be completely merged back into the parent branch, and the child branch will be redundant and can be deleted from the repository.

Tip: Before reintegrating the child branch it is recommended to synchronize it with its parent branch one more time, to help avoid any possible conflicts.

To reintegrate a child branch into its parent branch, follow these steps:

1. Go to menu Tools > Merge.
   The Merge wizard is opened.

2. Select the Reintegrate a branch option.

   Note: This option is not available if the selected working copy item (or if it is a directory, any of the items inside of it) has any type of modification. This is because it is mandatory for the target item to have no modifications.

3. It is recommended that you select the Perform pre-merge best practices checks of the working copy target option to make sure that the working copy target item is ready for the merge operation.

   a. Click the Next button.
      If the Perform pre-merge best practices checks of the working copy target option is selected, the Pre-Merge Checks wizard page (on page 2268) is displayed.
**Note:** If errors are found you need to solve them before proceeding.

4. Click the **Next** button.

   The **Reintegrate a branch** wizard page is displayed.

5. In the **Child branch (URL)** text box, enter the URL of the child branch to be reintegrated *(on page 2337).*

   This means that the URL must belong to the same repository as your working copy that was created from the parent branch.

   You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

   **Tip:** You can also specify a **peg revision (on page 2339)** at the end of the URL (for example, `URL@rev1234`). The peg revision specifies both the peg revision of the URL and the latest revision that will be considered for merging. By default, the **HEAD** revision is assumed.

   The **Merge Options** wizard page *(on page 2276)* is displayed that allows you to configure options for the operation.

   **Note:** Since a **reintegrate merge** is so specialized, most of the merge options are not available, except for those in the **File Comparison** category.

6. Click the **Merge** button.

   The merge operation is performed.

   If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

   It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts *(on page 2278)* after making major changes.

   **Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

### Merge Two Different Trees

This merge type is useful when you need to duplicate changes from one child branch (for example, `CB1`) to another child branch (`CB2`) from the same parent branch. The SVN client will calculate the changes necessary to get from the **HEAD** revision of the parent branch (or the **trunk**) to the **HEAD** revision of one of its child branches (`CB1`), and apply those changes to your working copy of the other branch (`CB2`). The result is that the latter child branch (`CB2`) will also include the changes made on the original child branch (`CB1`), although that branch was not reintegrated into the parent branch.

This merge type could also be used to reintegrate a child branch back into its parent when the repository does not support **merge tracking**.
Note: If the server does not support *merge-tracking*, then this is the only way to merge a branch back to its parent.

1. Go to menu **Tools > Merge**.
   The Merge wizard is opened.

2. Select the option **Merge two different trees**.

3. It is recommended that you select the **Perform pre-merge best practices checks of the working copy target** option to make sure that the working copy target item is ready for the merge operation.
   a. Click the **Next** button.
      If the **Perform pre-merge best practices checks of the working copy target** option is selected, the Pre-Merge Checks wizard page (on page 2268) is displayed.
      
      Note: If errors are found you need to solve them before proceeding.

4. Click the **Next** button.
   The **Merge two different trees** wizard is displayed.

5. In the **From (starting URL and revision)** section, enter the **URL of the first branch** (on page 2337). You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

   Tip: If you are using this method to merge a feature branch back to its parent branch, you need to start the merge wizard from within a working copy of the parent. In this field enter the full URL of the parent branch. This may sound wrong, but remember that the parent is the starting point to which you want to add the branch changes.

   Note: If the URL belongs to a different repository than the working copy, the **Ignore ancestry / Disable merge tracking** option (in the Merge Options wizard page (on page 2276)) will be selected automatically (and you cannot change this). This is because the Subversion client cannot track changes between different repositories (on page 2279).

   Tip: You can also specify a **peg revision** (on page 2339) at the end of the URL (for example, `URL@rev1234`). By default, the **HEAD** revision is assumed.

6. Enter the last revision number at which the two trees were synchronized by choosing between **HEAD revision** and **other revision**.
   - **HEAD revision** - Use this option if you are sure that no one else has committed changes since the last synchronization.
   - **other revision** - Use this option to input a specific revision number and avoid losing recent commits.
     You can use the **History** button to see a list of all revisions.

7. In the **To (ending URL and revision)** section, enter the **URL of the second branch** (on page 2337).
You may also click the **Browse** button to browse the repository and find the desired branch. If you have previously merged from this branch, then you can simply use the drop-down menu, which displays a history of previously used URLs.

**Tip:** If you are using this method to merge a feature branch back to its parent branch, enter the URL of the feature branch. This way, only the changes unique to this branch will be merged, since the branch should have been periodically synchronized with its parent.

**Attention:** The URL must point to the same repository as the one in the **From (starting URL and revision)** field. Otherwise, the operation will not be allowed, since Subversion cannot compute changes between items from different repositories.

**Tip:** You can also specify a **peg revision** (on page 2339) at the end of the URL (for example, URL@rev1234). By default, the **HEAD** revision is assumed.

8. Select a revision to compute all changes committed up to that point by choosing between **HEAD revision** and **other revision**.
   - **HEAD revision** - This is the default selected revision.
   - **other revision** - Use this option if you want to enter a previous revision. You can use the **History** button to see a list of all revisions.

9. Optionally, if you want to configure the options (on page 2276) for your merge, click the **Next** button. The **Merge Options** wizard page (on page 2276) is displayed that allows you to configure options for the operation.

**Warning:** If the **Ignore ancestry / Disable merge tracking** option is selected and you chose **all revisions** in the **Revisions to merge** section, revisions that were previously merged will also be included, which may result in conflicts.

10. Click the **Merge** button.
    The merge operation is performed.

If the merge is completed successfully, all the changes corresponding to the selected revisions should be merged in your working copy.

It is recommended to look at the results of the merge, in the working copy, to review the changes and see if it meets your expectations. Since merging can sometimes be complicated, you may need to resolve conflicts (on page 2278) after making major changes.

**Note:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

**Merge Options**
Here is the list of options that can be used when merging:
Figure 634. Merge Wizard - Advanced Options

- **Depth** (This option is applicable only for directories) - sets the depth of the merge operation. You can specify how far down into your working copy the merge should go by selecting one of the following values:
  - **Current depth** - Obey the depths registered for the directories in the working copy that are to be switched.
  - **Recursive (infinity)** - Merges all the files and folders contained in the selected folder. This is the recommended depth for most users, to avoid incomplete merges and subtree mergeinfo.
  - **Immediate children (immediates)** - Merges only the child files and folders without recursing subfolders.
  - **File children only (files)** - Merges only the child files.
  - **This folder only (empty)** - Merges only the selected folder (no child files or folders are included).

**Note:** The depth term is described in the Sparse checkouts (on page 2298) section. The default depth is the current depth of the working copy item receiving the merge.

- **Ignore ancestry / Disable merge tracking** - Changes the way two items are merged if they do not share a common ancestry. Most merges involve comparing items that are ancestrally related to one another. However, occasionally you may want to merge unrelated items. If this option is not selected, the first item will be replaced with the second item. In these situations, you would want the merge to do a path-based comparison only, ignoring any relations between the items. For example, if two different files have the same name and are in the same relative location, deselecting the option replaces one of the files with the other one, and selecting it merges their contents.

**Note:** If the URL of the merge source belongs to a different repository than the URL of the target working copy item (the one receiving the changes), this option is selected automatically (and you cannot
change this). This is because the Subversion client cannot track changes between different repositories (on page 2279).

- **Force deletion of modified or non-versioned items, if necessary** - If not selected, when the merge operation involves deleting locally modified or non-versioned items, it will fail. This is done to prevent data loss. This option is only available if there are uncommitted changes in the working copy.

- **Only record the merge (block revisions from getting merged)** - Available when the Ignore ancestry / Disable merge tracking option (on page 2277) is not selected. It enables a special mode of the merge operation that just records it in the local merge tracking information, without actually performing it (does not modify any file contents or the structure of your working copy). You might want to select this option for two possible reasons:
  - You made (or will make) the merge manually, and therefore need to mark the revisions as being merged to make the merge tracking system aware of them. This will exclude them from future merges.
  - You want to prevent one or more particular changes from being fetched in subsequent merges.

- **Ignore line endings** - Allows you to specify how the line ending changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.

- **Ignore whitespaces** - Allows you to specify how the whitespace changes should be handled. By default, all such changes are treated as real content changes, but you can ignore them if you select this option.
  - **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

  **Note:** Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

  - **Ignore all whitespaces** - Ignores all types of whitespace changes.

- **Test merge** - Performs a dry run of the merge operation, allowing you to preview it without actually performing the merge. In the Console view you will see a list of the working copy items that will be affected and how they will be affected. This is helpful in detecting whether or not a merge will be successful, and where conflicts may occur.

### Resolving Merge Conflicts

After the merge operation is finished, it is possible to have some items in conflict. This means that some incoming modifications for an item could not be merged with the current working copy version. If there are such conflicts, the Merge conflicts dialog box will appear, presenting the items that are in conflict. This dialog box offers you choices for resolving the conflicts.
The options to resolve a conflict are as follows:

- **Resolve later** - Used for leaving the conflict as it is, to manually resolve it later.
- **Keep incoming** - This option keeps all the incoming modifications and discards all current ones from your working copy.
- **Keep outgoing** - This option keeps all current modifications from your working copy and discards all incoming ones.
- **Mark resolved** - You should choose this option after you have manually solved the conflict, to instruct the Subversion that it was resolved. To do this, use the **Edit conflict** button, which displays a dialog box that presents the contents of the conflicting items (the content of the working copy version versus the incoming version).

**Additional Notes About the Merge Operation**

**Sub-tree Merges**

It is recommended to perform a merge on the whole working copy (select its root directory when triggering the operation) to avoid sub-tree mergeinfo. Sub-tree mergeinfo is the mergeinfo recorded to describe a sub-tree merge. That is, a merge done directly to a child of a branch root that might be needed in certain situations. There is nothing special about sub-tree merges or sub-tree mergeinfo except that the complete record of merges to a branch may not be contained solely in the mergeinfo on the branch root and you may have to look to any sub-tree mergeinfo to get a full accounting. Fortunately, Subversion does this for you and rarely will you need to look for it.

**Merging from Foreign Repositories**

Subversion supports merging from foreign repositories. While all merge source URLs must point to the same repository, the merge target (from the working copy) may come from a different repository than the source.
However, copies made in the merge source will be transformed into plain additions in the merge target. Also, merge-tracking is not supported for merges from foreign repositories.

**Note:** When performing merges from repositories other than the one corresponding to the target item (from the working copy), the **Ignore ancestry / Disable merge tracking** option (**on page 2277**) in the **Merge Options wizard page** (**on page 2276**) will be selected automatically (and you cannot change this).

**General Merge Recommendations**
As a recommendation, you should only merge into clean working copies that **do not** contain any of the following:

- Modifications.
- Sparse directories (all directories must be of depth *infinity*).
- Switched items.

**Important:** This recommendation becomes mandatory when performing a **reintegrate merge** (**on page 2272**) operation. Also, trying to merge to mixed-revision working copies will fail in all types of merge operations.

**Remember:** The merge result is only in your local working copy and needs to be committed to the repository for it to be available to others.

**Switch the Repository Location**
The **Switch** action is useful when the repository location of a working copy, or an already committed item in the working copy, must be changed within the same repository. The action is available on the **Tools** menu when a versioned resource is selected in the current working copy that is displayed in the **Working Copy view** (**on page 2304**).

**Note:** **External** items cannot be switched using this action. Instead, change the value of the **svn:externals** property set on the parent directory of the external item and update the parent directory.
Figure 636. Switch Dialog Box

The following options can be configured in the **Switch** dialog box:

**Switch to URL**

*The new location in the same repository* (on page 2337) *you are switching to.*

**Tip:** You can switch to items that were deleted, moved, or replaced, by specifying the original URL (before the item was removed) and use a **peg revision** (on page 2339) at the end (for example, `URL@rev1234`).

**Note:** For items that are already **switched** (on page 2306) that you want to switch back, the proposed URL is the original location of the item.

**Revision**

*The specific version of the location that you are switching to.*

**Depth** - *(This option is applicable only for directories)*

- **Current depth**
  
  Obeys the depths registered for the directories in the working copy that are to be switched.

- **Recursive (infinity)**
  
  Switches the location of the selected folder and all of its files and folders.

- **Immediate children (immediates)**
  
  Switches the location of the selected folder and its child files and folders without recursing subfolders.

- **File children only (files)**
  
  Switches the location of the selected folder and its child files.

- **This folder only (empty)**
Switches the location of the selected folder (no child files or folders are included).

**Ignore "svn:externals" definitions**

When selected, external items are ignored in the switch operation. This option is only available if you choose the **Current depth** or **Recursive (infinity)** depth.

**Change the working copy item to the specified depth**

Changes the **sticky** depth on the directory in the working copy.

**Ignore ancestry**

When not selected, the SVN system does not allow you to switch to a location that does not share a common ancestry with the current location. If selected, the SVN does not check for a common ancestry.

### Relocate a Working Copy

Sometimes the base URL of the repository is changed after a working copy is checked out from that URL. For example, if the repository itself is moved to a different server. In such cases, you do not have to check out a working copy from the new repository location. It is easier to change the base URL of the root folder of the working copy to **the new URL of the repository (on page 2337)**.

**Note:** *Peg revisions* have no effect for this operation.

This **Relocate** action is available in the **Tools** menu when selecting the root item of the working copy.

**Tip:** If you edit external items using the method described in the previous note, on the next update the system will try to fetch the external items again. To avoid this, you can invoke the **Relocate** action on each of these external items.

### Patches

This section explains how to work with patches in Syncro SVN Client.

**What is a Patch**

Suppose you are working with a set of XML files that you want to tag the project and distribute releases to other team members. While working on the project and correcting problems, you may need to distribute the corrections to other team members. In this case, you can distribute a patch (a collection of differences) that would correct the problems when applied over the last distribution. By default, the Syncro SVN Client generates patches in **the Unified Diff format**, but it can also use the **Git format (on page 2293)**.
Creating a patch in Apache Subversion™ implies the access to either two revisions of a versioned item, or two different versioned items from the repository:

- **Two revisions of a version item** - the item can be local or remote and you can select two versions of it. This also applies when you need to generate a patch that only contains the changes in the working copy that were not yet committed.
- **Two different versioned items from the repository** - the items are remote and you need to specify a revision for both.

⚠️ **Warning:** The resulting patch file may contain content that was written using a mix of encodings, based upon the encodings of the files that were compared. If you open the generated patch file in a text editor, it may result in unrecognizable content.

### Generating a Patch - Local Items

Based on a versioned item (already committed or scheduled for addition) in the working copy, you can generate patches that contain the local changes, the differences between a specific revision of that item and the item itself, or differences between the pristine item and another item from the repository. There are four options for generating a patch based upon local items.

To open the *Create patch* wizard, use the ✗ Create patch action from the **Tools** menu or from the contextual menu in the **Modified, Incoming, Outgoing,** or **Conflicts** modes.

![Create Patch Wizard - Local Items](image)

**Create Patch from Local Modifications**

This is the most commonly used type of patch and contains only the local changes for the selected item.
This option is useful if you want to share changes with other team members and you are not yet ready to commit them. This option is only available for local items that contain modifications. It is not available for items that have a local file status of unversioned or ignored, and in some cases missing or obstructed (on page 2306).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch from local modifications option in the dialog box.

3. Optionally, if you want to configure the options (on page 2291) for your patch, click the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

4. Click the Create patch button.
   If the patch is applied on a folder of the working copy and that folder contains unversioned files (on page 2306), this step of the wizard offers the option of selecting the ones that will be included in the patch.

   Figure 638. Create Patch Dialog Box - Add Unversioned Resources

   ![Create Patch Dialog Box - Add Unversioned Resources](image)

   The patch is created and stored in the path specified in the Output section of the Options page (on page 2291) or in the default location.

Create Patch Against a Specific Revision

This type of patch contains changes between an old revision and the current content from the selected item within the working copy.
This option is useful if you want to obtain differences between an older revision and the current state of the working copy (for instance, to test how current changes apply to an older version).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the **Create patch** wizard.

2. Select the **Create patch against a specific revision** option in the dialog box.

3. Click the **Next** button.
   The second step of the wizard is opened:

   ![Create Patch Wizard - Step 2](image)

4. Select the **revision to create patch against**.
   You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (on page 2240) to display a list of the item revisions.

   **Note:** If the **revision to create patch against** is older than the revision that the working copy item was updated for, the patch will include changes that were made **after** the selected revision.

5. Optionally, if you want to **configure the options** (on page 2291) for your patch, click the **Next** button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The **Options** wizard page is displayed.

6. Click the **Create patch** button.
The patch is created and stored in the path specified in the **Output** section of the **Options** page (on page 2291) or in the default location.

### Create Patch Between Two Revisions of an Item

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.

**Tip:** If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the **Create patch between two repository items** option (on page 2287) instead.

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the **Create patch** wizard.

2. Select the **Create patch between two revisions of an item** option in the dialog box.

3. Click the **Next** button.
   The second step of the wizard is opened:

   ![Figure 640. Create Patch Wizard - Step 2](image)

4. Select the starting and ending revisions in the **From** and **To** sections.
   You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (on page 2240) to display a list of the item revisions.

   **Note:** The patch will only include changes between the two specified revisions, starting with the changes that were made after the older revision.

   **Tip:** If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the **From** section and the older version in the **To** section.

5. Optionally, if you want to configure the options (on page 2291) for your patch, click the **Next** button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The **Options** wizard page is displayed.

6. Click the **Create patch** button.
The patch is created and stored in the path specified in the Output section of the Options page (on page 2291) or in the default location.

Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

Tip: To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a peg revision (on page 2339) at the end (for example, URL@rev1234).

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch between two repository items option in the dialog box.

3. Click the Next button.
   The second step of the wizard is opened:

   **Figure 641. Create Patch Wizard - Step 2**

4. Select the starting and ending URLs (on page 2337) and revisions in the From and To sections.
You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History button** *(on page 2240)* to display a list of the item revisions.

**Important:** Both URLs must point to items from the same repository.

**Note:** If you use a *peg* revision in the URL field, anything specified in the **other revision** field is ignored.

5. Optionally, if you want to **configure the options** *(on page 2291)* for your patch, click the **Next** button. This options page does not remember your selections when creating future patches. It will revert to the default values. The **Options** wizard page is displayed.

6. Click the **Create patch** button.

   The patch is created and stored in the path specified in the **Output** section of the **Options page** *(on page 2291)* or in the default location.

**Generating a Patch - Remote Items**

Based on a repository item, you can generate patches that contain the differences between two specific revisions of that item, or between a revision of that same item and another revision of another item from the repository. There are two options for generating a patch based upon remote items.

To open the **Create patch** wizard, use the ✡️ **Create patch** action from the **Tools** menu.

**Figure 642. Create Patch Wizard - Remote Items**

- **Create patch between two revisions of an item**
  - Create a patch containing all the differences between two revisions of an item.

- **Create patch between two repository items**
  - Create a patch containing all the differences between two different repository items.

**Create Patch Between Two Revisions of an Item**

This type of patch contains historical changes between two revisions of a selected item.

This option is useful if you want to share changes between two revisions with other team members.
Tip: If you need to generate a patch between two revisions of a previously deleted, moved, or replaced item, you should use the Create patch between two repository items option (on page 2287) instead.

The steps are as follows:

1. Go to menu Tools > Create patch.
   This opens the Create patch wizard.

2. Select the Create patch between two revisions of an item option in the dialog box.

3. Click the Next button.
   The second step of the wizard is opened:

   Figure 643. Create Patch Wizard - Step 2

4. Select the starting and ending revisions in the From and To sections.
   You can select between the HEAD revision and a specific revision number. For the other revision option, you can click the History button (on page 2240) to display a list of the item revisions.

   Note: The patch will only include changes between the two specified revisions, starting with the changes that were made after the older revision.

   Tip: If you want to reverse changes done between two revisions by using a patch file, you can specify the newer revision in the From section and the older version in the To section.

5. Optionally, if you want to configure the options (on page 2291) for your patch, click the Next button.
   This options page does not remember your selections when creating future patches. It will revert to the default values.
   The Options wizard page is displayed.

6. Click the Create patch button.
   The patch is created and stored in the path specified in the Output section of the Options page (on page 2291) or in the default location.

Create Patch Between Two Repository Items

This type of patch contains changes between one version of an item and a specific version of another item.

This option is useful for generating a patch that contains changes between existing, or even previously deleted, moved, or replaced items from different branches. This is the default option when you do not have a
working copy loaded, when no repository items are selected, or when exactly two repository items of the same kind are selected.

**Tip:** To access an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a peg revision (on page 2339) at the end (for example, `URL@rev1234`).

The steps are as follows:

1. Go to menu **Tools > Create patch**.
   This opens the **Create patch** wizard.

2. Select the **Create patch between two repository items** option in the dialog box.

3. Click the **Next** button.
   The second step of the wizard is opened:

   **Figure 644. Create Patch Wizard - Step 2**

   ![Create Patch Wizard - Step 2](image)

4. Select the starting and ending URLs (on page 2337) and revisions in the **From** and **To** sections.
   You can select between the **HEAD revision** and a specific revision number. For the **other revision** option, you can click the **History** button (on page 2240) to display a list of the item revisions.

   **Important:** Both URLs must point to items from the same repository.

   **Note:** If you use a peg revision in the URL field, anything specified in the **other revision** field is ignored.

5. Optionally, if you want to configure the options (on page 2291) for your patch, click the **Next** button.
This options page does not remember your selections when creating future patches. It will revert to the default values.

The Options wizard page is displayed.

6. Click the Create patch button.

The patch is created and stored in the path specified in the Output section of the Options page (on page 2291) or in the default location.

Patch Options

Figure 645. Create Patch Wizard - Options

Patch Section

Depth - (This option is applicable only for directories)

Current depth

The depth of recursing the folder for creating the patch is the same as the depth of that same folder in the working copy (available only when generating patches that contain changes from the working copy).

Recursive (infinity)

The patch is created on all the files and folders contained in the selected folder.

Immediate children (immediates)
The patch is created only on the child files and folders without recursing subfolders.

**File children only (files)**

The patch is created only on the child files.

**This folder only (empty)**

The patch is created only on the selected folder (no child file or folder is included in the patch).

**Ignore content of added files**

When selected, the patch file does not include the content of the *added* items. This option corresponds to the `--no-diff-added` option of the `svn diff` command.

**Ignore content of delete files**

When selected, the patch file does not include the content of the *deleted* items. This option corresponds to the `--no-diff-deleted` option of the `svn diff` command.

**Treat copied files as newly added**

When selected, copied items are treated as new, rather than comparing the items with their sources. This option corresponds to the `--show-copies-as-adds` option of the `svn diff` command.

**Include files having a binary MIME type**

When selected, the application is forced to compare items that are considered binary file types. This option corresponds to the `--force` option of the `svn diff` command.

**Ignore properties**

When selected, differences in the properties of items are ignored. This option corresponds to the `--ignore-properties` option of the `svn diff` command.

**Properties only**

When selected, only differences in the properties of the items are included in the patch file (file content is ignored). This option corresponds to the `--properties-only` option of the `svn diff` command.

**Note:** The **Ignore properties** and **Properties only** options are mutually exclusive.

**Notice ancestry**

If selected, the SVN common ancestry is taken into consideration when calculating the differences. This option corresponds to the `--notice-ancestry` option of the `svn diff` command.

**Files Comparison Section**

**Ignore line endings**
If selected, the differences in line endings are ignored when the patch is generated. This option corresponds to the \texttt{--ignore-eol-style} option of the \texttt{svn diff} command.

\textbf{Ignore whitespaces}

If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:

- \textbf{Ignore whitespace changes} (\texttt{--ignore-space-change}) - Ignores changes in the amount of whitespaces or changes to their type (for example, when changing the indentation or changing tabs to spaces).

\begin{itemize}
  \item Note: Whitespaces that are added or removed are still considered to be changes.
  \item \textbf{Ignore all whitespaces} (\texttt{--ignore-all-space}) - Ignores all types of whitespace changes.
\end{itemize}

\textbf{Output Section}

\textbf{Save as}

The patch will be created and saved in the specified file.

\textbf{Use Git extended diff format}

When selected, the patch is generated using the \texttt{Git} format. This option corresponds to the \texttt{git} option of the \texttt{svn diff} command.

\textbf{Working with Repositories}

This section explains how to locate and browse SVN repositories in Syncro SVN Client.

\textbf{Importing Resources Into a Repository}

Importing resources into a repository is the process of copying local files and directories into a repository so that they can be managed by an Apache Subversion™ server. If you have already been using Subversion and you have an existing working copy you want to use, then you will likely want to follow the procedure for using an existing working copy (on page 2241).

The \textbf{Import folder} and \textbf{Import Files} actions are available from the \textbf{Import} submenu of the \textbf{Repository} menu or of the contextual menu in the \textbf{Repositories} view. These actions open a dialog box that allow you to select the directories or files that will be imported into the selected repository location.

The \textbf{Import folder} action opens the \textbf{Import folder} dialog box.
You can configure the following options:

**Folder**

Specify the local folder *(on page 2337)* by using the text box or the **Browse** button. This folder should not be empty or already under version control.

**Important:** By default, the SVN system only imports the content of the specified folder, and not the folder itself. Therefore, it is recommended to use the **Browse** button to select the local folder so that the client will automatically append the name of it to the specified URL.

**URL**

Specify the repository location *(on page 2337)* that will be used to access the folder to be imported.

**Note:** Peg revisions have no effect for this operation since it is used to send information to the repository.

**Attention:** If the new location already exists, make sure that it is an empty directory to avoid mixing your project content with other files (if items exist with the same name, an error will occur and the operation will not proceed). Otherwise, if the address does not exist, it is created automatically.

**Depth**

**Recursive (infinity)**

Imports all the files and folders contained in the selected folder.

**Immediate children (immediates)**

Imports only the child files and folders without recursing subfolders.

**File children only (files)**

Imports only the child files.

**This folder only (empty)**

Imports only the selected folder (no child file or folder is included).
Share files matching global ignore patterns

When selected, the file names that match the patterns defined in either of the following locations are also imported into the repository:

- The `global-ignores` property in the SVN configuration file (on page 2336).
- The File name ignore patterns option (on page 214) in the SVN > Working Copy preferences page (on page 212).

Enable automatic properties/Disable automatic properties

Enables or disables automatic property assignment (per runtime configuration rules), overriding the `enable-auto-props` runtime configuration directive, defined in the SVN configuration file (on page 2336).

**Note:** This option is available only when there are defined properties to be applied automatically for newly added items under version control. You can define these properties in the SVN config file (in the `auto-props` section). Based on the value of the `enable-auto-props` runtime configuration directive, the presented option is either Enable automatic properties, or Disable automatic properties.

Exporting Resources From a Repository

This is the process of taking a resource from the repository and saving it locally in a clean form, with no version control information. This is very useful when you need a clean build for an installation kit.

The Export dialog box is similar to the Check out dialog box:

**Figure 647. Export from Repository Dialog Box**

You can configure the following options:

**URL**

Specify the source directory from the repository (on page 2337) by using the text box or the Browse button.
Tip: To export an item that was deleted, moved, or replaced, you need to specify the original URL (before the item was removed) and use a peg revision (on page 2339) at the end (for example, URL@rev1234).

Note: The content of the selected directory from the repository and not the directory itself will be exported to the file system.

Revision

You can choose between the HEAD or Other revision. If you need to export a specific revision, specify it in the Other text box or use the History button and choose a revision from the History dialog box.

Export to

Specify the location where you want to export (on page 2337) the repository directory by typing the local path in the text box or by using the Browse button. If the specified local path does not point to an existing directory, it will automatically be created.

Important: By default, the SVN system only exports the content of the directory specified by the URL, and not the directory itself. Therefore, it is recommended to use the Browse button to select the export location so that the client will automatically append the name of the remote directory to the path of the selected directory.

Warning: The destination directory should be empty. If files exist, they will be overwritten by exported files with matching names.

Depth

Recursive (infinity)

Exports all the files and folders contained in the selected folder.

Immediate children (immediates)

Exports only the child files and folders without recursing subfolders.

File children only (files)

Exports only the child files.

This folder only (empty)

Exports only the selected folder (no child file or folder is included).

Ignore "svn:externals" definitions

When selected, external items are ignored in the export operation. This option is only available if you choose the Recursive (infinity) depth.

EOL style

Defines the end-of-line (EOL) marker that should be used when exporting files that have the value or the svn:eol-style property set to native. You can choose between the following styles:
• **Default** - It uses the system-specific *end-of-line* marker.
• **CRLF** - The Windows-specific *end-of-line* marker (*carriage return - line feed*).
• **LF** - The Unix / OS X-specific *end-of-line* marker (*line feed*).
• **CR** - The Mac OS 9 (or older)-specific *end-of-line* marker (*carriage return*).

**Ignore keywords**

When selected, the export operation does not expand the *SVN keywords* found inside the files.

**Copy / Move / Delete Resources From a Repository**

Once you have a location defined in the **Repositories view** *(on page 2299)*, you can run commands (such as copy, move, and delete) directly on the repository. The commands correspond to the following actions in the contextual menu:

The **Copy to** and **Move to** action allows you to copy and move individual or multiple resources to a specific directory from the **HEAD** revision of the repository.

**Figure 648. Copy/Move Items in Repository**

![](image)

The dialog box used to copy or move items allows you to browse the **HEAD** revision of the repository and select the destination of the items, presenting its repository URL below the tree view.

The **Source** section presents relevant options regarding the item(s) that you move or copy:

- **URL** - This field is displayed only if you copy/move a single item.
- **Revision** - Presents the revision that will have one or more items copied, allowing you to also choose another revision.
Note: Since only items from the HEAD revision can be moved, the Revision options are not presented for the Move to action.

Note: When you copy a single item while browsing a revision other than HEAD, the Revision options present this revision but does not allow you to change it. The same applies if copying multiple items.

- New name - This option is presented when you copy or move a single item, allowing you to also rename it.

Another useful action is Delete, allowing you to erase resources directly from the repository.

All three actions are commit operations and you will be prompted with the Commit message dialog box.

Sparse Checkout

Sometimes you only need to check out certain parts of a directory tree. In this case, you can check out the top directory (using the Check out action from the Repositories view (on page 2300)) and then recursively update only the needed directories (using the Update action from the Working Copy view (on page 2311)). Each directory then has a depth set to it, with four possible values:

- Recursive (infinity) - Updates all descendant directories and files recursively.
- Immediate children (immediates) - Updates the directory, including direct child directories and files, but does not populate the child directories.
- File children only (files) - Updates the directory, including only child files without the child directories.
- This folder only (empty) - Updates only the selected directory, without updating any children.

For some operations, you can use as depth the current depth registered on the directories from the working copy (the value Current depth). This is the depth value defined in a previous check out or update operation.

The sparse checked out directories are presented in the Working Copy view (on page 2304) with a marker corresponding to each depth value, in the top left corner, as follows:

- 🌳 Recursive (infinity) - This is the default value and it is has no mark. The directory has no limiting depth.
- 📁 Immediate children (immediates) - The directory is limited to direct child directories (without contents) and files.
- 📄 File children only (files) - The directory is limited to direct child files only.
- 🍀 This folder only (empty) - The directory has empty depth set.

A depth set on a directory means that some operations process only items within the specified depth range. For example, Synchronize on a working copy directory reports the repository modified items within the depth set on the directory and those existing in the working copy outside of this depth.

The depth information is also presented in the SVN Information dialog box and in the tool tip displayed when hovering a directory in the Working Copy view.
Syncro SVN Client Views

The main working area occupies the center of the application window, which contains the most important views:

- Repositories View (on page 2299)
- Working Copy View (on page 2304)
- History View (on page 2317)
- Console View (on page 2331)

The other views that support the main working area are also presented in this section.

Repositories View

The Repositories view allows you to define and manage Apache Subversion™ repository locations and browse repositories. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

If no connections to your repository are available, you can add a new repository location (on page 2234). Repository files and folders are presented in a tree view with the repository locations at the first level, where each location represents a connection to a specific repository. More information about each resource is displayed in a tabular form:

- Date - Date when the resource was last modified.
- Revision - The revision number at the time the resource was last modified.
- Author - Name of the person who made the last modification on the resource.
- Size - Resource size on disk.
- Lock information - Information about the lock status of a file. When a repository file is locked by a user the icon is displayed in this column. If no icon is displayed the file is not locked. The tooltip of this column displays the details about the lock:
  - Owner - The name of the user who created the lock.
  - Date - The date when the user locked the file.
  - Expires on - Date when the lock expires. Lock expiry policy is set in the repository options, on the server side.
  - Comment - The message attached when the file was locked.
- Type - Contains the resource type or file extension.
Figure 649. Repositories View

The Repositories view's toolbar contains the following buttons:

- **New Repository Location** - Allows you to enter a new repository location by means of the Add SVN Repository dialog box.

- **Move Up** - Move the selected repository up one position in the list of repositories in the Repositories view.

- **Move Down** - Move the selected repository down one position in the list of repositories in the Repositories view.

- **Collapse all** - Collapses all repository trees.

- **Stop** - Stops the current repository browsing operation executed when a repository node is expanded. This is useful when the operation takes too long or the server is not responding.

- **Settings** - Allows you to configure the resource table appearance.

Repositories View Contextual Menu Actions

The Repositories view contextual menu contains various actions, depending on the selected item. If a repository location is selected, the following management actions are available:

- **New Repository Location (Ctrl + Alt + N (Command + Alt + N on OS X))**
Displays the **Add SVN Repository** dialog box. This dialog box allows you to define a new repository location.

**Figure 650. Add SVN Repository Dialog Box**

If the **Validate repository connection** option is selected, the URL connection is validated before being added to the **Repositories** view.

**Edit Repository Location** *(Ctrl + Alt + E (Command + Alt + E on OS X))*

Context-dependent action that allows you to edit the selected repository location using the **Edit SVN Repository** dialog box. It is active only when a repository location root is selected.

**Change the Revision to Browse** *(Ctrl + Alt + B (Command + Alt + B on OS X))*

Context-dependent action that allows you to change the selected repository revision using the **Change the Revision to Browse** dialog box. It is active only when a repository location root is selected.

**Remove Repository Location** *(Ctrl + Alt + R (Command + Alt + R on OS X))*

Allows you to remove the selected repository location from the view. It shows you a confirmation dialog box before removal. It is active only when a repository location root is selected.

The following actions are common to all repository resources:

**Open**

Opens the selected file in the Editor view in read-only mode.

**Open with**

Displays the **Open with** dialog box to specify the editor where the selected file is opened. If multiple files are selected, only external applications can be used to open the files.

**Save as**

Saves the selected files locally, as they are in the browsed revision.

**Refresh** *(F5)*

Refreshes the resource selected in the **Repositories** view.

**Check out** *(Ctrl + Alt + O (Command + Alt + O on OS X))*

Allows you to create a working copy from a repository directory, on your local file system. To read more about this operation, see Check out a working copy *(on page 2239)*.

**Branch/Tag**
Allows you to create a branch or a tag from the selected folder in the repository. To read more about how to create a branch/tag, see the Creation and management of Branches/Tags (on page 2264) section.

**Share project**

Allows you to share a new project (on page 2236) using an SVN repository. The local project is automatically converted into an SVN working copy.

**Import:**

**Import folder (Ctrl + Shift + L (Command + Shift + L on OS X))**

Allows you to import the contents of a specified folder from the file system into the selected folder in a repository. To read more about this operation, see the section Importing resources into a repository (on page 2293).

 giận Note: The difference between the import folder and Share project actions is that the latter also converts the selected directory into a working copy.

**Import Files (Ctrl + Shift + I (Command + Shift + I on OS X))**

Imports the files selected from the file system into the selected folder in the repository.

**Export**

Opens the Export dialog box (on page 2295) that allows you to configure options for exporting a folder from the repository to the local file system.

**Show History (Ctrl + H (Command + T on OS X))**

Displays the history of the selected resource. At the start of the operation, you can set filtering options.

**Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))**

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2323), along with the history of the file in the History view.

**Revision Graph (Ctrl + G (Command + G on OS X))**

This action allows you to see the graphical representation of a resource history. For more details about a resource revision graph see Revision Graph (on page 2332). This operation is available for any resource selected in the Repositories view or Working Copy view.

**Copy URL Location (Ctrl + Alt + U (Command + Alt + U on OS X))**

Copies to clipboard the URL location of the selected resource.

Copy to
Copies to a specified location the currently selected resource(s). This action is also available when you browse other revisions than the latest one (HEAD), to allow restoring previous versions of an item.

**Move to** *(Ctrl + M (Command + M on OS X))*

Moves to a specified location the currently selected resource(s).

**Rename** *(F2)*

Renames the selected resource.

**Delete** *(Delete)*

Deletes selected items from the repository via an immediate commit.

**New Folder** *(Ctrl + Shift + F (Command + Shift + F on OS X))*

Allows you to create a folder in the selected repository path (available only for folders).

**Locking**

The following options are available only for files:

- **Lock** *(Ctrl + K (Command + K on OS X))*
  
  Allows you to lock certain files that need exclusive access. For more details on the use of this action, see *Locking a file* *(on page 2248)*.

- **Unlock** *(Ctrl + Shift + K (Command + Shift + K on OS X))*
  
  Releases the exclusive access to a file from the repository. You can also choose to unlock it by force *(break the lock)*.

- **Show SVN Properties** *(Ctrl + Shift + P (Command + Shift + P on OS X))*
  
  Brings up the *Properties view* *(on page 2330)* displaying the SVN properties for the selected resource. This view does not allow adding, editing, or removing SVN properties of a repository resource. These operations are allowed only for working copy resources.

- **Show SVN Information** *(Ctrl + I (Command + I on OS X))*
  
  Provides additional information for the selected resource. For more details, go to *Obtain information for a resource* *(on page 2262)*.

**Assistant Actions**

When there is no repository configured, the **Repositories** view mode lists the following two actions:

**Figure 651. Repositories View Actions**

- Add a new repository
- Add a new repository to work on or to checkout a new working copy from it.
- Checkout a new working copy
  You can start using Syncro SVN Client by checking out a new working copy.
Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the Repositories view. These operations behave in the same way with the Copy to/Move to operations.

Working Copy View

The Working Copy view allows you to manage the content of an SVN working copy. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The toolbar contains the following:

- The list of defined working copies.
- A set of view modes that allow you to filter the content of the working copy based on the resource status (such as incoming or outgoing changes).
- Settings menu.

If you click any of the view modes (All Files, Modified, Incoming, Outgoing, Conflicts), the information displayed changes as follows:

- **All Files** - Resources (files and folders) are presented in a hierarchical structure with the root of the tree representing the location of the working copy on the file system. Each resource has an icon representation that describes the type of resource and also depicts the state of that resource with a small overlay icon.

![Figure 652. Working Copy View - All Files View Mode](image)

- **Modified** - The resource tree presents resources modified locally (including those with conflicting content) and remotely. Decorator icons are used to differentiate between various resource states:
\* Incoming modification from repository:
  - File content or properties modified remotely.
  - New file added remotely.
  - File deleted remotely.

\* Outgoing modification to repository:
  - File content or properties modified locally.
  - New file added locally.
  - File deleted locally.

\* Pseudo-conflict state - A resource being locally and remotely modified at the same time, or a parent directory of such a resource.

\* Real conflict state - A resource that had both incoming and outgoing changes and not all the differences could be merged automatically through the update operation (manually editing the local file is necessary for resolving the conflict).

**Figure 653. Working Copy View - Modified View Mode**

- **Incoming** - The resource tree presents only incoming changes.
- **Outgoing** - The resource tree presents only outgoing changes.
- **Conflicts** - The resource tree presents only conflicting changes (real conflicts and pseudo-conflicts).

The following columns provide information about the resources:

- **Name** - Resource name. Resource icons can have the following decorator icons:
  - Additional status information:
• **Propagated modification marker** - A folder marked with this icon indicates that the folder itself presents some changes (such as modified properties) or a child resource has been modified.

• **External** - This indicates a mapping of a local directory to the URL of a versioned resource. It is declared with a `svn:externals` property in the parent folder and it indicates a working copy not directly related with the parent working copy that defines it.

• **Switched** - This indicates a resource that has been switched from the initial repository location to a new location within the same repository. The resource goes to this state as a result of the Switch action *(on page 2280)* executed from the contextual menu of the Working Copy view.

• **Grayed** - A resource with a grayed-out icon, but no overlaid icon, is an ignored resource. It is obtained with the Add to `svn:ignore` action.

◦ Current SVN depth of a folder:
  - **Immediate children (immediates)** *(a variant of sparse checkout *(on page 2298)*) - The directory contains only direct file and folder children. Child folders ignore their content.
  - **File children only (files)** *(a variant of sparse checkout *(on page 2298)*) - The directory contains only direct file children, disregarding any child folders.
  - **This folder only (empty)** *(a variant of sparse checkout *(on page 2298)*) - The directory discards any child resource.

**Note:**
- Any folder not marked with one of the depth icons, has recursive depth *(infinity)* set by default (presents all levels of child resources).
- Although folders not under version control can have no depth set, Oxygen XML Editor presents unversioned and ignored folders with empty depth when Show unversioned directories content or Show ignored directories content options are not selected.

• **Local file status** - Shows the changes of working copy resources that were not committed to the repository yet. The following icons are used to mark resource status:
  - `-` - Resource is **not under version control (unversioned)**.
  - `I` - Resource is being **ignored** because it is not under version control and its name matches a file name pattern defined in one of the following places:
    - `global-ignores` section in the SVN client-side config file *(on page 2231)*.
    - Application global ignores option *(on page 214) of Oxygen XML Editor.
    - The value of a `svn:ignore` property *(on page 2244)* set on the parent folder of the resource being ignored.
  - `+` - Marks a newly created resource, scheduled for addition to the version control system.
  - `.` - Marks a resource scheduled for addition, created by copying a resource already under version control and inheriting all its SVN history.
  - `M` - The content of the resource has been modified.
- Resource has been replaced in your working copy (the file was scheduled for deletion, and then a new file with the same name was scheduled for addition in its place).
- Resource is deleted (scheduled for deletion from Repository upon the next commit).
- The resource is incomplete (as a result of an interrupted check out or update operation).
- Resource is missing because it was moved or deleted without using an SVN-aware application.
- The contents of the resource is in real conflict state (on page 2251).
- Resource is in a name conflict state.
- Resource is in tree conflict state after an update operation because:
  - Resource was locally modified and incoming deleted from repository.
  - Resource was locally scheduled for deletion and incoming modified.
- Resource is obstructed (versioned as one kind of object: file, directory, or symbolic link, but has been replaced outside Syncro SVN Client by a different kind of object).

- **Local properties status** - Marks the resources that have SVN properties, with the following possible states:
  - The resource has SVN properties set.
  - The resource properties have been modified.
  - Properties for this resource are in real conflict (on page 2251) with property updates received from the repository.

- **Revision** - The current revision number of the resource.
- **Date** - Date when the resource was last time modified on the disk.
- **BASE Revision** - The revision number of the pristine version of the resource.
- **BASE Date** - Date when the pristine version of the resource was last time committed in the repository.
- **Author** - Name of the person who made the last modification on the pristine version of the resource.

- **Remote file status** - Shows changes of resources recently modified in the repository. The following icons are used to mark incoming resource status:
  - Resource is newly added in repository.
  - The content of the resource has been modified in repository.
  - Resource was replaced in repository.
  - Resource was deleted from repository.

- **Remote properties status** - Resources marked with the icon have incoming modified properties from the repository.

- **Remote revision** - Revision number of the resource latest committed modification.
- **Remote date** - Date of the resource latest modification committed on the repository.
- **Remote author** - Name of the author who committed the latest modification on the repository.

- **Lock information** - Shows the lock state of a resource. The lock mechanism is a convention intended to help you signal other users that you are working with a particular set of files. It minimizes the time and effort wasted in solving possible conflicts generated by clashing commits. A lock gives you exclusive rights over a file, only if other users follow this convention and they do not try to bypass the lock state of a file.
A folder can be locked only by the SVN client application, completely transparent to the user, if an operation in progress was interrupted unexpectedly. As a result, folders affected by the operation are marked with the symbol. To clear the locked state of a folder, use the Clean up action.

**Note:** Users can lock only files.

The following lock states are displayed:

- *no lock* - the file is not locked. This is the default state of a file in the SVN repository.

  - *remotely locked* - shown when:
    - Another user has locked the file in the repository.
    - The file was locked by the same user from another working copy.
    - The file was locked from the Repositories view.

  If you try to commit a new revision of the file to the repository, the server does not allow you to bypass the file lock.

**Note:** To commit a new revision, you need to wait for the file to be unlocked. Ultimately, you might try to break or steal the lock, but this is not what other users expect. Use these actions carefully, especially when you are not the file lock owner.

- *locked* - displayed after you have locked a file from the current working copy. Now you have exclusive rights over the corresponding file, being the only one who can commit changes to the file in the repository.

  **Note:** Working copies keep track of their locked files, so the locks are presented between different sessions of the application. Synchronize your working copy with the repository to make sure that the locks are still valid (not stolen or broken).

- *stolen* - a file already locked from your working copy is being locked by another user. Now the owner of the file lock is the user who stole the lock from you.

- *broken* - a file already locked from your working copy is no longer locked in the repository (it was unlocked by another user).

**Note:** To remove the stolen or broken states from your working copy files, you have to Update them.

If one of your working copy files is locked, hover the mouse pointer over the lock icon to see more information:

- Lock type - current file lock state
- Owner - the name of the user who created the lock
- Date - the date when the user locked the file
- Expires on - date when the lock expires. Lock expiry policy is set in the repository options, on the server side
- Comment - the message attached when the file was locked
- **Size** - Resource size on disk
- **Type** - Contains the resource type or file extension
Note: The working copy table allows you to show or hide any of its columns and also to sort its contents by any of the displayed columns. The table header provides a contextual menu that allows you to customize the displayed information.

The toolbar contains the following options for switching to a different working copy:

- **List of Defined Working Copies** - A drop-down menu that contains all the working copies Oxygen XML Editor is aware of. When you select a different working copy from the list, the newly selected working copy content is scanned and displayed in the Working Copy view.

- **Working Copies Manager (on Mac OS X)** - Opens a dialog box that displays the working copies Oxygen XML Editor is aware of. In this dialog box, you can add existing working copies or remove those you no longer need. If you try to add a folder that is not a valid Subversion working copy, Oxygen XML Editor warns you that the selected directory is not under version control.

Note: Removing a working copy from this dialog box does NOT remove it from your file system; you will have to do that manually.

**Working Copy Settings**

The **Settings** button from the toolbar of the Working Copy view provides the following options:

- **Show unversioned directories content** - Displays the content of unversioned directories.

  Note: If this option is not selected, it will be ignored for items that, after a synchronize, are reported as incoming from the repository. This applies for all working copy modes, except All Files.

- **Show ignored items** - Displays the ignored resource when All Files mode is selected.

- **Show ignored directories content** - Displays the content of ignored directories when All Files mode is selected.

  Note: Although ignored items are not presented in the Modified, Incoming, and Conflicts modes, they will be if, after a synchronize, they are reported as incoming from the repository.

- **Show deleted items** - Displays the deleted resource when All Files mode is selected. All other modes always display deleted resources, disregarding this option.

  Tree / Compressed / Flat - Affect the way information is displayed inside the Modified, Incoming, Outgoing, and Conflicts view modes.

- **Configure columns** - Allows you to customize the structure of the Working Copy view data. This action opens the following dialog box:
The order of the columns can be changed with the two arrow buttons. The column size can be edited in the **Width of selected column** field. The **Restore Defaults** button reverts all columns to the default order, width, and enabled/disabled state from the installation of the application.

**Working Copy Format**

When an SVN working copy is loaded, Syncro SVN Client first checks the format of the working copy:

- If the format is older than SVN 1.7, you are prompted to upgrade it to SVN 1.8 to load it.
- If the format is 1.7, Syncro SVN Client takes into account the state of the **When loading an old format working copy** option (on page 213).

To change how working copy formats are handled, open the **Preferences** dialog box (Options > Preferences) (on page 72), go to SVN > Working copy, and configure the options in the **Administrative area** (on page 213) section.

**Note:**

- The format of the working copy can be downgraded or upgraded at any time with the **Upgrade** and **Downgrade** actions available in the **Tools** menu. These actions allow switching between SVN 1.7 and SVN 1.8 working copy formats.
- SVN 1.7 working copies cannot be downgraded to older formats.

**Refresh a Working Copy**

A refresh is a frequent operation triggered automatically when you switch between two working copies using the toolbar selector of the **Working Copy** view and when you switch between Oxygen XML Editor and other applications.
The **Working Copy** view features a fast refresh mechanism: the content is cached locally when loading the working copy for the first time. Later on, when the same working copy is displayed again, the application uses this cache to detect the changes between the cached content and the current content found on disk. The refresh operation is run on these changes only, thus improving the response time. Improvement is noticeable especially when working with large working copies.

**Working Copy View Contextual Menu Actions**

The contextual menu in the **Working Copy** view contains the following actions:

- **Edit conflict** *(Ctrl + E (Command + E on OS X))*
  
  Opens the **Compare** editor, allowing you to modify the content of the currently conflicting resources. For more information about editing conflicts, see *Edit conflicts (on page 2253)*.

- **Open in Compare Editor** *(Ctrl + Alt + C (Command + Alt + C on OS X))*
  
  Displays changes made in the currently selected file.

- **Open** *(Ctrl + O (Command + O on OS X))*
  
  Opens the selected resource from the working copy. Files are opened with an internal editor or an external application associated with that file type, while folders are opened with the default file system browsing application (Windows Explorer on Windows, Finder on OS X, etc).

- **Open with...**
  
  Submenu that allows you to open the selected resource either with Oxygen XML Editor or with another application.

- **Show in Explorer/Show in Finder**

  Opens the parent directory of the selected working copy file and selects the file.

- **Expand All** *(Ctrl + Alt + X (Command + Alt + X on OS X))*

  Displays all descendants of the selected folder. The same behavior is obtained by double-clicking a collapsed folder.

- **Refresh** *(F5)*

  Re-scans the selected resources recursively and refreshes their status in the working copy view.

- **Synchronize** *(Ctrl + Shift + S (Command + Shift + S on OS X))*

  Connects to the repository and determines the working copy and repository changes made to the selected resources. The application switches to **Modified** view mode if the **Always switch to 'Modified' mode** option *(on page 212)* is selected.

- **Update** *(Ctrl + U (Command + U on OS X))*

  Updates the selected resources to the **HEAD** revision (latest modifications) from the repository. If the selection contains a directory, it will be updated depending on its depth.
Allows you to update the selected resources from the working copy to an earlier revision from the repository. You can also select the update depth for the current folder. You can find out more about the depth term in the sparse checkouts (on page 2298) section.

Commit

Collects the outgoing changes from the selected resources in the working copy and allows you to choose exactly what resources to commit. A directory will always be committed recursively. Unversioned resources will be deselected by default. In the Commit dialog box you can also enter a comment before sending your changes to the repository.

Revert (Ctrl + Shift + V (Command + Shift + V on OS X))

Undoes all local changes for the selected resources. It does not contact the repository and the files are obtained from the Apache Subversion™ pristine copy. It is available only for modified resources. See Revert your changes (on page 2255) for more information.

Override and Update

Drops any outgoing change and replaces the local resource with the HEAD revision. This action is available on resources with outgoing changes, including conflicting ones. See the Revert your changes (on page 2255) section.

Override and Commit

Drops any incoming changes and sends your local version of the resource to the repository. This action is available on conflicting resources. For more information see Drop incoming modifications (on page 2257).

Mark Resolved (Ctrl + Shift + R (Command + Shift + R on OS X))

Instructs the Subversion system that you resolved a conflicting resource. For more information, see Merge conflicts (on page 2256).

Mark as Merged (Ctrl + Shift + M (Command + Shift + M on OS X))

Instructs the Subversion system that you resolved the pseudo-conflict by merging the changes and you want to commit the resource. Read the Merge conflicts (on page 2256) section for more information about how you can solve the pseudo-conflicts.

Create patch (Ctrl + Alt + P (Command + Alt + P on OS X))

Allows you to create a file containing all the differences between two resources, based on the svn diff command. To read more about creating patches, see the section about patches (on page 2284).

Compare with:

- Latest from HEAD (Ctrl + Alt + H (Command + Alt + H on OS X)) - Performs a 3-way diff operation between the selected file and the HEAD revision from the repository and displays the result in the Compare view. The common ancestor of the 3-way diff operation is the BASE version of the file from the local working copy.
• **BASE revision** *(Ctrl + Alt + C (Command + Alt + C on OS X))* - Compares the working copy file with the BASE revision file (the so-called *pristine copy*).

• **Revision** *(Ctrl + Alt + R (Command + Alt + R on OS X))* - Displays the History view that contains the log history of that resource.

• **Branch/Tag** - Opens the Compare with Branch/Tag dialog box that allows you to specify another file from the repository *(on page 2337)* *(To URL field)* to compare with the working copy file. You can specify the revision of the repository file by choosing between **HEAD revision** or specific **Other revision**.

  **Tip:** To compare with a file that was deleted, moved, or replaced, you need to specify the original URL (before the file was removed) and use a **peg revision** *(on page 2339)* at the end *(for example, URL@rev1234)*.

• **Each other** - Compares two selected files with each other.

These *compare* actions are available only if the selected resource is a file.

**Replace with:**

• **Latest from HEAD** - Replaces the selected resources with their versions from the **HEAD** revision of the repository.

• **BASE revision** - Replace the selected resources with their versions from the pristine copy (the BASE revision).

**Note:** In some cases it is impossible to replace the currently selected resources with their versions from the **BASE/HEAD** revision:

• For the **Replace with BASE revision** action, the resources being unversioned or added have no **BASE** revision, and thus cannot be replaced. However, they will be deleted if the action is invoked on a parent folder. The action will never work for missing folders or for obstructing files (folders being obstructed by a file), since you cannot recover a tree of folders.

• For the **Replace with latest from HEAD** action, you must be aware that there are cases when resources will be completely deleted or reverted to the BASE revision and then updated to a HEAD revision to avoid conflicts. These cases are:
  ◦ The resource is **unversioned, added, obstructed, or modified**.
  ◦ The resource is affected by a **svn:ignore** or **svn:externals** property that is locally added on the parent folder and not yet committed to the repository.

**Show History** *(Ctrl + H (Command + H on OS X))*

Displays the **History view** where the log history for the selected resource will be presented. For more details about resource history, see the sections about the **resource history view** *(on page 2317)* and requesting the history for a resource *(on page 2263)*.

**Show Annotation** *(Ctrl + Shift + A (Command + Shift + A on OS X))*
Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2323), along with the history of the file in the History view.

Revision Graph (Ctrl + G (Command + G on OS X))

This action allows you to see the graphical representation history of a resource. For more details about the revision graph of resources, see Revision Graph (on page 2332).

Copy URL Location (Ctrl + Alt + U (Command + Alt + U on OS X))

Copies the encoded URL of the selected resource from the Working Copy to the clipboard.

Mark as copied

You can use this action to mark an item from the working copy as a copy of another item under version control, when the copy operation was performed outside of an SVN client. The Mark as copied action is available when you select two items (both the new item and source item), and it depends on the state of the source item.

Mark as moved

You can use this action to mark an item from the working copy as being moved from another location of the working copy, when the move operation was performed outside of an SVN client. The Mark as moved action is available when you select two items from different locations (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Mark as renamed

You can use this action to mark an item from the working copy as being renamed outside of an SVN client. The Mark as renamed action is available when you select two items from the same directory (both the new item and the source item that is usually reported as missing), and it depends on the state of the source item.

Copy to

Copies the currently selected resource to a specified location.

Move to (Ctrl + M (Command + M on OS X))

Moves the currently selected resource to a specified location.

Rename (F2)

As with the move command, a copy of the original resource will be made with the new name and the original will be marked as deleted. Note that you can only rename one resource at a time.

Delete (Delete)

Schedules selected items for deletion upon the next commit and removes them from the disk. Depending on the state of each item, you are prompted to confirm the operation.

New:
• **New File** - Creates a new file inside the selected folder. The newly created file will be added under version control only if the parent folder is already versioned.

• **New Folder (Ctrl + Shift + F (Command + Shift + F on OS X))** - Creates a child folder inside the selected folder. The newly created folder will be added under version control only if its parent is already versioned.

• **New External Folder (Ctrl + Shift + W (Command + Shift + W on OS X))** - This operation allows you to add a new external definition on the selected folder. An external definition is a mapping of a local directory to a URL of a versioned directory (on page 2337), and ideally a particular revision, stored in the `svn:externals` property of the selected folder.

  **Tip:** You can specify a particular revision of the external item by using a **peg revision** (on page 2339) at the end of the URL (for example, `URL@rev1234`). You can also use peg revisions to access external items that were deleted, moved, or replaced.

The URL used in the external definition format can be relative. You can specify the repository URL that the external folder points to by using one of the following relative formats:

- `../` - Relative to the URL of the directory that the `svn:externals` property is set.
- `^/` - Relative to the root of the repository where the `svn:externals` property is versioned.
- `//` - Relative to the scheme of the URL of the directory that the `svn:externals` property is set.
- `/` - Relative to the root URL of the server that has the `svn:externals` property versioned.

**Important:** To change the target URL of an external definition, or to delete an external item, do the following:

1. Modify or delete the item definition found in the `svn:externals` property that is set on the parent folder.
2. For the change to take effect, use the **Update** operation on the parent folder of the external item.

**Note:** Syncro SVN Client does not support definitions of local relative external items.

**Add to "svn:ignore" (Ctrl + Alt + I (Command + Alt + I on OS X))**

Allows you to add files that should not participate in the version control operations inside your working copy. This action can only be performed on resources not under version control. It actually modifies the value of the `svn:ignore` property in the parent directory of the resource. Read more about this in the **Ignore Resources Not Under Version Control** (on page 2244) section.

**Add to version control (Ctrl + Alt + V (Command + Alt + V on OS X))**

Allows you to add resources that are not under version control. For further details, see **Add Resources to Version Control** (on page 2242) section.

**Remove from version control**
Schedules the selected items for deletion from the repository upon the next commit. The items are not removed from the file system after committing.

⚠️ **Clean up (Ctrl + Shift + C (Command + Shift + C on OS X))**

Performs a maintenance cleanup operation on the selected resources from the working copy. This operation removes the Subversion maintenance locks that were left behind. This is useful when you already know where the problem originated and want to fix it as quickly as possible. It is only active for resources under version control.

**Locking:**

- **Scan for locks (Ctrl + L (Command + L on OS X))** - Contacts the repository and recursively obtains the list of locks for the selected resources. A dialog box containing the locked files and the lock description will be displayed. This is only active for resources under version control. For more details see Scanning for locks (on page 2247).

- **Lock (Ctrl + K (Command + K on OS X))** - Allows you to lock certain files that need exclusive access. You can write a comment describing the reason for the lock and you can also force (steal) the lock. This action is active only on files under version control. For more details on the use of this action see Locking a file (on page 2248).

- **Unlock (Ctrl + Alt + K (Command + Alt + K on OS X))** - Releases the exclusive access to a file from the repository. You can also choose to unlock it by force (break the lock).

**Show SVN Properties (Ctrl + P (Command + P on OS X))**

Brings up the Properties view (on page 2330) and displays the SVN properties for the selected resource.

**Show SVN Information (Ctrl + I (Command + I on OS X))**

Provides additional information for the selected resource from the working copy. For more details, go to Obtain information for a resource (on page 2262).

### Drag and Drop Operations

The structure of the files tree can be changed with drag and drop operations inside the Working Copy view. These operations behave in the same way with the Copy to/Move to operations.

Also, files and folders can be added to the file tree of the view as unversioned resources by drag and drop operations from other applications (for example, from Windows Explorer or Mac OS X Finder). In this case, the items from the file system are only copied, without removing them from their original location.

⚠️ **Attention:** When you drag items from the working copy to a different application, the performed operation is controlled by that application. This means that the moved items are left as missing in the working copy (items are moved in the file system only, but no SVN versioning meta-data is changed).
Assistant Actions

To ensure a continuous and productive work flow, when a view mode has no files to present, it offers a set of guiding actions with some possible paths to follow.

Initially, when there is no working copy configured the All Files view mode lists the following two actions:

- **Check out a new working copy**: You can start using the SVN client by checking out a new working copy.
- **Add a working copy**: If you already have a working copy on disk, you can add it to the SVN client and start to work.

For Modified, Incoming, Outgoing, Conflicts view modes, the following actions may be available, depending on the current working copy state in various contexts:

- ![Synchronize with Repository](image)
  - Available only when there is nothing to present in the Modified and Incoming view modes.

- ![Switch to Incoming](image)
  - Selects the Incoming view mode.

- ![Switch to Outgoing](image)
  - Selects the Outgoing view mode.

- ![Switch to Conflicts](image)
  - Selects the Conflicts view mode.

- ![Show all changes/incoming/outgoing/conflicts](image)
  - Depending on the currently selected view mode, this action presents the corresponding resources after a synchronize operation was executed only on a part of the working copy resources.

- ![Information message](image)
  - Informs you why there are no resources presented in the currently selected view mode.

History View

In Apache Subversion™, both files and directories are versioned and have a history. If you want to examine the history for a selected resource and find out what happened at a certain revision you can use the History view that can be accessed from Repositories view (on page 2299), Working Copy view (on page 2304), Revision Graph (on page 2332), or Directory Change Set view (on page 2321). From the Working copy view you can display the history of local versioned resources. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The view consists of four distinct areas:

- The table showing details about each revision, such as revision number, commit date and time, number of changes (more details available in the tooltip), author’s name, and a fragment of the commit message.

  Some revisions may be highlighted to emphasize:

  - The current revision of the resource that has the history displayed - a bold font revision.
  - The last revision where the content or properties of the resource were modified - blue font revision.
Note: Both font highlights may be applied for the same revision.

- The complete commit message for the selected revision.
- A tree structure showing the folders where the modified resources are located. You can compress this structure to a more compact form that focuses on the folders that contain the actual modifications.
- The list of resources modified in the selected revision. For each resource, the type of action done against it is marked with one of the following symbols:
  - A newly created resource.
  - A newly created resource, copied from another repository location.
  - The content/properties of the resource were modified.
  - Resource was replaced in the repository.
  - Resource was deleted from the repository.

**Figure 656. History View**

You can group revisions in predefined time frames (today, yesterday, this week, this month), by pressing the **Group by date** button from the toolbar.

**History Filter Dialog Box**

The **History view** does not always show all the changes ever made to a resource because there may be thousands of changes and retrieving the entire list can take a long time. Normally you are interested in the more recent ones. That is why you can specify the criteria for the revisions displayed in the **History view** by selecting one of several options presented in the **History dialog box** that is displayed when you invoke the **Show History** action.
Options for the set of revisions presented in the History view are:

- All revisions of the selected resource.
- Only revisions between a start revision number and an end revision number.
- Only revisions added in a period of time (such as today, last week, last month, etc.)
- Only revisions between a start and an end date.
- Only revisions committed by a specified SVN user.

The toolbar of the History view has two buttons for extending the set of revisions presented in the view: Get next 50 and Get all.

**History Filter Field**

When only the history entries that contain a specified substring need to be displayed in the History view, the filter field displayed at the top of this view is a useful tool. Just enter the search string in the field next to the Find label. Only the items (with an author name, commit message, revision number, or date) that match the search string are kept in the History view. When you click the Search button, the filter action is executed and the content of the table is updated.

**History View Contextual Menu Actions**

The History view contains the following contextual menu actions:

**Compare with working copy**

Compares the selected revision with your working copy file. It is available only when you select a file.

**Open**

Opens the selected revision of the file into the Editor. This is available only for files.

**Open with**

Displays the Open with dialog box to specify the editor where the selected file will be opened.
Get Contents

Replaces the current version from the working copy with the contents of the selected revision from the history of the file. The BASE version of the file is not changed in the working copy so that after this action the file will appear as modified in a synchronization operation, that is newer than the BASE version, even if the contents is from an older version from history.

Save as

Allows you to save the contents of a file as it was committed at a certain revision. This option is available only when you access the history of a file.

Copy to

Copies to the repository the item whose history is displayed, using the selected revision. This option is active only when presenting the history for a repository item (URL).

Note: This action can be used to resurrect deleted items also.

Revert changes from this revision

Reverts changes that were made in the selected revisions. They are reverted only in the working copy and do not affect the repository items. It does not replace your working copy items with those from the selected revisions. This action is available when the resource history was launched for a local working copy resource.

Note: For items displayed in the Affected Paths section that were added, deleted, or replaced, this action has no effect because such changes are considered to be changes to the parent directory. To revert these types of changes, follow these steps:

1. Request the history for the parent directory.
2. Identify the revision that contains the changes you want to revert.
3. Invoke the action on that revision.

Warning: There are instances where the SVN Client is not able to identify the corresponding working copy item for the selected item in the Affected Paths section. In this case, the action does not proceed and an error message is displayed. For example, the selected item in the Affected Paths section is from a different repository location than the working copy item that has the history displayed.

Update to revision

Updates your working copy resource to the selected revision. This is useful if you want your working copy to reflect a time in the past. It is best to update a whole directory in your working copy, not just one file. Otherwise, your working copy is inconsistent and you are unable to commit your changes.

Check out

Checks out a new working copy of the directory that has the history presented, from the selected revision.
Export

Opens the Export dialog box (on page 2295) that allows you to configure options for exporting a folder from the repository to the local file system.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2323), along with the history of the file in the History view.

Change

Allows you to change commit data for a file:

- **Author** - Changes the name of the SVN user that committed the selected revision.
- **Message** - Changes the commit message of the selected revision.

When two resources are selected in the History view, the contextual menu contains the following actions:

Compare revisions

When the resource is a file, the action compares the two selected revisions using the Compare view. When the resource is a folder, the action displays the set of all resources from that folder that were changed between the two revision numbers.

Revert changes from these revisions

Similar to the `svn merge` command, it merges two selected revisions into the working copy resource. This action is only available when the resource history was requested for a working copy item.

For more information about the History view and its features, see the Request history for a resource (on page 2263) and Using the resource history view (on page 2317) sections.

Directory Change Set View

The result of comparing two reference revisions from the history of a folder resource is a set with all the resources changed between the two revision numbers. The changed resources can be contained in the folder or in a subfolder of that folder. These resources are presented in a tree format. For each changed resource all the revisions committed between the two reference revision numbers are presented.
The set of changed resources displayed in the tree is obtained by running the action **Compare revisions** available on the contextual menu of the **History** view when two revisions of a folder resource are selected in the **History** view.

The left side panel of the view contains the tree hierarchy with the names of all the changed resources between the two reference revision numbers. The right side panel presents the list with all the revisions of the resource selected in the left side tree. These revisions were committed between the two reference revision numbers. Selecting one revision in the list displays the commit message of that revision in the bottom area of the right side panel.

Double-clicking a file listed in the left-side tree performs a diff operation between the two revisions of the file corresponding to the two reference revisions. Double-clicking one of the revisions displayed in the right-side list of the view performs a diff operation between that revision and the previous one for the same file.

The contextual menu of the right side list contains the following actions:

- **Compare with previous version**
  
  Performs a diff operation between the selected revision in the list and the previous one.

- **Open**
  
  Opens the selected revision in the associated editor type.

- **Open with**
  
  Displays a dialog box with the available editor types and allows you to select the editor type for opening the selected revision.

- **Save as**
  
  Saves the selected file as it was in the selected revision.

- **Copy to**
  
  Copies to the repository the item whose history is displayed, using the selected revision.
Note: This action can be used to resurrect deleted items also.

Check out

Checks out a new working copy of the selected directory, from the selected revision.

Export

Opens the Export dialog box (on page 2295) that allows you to configure options for exporting a folder from the repository to the local file system.

Show Annotation (Ctrl + Shift + A (Command + Shift + A on OS X))

Opens the Show Annotation dialog box that computes the annotations for a file and displays them in the Annotations view (on page 2323), along with the history of the file in the History view.

Show SVN Information (Ctrl + I (Command + I on OS X))

Provides additional information for a selected resource. For more details, go to Obtain information for a resource (on page 2262).

Editor Panel of SVN Client

You can open a file for editing in an internal built-in editor. There are default associations between frequently used file types and the internal editors in the File Types preferences panel (on page 225).

The internal editor can be accessed either from the Working copy view (on page 2304) or from the History view (on page 2317). No actions that modify the content are allowed when the editor is opened with a revision from history.

Only one file at a time can be edited in an internal editor. If you try to open another file it will be opened in the same editor window. The editor provides syntax highlighting for known file types. This means that a different color will be used for each recognized token type found in the file. If the file's content type is unknown you will be prompted to choose the proper way the file should be opened.

After editing the content of the file in an internal editor you can save it to disk by using the Save action from the File (on page 2219) menu or the Ctrl + S (Command + S on OS X) key shortcut. After saving your file you can see the file changed status in the Working Copy view (on page 2304).

If the internal editor associated with a file type is not the XML Editor, then the encoding set in the preferences for Encoding for non XML files (on page 110) is used for opening and saving a file of that type. This is necessary because in the case of XML files, the encoding is usually declared at the beginning of the XML file in a special declaration or it assumes the default value UTF-8, but in the case of non-XML files, there is no standard mechanism for declaring the encoding for the file.

Annotations View

Sometimes you need to know not only what was changed in a file, but also who made those changes. The Annotations view displays the revision and the author that changed every line in a file. The annotations of a file are computed and this view is opened with the Show Annotation action, which is available in the
History menu, and from the contextual menu of the following views: Repositories view (on page 2299), Working copy view (on page 2304), History view (on page 2317), and Directory Change Set view (on page 2321).

This action opens a dialog box that allows you to configure some options for showing the annotations.

![Show Annotation Options Dialog Box](image)

Once you have configured the options and click **OK**, the Annotations view is displayed (by default, on the right side of the application). You can click a line in the editor panel where the file is opened to see the revision where the line was last modified. The same revision is highlighted in the History view and you can also see all the lines that were changed in the same revision highlighted in the editor panel. Also, the entries of the Annotations view corresponding to that revision are highlighted. Therefore, the Annotations view, History view, and annotations editor panel are all synchronized. Clicking a line in one of them highlights the corresponding lines in the other two.
The following options can be configured in the Show Annotation dialog box:

**From Revision Section**

Select the revision to have the annotation computed. If you click the History button, the History dialog box (on page 2240) is displayed, which allows you to select a revision.

**To Revision Section**

Select the ending revision by choosing between the HEAD revision or specify it in the Other text box. If you click the History button, the History dialog box (on page 2240) is displayed, which allows you to select a revision.

**Encoding**

Select the encoding to be used when the annotation is computed. For each line of text, the SVN Client looks through the history of the file to be annotated see when it was last modified, and by whom. It is required that it is in the form of a text file. Therefore, encoding is needed to properly decode and read the file content. By default, the encoding of the operating system is used.

**Ignore MIME type**

If selected, the file is treated as a text file and ignores what the SVN system infers from the svn:mime-type property.

**Ignore line endings**

If selected, the differences in line endings are ignored when the annotation is computed.

**Ignore whitespaces**

If selected, it allows you to specify how the whitespace changes should be handled. When selected, you can then choose between two options:
- **Ignore whitespace changes** - Ignores changes in the amount of whitespaces or to their type (for example, when changing the indentation or changing tabs to spaces).

    ![Note:](image) Whitespaces that were added where there were none before, or that were removed, are still considered to be changes.

- **Ignore all whitespaces** - Ignores all types of whitespace changes.

**Tip:** Selecting any of these *ignore* options can help you better determine the last time a meaningful change was made to a given line of text.

After you configure the options and click **OK**, the annotations will be computed and the **Annotations** view is displayed, where all the users that modified the selected resource will be presented, along with the specific lines and revision numbers modified by each user.

**Note:** If the file has a very long history, the computation of the annotation data can take a long time to process.

### Compare View

In the Oxygen XML Editor, there are three types of files that can be checked for differences: text files, image files and binary files. For the text files and image files you can use the built-in **Compare** view. This view is automatically opened if you select two files and use the **Compare with > Each Other** action in the contextual menu.
At the top of each of the two editors, there are presented the name of the open file, the corresponding SVN revision number (for remote resources) and the author who committed the associated revision.

When comparing text, the differences are computed using a line differencing algorithm. The view can be used to show the differences between two files in the following cases:

- After obtaining the outgoing status of a file with a Refresh operation, the view can be used to show the differences between your working file and the pristine copy. In this way you can find out what changes you will be committing.
- After obtaining the incoming and outgoing status of the file with the Synchronize operation, you can examine the exact differences between your local file and the HEAD revision file.
- You can use the Compare view from the History view to compare the local file and a selected revision or compare two revisions of the same file.

The Compare view contains two editors. Edits are allowed only in the left editor and only when it contains the working copy file. To learn more about how the view can be used, see View Differences (on page 2249).

Compare View Toolbar

The toolbar of the Compare view contains the operations that can be performed on the source and target files.
The following actions are available:

**Algorithm**

The algorithm to be used for performing a comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text. This algorithm is not available when the file comparison is in **Author** mode.
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

**Save action**

Saves the content of the left editor when it can be edited.

**Perform Files Differencing**

Looks for differences between the two files displayed in the left and right side panels.

**Ignore Whitespaces**

Enables or disables the whitespace ignoring feature. Ignoring whitespace means that before performing the comparison, the application normalizes the content and trims its leading and trailing whitespaces.

**Synchronized scrolling**

Toggles synchronized scrolling. When toggled on, a selected difference can be seen in both panels.

**Format and Indent Both Files (Ctrl + Shift + P (Command + Shift + P on OS X))**

Formats and indents both files before comparing them. Use this option for comparisons that contain long lines that make it difficult to spot differences.

**Note:** When comparing two JSON files, the **Format and Indent Both Files** action will automatically sort the keys in both files the same to make it easier to compare.

**Copy Change from Right to Left**

Copies the selected difference from the file in the right panel to the file in the left panel.
Copy All Changes from Right to Left

Copies all changes from the file in the right panel to the file in the left panel.

Next Block of Changes (Ctrl + Period (Command + Period on OS X))

Jumps to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note: A change block groups one or more consecutive lines that contain at least one change.

Previous Block of Changes (Ctrl + Comma (Command + Comma on OS X))

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change (Ctrl + Shift + Period (Command + Shift + Period on OS X))

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change (Ctrl + Shift + Comma (Command + Shift + M on OS X))

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Ignore Nodes by XPath

You can use this text field to enter an XPath expression (on page 1645) to ignore certain nodes from the comparison. It will be processed as XPath version 2.0. You can also enter the name of the node to ignore all nodes with the specified name (for example, if you want to ignore all ID attributes from the document, you could simply enter @id). This field is only available when comparing XML documents using the XML Fast or XML Accurate algorithms.

Note: If an XPath expression is specified in the Ignore nodes by XPath option (on page 217) in the Diff / File Comparison preferences page, that one is used as a default when the application is started. If you then enter an expression in this field on the toolbar, this one will be used instead of the default. If you delete the expression from this field, neither will be used.

First Change (Ctrl + B (Command + B on OS X))

Jumps to the first change.

Most of these actions are also available from the Compare (on page 2219) menu.
Image Preview

You can view your local files by using the built-in Image Preview component. The view can be accessed from the Working copy view (on page 2304) or from the Repository view (on page 2299). It can also be used from the History view (on page 2317) to view a selected revision of an image file.

Only one image file can be opened at a time. If an image file is opened in the Image preview and you try to open another one it will be opened in the same window. Supported image types are GIF, JPEG/JPG, PNG, BMP. Once the image is displayed in the Image Preview panel using the actions from the contextual menu, you can scale the image at its original size (1:1 action) or scale it down to fit in the view’s available area (Scale to fit action).

Compare Images View

The images are compared using the Compare Images view. This view is automatically opened if you select two image files and use the Compare with > Each Other action in the contextual menu. The images are presented in the left and right part of the view, scaled to fit the available area. You can use the contextual menu actions to scale the images at their original size or scale them down to fit the view’s available area.

The supported image types are: GIF, JPG / JPEG, PNG, BMP.

Properties View

The properties view presents Apache Subversion™ properties for the currently selected resource from either the Working Copy view or the Repositories view. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

![Properties View](image)

The table includes four columns:

- **State** - Can be one of the following:
  - (empty) - Normal unmodified property (same current and base values)
  - * (asterisk) - Modified property (current and base values are different)
• + *(plus sign)* - New property
• - *(minus sign)* - Removed property

- **Name** - The property name.
- **Current value** - The current value of the property.
- **Base value** - The base (original) value of the property.

### svn:externals Property

The `svn:externals` property can be set on a folder or a file. In the first case, it stores the URL of a folder from another repository *(on page 2314)*. In the second case, it stores the URL of a file from another repository. The external file will be added into the working copy as a versioned item. There are a few differences between directory and external file:

- The path to the external file must be in a working copy that is already checked out. While external directories can place the external directory at any depth and it will create any intermediate directories, external files must be placed into a working copy that is already checked out.
- The external file URL must be in the same repository as the URL that the external file will be inserted into *(inter-repository external files are not supported)*.
- While commits do not descend into an external directory, a commit in a directory containing an external file will commit any modifications to the external file.

The difference between a normal versioned file and an external file is that external files cannot be moved or deleted *(the `svn:externals` property must be modified instead. However, external files can be copied)*.

An external file is displayed as an X in the switched status column.

### Toolbar / Contextual Menu

The properties view toolbar and contextual menu contain the following actions:

- **➕ Add a new property** - This button invokes the *Add property* dialog box where you can specify the property name and value.
- **📝 Edit property** - This button invokes the *Edit property* dialog box where you can change the property value and also see its original(base) value.
- **✗ Remove property** - This button will prompt a dialog box to confirm the property deletion. You can also specify if you want to remove the property recursively.
- **🔄 Refresh** - This action will refresh the properties for the current resource.

### Console View

The *Console View* shows the traces of all the actions performed by the application. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.

Part of the displayed messages mirror the communication between the application and the Apache Subversion™ server. The output is expressed as subcommands to the Subversion server and simulates the
Subversion command-line notation. For a detailed description of the Subversion console output read the SVN User Manual.

The view has a simple layout, with most of its space occupied by a message area. On its right side, there is a toolbar holding the following buttons:

** Clear

Erases all the displayed messages.

🔒 Lock scroll

Disables the automatic scrolling when new messages are appended in the view.

The maximum number of lines displayed in the console (length of the buffer) can be modified in the Preferences (on page 211) page. By default, this value is set to 100.

Dynamic Help View

Dynamic Help view is a help window that changes its content to display the help section that is specific to the currently selected view. As you change the focused view, you can read a short description of it and its functionality. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Revision Graph of an SVN Resource

The history of an SVN resource can be watched on a graphical representation of all the revisions of that resource together with the tags in which the resource was included. The graphical representation is identical to a tree structure and very easy to follow.

The graphical representation of a resource history is invoked with the Revision graph action available on the right-click menu of an SVN resource in the Working Copy view (on page 2304) and the Repository view (on page 2299).
In every node of the revision graph an icon and the background color represent the type of operation that created the revision represented in that node. The commit message associated with that revision, the repository path, and the revision number are also contained in the node. The tooltip displayed when the mouse pointer hovers over a node specifies the URL of the resource, the SVN user who created the revision of that node, the revision number, the date of creation, the commit message, the modification type and the affected paths.

The types of nodes used in the graph are:

**Added resource**

The 📦 icon for a new resource added to the repository and a green background.

**Copied resource**

The 🔄 icon for a resource copied to other location (for example, when an SVN tag is created and a green background).

**Modified resource**

The ✍️ icon for a modified resource and a blue background.

**Deleted resource**

The ❌ icon for a resource deleted from the repository and a red background.

**Replaced resource**

The 🔄️ icon for a resource removed and replaced with another one on the repository and an orange background.
Indirect resource

The icon for a revision from where the resource was copied or an indirectly modified resource, that is a directory where a resource was modified and a gray background. The Modification type field of the tooltip specifies how that revision was obtained in the history of the resource.

A directory resource is represented with two types of graphs:

**Simplified graph**

Lists only the changes applied directly to the directory;

**Complete graph**

Lists also the indirect changes of the directory resource, that is the changes applied to the resources contained in the directory.

Figure 665. Revision Graph of a Directory (Direct Changes)
The **Revision graph** toolbar contains the following actions:

**Save as image**

Saves the graphical representation as image. For a large revision graph you have to [set more memory in the startup script](on page 262). The default memory size is not enough when there are more than 100 revisions that are included in the graph.

**Show/Hide indirect modifications**

Switches between simplified and complete graph.

**Zoom In**

Zooms in the graph.

**Zoom Out**

Zooms out the graph. When the font reaches its minimum size, the graph nodes will display only the icons, leading to a very compact representation of the graph.

**Reset scale**

Resets the graphical scale to a default setting.

**Print**

Prints the graph.

**Print preview**

Offers a preview of the graph to allow you to check the information to be printed.
The contextual menu of any of the graph nodes contains the following actions:

**Open**

Opens the selected revision in the editor panel. Available only for files.

**Open with**

Opens the selected revision in the editor panel. Available only for files.

**Save as**

Saves the file that had the revision graph generated, based on the selected node revision.

**Copy to**

Copies to the repository the item whose revision graph is displayed, using the selected revision.

- **Note:** This action can be used to resurrect deleted items also.

**Compare with HEAD**

Compares the selected revision with the HEAD revision and displays the result in the diff panel. Available only for files.

**Show History**

Displays the history of the resource in the History view (on page 2317). Available for both files and directories.

**Check out**

Checks out (on page 2239) the selected revision of the directory. Available only for directories.

**Export**

Opens the Export dialog box (on page 2295) that allows you to configure options for exporting a folder from the repository to the local file system.

When two nodes are selected in the revision graph of a file the right-click menu of this selection contains only the **Compare** for comparing the two revisions corresponding to the selected nodes. If the resource that had the revision graph built is a folder then the right-click menu displayed for a two nodes selection also contains the **Compare** action but it computes the differences between the two selected revisions as a set of directory changes. The result is displayed in the Directory Change Set (on page 2321) view.

- **Attention:** Generating the revision graph of a resource with many revisions may be a slow operation. You should enable caching for revision graph actions so that future actions on the same repository will not request the same data again from the SVN server, which will finish the operation much faster.

**Oxygen XML Editor SVN Preferences**

The options used in the SVN client are saved and loaded independently from the Oxygen XML Editor options. However, if Oxygen XML Editor cannot determine a set of SVN options to be loaded at startup, some of the preferences are imported from the XML Editor options (such as the License key and HTTP Proxy settings).
There is also an additional set of preferences applied to the SVN client that are set in global SVN files. There are two editing actions available in the Global Runtime Configuration submenu of the Options menu. These actions, Edit 'config' file and Edit 'servers' file, contain parameters that act as defaults applied to all the SVN client tools that are used by the same user on their login account.

**Entering Local Paths and URLs**

The Oxygen XML Editor includes a variety of option configuration pages or wizards that contain text boxes where you specify paths to local resources or URLs of items inside remote repositories. The Oxygen XML Editor provides support in these text boxes to make it easier to specify these paths and URLs.

**Local Item Paths**

The text boxes used for specifying local item paths support the following:

- **Absolute Paths** - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
- **Relative Paths** - The Oxygen XML Editor only accepts relative paths in the form ~/[/...], where ~ is the user home directory.
- **Path Validation** - Oxygen XML Editor validates the path as you type and invalid text becomes red.
- **Drag and Drop** - You can drag files and folders from the file system or other applications and drop them into the text box.
- **Automatic Use of Clipboard Data** - If the text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box.

**Repository Item URLs**

- **Local Repository Paths** - You can use local paths (absolute or relative) to access local repositories. When you use the Browse button, the Oxygen XML Editor will convert the file path to a file:// form of URL, provided that the location is a real repository.
  - **Absolute Paths** - In most cases, the Oxygen XML Editor expects absolute paths for local file system items.
  - **Relative Paths** - The Oxygen XML Editor only accepts relative paths in the form ~/[/...], where ~ is the user home directory.
- **Peg Revisions** - For URL text boxes found inside dialog boxes where you are pulling information from the repository, you can use peg revisions at the end of the URLs (on page 2339) (for example, URL@rev1234).

**Note:** If you try to use a peg revision number in a dialog box where you are sending information to the repository then the peg revision number will become part of the name of the item rather than searching for the specified revision. For example, in the URL http://host/path/inside/repo/item@100, the item name is considered to be item@100.

**Tip:** You can even use peg revisions with local repository paths. For example, C:\path\to\local\repo@100 will be converted to file:///C:/path/to/local/repo@100 and the Repository browser will display the content of the local repository as it is at revision 100.
• **URL Validation** - Oxygen XML Editor validates the URLs as you type and invalid text becomes red. Even paths to local repositories are not accepted unless using the **Browse** button to convert them to valid URLs.

• **Drag and Drop** - You can drag URLs from other applications or text editors and drop them into the URL text box. You can also drag folders that point to local repositories, from the local file system or from other applications, and they are automatically converted to valid `file://` type URLs.

• **Automatic Use of Clipboard Data** - If the URL text box is empty when its dialog box is opened, any data that is available in the system clipboard is used, provided that it is valid for that text box. Even valid local paths will be automatically converted to `file://` type URLs.

**Note:** The text boxes that are in the form of a combo box also allow you to select previously used URLs, or URLs defined in the **Repositories** view.

**Technical Issues**

This section contains special technical issues found during the use of Syncro SVN Client.

**Authentication Certificates Not Saved**

If Syncro SVN Client prompts you to enter the authentication certificate, although you already provided it in a previous session, then you should make sure that your local machine user account has the necessary rights to store certificate files in the **Subversion** configuration folder (write access to **Subversion** folder and all its subfolders). Usually, it is located in the following locations:

- **Windows**: `[HOME_DIR]\AppData\Roaming\Subversion`
- **Mac OS X and Linux**: `[HOME_DIR]/.subversion`

**Updating Newly Added Resources**

When you want to get a resource that is part of a newly created structure of folders from the repository, you need to also get its parent folders.

*Figure 667. Incoming Changes*

Syncro SVN Client allows you to choose how you want to deal with the entire structure from that moment onwards:

- **Update ancestor directories recursively**
This option brings the entire newly added folders structure into your working copy. In this case, the update time depends on the total number of newly incoming resources, because of the full update operation (not updating only selected resource).

**Update selected files only (leave ancestor directories empty)**

This option brings a skeleton structure composed of the resource's parent folders only, and the selected resource at the end of the operation. All of the parent directories will have depth set to *empty* in your working copy, thus subsequent *Synchronize* operations will not report any remote modifications in those folders. If you need to update the folders to full-depth, you can use the *Update to revision/depth* action (on page 2311) from the working copy view.

### Accessing Old Items from a Repository

Usually, you point to an item from a repository using a URL. However, sometimes this might not be enough because the URL alone might point to a different item than the one you want and a *peg revision* is needed.

A Subversion repository tracks any change made to its items by using *revisions*, which contain information such as the name of the author who made the changes, the date when they were made, and a number that uniquely identifies each of them. Over time, an item from a specific location in a repository evolves as a result of committing changes to it. When an item is deleted, its entire life cycle (all changes made to it from the moment it was created) remains recorded in the history of the repository. If a new item is created, with the same name and in the same location of the repository as a previously existing one, then both items are identified by the same URL even though they are located in different time frames. This is when a *peg revision* comes in handy. A *peg revision* is nothing more than a normal revision, but the difference between them is made by their usage. Many of the Subversion commands also accept a peg revision as a way to precisely identify an item in time, beside an *operative revision* (the revision regarding the used command).

**Example:**

To illustrate an example, consider the following:

- A new repository file `config` was created, identified by the URL `http://host.com/myRepository/dir/config`.
- The file has been created at revision 10.
- Over time, the file was modified by committing revisions 12, 15, 17.

To access a specific version of the file identified by the `http://host.com/myRepository/dir/config` URL, you need to use a corresponding revision (the operative revision):

- If a revision number is used that is lower than 10, an error is triggered, because the file has not been created yet.
- If a revision number is used that is between 10 and 19, the specific version you are interested in would be obtained.

**Note:** Although the file was modified in revisions 12, 15, 17, it existed in all revisions between 10 and 19. Starting with a revision where the file is modified, it has the same content across all revisions generated in the repository until another revision where it is modified again.
At this point, the file is deleted, creating revision 20. Now, no version of the file can be accessed because it no longer exists in the latest repository revision. This is due to the fact that Subversion automatically uses the HEAD revision as a peg revision (it assumes any item currently exists in the repository if not instructed otherwise). However, using any of the revision numbers from the 10-19 interval (when the file existed) as a peg revision (beside the operative revision), will help Subversion to properly identify the time frame when the file existed, and access the file version corresponding to the operative revision. If you use a revision number greater than 19, this will also trigger an error.

Continuing the example, suppose that at revision 30, a directory called config is created in the same repository location as the deleted file. This means that the new directory will be identified by the same repository address: http://host.com/myRepository/dir/config. If you only use this URL in any Subversion command, you will access the new directory. You will also access the same directory if you use any revision number equal to or greater than 30 as peg revision. However, if you are interested in accessing an old version of the previously existing file, then you must use one of the revisions that existed (10-19), as a peg revision, similar to the previous case.

Checksum Mismatch Error

A Checksum Mismatch error could happen if an operation that sends or retrieves information from the repository to the working copy is interrupted. This means that there is a problem with the synchronization between a local item and its corresponding remote item.

If you encounter this error, try the following:

1. Identify the parent directory of the file that caused the error (the file name should be displayed in the error message).

   Note: If the parent directory is the root of the working copy or if it contains a large amount of items it is recommended that you check out the working copy again, rather than continuing with the rest of this procedure.

2. Identify the current depth (on page 2306) of that directory.

3. Update the parent directory using the Update to revision/depth action that is available from the contextual menu or the Working copy menu. For the Depth option, select This folder only (empty).

   Warning: If you have files with changes in this directory, those changes could be lost. You should commit your changes or move the files to another directory outside the working copy prior to proceeding with this operation.

4. After clicking OK the contents of the directory will be erased and the directory is be marked as having an empty depth (on page 2306).

5. Once again, update the same directory using the Update to revision/depth action. This time, for the Depth option, select the depth that was previously identified in step 2.

6. If you moved modified files to another directory outside the working copy, move them back to the original location inside the working copy.

If this procedure does not solve the error, you need to check out the working copy again and move possible changes from the old working copy to the new one.
**External Tools**

A command-line tool can be started in the Oxygen XML Editor user interface as if from the command line of the operating system shell. Oxygen XML Editor offers you the option of integrating such a tool by specifying just the command line for starting the executable file and its working directory. To integrate such a tool, open the Preferences dialog box (Options > Preferences) (on page 72) and go to External Tools (on page 221) (or select Configure from the Tools > External Tools menu).

The External Tools preferences page (on page 221) presents a list of the external tools that have been configured. Once a tool has been configured (on page 221), you can open it by selecting it from the Tools > External Tools menu or from the External Tools drop-down menu on the toolbar (the Tools toolbar needs to be selected in the Configure Toolbars dialog box (on page 284)). You can also assign a keyboard shortcut (on page 223) to be used to launch the tool.

If the external tool is applied on one of the files opened in Oxygen XML Editor, the Save all files before calling external tools option (on page 140) (in the Save preference page) should be selected so that all edited files are automatically saved when an external tool is applied.

When an external tool is launched, the icon on the toolbar changes to a stop icon (■) and you can use this button to stop the tool. When the tool has finished running (or you close it), the icon changes back to the original icon (▶).

**Note:** Even though you can stop the external tool by invoking the stop action while it is running, that does not necessarily mean it will also stop the processes spawned by that external tool. For instance, if you stop an external tool that runs a batch file, the batch may be stopped but without actually stopping the processes that the batch was running at that time.

**Example: Integrating the Ant Tool**

This is an example procedure for integrating the Ant build tool into Oxygen XML Editor:

1. Download and install Apache Ant (on page 2641) on your computer.
2. Test your Ant installation from the command-line interface in the directory where you want to use Ant from. For example, run the clean target of your build.xml file:
   ```
   ant clean
   ```
3. Open the Preferences dialog box (Options > Preferences) (on page 72) and go to External Tools (or select Configure from the Tools > External Tools menu).
4. Click the New button to create a new external tool entry and enter the following information:
   - **Name** - For example, Ant tool.
   - **Working directory** - For example, C:\projects\XMLproject\build.xml.
   - **Command line** - For example, "C:\projects\XMLproject\ant.bat" clean.
5. Click OK to add the new tool to the list of external tools.
6. Run the tool from Tools > External Tools > Ant tool. You can see the output in the system console:
Started: "C:\projects\XMLproject\ant.bat" clean

Buildfile: build.xml

clean:

[echo] Delete output files.
[delete] Deleting 5 files from C:\projects\XMLproject

BUILD SUCCESSFUL
Total time: 1 second
21. Common Problems

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor.

Related Information:
- Documents with Long Lines (on page 376)
- Loading Large Documents (on page 374)
- External Tools (on page 2341)

Display Problems on Linux or Solaris

Problem
I experience display problems (such as screen freezes) on Linux or Solaris.

Cause
This is possibly a rendering problem with the off-screen pixmap support.

Solution
Add the following startup parameter (on page 262): 
-Dsun.java2d.pmoffscreen=false.

Out of Memory on External Processes

Problem
Oxygen XML Editor throws an Out Of Memory error when trying to generate PDF output with the built-in Apache FOP processor.

Cause
The amount of allocated memory might be insufficient.
Solutions

• Open the Preferences dialog box (Options > Preferences) (on page 72), go to XML > XSLT-FO-XQuery > FO Processors, and increase the value of the Memory available to the built-in FOP option (on page 195).
• For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

Related Information:
  • FO Processors Preferences (on page 194)
  • Custom Engines Preferences (on page 192)
  • External Tools Preferences (on page 221)
  • How to Enable Debugging for FO Processor Transformations (on page 1273)

Too many nested apply-templates calls Error When Running a Transformation

Problem
I'm getting the error message Too many nested apply-templates calls when I try to transform my DocBook file to HTML using default Oxygen XML Editor DocBook to HTML transformation scenario.

Cause
Most likely, this is the result of a masked stack overflow error.

Solution
Try setting a new VM option with the value -Xss4m. You can also try to slowly increase this to larger values (e.g. -Xss5m or -Xss6m). Note that this consumes memory on a per thread basis (Oxygen XML Editor can have tens of threads), so using a very large value here can backfire and leave Oxygen XML Editor without memory.

Related Information:
  • Setting a Java Virtual Machine Parameter when Launching Oxygen XML Editor (on page 262)

Performance Issues with Large Documents

Problem
The performance of the application slows down considerably over time when working with large documents.

Cause
A possible cause is that the application needs more memory to run properly.
Solutions

• You can increase the maximum amount of memory available to Oxygen XML Editor by setting the \texttt{-Xmx} parameter in a configuration file \textit{(on page 262)} that is specific to the platform that runs the application.

\begin{itemize}
  \item \textbf{Attention:} The maximum amount of memory should be less than 75\% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.
\end{itemize}

• When installed on a multiple user environment, each instance of Oxygen XML Editor will be allocated the amount stipulated in the memory value. To avoid degrading the general performance of the host system, ensure that the amount of memory available is optimally apportioned for each of the expected instances.

\begin{itemize}
  \item \textbf{Note:} When starting Oxygen XML Editor from the icon created on the Start menu or Desktop in Windows (or from the shortcut created on the Linux desktop), the default maximum memory available to the application is set to 40\% of the amount of physical RAM (but not more than 700 MB for 32-bit distributions or 4 GB for 64-bit distributions).
  \end{itemize}

When starting Oxygen XML Editor from a command-line script, the default maximum memory is 1 GB for 32-bit distributions or 4 GB for 64-bit distributions.

Performance Issues when Using Oxygen XML Editor with Remote Desktop

Problem

When trying to run Oxygen XML Editor in a Remote Desktop Protocol (RDP) environment, the performance is slow and choppy.

Cause

Running a standalone version of Oxygen XML Editor over a slow RDP connection may result in performance issues.

Solution

As a workaround, you try to run Oxygen XML Editor as an Eclipse plugin when working with a slow RDP connection.

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.
'Address Family Not Supported by Protocol Family; Connect' Error

Problem
I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?

Cause
This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution
A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` (java.net.preferIPv4Stack=true), by following this procedure:

1. Create a file named `custom_commons.vmoptions` and on a single line, add `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Editor installation folder (may need admin access).
2. Restart Oxygen XML Editor.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the `java.net.preferIPv4Stack` property is `true`.

Application Takes Several Minutes to Start

Problem
Oxygen XML Editor seems to take an abnormally long amount of time to start.

Cause
Some anti-virus software can cause Java applications, such as Oxygen XML Editor, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

Solution
A possible solution is to add the Oxygen XML Editor folder to the list of exceptions in the anti-virus software settings.

Archive Distribution Fails to Run on Mac OS 10.12 (Sierra)

Problem
For versions prior to 18.1, the classic archive distributions of Oxygen XML Editor (.zip or .tar.gz) fail to run on Mac OS 10.12 (Sierra).
Cause

This happens because the archives get quarantined and Mac OS 10.12 (Sierra) treats quarantined apps differently than older versions and isolates them from their parent folder at launch. If Oxygen XML Editor was already installed when you upgraded to Mac OS 10.12 (Sierra), there are no problems.

Solution

If Oxygen XML Editor was not already installed, or you need to reinstall an older version (prior to version 18.1), the quarantine flag must be removed for the entire content of the Oxygen XML Editor installation directory or the individual applications. To resolve this issue, follow these steps:

1. Open a Terminal window and change the directory to the folder where Oxygen XML Editor is located.
2. Run the following command:

   ```bash
   xattr -dr com.apple.quarantine oxygen/
   ```

   where "oxygen" is the actual name of the Oxygen XML Editor directory.

   If Oxygen XML Editor is in a location that requires administrator privileges for write access, you need to run the command from an administrator account and prefix the command with ```sudo```. You will then be prompted to enter your password.

Cannot Connect to SVN Repository from Repositories View

Problem

I cannot connect to an SVN repository from the Repositories view of SVN Client. How can I find more details about the error?

Solution

First check that you entered the correct URL of the repository in the Repositories view. Also check that an SVN server is running on the server machine specified in the repository URL and is accepting connections from SVN clients. You can check that the SVN server accepts connections with the command-line SVN client from CollabNet.

If you try to access the repository with an `svn+ssh` URL, also check that an SSH server is running on port 22 on the server machine specified in the URL.

If the above conditions are verified and you cannot connect to the SVN repository, generate a logging file on your computer and send the logging file to support@oxygenxml.com. For generating a logging file, you need to create a text file called `log4j.properties` in the install folder with the following content:

```properties
log4j.rootCategory= debug, R2
log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=logging.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
```
Cannot Open XML Files in Internet Explorer

Problem
Before installing Oxygen XML Editor I had no problems opening XML files in Internet Explorer. Now when I try to open an XML file in Internet Explorer, it opens the file in Oxygen XML Editor. How can I load XML files in Internet Explorer again?

Cause
XML files are opened in Oxygen XML Editor because Internet Explorer uses the Windows system file associations for opening files and you associated XML files with Oxygen XML Editor in the installer panel called File Associations. Therefore, Internet Explorer opens XML files with the associated Windows application.

Solution
To open XML files in Internet Explorer, you have to set Internet Explorer as the default system application for XML files. For example, you can do so by following this procedure:

1. Right-click the XML file in Windows Explorer and select Open With > Choose Default Program.
2. Expand the section with the down-arrow and select IE in the list of applications.
3. Select the Always use the selected program option.

If XML files are still not opened in Internet Explorer, create a file named revert.vbs with the following content:

```vbs
function revert()
    Set objShell = CreateObject("WScript.Shell")
    objShell.RegWrite "HKCR\xml\", "xmlfile", "REG_SZ"
    objShell.RegWrite "HKCR\xml\Content Type", "text/xml", "REG_SZ"
end function
revert()
```

Then run the following command from a command line:

```cmd
wscript revert.vbs
```
Cannot Uninstall Oxygen XML Editor in Windows

Problem
When I try to uninstall Oxygen XML Editor in Windows, I get an error that says it cannot find the files.log file.

Cause
The install4j installer that is used by Oxygen XML Editor creates the files.log file during the installation process. If you cannot uninstall the product, then most likely something went wrong with this file during the installation process.

Solution
To solve this, simply reinstall the software in the same directory as the current installation. This will automatically uninstall the old version or overwrite it with a clean install. You should then be able to uninstall this new installation.

Compatibility Issue Between Java and Certain Graphics Card Drivers

Problem
Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in Author or Text mode) being displayed garbled.

Solution
If you encounter this problem, update your graphics card driver. Another possible workaround is, open the Preferences dialog box (Options > Preferences) (on page 72), go to Appearance > Fonts, and set the value of the Text antialiasing option (on page 81) to ON.

Note: If this workaround does not resolve the problem, set the Text antialiasing option (on page 81) to other values.

Crash at Startup on Windows with an Error About the nvogl32.dll File

Problem
I try to start Oxygen XML Editor on Windows but it crashed with an error message about ‘Fault Module Name: nvogl32.dll’. What is the problem?

Cause
It is most likely an OpenGL driver issue.

Solution
This can be avoided by creating an empty file called opengl32.dll in the Oxygen XML Editor install folder (if you start Oxygen XML Editor with the shortcut created by the installer on the Start menu or on Desktop)
or in the subfolder bin of the home folder of the Java virtual machine that runs Oxygen XML Editor (if you start Oxygen XML Editor with the oxygen.bat script). The home folder of the Java virtual machine that runs Oxygen XML Editor is the value of the java.home property that is available in the System properties tab of the About dialog box (Help > About).

Crash in Java Runtime Thread

Problem
I encounter consistent crashes in one of the Java runtime threads (for example, AWT-EventQueue, Java2D Queue Flusher, or C2 CompilerThread).

Cause
This is usually caused by unknown errors somewhere in the implementation of the Java Runtime.

Solution
Although this does not guarantee that it will solve the problem, you could try updating the Java Runtime Environment (JRE) that comes bundled with Oxygen XML Editor to the latest supported version.

Important: You should only use a version of Java 8.

Windows/Linux

1. Download the latest Java 8 JRE from here: http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html. Download the JRE in the tar.gz format with the same architecture as your Oxygen XML Editor installation (x86=32bit / x64=64bit).
2. Navigate to the Oxygen XML Editor installation folder and rename the jre folder to jre.old (you will need admin privileges if it is installed in Program Files).
3. Unpack the tar.gz and rename the extracted folder to jre.
4. Move that folder to the Oxygen XML Editor installation folder.
5. Verify the paths in the jre folder. The path of the JRE bin folder should be: oxygen/jre/bin.
6. Start Oxygen XML Editor and check the Java version in Help > About > System properties. The java.runtime.version should be match the one you unpacked.

Mac OS X

2. Extract the archive contents in a location of your choice (for example, Downloads). You will end up with a folder named something like this: jre1.8.0_181.jre (depending on the version).
3. Move or rename the JRE that was bundled with Oxygen XML Editor. The bundled JRE folder (jre.bundle) is located inside a hidden folder named .install4j (in the Oxygen XML Editor installation folder), so you cannot see it in the Mac Finder. Thus, you need to move or rename it via the command line.
For example, if you have Oxygen XML Editor deployed in the `Applications` folder, the command should look similar to this:

```
mv "~/Downloads/jre1.8.0_181.jre" "~/Applications/Oxygen XML Editor/.install4j/jre.bundle"
```

4. Move the unpacked JRE folder from the location where you extracted it in the second step to a folder named `.install4j/jre.bundle` inside the Oxygen XML Editor installation direction.

For example, if you have Oxygen XML Editor deployed in the `Applications` folder, the command should look similar to this:

```
mv "~/Downloads/jre1.8.0_181.jre" "~/Applications/Oxygen XML Editor/.install4j/jre.bundle"
```

The default bundled JRE should now be successfully replaced by the newer one.

5. Start Oxygen XML Editor and check the Java version in `Help > About > System properties`. The `java.runtime.version` should be match the one you unpacked.

### Damaged File Associations on OS X

#### Problem

After upgrading OS X and Oxygen XML Editor, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

#### Cause

The upgrade damaged the file associations in the LaunchService Database on your OS X machine.

#### Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor installation kit on your desktop.
5. Copy the contents of the archive into the folder `/Applications/Oxygen`.
6. Run the following command in a Terminal:

   ```
   /System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/
   LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system
   -domain user
   ```

7. Restart Finder with the following command:

   ```
   killall Finder
   ```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor icon.
10. Accept the confirmation.

**Result:** When you start Oxygen XML Editor, the file associations should work correctly.

**Details to Submit in a Request for Technical Support Using the Online Form**

**Problem**

What details should I add to my request for technical support on the online form in the product website?

**Solution**

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (on page 22) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate an Oxygen XML Editor log file, follow these steps:

1. Create a text file called log4j.properties in the application installation folder, with the following content:

   ```
   log4j.rootCategory = debug, R2

   log4j.appender.R2=org.apache.log4j.RollingFileAppender
   log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
   log4j.appender.R2.MaxFileSize=12000KB
   log4j.appender.R2.MaxBackupIndex=20
   log4j.appender.R2.layout=org.apache.log4j.PatternLayout
   log4j.appender.R2.layout.ConversionPattern=%r %p [ %t ] %c - %m%n
   ```

2. Restart the application.

3. Reproduce the error.

4. Close the application.

5. Delete the log4j.properties file because it might cause performance issues if you leave it in the installation folder.

   **Important:** The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the log4j.properties file when you are done with the procedure.

**Result:** The resulting log file is named oxygen#.log (for example, oxygen.log, oxygen.log.1, oxygen.log.2, etc.) and is located in the Desktop\oxygenLog folder.
DITA Map Transformation Fails (Cannot Connect to External Location)

**Problem**

*DITA map (on page 2643)* transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the **Proxy preferences page (on page 229)**

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

*DITA Map WebHelp* transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA-OT Transformation Takes a Long Time to Process

**Problem**

A DITA transformation takes an extremely long time to process (over an hour, for example).

**Cause**

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.
Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Editor (on page 2344). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2585).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2421). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2643), broken links, and missing external resources.
You can analyze the **Results** tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the `clean.temp` parameter to `no` and the `retain.topic.fo` parameter to `yes`. Run the transformation, go to the temporary directory of the transformation, open the `topic.fo` file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help > About > Components > Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

### Related Information:
- [How to Enable Debugging for FO Processor Transformations](on page 1273)

## DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

### Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo

Failed to open C:\samples\dita\out\pdf\test.pdf
Failed to open samples\dita\out\pdf\test.pdf

..........  
[fop] Caused by: java.io.FileNotFoundException: C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)

### Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

### Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo

The column-number or number of cells in the row overflows the number of `fo:table-columns` specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
.......... 
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf

Solution: Table Contains More Cells Than Defined in Colspec
To resolve this issue, correct the @colspec attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter clean.temp to no.
2. Run the transformation, open the topic.fo file in Oxygen XML Editor, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2381)) to find the original DITA topic where the table was generated.

Problem: Broken Link
There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.

Solution: Broken Link
To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2381) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2381)) to find the original DITA topic where the table was generated.
DITA to CHM Transformation Fails - Cannot Open File

**Problem**

The DITA to CHM transformation fails with the following error: `[exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.`

**Cause**

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

**Solution**

To solve this issue, close the CHM help file and run the transformation scenario again.

**Tip:** It is a good practice to validate the DITA map (on page 2643) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2421). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

**DITA to CHM Transformation Fails - Compilation Failed**

**Problem**

The DITA to CHM transformation fails with the following error: `[exec] HHC5003: Error: Compilation failed while compiling fileName`.

**Cause 1**

One possible cause for this error is that the processed file does not exist.

**Solution 1**

To solve this issue, fix the file reference before executing the transformation scenario again.

**Cause 2**

Another possible cause for this error is that the processed file has a name that contains space characters.
Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2643) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2421). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Drag and Drop Without Initial Selection Does Not Work

Problem

When I try to drag with the mouse an unselected file from the Project view (on page 316) or the DITA Maps Manager view (on page 2381), the drag doesn't start, it only selects the resource. I need to drag the resource again after it becomes selected. Therefore, any drag and drop action without an initial selection becomes a two step operation. How can I fix this?

Solution

This is a bug present in JVM versions prior to 1.5.0_09. This issue is fixed in 1.5.0_09 and newer versions. See the installation instructions (on page 32) for setting a specific JVM version for running the Oxygen XML Editor application.

Gray Window on Linux With the Compiz / Beryl Window Manager

Problem

I try to run Oxygen XML Editor on Linux with the Compiz / Beryl window manager but I only get a gray window that does not respond to user actions. Sometimes the Oxygen XML Editor window responds to user actions but after opening and closing an Oxygen XML Editor dialog, or after resizing the Oxygen XML Editor window or a view of the Oxygen XML Editor window, the content of this window becomes gray and it does not respond to user actions.

Cause

Sun Microsystems' Java virtual machine does not support the Compiz window manager and the Beryl one very well. It is expected that better support for Compiz / Beryl will be added in future versions of their Java virtual machine.

Solution

Try turning off the special effects for the Compiz / Beryl window manager before starting the Oxygen XML Editor application or switch to another window manager.
Handshake Failure Error When Accessing an HTTPS (SSL) Resource

**Problem**
When attempting to access an HTTPS (SSL) resource, I receive a **handshake_failure** error.

**Cause**
The issue is most likely due to the limitation of Java cryptography capabilities.

**Solution**
A solution might be to download and deploy *Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy Files 8 (for Java 8)*.

⚠️ **Warning:** It is possible that this may not be legal in your country. Be advised that you bear legal responsibility for activating unlimited strength Java cryptography capabilities, so you must have the legal right to use such cryptography (consult your export/import control counsel or attorney to determine the exact requirements for your jurisdiction).

To deploy it in Oxygen XML Editor, unpack the downloaded zip archive and move the two jar files (local_policy.jar and US_export_policy.jar) from *UnlimitedJCEPolicyJDK8* to the following directory, overwriting existing files:

- **Windows** - `\{OXYGEN_INSTALL_DIR\}/jre/lib/security`
- **Linux** - `\{OXYGEN_INSTALL_DIR\}/jre/lib/security`
- **Mac OS X** - `\{OXYGEN_INSTALL_DIR\}/jre.bundle/Contents/Home/jre/lib/security`

Hunspell Spell Checker is Unusable on Your Platform Error

**Problem**
When trying to use the Check Spelling option, I receive the error **Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session**.

**Cause**
There are instances where Oxygen XML Editor determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

**Solution**
To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Editor.
2. Open the `%APPDATA%/com.oxygenxml` folder and look for a file called something like `HunspellCrashGuard*.txt`. Delete that file.
3. Restart Oxygen XML Editor.
High Resolution Scaling Issues

Problem
I encounter scaling detection issues in a high resolution display. For example, some GUI components are too small.

Cause
This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution
You can use the `com.oxygenxml.hidpi.scaling` custom system property (on page 260) to force a specific scaling setting. For example: `-Dcom.oxygenxml.hidpi.scaling=1.5` for 150% scaling.

Images Appear Stretched Out in the PDF Output

Problem
When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution
PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `<external-graphic>` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `org.dita.pdf2.fop/conf/fop.xconf`. The configuration file contains two XML elements called `<source-resolution>` and `<target-resolution>`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).
The commercial **RenderX XEP** XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

**Tip:** It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

This allows you to control the image resolution from the configuration file for all referenced images.

**Increasing the Memory for the Ant Process**

**Problem**

The Ant build process runs out of memory.

**Solution**

For details about setting custom JVM arguments to the Ant build process, see [JVM Arguments](on page 2576).

**Java Virtual Machine (JVM) Crash on Mac OS X**

**Problem**

Oxygen XML Editor crashed the Apple Java virtual machine or it could not start up on my OS X computer due to a JVM crash.

**Cause**

Usually it is an incompatibility between the Apple JVM and a native library of the host system. More details are available in the crash log file generated by OS X and reported in the crash error message.

**Solution**

If this happens, it is best to send a copy of the logs via email to support@oxygenxml.com. Usually, the operating system will offer a prompt that allows you to see the logs. If not, you should be able to find the logs in the Console app (Applications > Utilities, under ~/Library/Logs/DiagnosticReports. They are usually named JavaApplicationStub*.crash/.hang.
JPEG CMYK Color Space Issues

Problem
JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the Author mode.

Solution
If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the profileFileName.icc to the \{OXYGEN_INSTALL_DIR\}\lib directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The Unsupported Image Type message is displayed above the image.

Keyboard Language Resets to Default on Windows

Problem
In Windows, I have set a specific language for my keyboard and while using Oxygen XML Editor, it keeps getting reset to the default language.

Cause
When multiple languages are enabled in Windows, the default shortcut key combination for switching the input language is Left Alt + Shift. Trying to use various shortcuts in Oxygen XML Editor that involves combinations of those two keys is probably resetting your input language to the default setting if you press those two keys without a third combination.

Solution
You can change the Windows shortcut keys that are assigned to the input language by going to the control panel and searching for the Switch input languages option. For example, in Windows 10, go to Control Panel > Language > Advanced Setting. In the Switching input methods section, click on Change language bar hot keys. Click the Change Key Sequence button. This opens a dialog box that allows you to switch the shortcut keys for the input language or keyboard layout.

Keyboard Shortcuts Do Not Work At All

Problem
The keyboard shortcuts listed in the Menu Shortcut Keys preferences page (on page 223) do not work.

Cause
Usually this happens when a special keyboard layout is set (in the operating system) that generates non-standard characters. For example, an extended Greek layout will generate special characters that are not present in the default Greek layout. This causes the Java virtual machine that runs the application to receive unexpected key codes.
Solution

Reset the keyboard layout to the standard layout for your particular language.

Keyboard Shortcuts Result in Unexpected Behavior

Problem

In some rare cases, using certain keyboard shortcuts listed in the Menu Shortcut Keys preferences page (on page 223) result in something different than what is listed in that preferences page.

Cause

This is usually caused by the operating system intercepting the keyboard shortcut. For example, certain applications or hardware drivers intercept certain keyboard shortcuts by default. Another example is if you have multiple input sources configured, the operating system might intercept shortcuts if they match the ones used to change between the input sources.

Solution

Assign a different keyboard shortcut for the particular action in the Menu Shortcut Keys preferences page (on page 223) or refer to documentation for your operating system or hardware equipment to see if there are options to change the behavior.

Mac Touch Bar Function Keys Do Not Work

Problem

I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Editor.

Causes

By default, the Touch Bar function keys are not enabled for Oxygen XML Editor.

Solution

To enable the Touch Bar function keys for Oxygen XML Editor, follow these steps:

1. Go to System Preferences and select Keyboard.
2. Click Shortcuts.
3. From the left sidebar, select Function Keys.
4. Click the + symbol, select Oxygen from the list of apps, and click Add.
Mac OS X Keyboard no Longer Works After Inserting Accented Characters

Problem

Mac OS X has a method for inserting accented characters that is triggered by holding a key and then selecting the desired character from a contextual menu. When using this method in OS X 10.14 (Mojave) to insert accented characters in Oxygen XML Editor, the keyboard can no longer be used unless I restart the application.

Causes

This problem is caused by some sort of incompatibility issue with Java 8 and OS X 10.14 (Majave).

Solution

To prevent this problem, you should use an Oxygen XML Editor distribution that includes OpenJDK 12:

1. Uninstall Oxygen XML Editor:
   a. All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Therefore, you should make a backup of any data you want to keep.
   b. Remove the application by manually deleting the installation folder and all its contents.

2. Reinstall Oxygen XML Editor using the distribution that includes OpenJDK:
   a. Go to the Oxygen Download page.
   b. In the Mac OS X tab, click on the macOS 10.11 and later (Includes OpenJDK 12.0.1) link to download this particular distribution.
   c. Follow the instructions to install the downloaded installation package.

Machine Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server’s Machine Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Machine Signature) is sent to the Oxygen XML Editor servers, which in turn will sign the license key. The Machine Signature is computed from the list of network interfaces of the machine where you deployed the license.

When starting the license server, if you receive an error stating that your server's Machine Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new machine that hosts your license server.
Solution

Revert to your previous configuration.

Possible Cause 2
A new network interface was changed, added, or activated in the machine that hosts your license server.

Note: A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3
The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

MSXML 4.0 Transformation Issues

Problem
When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

Cause
It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

Solution
To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.
Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

**Problem**

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: *Navigation to the web page was canceled.*

**Cause**

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM open on a network drive.

**Solution**

As a workaround, copy the CHM file on your local system and view it there.

Out Of Memory Error When Opening Large Documents

**Problem**

I am trying to open a file larger than 100 MB in Oxygen XML Editor, but it runs out of memory (**OutOfMemoryError**).

**Solution**

You should make sure that the value of the *Optimize loading in the Text edit mode for files over* option *(on page 139)* is less than the size of your document. This will enable the optimized support for large documents. If that fails and you still get an *Out Of Memory* error you should increase the memory available to Oxygen XML Editor *(on page 2344)*.

Other tips:

- Make sure that you close other files before opening the large file.
- You can set the default editing mode in the **Preferences** dialog box *(on page 113)*. The **Text** editing mode uses less memory than other editing modes.
- If the file is too large for the editor to handle, you can open it in for viewing in **Large File Viewer** *(on page 2182)*.

Rectangular Selection Feature Does Not Work On Windows

**Problem**

When trying to use the **Rectangular Selection feature** *(on page 429)* on Windows using both the keyboard and mouse, releasing the **Alt** key shifts the focus to the main menu instead of entering the edit mode.

**Cause**

This seems to be an issue caused by something that was changed in Java 8u172.
Solution

A workaround is to use Shift or Ctrl along with Alt and release them simultaneously.

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, map, or binary resource (for example, an image) that is located outside of the folder where the main DITA map (on page 2643) is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause

DITA-OT often has trouble resolving references that are outside the directory where the published DITA map is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:

- Create another DITA map that is located in a folder path above all referenced folders and reference the original DITA map from this new map. Then transform this DITA map instead.
- Edit the transformation scenario and in the Parameters tab, change the value of the fix.external.refs.com.oxygenxml parameter to true. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

1 Important: The fix.external.refs.com.oxygenxml parameter is only supported when the DITA-OT transformation process is started from Oxygen XML Editor.

- For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

1 Important: This method is recommended for transformation scenarios that use an external DITA-OT.

Saxon 9.7 Transformer Issues

Problem

I have upgraded to Oxygen XML Editor version 19.0 (which comes bundled with Saxon 9.7) and I am experiencing issues when trying to use the Saxon 9.7 transformer. Is it possible to use the Saxon 9.6 transformer with Oxygen XML Editor version 19.0 or later?
**Solution**

There is a plugin available that can be installed and it allows you to use Saxon 9.6. To install it, follow these instructions:

1. Go to Help > Install new add-ons to open an add-on selection dialog box.
2. Select the default update site from the drop-down menu (https://www.oxygenxml.com/InstData/Addons/default/updateSite.xml).
3. Select the Saxon 9.6 XSLT and XQuery Transformer plugin and click Next.
4. Select the I accept all terms of the end user license agreement option and click Finish.
5. Restart the application.

Result: When you configure the transformation scenario, you will now have the option to choose the Saxon 9.6 transformer.

**Scroll Function of my Notebook Trackpad is Not Working**

**Problem**

I got a new notebook (Lenovo Thinkpad™ with Windows) and noticed that the scroll function of my trackpad is not working in Oxygen XML Editor.

**Cause**

It is most likely a problem with the Synaptics™ trackpads.

**Solution**

Try adding the following lines to the C:\Program Files\Synaptics\SynTP\TP4table.dat file (depending on your version of Oxygen XML Editor). For example:

```
*,*,oxygen20.1.exe,*,*,WheelStd,1,9
*,*,oxygenAuthor20.1.exe,*,*,WheelStd,1,9
*,*,oxygenDeveloper20.1.exe,*,*,WheelStd,1,9
*,*,syncroSVNClient.exe,*,*,WheelStd,1,9
*,*,diffDirs.exe,*,*,WheelStd,1,9
*,*,diffFiles.exe,*,*,WheelStd,1,9
```

**Segmentation Fault Error on Mac OS X**

**Problem**

On Mac OS X, the application gives a Segmentation fault error when I double-click the application icon. Sometimes it gives no error but it does not start.
Solution

Make sure you have the latest Java update from the Apple website installed. If this does not solve the problem, copy the `JavaApplicationStub` file from the `/System/Frameworks/JavaVM.framework` folder to the `Oxygen.app/Contents/MacOS` folder. To browse the `.app` folder, you have to use the `Command` key while clicking the Oxygen XML Editor icon and select `Show Package Contents`.

Special Characters are Replaced with a Square

Problem

My file was created with another application and it contains special characters (such as é, ©, ®, etc.) but Oxygen XML Editor displays a square for these characters.

Solution

You must set a font that is able to render the special characters in the Font preferences (on page 80). If it is a text file, you must also set the encoding used for non XML files (on page 110). If you want to set a font that is installed on your computer but that font is not accessible in the Font preferences, this means the Java virtual machine is not able to load the system fonts (probably because it is not a True Type font). It is a problem of the Java virtual machine and a possible solution is to copy the font file in the `[JVM_DIR]/lib/fonts` folder. `[JVM_DIR]` is the value of the property `java.home` that is available in the System properties tab of the About dialog box that is opened from menu Help > About.

TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The TocJS transformation of a DITA map (on page 2643) does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.
2. Copy the content of the `DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles` folder to the transformation output folder.
3. Copy the `DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html` file to the transformation output folder.
5. Locate element `<frame name="contentwin" src="concepts/about.html">`.
6. Replace `"concepts/about.html"` with `"index.html"`. 
Windows Service Reports Incorrect Function Error When Starting (TCP Server)

Problem
My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

Cause
This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Solution
Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.

Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

Problem
My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

Cause
This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder).

Solution
Re-deploy your license key. For more information, see the Setting up a Floating License Server section (on page 61).

Wrong Words are Highlighted when Searching in a User Manual

Problem
When I do a keyword search in the User Manual that is included with the Oxygen XML Editor application, the search highlights the wrong word in the text. Sometimes the highlighted word is several words after the matched word.

Cause
This does not happen when Oxygen XML Editor runs with a built-in Java virtual machine that was installed by Oxygen XML Editor in a subfolder of the installation folder (for example, on Windows and Linux when installing
Oxygen XML Editor with the installation wizard specific for that platform). However, when Oxygen XML Editor runs from an All Platforms installation, it uses whatever JVM was found on the host system, which may be incompatible with the JavaHelp indexer used for creating the built-in User Manual. Such a JVM may offset the highlight of the matched word with several characters, usually to the right of the matched word.

Solution

To see the highlight the exact matched word, it is recommended to install the application with the specific installation wizard for your platform (available only for Windows and Linux).

XML Document Takes a Long Time to Open

Problem

Oxygen XML Editor takes a long time to open an XML document.

Cause

It takes longer to open an XML document if the whole content of your document is on a single line or if the document size is very large.

Solution

If the content is on a single line, you can speed up loading by selecting the Format and indent the document on open option (on page 142) (in the Format preferences page).

If the document is very large (above 30 MB), make sure that the value of the Optimize loading in the Text edit mode for files over option (on page 139) (in the Open preferences page) is greater than the size of your document.

If that fails and you get an Out Of Memory error (OutOfMemoryError) you can increase the memory available to Oxygen XML Editor. (on page 2344)

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the XSLT Debugger perspective (on page 2646), it is very slow.

Solution

If the transformation produces HTML or XHTML output, you can disable rendering of output in the XHTML output view (on page 189) during the transformation process. To view the XHTML output result do one of the following:

• Run the transformation in the Editor perspective (on page 2646) and make sure the Open in Browser/System Application option (on page 1224) is selected.
• Run the transformation in the XSLT Debugger perspective (on page 2646), save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Internet Explorer).
DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more general information and technical details about working with DITA, refer to the following resources:

- **The DITA Specifications**.
- **The DITA Style Guide Best Practices for Authors**.
- Various sample DITA topics and maps can be found in the `OXYGEN_INSTALL_DIR/samples/dita` folder.
Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor. Oxygen XML Editor makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor

To create a DITA topic (on page 2438):

1. Select File > New or click the New button on the toolbar.

   Step Result: The New Document Wizard (on page 287) is displayed:
2. Go to Framework templates > DITA > topic and select the type of topic that you want to create.

Note: If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved. You can also optionally specify a title.

4. Click Create.

Result: Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map (on page 2375).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents (on page 7) also apply to DITA topics. Oxygen XML Editor also provides additional specific DITA-related support for working with DITA topics (on page 2437), their associated DITA maps (on page 2379), and for creating DITA output (on page 2548).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 2643). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.
A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor

To create a map (on page 2396):

1. Select File > New or click the New button on the toolbar.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 2381). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

Adding Existing Topics to a Map in Oxygen XML Editor

There are several ways to add a topic reference to a map (on page 2399). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the DITA map in the DITA Maps Manager view (on page 2381) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

Step Result: This opens the Insert Reference dialog box (on page 2404) with all of the required fields already filled in for you.
3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select Insert and close to add a reference to your topic in the map.
5. Save the DITA map.

Adding New Topics to a Map in Oxygen XML Editor

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To add a new topic to a map (on page 2399), follow these steps:

1. In the DITA Maps Manager (on page 2381), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 2440) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 2440) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 2440) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
• **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Note:** The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the **DITA > New topics preferences page (on page 204)** into account. When the option is deselected, a unique ID is generated.

**Step Result:** The new topic is now referenced (as a `<topicref>`) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

• Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
• Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

**Adding Submaps in Oxygen XML Editor**

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can **break up the content into smaller submaps** (**on page 2397**). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (**on page 2397**):

1. Right-click the parent **DITA map** in the **DITA Maps Manager view (on page 2381)** and choose **Append child > Map reference**.

   **Step Result:** This opens the **Insert Reference dialog box (on page 2404)** with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select **Insert and close** to add a reference to your submap in the main map.
4. Save the main **DITA map**.

**Validating a Map in Oxygen XML Editor**

Just as it is with your individual topics, it is important to **validate your maps (on page 2421)**. Oxygen XML Editor provides a validation function for **DITA maps** that does more than simply validating that the XML is well formed. It also does the following:
• Validates all of the relationships defined in the maps.
• Validates all of the files that are included in the map.
• Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (on page 2381).

   **Step Result**: This opens the DITA Map Completeness Check dialog box (on page 2422).

2. Select any of the various options you want to check.

3. Click **Check** to run the validation process.

**Publishing Your Topics in Oxygen XML Editor**

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (on page 2548) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Editor manages them by using transformation scenarios.

To publish output for a map:

1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (on page 2381).

   **Step Result**: This opens the Configure Transformation Scenario(s) dialog box (on page 1290).
2. Select the appropriate transformation depending on the type of output you desire.
3. To change or view the configuration or storage options for a transformation scenario, select the
   transformation and click **Edit**.
4. Click **Apply associated**.

**Result:** Depending on the configuration of the transformation scenario, when the transformation is finished,
your output may automatically be opened in the appropriate application.

**Related Information:**
- DITA Authoring *(on page 2372)*
- Editing XML Documents in Author Mode *(on page 483)*

**Working with DITA Maps**

In the DITA standard architecture you create documents by collecting topics into maps.

**DITA Maps**

A *DITA map (on page 2643)* organizes a set of topics into a hierarchy. In most output formats, the structure
of the map becomes the structure of the table of contents. Oxygen XML Editor provides support for creating
*(on page 2396)* and managing DITA maps *(on page 2398)* through the **DITA Maps Manager (on page 2381)**.
There are also specialized types of DITA maps, such as a *bookmap (on page 2641)*, which is intended for
creating the structure of a book.
Submaps
You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (on page 2397) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (on page 2381) provides support for easily creating and managing submaps.

Opening a DITA Map
There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (on page 2381) or in the XML Editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).
- To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.
- Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
- If you open a file with the .ditamap or .bookmap extension (from the Project view (on page 316) or a system browser), a dialog box is opened that offers you the choice of opening it in the XML editor or in the DITA Maps Manager.

Note: If you select the Do not show the dialog again option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting Always ask for the When opening a map option in the DITA preferences page (on page 202).
- To open a map in the DITA Maps Manager, you can right-click a map file in the Project view (on page 316) and select Open with > DITA Maps Manager.
- If you have a DITA map file open in the XML editor, you can open it in the DITA Maps Manager by right-clicking the title tab and selecting Open in DITA Maps Manager View.

Chunking DITA Maps
By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (on page 2421). To support this, Oxygen XML Editor provides an Edit Properties dialog box (on page 2413) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map
You should validate your maps (on page 2421) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

For more information about DITA editing, watch our video demonstration:

https://www.youtube.com/embed/t2cG3Xe1TXY
DITA Maps Manager

Oxygen XML Editor provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a Table of Contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The DITA Maps Manager includes a variety of useful actions to help you edit and organize the structure of your DITA maps and topics. The actions that are available and their functions depend on the type of nodes that are selected in the DITA Maps Manager. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

Figure 672. DITA Maps Manager View

Opening Maps in the DITA Maps Manager

The DITA Maps Manager view supports opening multiple maps at the same time, with each one presented in its own tab. To open a DITA map in the DITA Maps Manager, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select Open).
- If you open a file with a .ditamap or .bookmap extension (from the Project view (on page 316) or a system browser), a dialog box is opened that offers you the choice of opening it in the DITA Maps Manager or the XML editor.
Note: If you select the Do not show the dialog again option, it will always be opened in the method that you choose and you will not be asked in the future. However, you can reset this by selecting the Always ask choice for the When opening a map option in the DITA preferences page (on page 202).

• Right-click a map file in the Project view (on page 316) and select Open with > DITA Maps Manager.
• If you have a DITA map file open in the XML editor, you can right-click the title tab and select Open in DITA Maps Manager View.

By default, when a map is opened in the DITA Maps Manager, its index is automatically refreshed. You can disable this feature by deselecting the Refresh index when opening a map in DITA Maps Manager option (on page 226) in the Open/Find Resource preferences page.

Submap Nodes

If your root map (on page 2648) (main DITA map) references other maps (submaps), they can be expanded and you can navigate their content in the DITA Maps Manager, but the references within those submaps are not editable unless you open the submap separately in its own tab. The references within submap nodes are shown with a gray background.

Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the Ctrl or Shift key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the Ctrl key. The mouse pointer changes to a symbol to indicate that a copy operation is being performed.

Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (Alt + LeftArrow) /Demote (Alt + RightArrow)

You can move nodes between child and parent nodes by using the Promote (Alt + LeftArrow) and Demote (Alt + RightArrow) operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the DITA Maps menu) and their availability depend on the nodes that are selected:
Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

- **Open Drop-down Menu**
  You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps. The drop-down menu contains the following:
  
  • **List of recently viewed DITA maps** that can be selected to reopen them.
  • **Clear history** - Clears the history list of the recently viewed DITA maps.
  • **Open** - Allows you to open the map in the DITA Maps Manager view (on page 2381). You can also open a map by dragging it from the file system explorer and dropping it into the DITA Maps Manager view (on page 2381).
  • **Open URL** - Displays the Open URL dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the **Browse for remote file** drop-down menu.

- **Save (Ctrl + S (Meta + S on Mac OS))**
  Saves the current DITA map.

- **Validate and Check for Completeness**
  Checks the validity and integrity (on page 2421) of the map.

- **Apply Transformation Scenario(s)**
  Applies the DITA Map transformation scenario (on page 1192) that is associated with the current map.

- **Configure Transformation Scenario(s)**
  Opens the Configure Transformation Scenarios(s) dialog box (on page 1290) where you can edit or create transformation scenarios or associate a DITA Map transformation scenario (on page 1238) with the current map.

- **Refresh References**
  You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Editor, the DITA map is updated automatically.

- **Open Map in Editor with Resolved Topics**
  Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action Edit Reference to open the topic for editing.

  **Tip:** If you want to print the expanded content, you should consider changing the Styles drop-down to + Print ready.
**Open Map in Editor**

For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

**Note:** You can also use this action to open referenced DITA maps in the Editor.

**Link with Editor**

Toggles the synchronization between the file path of the current editor and the selected topic reference in the DITA Maps Manager view. If enabled, it results in the following types of synchronizations:

- If you select a topic tab in the main editing area and it is referenced in the map currently opened in the DITA Maps Manager, the reference to that topic is selected in the DITA Maps Manager.
- If you have a map opened in both the DITA Maps Manager and the main editor, selecting the map tab in the main editing area opens that map in the DITA Maps Manager.
- If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the DITA Maps Manager will also select the same topicrefs in the main editor.
- If you have a map opened in both the DITA Maps Manager and the main editor (Author mode) and, selecting one or more topicrefs in the main editor will also select the same topicrefs in the DITA Maps Manager.

**Settings**

- **Show extended toolbar**
  
  Toggles whether or not the extended toolbar will be displayed in the DITA Maps Manager toolbar.

- **Show root map toolbar**
  
  Toggles whether or not the Root map option (on page 2384) will be displayed in the DITA Maps Manager toolbar.

- **Show topic titles**
  
  Toggles how topics are presented in the DITA Maps Manager. If selected, the title of each topic is shown. Otherwise, the file path (value of the @href attribute) for each topic is shown.

**Root Map Drop-down menu**

The drop-down menu displayed after Context can be used to specify the DITA root map (on page 2648) that Oxygen XML Editor uses to define a hierarchical structure of submaps and to establish a key space (on page 2644) that defines the keys that are propagated throughout the entire map structure. For more information, see Selecting a Root Map (on page 2396).

- **Choose Root Map Drop-down menu**
You can use this drop-down menu to browse for root maps with the following choices:

- **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local root map.
- **Browse for remote file** - Displays the Open URL dialog box (on page 303) that allows you to select a remotely stored root map.
- **Browse for archived file** - Displays the Archive Browser (on page 1654) that allows you to browse the content of an archive and choose a root map.
- **Browse Data Source Explorer** - Opens the Data Source Explorer (on page 1660) that allows you to browse the data sources defined in the Data Sources preferences page (on page 206).

Tip: You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- **Search for file** - Displays the Find Resource dialog box (on page 337) to search for a root map.

### Profiling/Conditional Text Drop-down Menu

You can use this drop-down menu to select and apply a defined profiling condition set (on page 2597) to filter the content based on that condition set. The drop-down menu also contains the following other options:

- **Show Profiling Colors and Styles** - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (Options > Preferences) (on page 72) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.
- **Show Profiling Attributes** - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.
- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (on page 436) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.
- **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (on page 560) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

The following additional actions are displayed in the toolbar when the Show extended toolbar option is selected in the Settings menu:

- **Insert Topic Reference**
Opens the **Insert Reference** dialog box *(on page 2404)* that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

*Edit Properties*

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see **Edit Properties Dialog Box** *(on page 2413)*.

*Edit Attributes*

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the **Attributes View in Author Mode** *(on page 518)* topic.

*Delete*

Deletes the selected node.

*Move Up*

Moves the selected node up within the *DITA map* tree.

*Move Down*

Moves the selected node down within the *DITA map* tree.

*Promote*(Alt + LeftArrow)

Moves the selected node up one level to the level of its parent node.

*Demote*(Alt + RightArrow)

Moves the selected node down one level to the level of its child nodes.

**Contextual Menu of the DITA Maps Manager**

**Root Map**

The following actions can be invoked from the contextual menu on the *root map* *(on page 2648)* of an opened *DITA map* (many of them are also available in the *DITA Maps* menu):

*Open Map in Editor*

For complex operations that cannot be performed in the simplified *DITA Maps Manager* view (for instance, editing a relationship table) you can open the map in the main editing area.

*Open Map in Editor with Resolved Topics*

Opens the *DITA map* in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

*Export DITA Map*

Opens a dialog box that allows you to choose a destination for exporting the *DITA map*. It also includes an **Export as Zip archive** option that allows you to package
the *DITA map* as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map.

**Find Unreferenced Resources**

Allows you to search for orphaned resources that are not referenced in the *DITA maps*.

**Add to Review Task**

This action can be used to add the selected documents to a task in the Content Fusion Tasks Manager view. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector add-on *(on page 2103)*. To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

**Show Feedback Comments Manager**

Opens the Feedback Comments Manager view. This view is for those who use **Oxygen Feedback** to provide a commenting component in WebHelp output. This view makes it possible to see all the comments added by users in WebHelp output directly in Oxygen XML Editor.

**Edit Properties**

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box *(on page 2413)*.

**Fast Create Topics**

Opens the Fast Create Topics dialog box *(on page 2441)* that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map* *(on page 2643)*.

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 2438).*
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References *(on page 2404)* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References *(on page 2404)* topic.
• **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 2412) (for example, to target a resource such as an image or external link).

• **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 2412).

• A set of actions that open the Insert Reference dialog box (on page 2404) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Search References

Searches all references to the current topic in the entire DITA map (on page 2643). It also reports references that are defined as related links in relationship tables. If you have enabled Master Files support (on page 2628), it also searches for references in the DITA maps added to the Master Files folder.

Refactoring submenu

The following actions are available from this submenu when invokes from a root map:

**Rename resource**

Allows you to change the name of a resource linked in the edited DITA map (on page 2401) and you have the option of updating all the references to the renamed DITA resource. If you have enabled Master Files support (on page 2628), it also searches for references in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 2401) and you have the option of updating all the references to the moved DITA resources. If you have enabled Master Files support (on page 2628), it also searches for references in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).
Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 705) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 705) that presents refactoring operations to assist you with managing the structure of your XML documents.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 346) that allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to spell check multiple files (on page 365).

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.
Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

.expand_all

Allowed you to expand the entire DITA map structure.

Collapse All

Allowed you to collapse the entire DITA map structure.

Editable Child Nodes

The following actions are available when the contextual menu is invoked on an editable child node of a DITA map (submaps need to be opened in the DITA Maps Manager to access these actions since they are in a read-only state in the parent map):

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens the selected resource in the editor.

Add to Review Task

This action can be used to add the selected documents to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed connector addon (on page 2103). To fully take advantage of all of the benefits and features of Content Fusion, your organization will need an Oxygen Content Fusion Enterprise Server. For more information, see the Oxygen Content Fusion website.

Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 2413).

Fast Create Topics

Opens the Fast Create Topics dialog box (on page 2441) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2643).

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:
- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic ([on page 2438](#)).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References](#) topic.
- **Key Reference** - Opens an [Insert Key Definition](#) dialog box that allows you to insert a targeted key definition ([on page 2412](#)) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an [Insert Key Definition](#) dialog box that allows you to define a key and a value inside a keyword ([on page 2412](#)).
- A set of actions that open the [Insert Reference](#) dialog box ([on page 2404](#)) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Insert Before submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic ([on page 2438](#)).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References](#) topic.
- **Key Reference** - Opens an [Insert Key Definition](#) dialog box that allows you to insert a targeted key definition ([on page 2412](#)) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an [Insert Key Definition](#) dialog box that allows you to define a key and a value inside a keyword ([on page 2412](#)).
- A set of actions that open the [Insert Reference](#) dialog box ([on page 2404](#)) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

**Insert After submenu**

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:
New - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2438).

Reference - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 2404) topic.

Reference to the currently edited file - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 2404) topic.

Key Reference - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 2412) (for example, to target a resource such as an image or external link).

Key Reference with Keyword - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 2412).

A set of actions that open the Insert Reference dialog box (on page 2404) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Search References

Searches all references to the current topic in the entire DITA map (on page 2643). It also reports references that are defined as related links in relationship tables. If you have enabled Master Files support (on page 2628), it also searches for references in the DITA maps added to the Master Files folder.

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic (on page 2496).

Rename resource

Allows you to change the name of a resource linked in the edited DITA map (on page 2401) and you have the option of updating all the references to the renamed DITA resource. If you have enabled Master Files support (on page 2628), it also searches for references in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

Move resource

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 2401) and you have the option of updating all the references to the moved DITA resources. If you have enabled Master Files support (on page 2628), it also searches for...
references in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

**Extract to New DITA Map**

Use this operation to extract editable topics into a new DITA map. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click **Create** to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2381))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2381))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the **Strict Task** information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).
Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 705) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 705) that presents refactoring operations to assist you with managing the structure of your XML documents.

Find/Replace in Files

Opens the Find/Replace in Files dialog box (on page 346) that allows you to find and replace content across multiple files.

Check Spelling in Files

Allows you to spell check multiple files (on page 365).

Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After

Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Delete

Deletes the currently selected node from the DITA map.

Remove from Disk
This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the Also remove all descendants option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links. If you have enabled Master Files support (on page 2628), it also searches for references in the DITA maps added to the Master Files folder.

**Organize**

Allows you to organize the DITA map with the several submenu actions:

- ⬆️ Move Up - Moves the selected node up within the DITA map tree.
- ⬇️ Move Down - Moves the selected node down within the DITA map tree.
- ➡️ Promote (Alt + LeftArrow) - Moves the selected node up one level to the level of its parent node.
- ➡️ Demote (Alt + RightArrow) - Moves the selected node down one level to the level of its child nodes.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

**Other Nodes**

The following additional actions are available when the contextual menu is invoked from other nodes, such as a submap node or a relationship table:

**Open Map in Editor (available when invoking on a submap)**

Opens the currently selected DITA map in the editor.

**Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)**

Opens the parent DITA map of the currently selected reference in the DITA Maps Manager.

**Edit Attributes (only available for relationship table nodes)**

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 518) topic.

**Edit Profiling Attributes (only available for relationship table nodes)**

Allows you to change the profiling attributes (on page 554) defined on the selected node.
For more information about the **DITA Maps Manager** view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZZ6Y3MCY

**Related Information:**

- DITA Map Validation and Completeness Check *(on page 2421)*
- DITA Map Author Mode Actions *(on page 2426)*
- Find/Replace in Multiple Files *(on page 346)*

### Creating a Map

To create a *DITA map*(on page 2643), *subject scheme map*(on page 2648), *bookmap*(on page 2641), or other types of *DITA maps*, follow these steps:

1. Use the **New Document** wizard *(on page 287)* to start creating your map.
   
   ℹ️ **Tip:** If you want the *map* to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager** *(on page 2381)*) and selecting **New** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

2. Select one of the **DITA Map** templates from the **Framework templates** folder.

3. Click the **Create** button.

4. Select whether you want to open the map in the **DITA Maps Manager** *(on page 2381)* or the **Editor**.

5. Save the map using the ⬇️ **Save** button on the toolbar of the **DITA Maps Manager view** *(on page 2381).*

**Related Information:**

- Customizing Profiling Values with a Subject Scheme Map *(on page 2605)*
- Managing DITA Maps *(on page 2398)*

### Selecting a Root Map

Oxygen XML Editor allows you to select a *root map*(on page 2648) *(a master DITA map*(on page 2643))* that defines a hierarchical structure of submaps and establishes a *key space*(on page 2644) that defines the keys used in all the other *DITA maps* and topics in the project. Specifying the correct *root map* helps to prevent validation problems when you work with *keyrefs* and also acts as the foundation for content completion. All the *keys* that are defined in a *root map* are available in the submaps that are contained within the *root map*.

There are several ways to select or change the *root map*:

- The easiest method is to use the **Root map** drop-down menu *(on page 2384)* in the **DITA Maps Manager** *(on page 2381)* toolbar to select the appropriate *root map*. 

• If you insert a key reference using the Cross Reference action from the Link drop-down menu (from the toolbar or Link submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

• If you insert a content key reference or key reference using the Reuse Content action (from the toolbar, DITA menu, or Reuse submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

For more information about the DITA root map support, watch our video demonstration:

https://www.youtube.com/embed/e81r3Y1qjnE

Creating DITA Submaps

You can break up a large DITA map (on page 2643) into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an existing topic into a map (on page 2399), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a mapref element or a topicref element with the @format attribute set to ditamap. In most cases, Oxygen XML Editor takes care of this for you.

Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select Append Child > New. To insert the submap as a sibling to the current node, select Insert After > New or Insert Before > New.
   
   Step Result: This opens a New DITA file dialog box (on page 2438) that allows you to select the type of document and assists you with naming it.
3. Select the type of map in one of the folders inside the DITA Map folder and give it a name (the file should have a .ditamap file extension).
4. Click Create to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see Managing DITA Maps (on page 2398).
Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a bookmap (on page 2641) to organize your topics into a book. A DITA bookmap is a specialized type of map, intended for creating output that is structured like a book. A bookmap allows you to add book-specific elements such as <frontmatter>, <part>, <chapter>, <appendix>, and <backmatter> to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the DITA documentation for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor.

To create a book in DITA using a bookmap, follow these steps:

1. Create a new bookmap (on page 2397) (File > New > Framework templates > DITA Map > map > Bookmap). If you want the bookmap to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 2381)) and selecting New from the Append Child, Insert Before, or Insert After submenus.

2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a bookmap, or children to a section, right-click the bookmap or section icon and choose any of the reference actions in the Append child menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the DITA documentation to fully understand the structure of a DITA bookmap and where to create each element.

3. Create special elements such as an index (on page 2419) and table of contents (on page 2419). The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. Add topics (on page 2399) to your chapters to add content to your book. You may find it easier to manage if you use submaps (on page 2397) to create the content of your chapters. This keeps your bookmap from becoming long and difficult to manage.

Managing DITA Maps

You may want to manage your DITA maps (on page 2643) in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:
Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the DITA Maps Manager (on page 2381).
- By highlighting a topic in the DITA Maps Manager (on page 2381), holding down the Alt key, and pressing the arrow keys.
- By showing the extended DITA Maps Manager (on page 2381) toolbar (click the ☰, Settings icon on the DITA Maps Manager (on page 2381) toolbar and select the extended toolbar) and then using the node moving buttons (↑ ▼ ← →) on the toolbar to move topics around in the map.

To understand how to organize topics in a DITA map using the DITA Maps Manager (on page 2381), you can examine and experiment with the sample map called flowers.ditamap, located in the [OXYGEN_INSTALL_DIR]/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor supports both approaches.

A DITA map (on page 2643) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the <topicref> element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Editor provides several tools for inserting reference elements into a map:

**Using the Insert Reference Dialog Box**

The Insert Reference dialog box (on page 2404) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select **Reference to the currently edited file**.

- Selecting an item in the map and click the **Insert Reference** button from the **DITA Maps Manager** (on page 2381) toolbar.
- Select **Insert Reference** from the **DITA Maps** menu.

### Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a **DITA map** by dragging and dropping the file into the **DITA Maps Manager** (on page 2381). You can drag and drop files from any of the following:

- Your OS file system explorer.
- The **Project view** (on page 316).
- The **Open/Find Resource view** (on page 334).

Adding topics this way will not open the **Insert Reference** dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting **Edit Properties**.

### Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the **DITA Maps Manager** (on page 2381), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** (on page 2440) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** (on page 2440) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** (on page 2440) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Note:** The value of the root ID is generated taking the **Use the file name as the value of the root ID attribute** option from the **DITA > New topics** preferences page (on page 204) into account. When the option is deselected, a unique ID is generated.

**Step Result:** The new topic is now referenced (as a `<topicref>` ) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.
Adding Multiple Skeleton Topics at Once

Oxygen XML Editor includes a feature in the DITA Maps Manager (on page 2381) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2643).

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.

For more information, see Fast Create Multiple DITA Topics (on page 2441).

Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor allows you to reuse entire topics by adding multiple references to the same topic in a DITA map. Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2381), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

• Highlight the topic and press the Delete or Backspace key on your keyboard.
• Highlight the topic and click the Delete button on the DITA Maps Manager (on page 2381) extended toolbar.

Moving and Renaming Resources

You can move or rename resources on disk directly from Oxygen XML Editor and you have the option of updating all the references to the moved or renamed DITA resources. For DITA resources (such as topics and maps), you can do this from the DITA Maps Manager view (on page 2381). For non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can do this from the Project view (on page 316). If you have enabled Master Files support (on page 2628), you will also have the option to update all the references to the moved or renamed non-DITA resource.
Moving or Renaming DITA Resources (Topics or Maps)

To move or rename normal DITA resources (such as topics or maps), use one of the following actions available in the Refactoring submenu of the contextual menu when invoked on the resource in the DITA Maps Manager view (on page 2381):

- **Refactoring > Move resource**

  This action allows you to change the location of a resource linked in the edited DITA map, using the Move resource dialog box. This dialog box contains the following options:

  - **Destination** - Specifies the target location of the edited resource.
  - **File name** - Allows you to change the name of the edited resource.
  - **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
  - **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
  - **Move** - Moves the edited resource in the target location on disk.
  - **Cancel** - Cancels the Move resource operation. No changes are applied.

- **Refactoring > Rename resource**

  This action allows you to change the name of a resource linked in the edited DITA map (on page 2643), using the Rename resource dialog box. This dialog box contains the following options:

  - **New name** - Presents the current name and allows you to change it.
  - **Update references** - Select this checkbox to update all references of the file in the edited DITA map and in the files referenced from the DITA map, preserving the completeness of the DITA map.
  - **Preview** - Select this button to display a preview of the changes Oxygen XML Editor is about to make.
  - **Rename** - Executes the Rename resource operation.
  - **Cancel** - Cancels the Rename resource operation. No changes are applied.

**Note:** If a root DITA map (on page 2648) is not defined, the move and rename actions are executed in the context of the current DITA map.

Moving or Renaming Non-DITA Resources and Updating the References to Them

To move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming Resources in the Project View (on page 325). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on non-DITA resources while also updating all the references to them, use the following sets of procedures:
1. Enable Master Files support and add your root DITA map to the Master Files folder by following the procedure found here: How to Enable Master Files Support in DITA (on page 2629).
2. Move or rename resources and update the references to them by following the procedure found here: Moving or Renaming Non-DITA Resources and Updating the References to Them (on page 2630).

- Master Files Support in DITA (on page 2628)
- Finding Resources Not Referenced in DITA Maps (on page 2403)

Finding Resources Not Referenced in DITA Maps

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from DITA maps (on page 2643). To assist you with organizing project resources, Oxygen XML Editor includes the Find Unreferenced Resources action, that searches for such resources.

To perform this search, open the DITA map in the DITA Maps Manager (on page 2381), invoke the contextual menu on the map, and select the Find Unreferenced Resources action. It can also be selected from the DITA Maps menu. This action opens the Find Unreferenced Resources dialog box, shown below.

**Figure 673. Find Unreferenced Resources Dialog Box**

The Find Unreferenced Resources dialog box includes the following options:

- **DITA Maps** - Provides a list of DITA maps to be included in the search and allows you to Add maps to the list or Remove them.
• **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders. All files from this list of folders that are not referenced from the maps specified in the **DITA Maps** list will be reported.

• **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

**Note:** In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the **Find** button, if the search operation finds unreferenced resources, they are displayed in the **Results** panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select **Remove from Disk**. If you want to see the resource before deciding what to do with it, you can right-click its result and select **Show in Explorer**.

### Inserting References in DITA Maps

A **DITA map (on page 2643)** may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the **Insert Reference dialog box (on page 2404)**.

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a **DITA map**.

### Insert Reference Dialog Box

The **Insert Reference** dialog box allows you to insert and configure references in **DITA maps (on page 2643)**. There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:

• Select **Reference, Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child, Insert Before, and Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager (on page 2381)**.
  - To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
  - To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the **Insert After** submenu.
  - To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the **Insert Before** submenu.
Note: The content of these submenus depends on the node that is selected in the DITA map tree when the contextual menu is invoked. For example, if the selected node is a topic reference (<topicref>), its possible child nodes include the following elements: <anchorref>, <chapter>, <keydef>, <mapref>, <topicgroup>, <topichead>, <topicref>, <topicset>, and <topicsetref>.

- Click the Insert Reference button on the DITA Maps Manager extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select Insert Reference from the DITA Maps menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the Reference or Reference to the currently edited file actions, a Reference type drop-down list is displayed at the top of the Insert Reference dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the Append Child, Insert Before, and Insert After submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling.

Target Tab

Figure 674. Insert Reference Dialog Box - Target Tab
The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

### Choose a file location section

You can browse for and select the source target file by using the **Look in** drop-down list, browsing buttons, or file window in this section. You can use the **Files of type** drop-down menu to narrow the list of possible file types that will be displayed.

### URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

### ID

The drop-down list displays all of the target elements that are available for the selected target URL.

### Href

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `<navref>` element requires a `@mapref` attribute instead.

### Keys Tab

**Figure 675. Insert Reference Dialog Box - Keys Tab**

The **Keys** tab allows you to use and define keys ([on page 2411]) for indirect referencing. For more information, see **Working with Keys in DITA** ([on page 2498]). This tab includes the following:

#### Define keys

Use this text field to define the `@keys` attribute for the target.

#### Key scopes

Use this text field to define or edit the value of a `@keyscope` attribute. Key scopes allow you to specify different sets of key definitions for different map branches.
Key reference

Instead of using the Target tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the Choose key reference button to access the list of keys that are already defined in the current root map (on page 2648).

Attributes Tab

Figure 676. Insert Reference Dialog Box - Attributes Tab

The Attributes tab of the Insert Reference dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 203). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

Collection type

This drop-down list allows you to select the @collection-type attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target ).

Type

Allows you to select a @type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the Always fill values for attributes option in the DITA preferences page (on page 203).

Scope
This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 203).

**Format**

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 203).

**Processing Role**

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 677. Insert Reference Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.
Profiling Tab

Figure 678. Insert Reference Dialog Box - Profiling Tab

The Profiling tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2648) references a DITA subject scheme map (on page 2648) that defines values for the profiling attributes, those values are used.
- If your project defines project-level (on page 2647) configuration values for the profiling attributes (on page 129), those values are used.
- If Oxygen XML Editor defines global-level (on page 2644) configuration values for the profiling attributes (on page 129), they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 2589).

Finalizing Your Insert Reference Configuration

Once you click Insert or Insert and close, the configured reference is added in the map.

Tip: You can easily insert multiple references by keeping the Insert Reference dialog box opened, using the Insert button.

Related Information:
- DITA Profiling / Conditional Text (on page 2589)
- Working with Keys in DITA (on page 2498)

Inserting Topic Headings

The <topichead> element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the <topicref> element.

You can insert a topic heading by doing the following:
• Select **Topic Head** from the **Append Child, Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager view** (on page 2381).

• Open the **DITA map** in the XML editor *(on page 2380)* and select the **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box *(on page 2404)* that allows you to easily insert a `<topichead>` element. A **Navigation title** ( @navtitle attribute) is required but other attributes can also be specified from this dialog box (such as **Type, Scope, Format**, etc.)

![Insert Topic Heading Dialog Box](image)

**Figure 679. Insert Topic Heading Dialog Box**

**Related Information:**

• **Insert Reference Dialog Box** *(on page 2404)*

**Inserting Topic Groups**

The `<topicgroup>` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `<topicgroup>` can contain other `<topicgroup>` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `<topicgroup>` and its children. You can set the collection-type of a container `<topicgroup>` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

• Select **Topic Group** from the **Append Child, Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager view** (on page 2381).

• Open the **DITA map** in the XML editor *(on page 2380)* and select the **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).
Those actions open the **Insert Topic Group** dialog box *(on page 2404)* that allows you to easily insert a `<topicgroup>` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

**Figure 680. Insert Topic Group Dialog Box**

![Insert Topic Group Dialog Box](image)

**Related Information:**
- Insert Reference Dialog Box *(on page 2404)*

### Defining Keys in DITA Maps

DITA uses **keys (on page 2498)** to insert content that may have different values in various circumstances. **Keys provide the means for indirect referencing in DITA.** This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the **main (root) map (on page 2648)**. This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- **Key with a value inside a keyword.**
- **Key with a target (for example, to target a resource such as an image or external link).**

The following example is a **DITA map (on page 2643)** *(a key definition submap)* that contains some key definitions with various values for the **product key** and some targets to external URLs:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
<!-- product name -->
<title>Key Definitions</title>
```
Key Definition with a Keyword Value

To define a key with a value inside a keyword, follow these steps:

1. [Optional but Recommended] Create a submap (on page 2397) that will contain all of your key definitions and reference the submap in your main (root) map (if you don't already have one created).
2. Open that map in the DITA Maps Manager (on page 2381).
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition with Keyword from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition). This opens an Insert Key Definition dialog box.
4. Enter the name of the key in the Key field.
5. Enter the key's value in the Keyword field.
6. Click Insert and close.

Tip: If you need to profile the key or add other attributes, you can right-click the key definition in the DITA Maps Manager, select Edit properties, and configure them in the Profiling tab or Attributes tab, respectively.

Key Definition with a Target

To insert a targeted key definition (for example, to target a resource such as an image or external link), follow these steps:
1. **[Optional but Recommended]** Create a submap (on page 2397) that will contain all of your key definitions and reference the submap in your main (root) map (if you don’t already have one created).
2. Open that map in the DITA Maps Manager (on page 2381).
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition** from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition in the DITA map). This opens an **Insert Key Definition** dialog box.
4. Go to the Keys tab and enter the name of the key in the Define keys field.
5. Go to the Target tab and select a target resource (such as an image or external link).

   **Tip:** You can profile the key by using the **Profiling** tab and other attributes can also be defined in the Attributes tab.
6. Once you are done configuring the targeted key definition, click **Insert and close**.

---

**Edit Properties Dialog Box**

The DITA Maps Manager view (on page 2381) includes a feature that allows you to view and edit the properties of a selected node. The **Edit properties** action is available on both the DITA Maps Manager toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map (on page 2643) document in Author mode. The action opens the Edit Properties dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node where the action was invoked.

**Note:** If you select multiple sibling nodes and invoke the **Edit properties** action, only the **Profiling** tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the Edit Properties dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps (on page 2648).

At the top of the Edit Properties dialog box, the **Reference type** drop-down list displays the type of the selected node and it depends on the node where the action was invoked.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a root map (on page 2648), only the Attributes, Metadata, and Profiling tabs are accessible and the Title property can be configured. Also, if you select multiple nodes, only the Profiling tab is available.
Target Tab

Figure 681. Edit Properties Dialog Box - Target Tab

The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the **Look in** drop-down list, browsing buttons, or file window in this section. You can use the **Files of type** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.

**Note:** If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `<navref>` element requires a `@mapref` attribute instead.
Keys Tab

The Keys tab allows you to use and define keys (on page 2411) for indirect referencing. For more information, see Working with Keys in DITA (on page 2498). This tab includes the following:

**Define keys**

Use this text field to define the @keys attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a @keyscope attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**

Use this combo box (or the Choose key reference button) to select a key that is already defined in the root map (on page 2648).

Attributes Tab

The Attributes tab allows you to set various attributes for the target. This includes:

- **Collection type**: Unordered, Ordered, List, Topic, Local, and Data
- **Scope**: Local and Global
- **Format**: DITA, HTML, XML
- **Processing rules**: None, Ignore, Default, Localized

The Other attributes section allows you to set additional attributes with their corresponding values.
The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node where the action was invoked.

If the target is a **root map** *(on page 2648)*, the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**.

![Figure 684. Attributes Tab for a Root Map](image)

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** *(on page 203)*. For references to DITA resources, you can enforce the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).

**Tip:** You can also select the **Prefer navigation title for topicref rendering** option in the **DITA preferences page** *(on page 203)* to always enforce the use of the @navtitle value rather than selecting this **Lock** option on individual topics.

**Collection type**

This drop-down list allows you to select the @collection-type attribute to create hierarchical linking between topics in a **DITA map** *(for example, unordered, sequence, choice, family, -dita-use-conref-target)*.

**Type**

 Allows you to select a @type attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** *(on page 203)*.

**Scope**

This property corresponds to the @scope attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope**
checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 203).

**Format**

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 203).

**Processing Role**

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 685. Edit Properties Dialog Box - Metadata Tab**

The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.
The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2648) references a DITA subject scheme map (on page 2648) that defines values for the profiling attributes, those values are used.
- If your project defines project-level (on page 2647) configuration values for the profiling attributes (on page 129), those values are used.
- If Oxygen XML Editor defines global-level (on page 2644) configuration values for the profiling attributes (on page 129), they are used.
- Otherwise, a basic default set of profiling attributes and values are used.

If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 2589).

**Note:** If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.
Finalizing Your Modifications
Once you click **OK**, all your changes are applied to the target node.

Related Information:
- DITA Profiling / Conditional Text *(on page 2589)*
- Working with Keys in DITA *(on page 2498)*

Generating a Table of Contents in DITA
In DITA, the order and hierarchy of the table of contents of a document is based directly on the **DITA map that defines the document** *(on page 2379)*. In most cases, the processor generates a table of contents (TOC) based on the hierarchy of the topics in a DITA map. By default, each `<topicref>` element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the `<toc>` element in a **bookmap** *(on page 2397)* (as in the example below). For more information about the `<toc>` element, see [https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html](https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html).

Example:

```xml
<bookmap>
   ....
   <frontmatter>
      <booklists>
         <toc href="chapter1.dita"/>
      </booklists>
   </frontmatter>
   ....
</bookmap>
```

Creating an Index in DITA
In DITA, indexes are created from `<indexterm>` elements. You can insert index term elements in the following:

- **The header of a topic**: In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page where the topic starts, even if it is not the page in which the indexed term occurs.
In the `<topicref>` element in a map that references the topic: This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page where the topic starts.

In the body of a topic: In paginated media, this results in an index entry that points to the page where the `<indexterm>` element occurs, even if that is not the page where the topic starts.

To add index terms to the text of a topic of the topic header, create the elements as you normally would in Oxygen XML Editor (on page 2443). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a bookmap (on page 2641), you need to add an `<indexlist>` element to the `<backmatter>` of the book.

1. Open your bookmap (on page 2397) in the DITA Maps Manager (on page 2381).
2. Right-click the bookmap and select Append Child > Backmatter.
   The Insert Reference dialog box (on page 2404) appears.
3. Click Insert and Close to insert the `<backmatter>` element.
4. Right-click the `<backmatter>` element and create a `<booklists>` element using Append Child > Book Lists.
5. Use the same steps to create an `<indexlist>` element.

**CAUTION:** Adding index entries and an `<indexlist>` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

### Resolving Topic References Through an XML Catalog

There are situations where you want to resolve URIs with an XML Catalog (on page 2649):

- You customized your DITA map (on page 2643) to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor. The DITA Maps Manager view (on page 2381) will solve the displayed topic refs through the added XML catalog, as well as DITA map transformations (for PDF output, XHTML output, etc.)

To add an XML catalog to the DITA framework (on page 2643), follow these steps:

1. Create an XML catalog using the guidelines described in Working with XML Catalogs (on page 690).
2. Open the Preferences dialog box (Options > Preferences) (on page 72) and go to Document Type Association.
3. Select the **DITA** document type and use the **Edit**, **Duplicate**, or **Extend** button to open a **Document type configuration dialog box** *(on page 87)*.

4. Go to the **Catalogs** tab *(on page 107)*.

5. Click on the [+ Add] button to open a dialog box that allows you to add your created **XML Catalog** to the list.

6. After adding your catalog, click **OK**. You may need to reopen any currently edited files that use the new catalog or run a manual **Validate** action *(on page 655)* for the changes to take effect.

**Note:** You could also add your created catalog to the list of global catalogs in the **XML Catalog preferences** *(on page 169)* page.

### Chunking DITA Topics

By default, when a **DITA map** *(on page 2643)* is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as **chunking**.

To chunk DITA topics, you set the chunking attribute on the `<topicref>` that contains the sub-topics in a **DITA map**. There are several values that you can set on the chunking attribute (for example, `by-topic` or `to-content`). See the **DITA documentation** for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `@toc` and `@collection-type` attributes on the sub-topics or container topic to suitable values. See the **DITA documentation** for details.

You can set the `@collection-type` attribute on your topics using the **Edit Properties** action in the **DITA Maps Manager** *(on page 2381)*. To set the `@toc` and `@chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon 📐 in the **DITA Maps Manager** *(on page 2381)* to open the map in the editor).

### DITA Map Validation and Completeness Check

You should validate your **DITA maps** *(on page 2643)* regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

**Validating a DITA Map**

To validate a DITA, follow these steps:

1. In the **DITA Maps Manager** view *(on page 2381)*, make sure that the tab that holds your **root map** *(on page 2648)* is selected and that the **Root map** selection is set either to the name of your **root map** or to `<current map>`.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click **Reload** (F5).

3. Click the **Validate and Check for Completeness** button on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (on page 2422).

4. If you are using profiling, check the **Use DITAVAL filters** box and select the appropriate option.

5. Select any other options you want to check.

6. Click **Check** to run the validation process.

**Result:** A dialog box is displayed showing the progress of the operation. You can click the **Run in Background** button to close this dialog box so that you can continue working while the operation continues in the background and the progress would continue in the information ribbon at the bottom of the application.

**Validation Process**

The validation process of a DITA map includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an @href attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

**DITA Map Completeness Check Dialog Box**

The DITA Map Completeness Check dialog box allows you to configure the DITA map validation.
You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated *validation scenario* (on page 664).

**Note:** If you want your DITA topics to be validated against a Relax NG schema, this checkbox must be selected.

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.

**Include remote resources**

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.
Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set (on page 2589) before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the DITA Maps Manager view (on page 2381). Clicking the Details icon opens a topic in the Oxygen XML Editor User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the DITA map.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the Add or Remove buttons to configure the list. The Add button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 249) button, or the browsing actions in the Browse drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the main DITA map (on page 2648) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the DITA map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the DITA map, unless a unique @copy-to attribute is used on the <topicref> element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second <topicref> has a @copy-to attribute set:

```xml
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a @copy-to attribute set or both of them have the @copy-to attribute set to the same value:

```xml
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```
Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

Note: This option takes key scopes (on page 2528) into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
    <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 2528) on the second occurrence.

Report unreferenced key definitions

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option (on page 2424) is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any <topicref> that contains a @processing-role attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a @conref or @conkeyref.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of <cols> is different than the number of columns detected from the table @cols attribute.
- For a CALS table, if the number of columns detected from the table @cols attribute is different than the number of columns detected in the table structure.
- For a CALS table, if the value of the @cols, @rowsep, or @colsep attributes are not numeric.
- For a CALS table, if the @namest, @nameend, or @colname attributes point to an incorrect column name.
**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 129) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Editor will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 249) button, or the browsing actions in the Browse drop-down list.

**Export settings**

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

**Import settings**

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.

**Check**

Use the Check button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

**Tip:** This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

**Related Information:**

- DITA Maps Manager (on page 2381)

**DITA Map Author Mode Actions**

A variety of actions are available for DITA map documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2642).

**DITA Map Toolbar and Menu Actions**

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- Insert New DITA Resource
Opens a New DITA file dialog box (on page 2438) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

**Insert Topic Reference**

Opens the Insert Reference dialog box (on page 2404) where you can configure a topic reference and inserts it at the current position within the map.

**Insert Key Definition with Keyword**

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

**Reuse Content**

Opens the Reuse Content dialog box (on page 2513) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

**Insert Topic Heading**

Opens the Insert Reference dialog box (on page 2404) that allows you to insert a topic heading at the cursor position.

**Insert Topic Group**

Opens the Insert Reference dialog box (on page 2404) that allows you to insert a topic group at the cursor position.

**Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Relationship Table Properties**

Allows you to change the properties of rows in relationship tables.

**Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

**Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

**Delete Relationship Column**

Deletes the table column where the cursor is located.

**Delete Relationship Row**

Deletes the table row where the cursor is located.

**Move Up**
Moves the selected node up one position on its same level.

**Move Down**

Moves the selected node down one position on its same level.

**Promote (Alt + LeftArrow)**

Moves the selected node up one level to the level of its parent node.

**Demote (Alt + RightArrow)**

Moves the selected node down one level to the level of its child nodes.

**DITA Map Contextual Menu Actions**

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

**Add File to Review Task**

This action can be used to add the current document to a task in the **Content Fusion Tasks Manager** view. **Oxygen Content Fusion** is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a pre-installed **connector add-on** (on page 2103). To fully take advantage of all of the benefits and features of **Content Fusion**, your organization will need an **Oxygen Content Fusion Enterprise Server**. For more information, see the **Oxygen Content Fusion** website.

**Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see **Edit Properties Dialog Box** (on page 2413).

**Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

**Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA framework:

**Paste as content reference**

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.
Paste as content key reference

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (on page 2643)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 2384) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 2384) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA Map framework:

- **Insert New DITA Resource**

  Opens a New DITA file dialog box (on page 2438) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
Opens the **Insert Reference dialog box** *(on page 2404)* where you can configure a topic reference and inserts it at the current position within the map.

**Insert Key Definition with Keyword**

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

**Reuse Content**

Opens the **Reuse Content dialog box** *(on page 2513)* that allows you to insert and configure a content reference ( *@conref* ), or a content key reference ( *@conkeyref* ) at the cursor position.

**Insert Topic Heading**

Opens the **Insert Reference dialog box** *(on page 2404)* that allows you to insert a topic heading at the cursor position.

**Insert Topic Group**

Opens the **Insert Reference dialog box** *(on page 2404)* that allows you to insert a topic group at the cursor position.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

**Relationship Table > Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.
Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Search References

Finds the references to the @href or @keys attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 2381)). The current topic/map reference element must have an @href or @keys attribute defined to complete the search.

Show Key Definition

Available for elements that have a @conkeyref or @keyref attribute set (or elements with an ancestor element that has a @conkeyref or @keyref attribute). It computes the key name and opens the DITA map (on page 2643) that contains the definition of the key with the element that defines that key selected.

Select submenu

This submenu allows you to select the following:

- **Element**
  
  Selects the entire element at the current cursor position.

- **Content**
  
  Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

- **Parent**
  
  Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

- **To Lower Case**
  
  Converts the selected content to lower case characters.

- **To Upper Case**
  
  Converts the selected content to upper case characters.

- **Capitalize Sentences**
  
  Converts to upper case the first character of every selected sentence.

- **Capitalize Words**
  
  Converts to upper case the first character of every selected word.

- **Count Words**
  
  Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.
Note: The content marked as deleted with change tracking (on page 2648) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 368). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to ←

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 371).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- ! Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

- Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

- Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- Join Elements

Joins two adjacent block elements (on page 2641) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or
Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Ctrl + E (Command + E on OS X))

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the Position cursor between tags option (on page 149) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the Position cursor between tags option (on page 149) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with [tag] (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute
Allows you to remove one or more attributes.

**Rename attribute**
Allows you to rename an attribute.

**Replace in attribute value**
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**
Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**
Allows you to delete elements.

**Delete element content**
Allows you to delete the content of elements.

**Insert element**
Allows you to insert new elements.

**Rename element**
Allows you to rename elements.

**Unwrap element**
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**
Allows you to surround elements with element tags.

**Wrap element content**
Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**
Allows you to insert an XML fragment.
Replace element content with XML fragment
Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment
Allows you to replace elements with an XML fragment.

Review submenu
This submenu includes the following actions:

✓ Track Changes
Enables or disables the Track Changes (on page 2648) support for the current document.

✓ Accept Change(s) and Move to Next
Accepts the Tracked Change (on page 2648) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

✓ Accept All Changes
Accepts all Tracked Changes (on page 2648) in the current document.

✗ Reject Change(s) and Move to Next
Rejects the Tracked Change (on page 2648) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

✗ Reject All Changes
Rejects all Tracked Changes (on page 2648) in the current document.

✏ Comment Change
Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2648). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

 pena Highlight
Enables the highlighting tool that allows you to mark text in your document.

Colors
Allows you to select the color for highlighting text.

Stop highlighting
Use this action to deactivate the highlighting tool.

Remove highlight(s)
Use this action to remove highlighting from the document.
Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 550).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad, (Command + NumPad, on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 529) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 118) where you can configure various options with regard to the Author editing mode.
DITA Map Drag/Drop Actions

Dragging a file from the Project view (on page 316) or DITA Maps Manager view (on page 2381) and dropping it into a DITA map document that is edited in Author mode creates a link to the dragged file (a <topicref> element, <chapter>, <part>, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a DITA map is opened in Author mode, you can click the icon to the left of a topic to open that particular topic in the editor.

Tip: For information about customizing Author mode actions for a particular framework (on page 2643) (document type), see the Customizing the Editing Experience for a Framework (on page 1773) section.

Related Information:
- Customizing the Editing Experience for a Framework (on page 1773)

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as <p>, <ol>, and <simpletable>. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A <task> element specifies that a block of content contains the description of a task.
- A <codeblock> element specifies that a block of text consists of programming code.
- A <uicontrol> element specifies that a word is the name of a control in a computer GUI.
The `platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

**Document Semantics**

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

**Subject Matter Semantics**

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`<wintitle>`), or to mark a piece of text as applying only to a particular product.

**Audience Semantics**

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an `<audience>` element to capture audience metadata.

**Creating Topic Structures**

Oxygen XML Editor provides a number of tools to help you create topic structures:

- **Content Completion Assistant (on page 2642)** - Shows you which elements can be created at the current position.
- **Model view (on page 442)** - Shows you the complete structure supported by the current element.
- **Outline view (on page 436)** - Shows you the current structure of your document.
- **DITA toolbar** - Helps you to easily insert many common structures.

Related Information:

- **Getting Started with DITA (on page 2373)**
- **DITA Topics Document Type (Framework) (on page 1102)**
Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- **Topic** - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- **Task** - For procedural information such as how to use a dialog box.
- **Concept** - For general, conceptual information such as a description of a product or feature.
- **Reference** - For reference information.

Oxygen XML Editor also supports numerous other specialized topic types that you will find templates for in the various folders in the New DITA file dialog box *(on page 2440)*. They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and DITA map *(on page 2643)* types such as Glossentry, Troubleshooting, Bookmap *(on page 2641)*, and Subject Scheme Map *(on page 2648)*.

To create a new DITA topic and add a reference to it in your DITA map *(on page 2643)*, follow these steps:

1. In the DITA Maps Manager *(on page 2381)*, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box *(on page 2440)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box *(on page 2440)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box *(on page 2440)* that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.

   **Note:** The value of the root ID is generated taking the Use the file name as the value of the root ID attribute option from the DITA > New topics preferences page *(on page 204)* into account. When the option is deselected, a unique ID is generated.

   **Step Result:** The new topic is now referenced (as a `<topicref>` ) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.
New DITA File Dialog Box

The New DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

![New DITA File Dialog Box](image)

**Note:** The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates (on page 294).

The New DITA file dialog box includes the following features and options:

**Choose a file template**

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

**Tip:** You can use the text filter field at the top of the dialog box to search for a specific template.

**Title**

Depending on the selected file template, the value of the Title field is set in:

- The <title> element of a DITA topic file. The <title> element needs to be the first child of the root element.
• The `<glossterm>` element of a `<Glossentry>` file.

**New Topics Preferences**

Pressing this button opens the DITA New Topics preference page *(on page 204)*

**Save as**

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browser drop-down menu.

**Create**

When you click this button, a reference ( `<topicref>` ) to the new topic is added to the current DITA map and the new topic is opened in the editor.

Related Information:

• Getting Started with DITA *(on page 2373)*

• Adding Topics to a DITA Map *(on page 2399)*

• Working with Markdown Documents in DITA *(on page 2495)*

• Fast Create Multiple DITA Topics *(on page 2441)*

**Fast Create Multiple DITA Topics**

The DITA Maps Manager *(on page 2381)* includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map *(on page 2643)*. A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

**Note:** The Fast Create Topics feature works for the following types of local and remote resource protocols: `file`, `http`, `https`, `ftp`, `ftps`.

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.
The `Fast Create Topics` dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (Tab or Space). Topic references will be created in the DITA map according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the `File name generation rules` link to configure the rules (on page 204) for how those file names will be generated.

**Tip:** If you have added a file name prefix or suffix to the properties file (on page 296) for DITA document templates, the generated file name will include that prefix or suffix.

**File name prefix**

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file (on page 296) for DITA document templates, the prefix you enter here will override the one from the properties file.

**File name suffix**
Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (on page 296) for DITA document templates, the suffix you enter here will override the one from the properties file.

**Topic type**

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the Change button to select a different type from a list of possible DITA templates.

**Tip:** You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (on page 2446).

**Add created topic hierarchy relative to the selection as**

By default, the hierarchy of topics will be added to the DITA map as the First Child of the node where the action was invoked. You can change this to Last Child, Preceding Sibling, or Following Sibling if the selected node allows topics to be inserted as such.

**Create**

When you click Create, the specified hierarchy is added as topic references in the DITA map. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

**Tip:** You can easily change the order of the topics in the DITA map (on page 2399) at a later time.

**Related Information:**

- Adding Topics to a DITA Map (on page 2399)
- Converting DITA Topics to Another Type (on page 2446)

**Editing DITA Topics**

Oxygen XML Editor provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor provides for editing XML documents also apply to DITA topics. Oxygen XML Editor also provides extensive additional support specifically for DITA.

**Opening a DITA Topic**

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the DITA Maps Manager (on page 2381) (or right-click the topic and select Open).
- Double-click the file in the Project view (on page 316) (or right-click the file and select Open).
If you have a DITA map (on page 2643) opened in the XML editor, you can click the icon to the left of the topic.

Drag a DITA file from your system browser and drop it in the XML editor.

**Visual Editing in Author Mode**

DITA is an XML format (on page 7), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor provides a graphical view of your topics in Author mode (on page 275). Your topics will likely open in Author mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in Author mode, just click Author at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- Author mode is not a WYSIWYG view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat Author mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. Author mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to Text mode (on page 274). You, or someone in your organization, can change how the Author view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. Author mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
- Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the Author view (though there are some exceptions) and cannot be edited directly in the Author view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press Alt+Enter to bring up the attribute editor. Alternatively, you can use the Attributes view (on page 518) to edit attributes.

**Tip:** You can select Hints from the Styles drop-down menu (available on the Author Styles toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1810) section.

**Content Completion Assistance**

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differs from one DITA topic type to another (this is what makes one topic type different from another).
To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor has a number of Content Completion Assistant (on page 2642) features.

- **The Enter key:** In Author mode, the Enter key does not create line breaks, it brings up the Content Completion Assistant to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element \<p\> in DITA) and tools insert the line breaks in the output and on-screen.

The Content Completion Assistant not only suggests new elements you can add. If you press Enter at the end of a block element (on page 2641) (such as a paragraph) it suggests creating a new element of the same type. If you press Enter in the middle of a block element, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting Enter twice (just as you might in a text editor).

As you highlight an element name, a basic description of the element is displayed. Select the desired element and press Enter to create it.

To wrap an element around an existing element or piece of text, simply select it and press Enter and use the Content Completion Assistant to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the Model view (on page 442) (Window > Show View > Model, if the view is not already open). The Model view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

Tip: You can also select Inline actions from the Styles drop-down menu (available on the Author Styles toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1810) section.

**DITA Editing Actions**

A variety of actions are available in the DITA framework (on page 2643) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the DITA menu, the DITA (Author Custom Actions) toolbar, or the Content Completion Assistant.

The DITA toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).
If the DITA toolbar is not displayed, right-click anywhere on the toolbar area, select Configure Toolbars, and select it from the displayed dialog box.

**Note:** The DITA toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press Enter to open the Content Completion Assistant.

Whenever the current document in the editor is a DITA document, the DITA menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA framework-specific actions (on page 2475), the contextual menu also includes various general Author mode contextual menu actions (on page 640).

**Related Information:**
- Getting Started with DITA (on page 2373)
- DITA Topic Author Mode Actions (on page 2475)

### Converting DITA Topics to Another Type

Oxygen XML Editor includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

#### DITA Conversion Refactoring Operations for DITA

The following conversion operations are available:

**Convert Nested Topics to New Topics** *(Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2381))*

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics** *(Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2381))*

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.
Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Methods for Accessing the DITA Conversion Refactoring Operations

To access the conversion operations, use one of the following methods:

Single Document Method

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2381)), go to the Refactoring submenu, and choose whichever operation is appropriate for your needs.

Multiple Documents At Once Method

Select XML Refactoring from the Tools menu (or from the Refactoring submenu when you right-click one or more documents in the Project view (on page 316) or the DITA Maps Manager view (on page 2381)). Then select whichever operation is appropriate for your needs.

XML Refactoring Wizard Dialog Box

When you select any of the operations, Oxygen XML Editor proceeds to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 2447), the wizard page allows you to choose a scope for the operation and some filtering options:
• **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, **Selected reference**, and others depending on the context.

• **Filters** section
  ◦ **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  ◦ **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  ◦ **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method** (**on page 2447**), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

⚠️ **Warning:** It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, behind the scenes Oxygen XML Editor maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

**Handling Special Characters When Generating New File Names**

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Ä is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character ( _ ). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

```
{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/utils/character-map.xsl
```

**Converting To and From DITA Specialization Document Types**

If you use your own **DITA specialization document type** (**on page 2624**), you can modify mappings for the predefined conversion operations to work with your specialization.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory (and its subdirectories):

```
{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/.
```
Note: The stylesheets for converting entire files (from one type to another) are located in the `dita-files-conversion-stylesheets` folder. Each of these conversion operations has a stylesheet with the word `entrypoint` at the end of its name. Edit the appropriate `*-entrypoint.xsl` file (for example, to modify the Convert to Task operation, edit the `convert-resource-to-task-entrypoint.xsl` file).

2. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
   a. Modify the values of the declared `root-element`, `public-literal-target`, and `system-literal-target` variables to match your specialization's DTD information.
   b. Modify the value of the declared `schema-location` variable to match the location of your specialization's XML schema.
   c. Modify the value of the declared `xml-model-location` variable to match your Relax NG specialization.

3. For the Convert Nested Topics to New Topics and Convert Sections to New Topics operations, if your DITA specialization uses your own custom URN or DOCTYPE, you can replace the default mappings in the `OXYGEN_INSTALL_DIR/frameworks/dita/refactoring/utils/dita-formats.xsl` stylesheet with your own values for the DOCTYPE or xml-model.

4. If you want to change the name of the operation that will be displayed in Oxygen XML Editor, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/refactoring/` (for example, for the Convert to Task operation, it is `convertResource2Task.xml`).
   b. Edit that XML file and change the `name` attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).

5. Save your changes to all modified files.

6. Restart Oxygen XML Editor

Result: You should now see your changes when accessing the conversion operations (on page 2447).

Tip: You can also create your own customized refactoring operations. For more information, see Custom Refactoring Operations (on page 717).

Related Information:
- Editing DITA Topics (on page 2443)
- Refactoring XML Documents (on page 705)

Working with Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:
1. Place the cursor in the position you want the graphic to be inserted.

2. Select the **Insert Image** action. The **Insert Image** dialog box appears.

![Figure 692. Insert Image Dialog Box](image)

3. Configure the options in this dialog box and click **Insert**.

   The **Insert Image** dialog box includes the following options and features for inserting images into a DITA document:

   **Location**

   Use this option to specify a URL for the image as the value of an `<image>` element. You can type the URL of the image you want to insert or use browsing actions in the **Browse** drop-down menu (there is also a history drop-down).

   **Key**

   Use this option to insert the selected key as the value of a `<keyref>` attribute inside the `<image>` element. All keys that are presented in the dialog box are gathered from the root map (on page 2648) of the current DITA map. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected root map.

   **Note:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link in the **Choose Key** dialog box or change it in the **Root map** option in the toolbar of the **DITA Maps Manager**.

   **Figure title**

   Use this text box to insert a `<fig>` element inside a `<title>` and `<image>` element inside a `<fig>`.

   **Alternate text**
Use this text box to insert an `<alt>` element inside the `<image>`.

**Size**

Use this section to configure the **Width** and **Height** of the image, or **Scale** the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

**Layout**

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

**Preview**

The **Preview** box shows a thumbnail of the selected image so that you can see a preview of the image before clicking **Insert**.

**Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions**

You can drag images from your system explorer or the [Project view](on page 316) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```
<image href="../images/image_file.png"/>
```

**Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor will automatically update the reference to the new image.

**Adding an Image in a Figure Element**

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.
3. Add an `<image>` element ([on page 2449](#)) to the `<fig>` element.

**Note:** The `<fig>` element has a number of other child elements that may be appropriate to your content. See the [DITA documentation](#) for complete information about `<fig>`.

**Note:** The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

**Floating Images in DITA Topics for PDF or XHTML Output**

Oxygen XML Editor provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `@outputclass` attribute on the `<image>` element. The possible values are:
For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```dita
<p>
  <image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/>
  <b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

**Figure 693. Image Floated to the Right**

Searching for References to Images

You can search for all references to an image by selecting Search References from the contextual menu. The result depends on how the image is defined, as follows:

- If the action is invoked on an `<image>` element that contains an `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.
- If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified ID are also reported.

Related Information:

- Image Maps in DITA (on page 2456)

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs. There is a toolbar button (`🔍`) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Project view (on page 316) and drop them into your documents (or copy and paste them).
### Table 49. Supported Media Types

<table>
<thead>
<tr>
<th>Media</th>

</tr>
</tbody>
</table>

**Adding a Media Resource**

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the [Insert Media Resource](#) action from the toolbar. The [Insert Media](#) dialog box appears.

**Note:** You can also drag media files from your system explorer or the [Project view](#) and drop them into your documents (or copy and paste them). Note that this method will bypass the [Insert Media](#) dialog box, so if you need to adjust the size you will need to adjust the `@width` or `@height` attributes manually.
3. Configure the options in this dialog box and click **Insert**.

The **Insert Media** dialog box includes the following options:

**Location**

Use this option to specify a URL for the media resource as the value of a `@data` attribute inside the `<object>` element. You can type the URL of the resource you want to insert or use browsing actions in the `Browse` drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a `@datakeyref` attribute inside the `<object>` element. All keys that are presented in the dialog box are gathered from the root map (on page 2648) of the current DITA map. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected root map.

**Note:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link in the **Choose Key** dialog box or change it in the **Root map** option in the toolbar of the **DITA Maps Manager**.

**Type**

Oxygen XML Editor detects and automatically selects the media type based upon the specified resource in the **URL field** (on page 2454). You can manually change the type, but keep in mind that in the publishing stage the **object** element is converted to an HTML5 **element** (on page 2455) based upon the type selected here. You can choose between: audio, video, or iframe.

**Size**
Use this section to configure the **Width** and **Height** of the frame for the media resource. Specifying a value in these options inserts a `@width` and `@height` attribute, respectively. For audio clips, only the **Width** can be adjusted.

**Result in Author Mode:** A reference to the specified video, audio, or embedded HTML frame is inserted in an `<object>` element and it is rendered in Author mode so that it can be played directly from there.

⚠️ **Attention:**

- On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the `libavformat57` library.

**Result in Output:** In the publishing stage, the `<object>` element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The `<object>` element is converted to an HTML5 `<video>` element.
- **Audio Clips** - The `<object>` element is converted to an HTML5 `<audio>` element.
- **Embedded HTML Frames** - The `<object>` element is converted to an HTML5 `<iframe>` element.

**Tip:** There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select Copy embed code), you can then paste the contents of the clipboard in the URL field (on page 2454) and the Type (on page 2454) will automatically be set on iframe, while the Width and Height (on page 2454) will be populated according to the detected size, and an allowfullscreen parameter will automatically be added (set the value of this parameter to true to allow videos to play in full screen mode once the document is converted to XHTML output).

**Inserting Media in HTML Outputs That Do Not Support Embedded Media**

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. **Edit the DITA transformation scenario (on page 2565)** for the output type that does not support embedded objects (for example, DITA Map CHM).
2. Go to the **Parameters tab (on page 2572)** and click the **New** button to add a new parameter.
3. For the **Name**, enter: `com.oxygenxml.xhtml.linkToMediaResources`.
4. For the **Value**, enter: `true`.
5. Click **OK** and continue on to run the transformation.

**Result:** The media object will appear in the output as a plain link instead of an embedded object.

For more information, see the following video demonstration:

[https://www.youtube.com/embed/lIX11gS4WaU](https://www.youtube.com/embed/lIX11gS4WaU)
Image Maps in DITA

Oxygen XML Editor includes support for **image maps** in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

**Figure 695. Image Map Editor in DITA**

The interface of the **Image Map Editor** consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  
  Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.
New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

- Color Chooser
Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the Ctrl key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down Shift while using the arrow keys to move the shape further or Alt to move it 1 pixel at a time.
- To zoom in or out, you can use the NumPad + or NumPad - keys respectively. Use Ctrl + NumPad 0 to reset the zoom level to its default value.
- You can use Ctrl + Z to undo an action or Ctrl + Y to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to Polygon or Free Form shapes.

Remove Point

Removes the current point from Polygon or Free Form shapes.

Duplicate

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

○ New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

○ New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

_undo

Use this action to undo the last action.

-redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA (on page 2542) by using the identical Link drop-down menu from the main toolbar.

When you click OK to finalize your changes in the Image Map Editor, an <xref> element will be inserted with either an @href attribute or a @keyref attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor (on page 2542).

Description
You can enter an optional description for the selected area (shape) that will be displayed in the **Image Map Details** section *(on page 2460)* in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

**How to Create an Image Map in DITA**

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.
   
   **Step Result:** This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (☐ **New Rectangle**, ☪ **New Circle**, or ☐ **New Polygon**).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the *other buttons on the toolbar* *(on page 2456)* to adjust its layer and color, or to perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful *contextual menu actions* *(on page 2458)*. For example, the easiest way to remove a point is to right-click the point and select ✗ **Remove Point**.

4. With the shape selected, use one of the *linking options* *(on page 2459)* in the ☮ **Link** drop-down menu to select a target resource (or enter its path in the **Target** *(on page 2459)* text field).

5. (Optional) Enter a **Description** *(on page 2459)* for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.

7. When you are finished creating hyperlinks, click **OK** to process your changes.

**Result:** The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.
How to Edit an Existing Image Map in DITA
To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

**Overlapping Areas**
If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar (on page 2456)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (on page 2456) (↑, ↓, ➨, ➧).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Related Information:**
- DITA 'imagemap' Element Specifications
- Working with Images in DITA Topics (on page 2449)

**Adding Tables in DITA Topics**
You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:
• **DITA Simple table model (on page 2462)** - This is the most commonly used model for basic tables.
• **CALS table model (OASIS Exchange Table Model) (on page 2463)** - This is used for more advanced functionality.
• **DITA Choice table model (on page 2466)** - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
• **DITA Properties table model (on page 2467)** - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

**Inserting a Simple Table Model**

To insert a Simple DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table Model.

![Insert Table Dialog Box - Simple Model](image)

The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**

Allows you to specify the type of properties for column widths ( `<colwidth>` attribute). You can choose one of the following properties for the column width:
• **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.

• **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.

- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the Insert Table action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select CALS for the table Model. This model allows you to configure more properties than the Simple model.
Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of Rows and Columns for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, colwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%.
  
  When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (@colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the \text{pt} unit is inserted, but you can change the units in the \text{colspecs} (column specifications) section above the table or in Text
mode. The following units are allowed: \textit{pt} (points), \textit{cm} (centimeters), \textit{mm} (millimeters), \textit{pi} (picas), \textit{in} (inches).

**Frame**

Allows you to specify a value for the \texttt{@frame} attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a \texttt{@conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{@conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}.

**Row separator**

Specifies whether or not to include row separators (\texttt{@rowsep} attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Column separator**

Specifies whether or not to include column separators (\texttt{@colsep} attribute). The allowed values are: 0 (no separator) and 1 (include separators).

**Alignment**

Specifies the alignment of the text within the table (\texttt{@align} attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

\begin{itemize}
  \item \textbf{Note:} The \texttt{justify} value cannot be rendered in \texttt{Author} mode, so you will only see it in the output.
\end{itemize}

- **char** - Aligns text to the leftmost occurrence of the value specified on the \texttt{@char} attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a \texttt{@conref}, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the \texttt{@conref} target. For more information, see \url{https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html}. 

**Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (on page 275), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

**Figure 699. CALS Table in DITA**

![Sample CALS Table with Fixed Width](image)

**Inserting a Choice Table Model**

To insert a Choice table within a `<step>` element in a DITA Task document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select choicetable from the Content Completion Assistant (on page 2642). The Insert Table dialog box appears. Select Simple for the table Model.

**Figure 700. Insert Table Dialog Box - Choice Model**

![Insert Choice Table](image)

The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

**Table Size**

- Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

- If selected, an extra row will be inserted at the top of the table to be used as the table header.
Column widths

Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click Insert, a Choice table is inserted into your DITA Task document at the current cursor position (within a <step> element).

**Inserting a Properties Table Model**

To insert a Properties table within a <refbody> element in a DITA Reference document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select properties(wizard) from the Content Completion Assistant (on page 2642). The Insert Table dialog box appears. Select Properties for the table Model.
The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click **Insert**, a Properties table is inserted into your DITA Reference document at the current cursor position (within a <refbody> element).
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 518) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (on page 2471) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 2471).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 274).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor includes a Smart Paste feature (on page 505) that preserves certain style and structure information when pasting content.

Tip: When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:

- Editing Tables in Author Mode (on page 568)

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- CALS table model (on page 2469)
- Simple table model (on page 2470)
- Choice table model (on page 2470)
- Properties table model (on page 2470)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (@colwidth attribute) or the text alignment (@align attribute). Although they appear as part of the Author mode (on page 275), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.
Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Choice Table Model Layout

A Choice table model is used within a <step> element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The <choicetable> element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (on page 2642) (within a <step> element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

Properties Table Model Layout

A Properties table model is used within a <refbody> element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference
documents either by selecting `properties(wizard)` from the [Content Completion Assistant](on page 2642) (within a `<refbody>` element) or by using the `Insert Table` action on the toolbar (or from the contextual menu) and selecting `Properties` for the Model. The layout of a `Properties` table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 705. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

**Table Validation in DITA**

Oxygen XML Editor reports table layout problems that are detected in manual or automatic validations. When you validate a [DITA map](on page 2643) with the `Validate and Check for Completeness` action, if the `Report table layout problems` option is selected in the [DITA Map Completeness Check](on page 2425) dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.

**Editing Table Properties in DITA**

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the `Table Properties (Ctrl + T (Command + T on OS X))` action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

**Note:** Some properties allow the following special values, depending on the context and the current properties or values:
• `<not set>` - Use this value if you want to remove a property.
• `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

**Edit Table Properties for a CALS Table Model**

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in the four tabs include a **Preview** pane that shows a representation of the modification.

**Figure 706. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)**

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
• **justify** - Stretches the line of text so that it has equal width.

  **Note:** The **justify** value cannot be rendered in **Author** mode, so you will only see it in the output.

• **char** - Aligns text to the leftmost occurrence of the value specified on the **char** attribute for alignment.

• **-dita-use-conref-target** - Normally, when using a **conref**, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the **conref** target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Vertical alignment (Available in the Row and Cell tabs)**

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells ( **valign** attribute). The allowed values are as follows:

• **top** - Aligns the text at the top of the cell.
• **middle** - Aligns the text in a vertically centered position.
• **bottom** - Aligns the text at the bottom of the cell.

• **-dita-use-conref-target** - Normally, when using a **conref**, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the **conref** target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

**Column separator (Available in the Table, Column, and Cell tabs)**

Specifies whether or not to include column separators (borders/grid lines) in the form of the **colsep** attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Row separator (Available in all four tabs)**

Specifies whether or not to include row separators (borders/grid lines) in the form of the **rowsep** attribute. The allowed values are: 0 (no separator) and 1 (include separators).

**Frame (Available only in the Table tab)**

Allows you to specify a value for the **frame** attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

• **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.

• **-dita-use-conref-target** - Normally, when using a **conref**, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the
value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row tab (not available for Properties tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:

- Adding Tables in DITA Topics (on page 2461)
- Editing Tables in Author Mode (on page 568)

Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document using one of the following methods:

- Embed MathML directly into a DITA topic. You can use Insert > Insert Equation from the contextual menu to insert a MathML equation. Clicking on the equation will open a MathML Editor where you can edit the code.
- Reference an external MathML file as an image, using the Insert Image action that is available on the DITA toolbar (or from the DITA > Insert menu).
Publishing Notes:

- MathML equations contained in DITA topics can be published out-of-the-box in PDF using the DITA PDF transformation scenario.
- The DITA Map PDF - based on HTML5 & CSS transformation scenario *(on page 1476)* support MathML equations *(on page 1609)*.
- For details about HTML output, see MathML Equations in HTML Output *(on page 632)*.
- For other publishing formats, you might need to employ additional customizations for handling MathML content.

Adding LaTeX Equations in DITA Topics

LaTeX is a high-quality typesetting system that includes features designed for the production of technical and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format. By default, web browsers and PDF readers do not have support to show mathematical equations written in LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.

Adding support for writing LaTeX equations in a DITA topic implies three stages:

1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD specialization and add a new element (for example, called `<latex>` and it extends the DITA `<foreign>` element). Alternatively, you can directly use the DITA `<foreign>` element with a specific `@outputclass` attribute value:

```xml
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="testEquation">
  <title>Test equation</title>
  <body>
    <p><foreign outputclass="embed-latex">L' = \sqrt{1-\frac{v^2}{c^2}}</foreign></p>
  </body>
</topic>
```

2. If you want Oxygen XML Editor to properly present the LaTeX equation when editing in the Author visual mode, you need a plugin that converts the equation content to an image. There is a sample plugin that does that here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support. You can download and copy the plugin folder latex-images-support to the Oxygen XML Editor plugins folder, then restart Oxygen XML Editor.

3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: https://github.com/oxygenxml/dita-latex.

DITA Topic Author Mode Actions

A variety of actions are available for DITA documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant *(on page 2642)*.
DITA Toolbar Actions

The following default actions are available on the DITA toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

- **Bold**
  Surrounds the selected text with a `<b>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**

  The following link actions are available from this menu:

  - **Cross Reference**
    Opens the Cross Reference (xref) dialog box (on page 2542) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2643) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2541).

  - **File Reference**
    Opens the File Reference dialog box (on page 2542) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2541).

  - **Web Link**
    Opens the Web Link dialog box (on page 2542) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2541).

  - **Related Link to Topic**
    Opens the Cross Reference (xref) dialog box (on page 2542) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been
selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2541).

**Tip:** You can use the **Find Similar Topics** action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

**Related Link to File**

Opens the **File Reference** dialog box (on page 2543) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2541).

**Related Link to Web Page**

Opens the **Web Link** dialog box (on page 2543) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2541).

**Insert Image**

Opens the **Insert Image** dialog box (on page 2449) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

**Insert Media Resource**

Opens the **Insert Media** dialog box (on page 2452) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an `<object>` element and it is rendered in Author mode so that it can be played directly from there.

**Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

**Insert Section**

Inserts a new `<section>` element in the document, depending on the current context.

**Insert Concept**
Inserts a new `<concept>` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

**Insert Task**

Inserts a new `<task>` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

**Insert Topic**

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Reference**

Inserts a new `<reference>` element, depending on the current context. A reference is a top-level container for a reference topic.

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2513) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (`@conref`) (on page 2515), content key references (`@conkeyref`) (on page 2517), or key references to metadata (`@keyref`) (on page 2520).

**Insert step or list item**

Inserts a new list or step item in the current list type.

**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2641)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**

Deletes the table column located at cursor position or multiple columns in a selection.

**Table Properties**

Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DITA Contextual Menu Actions**

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DITA menu at the top of the interface):

**Add File to Review Task**

This action can be used to add the current document to a task in the Content Fusion Tasks Manager view. Oxygen Content Fusion is a flexible, intuitive collaboration platform designed to adapt to any type of documentation review workflow. This functionality is available through a
pre-installed connector add-on (on page 2103). To fully take advantage of all of the benefits and
features of **Content Fusion**, your organization will need an **Oxygen Content Fusion Enterprise
Server**. For more information, see the **Oxygen Content Fusion website**.

**Edit Attributes**

Displays an in-place attributes editor (on page 520) that allows you to manage the attributes of
an element.

**Edit Profiling Attributes**

Allows you to change the profiling attributes (on page 554) defined on all selected elements.

**Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

**Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA
framework:

**Paste as content reference**

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA
XML element from the clipboard. An entire DITA XML element with an ID attribute
must be present in the clipboard when the action is invoked. The `conref` attribute
will point to this ID value.

**Paste as content key reference**

Allows you to indirectly reference content using the `@conkeyref` attribute. When the
DITA content is processed, the key references are resolved using key definitions
from **DITA maps (on page 2643)**. To use this action, you must first do the
following:

1. Make sure the DITA element that contains the copied content has an ID
   attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map combo box (on
   page 2384)** points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key
   assigned to it. To assign a key, right-click the topic with its parent map opened
   in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the
   **Keys** field.
Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 2384) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA framework:

* [Insert Table](#)

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2641)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

* [Insert Image](#)

Inserts an image reference (on page 599) at the cursor position. Depending on the current location, an image-type element is inserted.

* [Insert Media Resource](#)

Opens a Choose Media dialog box (on page 628) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.
Σ Insert Equation

Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 630).

¶ Insert Paragraph

Inserts a new paragraph at current cursor position.

§ Insert Section

Inserts a new <section> element in the document, depending on the current context.

❖ Insert Topic

Inserts a new <topic> element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

• &#<decimal value> - e.g. &#65
• &<decimal value> - e.g. &#65
• #x<hexadecimal value> - e.g. #x41
• &#x<hexadecimal value> - e.g. &#x41

Style submenu

This submenu includes the following text styling actions:

Ｂ Bold

Emphasizes the selected text by surrounding it with a bold tag. You can use this action on multiple non-contiguous selections.

Ｉ Italic

Emphasizes the selected text by surrounding it with an italic tag. You can use this action on multiple non-contiguous selections.

Ｕ Underline

Emphasizes the selected text by surrounding it with an underline tag. You can use this action on multiple non-contiguous selections.

Ｔ Subscript

Surrounds the selected text with a subscript tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.
Superscript

Surrounds the selected text with a superscript tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an image map to the current image (if one does not already exist) and opens the Image Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  
  Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  
  Sorts cells or list items in a table.

- **Table Properties**
  
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu
This submenu give you access to all the usual contextual menu actions.

- **Link submenu**

  The following link actions are available from this submenu:

  **Cross Reference**

  Opens the Cross Reference (xref) dialog box (on page 2542) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2643) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2541).

  **File Reference**

  Opens the File Reference dialog box (on page 2542) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2541).

  **Web Link**

  Opens the Web Link dialog box (on page 2542) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2541).

  **Related Link to Topic**

  Opens the Cross Reference (xref) dialog box (on page 2542) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2541).

  **Tip:** You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

  **Related Link to File**

  Opens the File Reference dialog box (on page 2543) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not
already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2541).

**Related Link to Web Page**

Opens the Web Link dialog box (on page 2543) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2541).

**Sort**

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

**Generate IDs**

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

**Note:** The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

**Reuse submenu**

This submenu includes the following actions regarding reusing content in DITA:

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2513) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references ( @conref ) (on page 2515), content key references ( @conkeyref ) (on page 2517), or key references to metadata ( @keyref ) (on page 2520).

**Push Current Element**

Opens the Push current element dialog box (on page 2522) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

**Edit Content Reference**

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source
location (or key) and source element of a content reference (or content key reference), and the reference details (@conref / @conkeyref and @conrefend attributes). For more information, see *Reuse Content Dialog Box (on page 2513)*.

**Replace Reference with Content**

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see *Creating a Reusable Content Component (on page 2525)*.

**Insert Reusable Component**
Inserts a reusable component at cursor location. For more information, see "Inserting a Reusable Content Component (on page 2526)."

**Search References (Ctrl + Shift + G (Command + Shift + G on OS X))**

Finds the references to the `@id` attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 2643) (opened in the DITA Maps Manager view (on page 2381)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

**Figure 707. Search References to Ancestors Dialog Box**

![Search References to Ancestors Dialog Box](image)

**Tip:** If you are invoking the action on an image, see "Searching for References to Images (on page 2452)" for details about what will be reported.

**Find Similar Topics**

Opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements. It is helpful for quickly finding related topics that can be added as related links.

**Show Key Definition**

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the DITA map (on page 2643) that contains the definition of the key with the element that defines that key selected.

**About Element submenu**

This submenu includes the following actions:

**Style Guide**

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 2642).

**Browse reference manual**

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.
Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note: The content marked as deleted with change tracking (on page 2648) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 368). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the Ox or
ox prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to ←

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 371).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

- Toggle Comment
  
  Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

- Move Up (Alt + UpArrow)
  
  Moves the current node or selected nodes in front of the previous node.

- Move Down (Alt + DownArrow)
  
  Moves the current node or selected nodes after the subsequent node.

- Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))
  
  Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

- Join Elements
  
  Joins two adjacent block elements (on page 2641) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

- Surround with Tags (Ctrl + E (Command + E on OS X))
  
  Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

  - If the Position cursor between tags option (on page 149) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
• If the Position cursor between tags option (on page 149) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with [tag] (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert @conref attributes to @conkeyref attributes.

Convert Simple Tables to CALS Tables
Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

**Rename Key**

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.
Delete attribute
Allows you to remove one or more attributes.

Rename attribute
Allows you to rename an attribute.

Replace in attribute value
Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions
Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments
Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions
Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element
Allows you to delete elements.

Delete element content
Allows you to delete the content of elements.

Insert element
Allows you to insert new elements.

Rename element
Allows you to rename elements.

Unwrap element
Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element
Allows you to surround elements with element tags.

Wrap element content
Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions
Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment
Allows you to insert an XML fragment.

**Replace element content with XML fragment**

Allows you to replace the content of elements with an XML fragment.

**Replace element with XML fragment**

Allows you to replace elements with an XML fragment.

**Review submenu**

This submenu includes the following actions:

- **Track Changes**
  Enables or disables the Track Changes support for the current document.

- **Accept Change(s) and Move to Next**
  Accepts the Tracked Change located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

- **Accept All Changes**
  Accepts all Tracked Changes in the current document.

- **Reject Change(s) and Move to Next**
  Rejects the Tracked Change located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

- **Reject All Changes**
  Rejects all Tracked Changes in the current document.

- **Comment Change**
  Opens a dialog box that allows you to add a comment to an existing Tracked Change. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

- **Highlight**
  Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**
Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 550).

Manage IDs submenu

This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 696) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 696).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.
Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

Inspect Styles

Opens the CSS Inspector view (on page 529) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 118) where you can configure various options with regard to the Author editing mode.

DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the Project view (on page 316) or DITA Maps Manager view (on page 2381) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the \texttt{xref} DITA element with the \texttt{@href} attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the Project view (on page 316) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA \texttt{image} element with an \texttt{@href} attribute).

\textbf{Tip:} For information about customizing Author mode actions for a particular framework (on page 2643) (document type), see the Customizing the Editing Experience for a Framework (on page 1773) section.

Working with Markdown Documents in DITA

Oxygen XML Editor includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the DITA topic will look after conversion. Likewise, the XDITA
tab in the Preview pane provides a visualization of how a Lightweight DITA topic will look after conversion. Keys that are defined in the root map are also resolved in the Preview pane.

**Export Markdown as a DITA Topic**

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The Export as DITA Topic action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

**Working with Markdown Documents in the DITA Maps Manager**

Oxygen XML Editor has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (on page 2381). The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.
This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**

Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

**Delete Markdown file**

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

**Preview**

Select this button to display a preview of the changes Oxygen XML Editor is about to make.

**Convert**

Select this button to perform the conversion. If the Markdown file has format="markdown", it will be converted to a DITA topic. If it has format="mdita", it will be converted to a LightWeight DITA topic.

**Tip:** Oxygen XML Editor comes with a sample ditamap project for converting Markdown to DITA. Go to the Project view (on page 316), open the sample.xpr project, and navigate to the dita/markdown-dita folder.

### Converting Multiple Markdown Documents to DITA

Oxygen XML Editor offers an add-on that contributes actions in the Tools menu and contextual menu to enable batch conversion between various formats, including Markdown to DITA. For more information and instructions for installing the add-on, see Batch Converter Add-on (on page 2101).
Working with Keys in DITA

DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

Defining Keys in DITA Maps

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2648). This makes it easier to manage since they’re all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a `<keyword>` . To define this type of key, follow these instructions: Key Definition with a Keyword Value (on page 2412).
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: Key Definition with a Target (on page 2412).

Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see Working with Variable Text in DITA (on page 2526).
Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the <topicref> element:

```xml
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the <topicref> element in its DITA map (on page 2643)) is to use the Keys tab in the Edit Properties dialog box (on page 2415). In the DITA Maps Manager (on page 2381), invoke the contextual menu on the topic that will have the key assigned and select Edit Properties. Go to the Keys tab and enter the name of the key in the Define keys field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link (on page 2541) to it using `<xref keyref="feature.quick-heat">`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic (on page 2399) by key: `<topicref keyref="feature.quick-heat">`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to insert a content reference (on page 2509). In this case, the content reference uses the key to locate the topic to pull content from. It uses a @conkeyref attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure">`. In this example, feature.quick-heat is the key, and preheat-procedure is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file (on page 2412)) and then insert the image using the key (on page 2449).

Example of a key definition for a targeted image file:

```xml
<map id="keydefs">
    <!-- product name -->
    <title>Key Definitions</title>
    <keydef keys="image1" href="../img/image1.png" format="png"/>
</map>
```

Related Information:

- Defining Keys in DITA Maps (on page 2411)
- Creating a DITA Content Key Reference (on page 2509)
- Reuse Content Dialog Box (on page 2513)
- DITA Reusable Components View (on page 2530)
Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (on page 2648). The actual glossary terms are small glossary entry topics that are referenced in the glossary map. You can add links to the glossary terms (on page 2501) in the output and you can even define abbreviated forms (on page 2501) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Editor

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. Create a new submap (on page 2397) for your glossary and embed it in your main map.
2. Create a glossary entry topic (glossentry) for each glossary term. The glossentry element may contain numerous optional glossentry elements, but every glossentry topic must contain a glossterm and glossdef element. The glossterm is the name of the term while the glossdef is its definition.

Here is an simple example:

```
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>
```

The easiest way to create a glossentry topic in Oxygen XML Editor:

a. Click the New file wizard button on the toolbar.
b. Type glossentry in the search field at the top of the dialog box.
c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.

3. Reference each glossary entry topic in your glossary submap using the glossref element. This element requires a @keys attribute. Please make sure the @print attribute is set to yes to show the glossary also in the PDF output.

```
<glossref keys="gloss_ddl" href="ddl.dita" print="yes"/>
```

The easiest way to reference a glossentry in Oxygen XML Editor:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select Append Child > Reference to the currently edited file (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select Insert After > Reference to the currently edited file).

  **Step Result:** This opens the Insert Reference dialog box (on page 2404).

b. Go to the Keys tab and enter a name in the Define keys field.
c. Go to the Attributes tab and select Glossary Reference from the Reference type drop-down list at the top of the dialog box.
d. Click **Insert and Close**.

**Tip:** You could also group multiple glossentry topics into a single collection by using the `<glossgroup>` element.

### How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the `<term>` element (or `<abbreviated-form>` element as described in the next section (on page 2501)) with a `@keyref` attribute that references the corresponding key specified in the `<glossref>` element. Of course, the glossref points to the glossentry topic where the glossary term is defined.

```
<term keyref="gloss_ddl"/>
```

In the output, the text specified in the `<glossterm>` element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a `<term>` element and reference the glossary term in Oxygen XML Editor:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the **DITA Reusable Components view (on page 2530)**, go to the **Keys** tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select **Insert as Keyref > More > Term**.

### Using Abbreviated Forms (Acronyms) with Glossary Terms

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:
For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: http://www.oasis-open.org/committees/download.php/29734/ AcronymBestPractice_08112008.doc.

- https://docs.oasis-open.org/dita/v1.2/os/spec/langref/abbreviated-form.html

Reusing DITA Content

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Editor provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (on page 2504).

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (on page 2506) (conref, conkeyref, coderef). A conref (content reference) (on page 2507) creates a direct reference to a specific element of another topic. A conkeyref (content key reference) (on page 2509) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a conkeyref is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A coderef references an external file that contains literal code.

Oxygen XML Editor provides support for all of these mechanisms.

While the conref and conkeyref mechanisms can be used to reference any content element, it is considered best practice to only conref or conkeyref content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by the reference. Oxygen XML Editor can help you create a reusable component from your current content.

Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a reusable component (on page 2524) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.
Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (on page 2526), which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

Reusing Content with DITA 1.3 Concepts

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. Key Scopes (or scoped keys) (on page 2528) allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. Branch Filtering (on page 2529) allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

DITA Reusable Components View

If you use a large amount of keys or reusable components in your DITA project, the DITA Reusable Components view (on page 2530) can be quite helpful. It collects all of the keys and reusable components that are defined in the root map (on page 2648) and presents them in a dynamic table where you can easily locate and insert references to them.

Reuse Actions in Oxygen XML Editor

Oxygen XML Editor includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the DITA menu, and some are available on the toolbar.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2513) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 2515), content key references (@conkeyref) (on page 2517), or key references to metadata (@keyref) (on page 2520).

Push Current Element

Opens the Push current element dialog box (on page 2522) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref / @conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2513).

Replace Reference with Content
Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside `<xref>` or `<link>` elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component (on page 2525).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 2526).

**Related Information:**

- Working with Keys in DITA (on page 2498)
Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map (on page 2401)) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the DITA map (on page 2643) is opened in the DITA Maps Manager (on page 2381).
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this DITA map, do one of the following:
      • Simply drag the topic and press Ctrl (or Alt on OS X) at the new location within the map (or use the Copy and Paste contextual menu actions).
      • If the topic is the current open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2381)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   b. If the topic already exists in another DITA map, do one of the following:
      • Open the other map in the DITA Maps Manager (on page 2381), right-click the topic, select Copy, switch back to the original DITA map in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the current open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2381)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
      • Right-click the topic in the Project view (on page 316) (or the file system), select Copy, switch to the DITA Maps Manager (on page 2381) view, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the current open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 2381)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
3. If your topic uses a key reference (on page 2498), set up the appropriate key definition in your map (on page 2411).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2547).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 2421) on the toolbar in the DITA Maps Manager.
**Reuse Topics Using Author Mode Editor**

1. Open the DITA map (on page 2380) in the Author mode editor.
2. Add a reference to an existing topic by dragging it from the Project view (on page 316) (or the file system) and dropping it in the desired location in the DITA map opened in Author mode. You can also accomplish the same thing by using the Copy and Paste contextual menu actions.
3. If your topic uses a key reference (on page 2498), set up the appropriate key definition in your map (on page 2411).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2547).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 2421) on the toolbar in the DITA Maps Manager.

**Displaying Multiple References to the Same Topics**

Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 2381), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the current topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference in the DITA Maps Manager.

**Working with Content References**

The DITA content reference feature lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place. The source content can be referenced using the DITA @conref or @conkeyref attributes.

There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.

- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.
• **Arbitrary content references** - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

A reference to the external content is created by adding a `@conref` or `@conkeyref` attribute to an element in the local document. The `@conref` or `@conkeyref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Editor displays it in **Author** mode as if it is there in the referencing file. If you do not want referenced content displayed, open the Preferences dialog box (Options > Preferences) (on page 72), go to Editor > Edit modes > **Author**, and deselect the Display referenced content option (on page 118).

**Note:** A reference also displays tracked changes (on page 2648) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select Edit Reference.

**Tip:** To search for references made through a direct content reference, use the Search References action from the contextual menu.

### Accessing Referenced Content

When you reference reusable content using a `@conref` or `@conkeyref` attribute, the content is grayed out in the document and can only be edited from the source document. To edit the source of the referenced content, click the Edit Content icon at the beginning of the inserted content. This will open the source document where you can edit the referenced content.

**Related Information:**
- Working with Reusable Components (on page 2524)
- Working with Keys in DITA (on page 2498)
- Working with the Conref Push Mechanism (on page 2522)
- DITA Reusable Components View (on page 2530)

### Creating a DITA Content Reference

**DITA Content Reference**

A DITA content reference, or `conref`, is one of the main content reuse features of DITA (on page 2502). It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.
Assigning an ID to the Referenced Content

To add an id to a DITA element in a topic, place the cursor on the element and select Edit Attributes from the contextual menu (or simply press Alt+Enter) to open the in-place attribute editor (on page 520). Enter id as the Name of the attribute and a value of your choice in the Value field. You can also use the Attributes view (on page 518) to enter a value in the id attribute.

Note: The element may already have an id, since in some cases, Oxygen XML Editor automatically generates an ID value when the id attribute is created.

Creating a Content Reference

To create a content reference (conref), follow these steps:

1. Make sure the element you want to reference has an ID assigned to it (on page 2508).
2. In Author mode (on page 275), place the cursor at the location where you want the reused content to be inserted.
3. Select the Reuse Content action on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 2513) is displayed.
4. In the Location field of the Reuse Content dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the Target ID of the element (or elements) to have their content inserted, and verify the content in the Preview pane. The id value of the element that you select is automatically added to the Reference to (conref) field.
6. Make any other selections you need in the Reuse Content dialog box (on page 2513). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the id value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 124) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (conref) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the Paste as Content Reference action from the Paste Special submenu from the contextual menu.
Other Ways to Reuse Content

- You can use the **Components** tab in the **DITA Reusable Components** view (on page 2535) to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Editor **Create Reusable Component** (on page 2525) and **Insert Reusable Component** (on page 2526) actions (available in the **DITA** menu and the **Reuse** submenu of the contextual menu). They handle the details of creating an *ID* and *conref* and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.
- You can also insert reusable content using content key references (on page 2509). This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways of reusing content, such as code references (on page 2522), the conref push mechanism (on page 2522), variable text (on page 2526), key scopes (on page 2528), and branch filtering (on page 2529).

- Working with Reusable Components (on page 2524)
- Accessing Referenced Content (on page 2507)

Creating a DITA Content Key Reference

**DITA Content Key Reference**

A DITA content key reference, or [@conkeyref](#), is a mechanism for inserting a piece of content from one topic into another. It is a version of the **DITA content reference mechanism** (on page 2507) that uses **keys** (on page 2498) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a *conref*, a *conkeyref* requires that the element to be reused has an *id* attribute. It also requires the topic that contains the reusable content to be assigned a *key* (on page 2498) in a map. As with all uses of keys, you can substitute multiple maps or **use profiling** (on page 2589) to create multiple definitions of keys in a single map. This allows the same [@conkeyref](#) to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

**Creating a Content Key Reference**

To create a content key reference (@conkeyref), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the **DITA map** and the element you want to reference has an *ID* assigned to it.
2. In **Author mode (on page 275)**, place the cursor at the location where you want the reused content to be inserted.

3. Select 🔄 **Reuse Content** on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The **Reuse Content** dialog box ([on page 2513](#)) is displayed.

4. Select the **Key** radio button for the content source and use the 🎉 **Choose Key Reference** button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the **Key** field). The elements that you can reference from the source are presented in the table in the middle of the **Reuse Content** dialog box.

5. Select the **Target ID** of the element (or elements) that you want to insert, and verify the content in the **Preview** pane. The @id value of the element that you select is automatically added to the Reference to (conkeyref) field.

6. Make any other selections you need in the **Reuse Content** dialog box ([on page 2517](#)). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the @id value of the last element in your selection.

7. Click **Insert** or **Insert and close** to create the content reference.

**Note:** If you are using **Text mode (on page 274)**, when you insert a @conkeyref attribute, after you enter the first quote (conkeyref=”), the **Content Completion Assistant** will list all the defined keys that you can select from. Also, after you select the key, the **Content Completion Assistant** will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

**Using Copy/Paste Actions to Create a Content Key Reference**

Oxygen XML Editor also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from **DITA maps**.

The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a **DITA map**. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop option (on page 124)** is selected in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (@conkeyref) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager view (on page 2381)**, make sure that the **Root map combo box (on page 2384)** points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager (on page 2381)**, select **Edit Properties**, and enter a value in the **Keys** field.
3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.
5. Select the **Paste as Content Key Reference** action from the 🎁 **Paste Special** submenu from the contextual menu.
Other Ways to Reuse Content

- You can use the **Components tab** in the **DITA Reusable Components view** (on page 2535) to easily insert content key references.
- You can also insert reusable content using content references (**conref**) (on page 2507).
- Other topics in this section include information about more specialized or advanced ways of reusing content, such as code references (on page 2522), the conref push mechanism (on page 2522), variable text (on page 2526), key scopes (on page 2528), and branch filtering (on page 2529).

Related Information:

- Reuse Content Dialog Box (on page 2513)
- DITA Reusable Components View (on page 2530)
- Creating a DITA Content Reference (on page 2507)
- Editing DITA Content References (on page 2511)
- Working with Reusable Components (on page 2524)
- Accessing Referenced Content (on page 2507)

Editing DITA Content References

Oxygen XML Editor also includes some actions that allow you to quickly edit existing content references. When the element that contains a content reference (@conref or @conkeyref) is selected, the following actions are available in the **DITA** menu and the **Reuse** submenu of the contextual menu:

**Edit Content Reference**

This action is available for elements with a @conref or @conkeyref attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref / @conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2513).

**Replace Reference with Content**

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (**hrels**), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a –dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Converting Conrefs to Conkeyrefs**

Oxygen XML Editor includes a DITA refactoring operation called **Convert conrefs to conkeyrefs** that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the Convert conrefs to conkeyrefs operation, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 2381)), go to the Refactoring submenu, and choose Convert conrefs to conkeyrefs.

**Multiple Documents At Once Method**

Select XML Refactoring from the Tools menu (or from the Refactoring submenu when you right-click a document in the Project view (on page 316) or the DITA Maps Manager view (on page 2381)). Then select Convert conrefs to conkeyrefs from the DITA section and click Next.

Either method will proceed to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 2512), the wizard page allows you to choose a scope for the operation and some filtering options.
• **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

• **Filters** section
  ◦ **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  ◦ **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  ◦ **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

If you used the **Single Document Method (on page 2512)**, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

⚠️ **Warning:** It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, the operation will be processed and all content references will be converted to content key references (either all content references in the current document or all content references in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the **DITA Map (on page 2643)**, so you still need to manually define each key in your **DITA map (on page 2411)**.

**Related Information:**

- Creating a DITA Content Reference (on page 2507)
- Creating a DITA Content Key Reference (on page 2509)
- Defining Keys in DITA Maps (on page 2411)

**Reuse Content Dialog Box**

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `@conref`, `@conkeyref`, and `@keyref` attributes can be used to insert references to reusable content. The `@conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `@conkeyref` attribute uses **keys (on page 2498)** to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `@keyref` attribute also uses **keys**
and can be used to indirectly reference metadata that may have different values in various circumstances.

**Note:** For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `@id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `@conref` and `@conkeyref` attributes, go to [https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html](https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html).

**Note:** For the purposes of using a `@keyref`, keys are defined at map level and referenced afterwards. For more information about the DITA `@keyref` attribute, go to [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html).

Oxygen XML Editor displays the referenced content (on page 489) of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA-OT transformation needs an XML Catalog (on page 2649) to map the URIs to local paths, you need to add the catalog in Oxygen XML Editor (on page 690). If the URIs can be resolved, the referenced content is displayed in Author mode and in the transformation output.

In Author mode, a reference to reusable content (`@conref`, `@conkeyref`, or `@keyref`) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Click the **Reuse Content** action on the main toolbar.
- In the contextual menu of the editing area, go to **Reuse > Reuse Content**.
- Go to **DITA > Reuse Content**.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor will insert a `@conref`, `@conkeyref`, or `@keyref`.

If you select **Location** for the content source, a **content reference** (`@conref`) will be inserted. If you select **Key** for the content source, keys will be used to insert a **content key reference** (`@conkeyref`) or a **key reference** (`@keyref`).
Content Reference (@conref) Options Using the Reuse Content Dialog Box

Choose the content source Section

When Location is selected for the content source, a content reference (@conref) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.
Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor automatically fills this text field with the value of the @conref attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the @id value of the last element in your selection. This value will be inserted as a @conrefend attribute, defining the end of the conref range.
Content Key Reference (\@conkeyref) Options Using the Reuse Content Dialog Box

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2648) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 2530) for similar purposes.
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2396).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2643) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

To insert a **content key reference** (@conkeyref), select the key that contains the content you want to reference. Notice that the file path is shown in the Href column. Keys that do not have a value in the Href column are for referencing metadata with a @keyref attribute. Therefore, to insert a @conkeyref, you need to select a key that does have a value (file path) in the Href column.

After you select a key, click **OK** to return to the Reuse Content dialog box.

When a key that is defined as a **content key reference** has been selected, the Reuse Content dialog box offers the following additional options for inserting a @conkeyref:

**Select an element from the content source Section**

**Show elements of type**

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**
You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

**Preview Pane**

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

**Source Pane**

Displays the source code of the element to be referenced.

**Reference details Section**

**Reference type**

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that *conkeyref* value is automatically selected.

**Reference to**

Oxygen XML Editor automatically fills this text field with the value of the *conkeyref* attribute to be inserted. However, you can edit this value if need be.

**Fallback to (conref)**

You can select this option to define a *conref* attribute to be used as a fallback to determine the content reference relationship if the specified *conkeyref* cannot be resolved.

**Reference to range end (conrefend)**

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor automatically fills this text field with the *id* value of the last element in your selection. This value will be inserted as a *conrefend* attribute, defining the end of the *conkeyref* range.
Key Reference to Metadata (@keyref) Options Using the Reuse Content Dialog Box

Figure 712. Insert Key Reference Options

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2648) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 2530) for similar purposes.

Figure 713. Choose Key Dialog Box
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 2396).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2643) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

To insert a **key reference** to metadata ( @keyref ), select the key you want to reference. Keys that do not have a value in the Href column are for referencing metadata with a @keyref attribute. Therefore, to insert a @keyref, you need to select a key that does not have a value (file path) in the Href column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a @keyref:

* **Select an element from the content source Section**
  
  This section is not used when referencing metadata.

* **Reference details Section**
  
  **Reference type**
  
  The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that keyref value is automatically selected.

  **Reference to**
  
  Oxygen XML Editor automatically fills this text field with the value of the @keyref attribute to be inserted.

  **Element name**
  
  Oxygen XML Editor automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

**Finalizing Your Content Reference Configuration**

Once you click **Insert** or **Insert and close**, the configured content reference is inserted into your document.
Tip: You can easily insert multiple content references by keeping the Reuse Content dialog box opened, using the Insert button.

Working with Code References

Code References

The DITA `<coderef>` element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the `<coderef>` is processed, the referenced code file is imported and delimiting characters (such as `<` or `&`) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.

Example of using a Coderef

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (`conref push`).

The `conref push` mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements `before or after` a named element, or `replaces` the named element. Assuming the source topic is included in the DITA map (on page 2643), the `conref push` will be processed during publishing stage for the DITA map.
Example of a Conref Push Scenario

An example of a scenario where a conref push would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a conref push technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor includes an action that allows you to easily reference content with a conref push mechanism. The Push Current Element action is available in the DITA menu and in the Reuse subfolder of the contextual menu when editing in Author mode. Selecting this action opens the Push current element dialog box that allows you to select a target resource and element, and where to insert the current element content.

This dialog box allows you to configure the following options for the conref push action:

Choose the target resource

Allows you to select a Location URL or a Key for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

Select the target element

The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

Push action

Allows you to choose one of the following options for where you want to insert the current element content:
replace the target element

The target element will be replaced with the current element content.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushreplace` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

push before

The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

push after

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

You can also use the Preview panel to view the content that will be pushed and the Source panel to see the XML code for the content to be pushed. After you click OK, the `conref push` mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the DITA map.

Related Information:

For more technical details about the conref push mechanism, refer to "The Conref Push Technique" section of The DITA Style Guide Best Practices for Authors.

Working with Reusable Components

In DITA, the content of almost any element can be made reusable simply by adding an `@id` attribute to the element. The DITA content reference mechanism can reuse any element with an `ID`. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.
Oxygen XML Editor allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the **Create Reusable Component** and **Insert Reusable Component** actions.

**Related Information:**
- [DITA Reusable Components View (on page 2530)](#)

## Creating a Reusable Content Component

Oxygen XML Editor makes it easy to create reusable content components from existing topic content.

**Note:** To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Editor creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In **Author** mode, select the content you want to make into a reusable component.

2. Select the **Create Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
   
The **Create Reusable Component** dialog box is displayed.

3. Use the **Reuse Content** drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.

4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.

5. If you want to replace the extracted content with a reference to the new component you should leave the **Replace selection with content reference** option selected. This is recommended, since the point of reuse is to maintain only one copy of the content.

6. Select a file name and location to save the topic containing the reusable component and click **Save**. It is considered best practice to save or store reusable components in an area set aside for that purpose.

   If the **Replace selection with content reference** option was selected, Oxygen XML Editor replaces the current content with a @conref attribute. The content of the content reference will be displayed in your current topic with a gray background, but it will no longer be editable since it is stored in a separate file.

   To edit the source of the reusable component, click the **Edit Content** icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu. You can
also reference this new reusable component by using a content reference (on page 2507) or content key reference (on page 2509).

Inserting a Reusable Content Component

Oxygen XML Editor includes an Insert Reusable Content action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (on page 2525).

⚠️ CAUTION: This action is only designed to insert reusable components created using the Oxygen XML Editor Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The Insert Reusable Content action creates a DITA @conref to insert the content, and creates a parent element for the @conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the @conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
2. Select the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Insert Reusable Component dialog box is displayed.
3. Locate the reusable content file that you want to insert its content.
4. If you select Content reference in the Insert as drop-down list, the action will add a @conref attribute to the DITA element at the current location. If you select Copy in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
5. Click Insert to perform the action.

Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

The quick-heat feature allows [product-name] to come up to temperature quickly.
You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the \texttt{@product} profiling attribute, as in the following example:

\begin{verbatim}
<p>The quick-heat feature allows
    <ph product="basic">Basic Widget</ph>
    <ph product="pro">Pro Widget</ph>
to come up to temperature quickly.</p>
\end{verbatim}

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

\begin{verbatim}
<p>The quick-heat feature allows <ph keyref="product"/>
to come up to temperature quickly.</p>
\end{verbatim}

The definition of the key reference determines the name of the product:

\begin{verbatim}
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
<keydef keys="product" product="pro">
  <topicmeta>
    <keywords>
      <keyword>Pro Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
\end{verbatim}

When the content is published, the value defined in the \texttt{product} key will be inserted for each product.

**Inserting a Keyref**

To insert a defined key reference (on page 2411) into a document in Oxygen XML Editor \textbf{Author} mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Editor feature you prefer):

- \textbf{DITA Reusable Components View Method}

  Use the DITA Reusable Components view (on page 2530) to insert a variable reference to the defined key (on page 2411). For example, in the Keys tab, find a key defined as a variable and double-click it. Oxygen XML Editor will insert the variable as a \texttt{ph} element with a \texttt{@keyref} attribute that references the specified key.
• **Code Template Method**

Add the source code pattern of the defined key (on page 2411) to a code template (on page 154) so that it appears in the list of proposals in the Content Completion Assistant (on page 2642). For example, the code pattern could be something like `<ph keyref="product">` for defined product key.

• **Reuse Content Dialog Box Method**

Use the Reuse Content action on the main toolbar to open the Reuse Content dialog box (on page 2513). Use the Key option to select a key that is defined as a variable (key reference to metadata) (on page 2520) and Oxygen XML Editor will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Manual Method**

Manually insert the `@keyref` attribute using the attributes editor as follows:

1. Press Enter and select a DITA element (for example, `<ph>`) that supports the `@keyref` attribute.
2. Select Edit Attributes from the contextual menu (or simply press Alt+Enter) to bring up the attributes editor (on page 520).
3. In the Name field, select keyref.
4. In the Value field, select or enter the name of the defined key (on page 2411).

---

**Working with DITA 1.3 Key Scopes**

DITA 1.3 includes the possibility of using a concept called Key Scopes (or scoped keys). It allows you to reuse a topic in multiple places within the same DITA map (on page 2643), but with slightly different content in each instance.

**Key Scopes Use-Case**

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 Key Scopes mechanism, you can define multiple values for the same key depending on the context.

**How to Use Key Scopes in Oxygen XML Editor**

To use DITA 1.3 key scopes in Oxygen XML Editor, follow these steps:

1. Define the keys (on page 2498) to be used in multiple places within your DITA map.
2. For each particular topic that contains the keys, define the key scopes:
a. Right-click the topic in the DITA Maps Manager (on page 2381) and select Edit properties.
b. In the Keys tab (on page 2415), enter a value (or multiple values) in the Key scopes field.
c. Click OK to save your changes.

3. Save the DITA map.

Result: In the DITA Maps Manager (on page 2381), you can now see the key scopes in brackets and when you open each topic reference.

The content will also be expanded in Author mode according to the context of the key scope you defined for that particular topic. Also, when you transform the DITA map, the scoped keys will be reflected in the published content.

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the DITA 1.3 Key Scopes - Next Generation of Reuse blog post.
- You can also watch our DITA 1.3 video tutorial to see how key scopes can be used in Oxygen XML Editor.

Related Information:

- Working with DITA 1.3 Branch Filtering (on page 2529)
- Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse
- Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called Branch Filtering that enables you to set filtering conditions for specific branches of a DITA map (on page 2643). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 Branch Filtering mechanism, you can reuse content multiple times within the same map, each time using different filters.
How to Use Branch Filtering in Oxygen XML Editor
To use DITA 1.3 branch filtering in Oxygen XML Editor, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (on page 202).
2. Assuming you have already defined your profiling attributes (on page 555), create a DITAVAL filter file (on page 2610).
3. Insert a reference to the DITAVAL filter file in the DITA map:
   a. Right-click the DITA map reference in the DITA Maps Manager (on page 2381) and select Append Child > DITAVAL Reference.
   b. Select the DITAVAL file.
   c. Click Insert and Close.
4. Save the DITA map.

Result: You can now see the ditaval files referenced in the DITA Maps Manager (on page 2381) and when you transform the DITA map, filtered content will be reflected in the published output.

Figure 716. Branch Filtering in DITA Maps Manager

Resources

• You can find a more detailed example and download samples for reuse possibilities based on key scopes in the DITA 1.3 Branch Filtering: Next Generation of Reuse blog post.
• You can also watch our DITA 1.3 video tutorial to see how branch filtering can be used in Oxygen XML Editor.

DITA Reusable Components View

The DITA Reusable Components view is helpful if you use a large amount of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the root map (on...
The **Keys Tab** collects all the keys that are defined in the current root map and displays them in the Keys tab. This tab has two view modes. The default tiles style view mode and a table style view mode.

**Tiles Mode**

The default tiles mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small width. Each block (card) displays the name of the key (the value of the @keys attribute), followed by its description and/or @href value, followed by the name of the DITA map file where the key is defined.
Table Mode

You can switch to a table style display mode by selecting the Table mode toggle action from the Settings menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in the Description column, while keys that are defined with a value in an `@href` attribute have that href value listed in the Href column.

Both display modes in the Keys tab include a variety of features and options:

Search Filter

You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

Sorting

Tiles Mode: In the default tiles display mode, to sort the keys alphabetically in ascending order, select Sort by key name from the Settings menu.
**Table Mode:** In the *table* display mode, the following columns can be sorted by clicking on the heading:

- **Key** - The name of the key (the value of the `@keys` attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an `@href` attribute have that href value listed in this column.
- **Definition Location** - The name of the *DITA map (on page 2643)* where the key is defined.

**Double-Click Mechanism**

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `@href` value, it is inserted as a *cross reference link (xref) (on page 2541)*.
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a *variable reference (ph) (on page 2526)*.

**Drag and Drop Mechanism**

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an `@href` value, it is inserted as a *cross reference link (xref) (on page 2541)*.
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a *variable reference (ph) (on page 2526)*.

**Contextual Menu Actions**

**Insert as Link**

Inserts a *cross reference link (xref) (on page 2541)* to the selected key at the current cursor position or surrounding the current selection.

**Insert as Variable**

Inserts a *variable reference (ph) (on page 2526)* to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `<image>` element.

**Insert as Keyref**
Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a `@keyref` attribute and its value set to the selected key.

**Rename Key**

Opens a refactoring wizard (on page 708) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

**Notes:**

- This action does not work on DITA 1.3 key scopes.
- This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

**Go to Definition**

Opens the DITA map where the key is defined.

**Search References**

Searches for all references to the selected key in the entire DITA map structure.

**Group by Definition Location (Available in Table mode only)**

A toggle action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

**Settings Menu**

This menu includes the following options:

**Filtering Options**

- **Show all** - Shows all defined keys found in the current root map (on page 2648).
- **Show only variables** - Filters the keys to show only those defined as variable references (on page 2526).
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

**Sort by key name (Available in Tiles mode only)**

Sorts the keys alphabetically in ascending order.

**Table mode**

A toggle action that switches between the table and tiles display modes.
Components Tab

The DITA Reusable Components view collects all the topics from the current root map (on page 2648) that are marked as resource-only, then collects the reusable components from those topics, and displays them in the Components tab. To set a topic as resource-only, the `<topicref>` in the DITA map file needs to have a `@processing-role` attribute set like this:

```xml
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The DITA Reusable Components view considers topic references that contain `processing-role="resource-only"` to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an ID specified. These reusable components are displayed in the Components tab along with the file name and the specific names of the elements that contain an ID attribute.

![Figure 719. DITA Reusable Components View - Components Tab](image)

The Components tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards ( * or ? ), boolean operators ( AND, OR, NOT ), fuzzy searches (~), boosting searches (^), and more.

**Settings Menu**

This menu includes the following options:

**Compact Mode**

You can use this toggle action to switch the display for the Components tab to a compact visualization mode. When switched to Compact mode, fewer details are shown for each component, but more components are displayed in the view.

**Reindex**
You can use this action force a re-indexing of the reusable components.

**Show Elements of Type**

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.

**Source File(s)**

You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as `*` or `?`) in this field.

**Double-Click Mechanism**

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a `content key reference (conkeyref) (on page 2509)`.
- If the parent topic of the selected component does not have a key defined, it is inserted as a `content reference (conref) (on page 2507)`.

**Drag and Drop Mechanism**

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a `content key reference (conkeyref) (on page 2509)`.
- If the parent topic of the selected component does not have a key defined, it is inserted as a `content reference (conref) (on page 2507)`.

**Hover and Click Actions**

If you hover over a component shown in the preview window, you have access to the following link actions:

**Insert**

Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a `content key reference (conkeyref) (on page 2509)`. Otherwise, it is inserted as a `content reference (conref) (on page 2507)`.

**Open**

Opens the source file that contains the reusable component.

**Contextual Menu Actions**
Insert Content Reference

Inserts the component as a content reference (conref) (on page 2507) at the current cursor position or replaces the current selection.

Insert Content Key Reference

Inserts the component as a content key reference (conkeyref) (on page 2509) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

Go to Definition

Opens the source file that contains the reusable component.

Search References

Searches for all references to the selected component in the entire DITA map (on page 2643) structure.

Media Tab

The Media tab displays all media resources (images, audio, video) referenced as keys in the current root map along with all audio, image, and video resources found in user-defined working sets (on page 2538).

Figure 720. DITA Reusable Components View - Media Tab

The Media tab includes the following features and options:

Search Filter

You can enter text in the filter field at the top of this tab to filter the list and search for specific media resource key or file names in the list of available resources.

Resource Type Filter
You can quickly show resources of a specific type by clicking one of the type buttons (Images, Audio, Video, Others).

**Settings Menu**

This menu includes the following options:

- **Configure working sets**
  Use this option to define folders where the media resources will be gathered. The Media tab will include audio, image, and video resources collected from the current root map as well as media resources located in the folders defined as active working sets. The working sets are defined at project level so that they can be shared with others.

- **Reload**
  Refreshes the list of displayed media resources. This is useful if resources were recently added in the searched folders.

**Double-Click Mechanism**

You can double-click any media resource in the list to add a reference to it.

**Drag and Drop Mechanism**

You can drag a media resource from the list and drop it in the main editor to add a reference to it.

**Contextual Menu Actions**

- **Insert As Image Reference**
  Inserts an image reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

- **Insert As Audio Reference**
  Inserts an audio reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

- **Insert As Video Reference**
  Inserts a video reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

- **Insert As Embedded Reference**
  Inserts as an embedded reference. If the resource is referenced using a key in the DITA map, an indirect reference using the defined key will be used. Otherwise, the reference will point directly to the resource location.

- **Insert as Link**
Inserts a link to the resource, either as a DITA `<xref>` or `<link>`, depending on the cursor position.

**Insert as Variable**

Inserts a variable reference *(ph) (on page 2526)* to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `<image>` element.

**Insert as Keyref**

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a `@keyref` attribute and its value set to the selected key.

**Preview**

Shows the selection in an Image Preview side view.

**Open in System Application**

Opens the default system editor/viewer associated with the resource type.

**Show in Explorer/Finder**

Opens the default file browser at the specific folder where the resource is located.

Items in the Media tab are presented in the following order:

- Key definitions are always presented first, in document order.
- Resources defined and collected from working sets are sorted alphabetically by name, for each folder separately.

Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor provides support for all forms of linking in DITA.

Linking Between Parent, Child, and Sibling Topics

A DITA map (on page 2643) creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA collection-type attribute (on page 2416).

In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the <xref> element. The destination of the link can be expressed directly using the @href attribute or indirectly using the @keyref attribute. If you use the @keyref attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

Linking Between Related Topics

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the Related Links section of a topic and relationship tables in maps. To add related links, select Related Link to Topic, Related Link to File, or Related Link to Web Page from the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or DITA menu).

Tip: You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The DITA Maps Manager (on page 2381) provides a way to validate all the links
in the documents that are included in the map (on page 2421). This can include validating all the profiling conditions that are applied.

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a DITA map (on page 2643), you set the appropriate value of the @collection-type attribute on the map. See the DITA documentation for the meaning of each of the values of the @collection-type attribute.

Note: Publishing scripts determine when and how to create hierarchical links. The @collection-type attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the @linking attribute.

To add the @collection-type to an item in a map:

1. Right-click the topic and choose Edit Properties. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the @linking attribute.

Linking in DITA Topics

Direct Links

Inline links can be created DITA topics using the <xref> element. The destination of the link can be expressed directly by using the @href attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the <related-links> element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys (on page 2498) to create either inline links or related links (with the @keyref attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps (on page 2411).
- Key Reference - Created in an <xref> element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the <topicref> element that points to a topic. This allows you to assign a particular
key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

**Inserting a Link in Oxygen XML Editor**

To insert a link in **Author mode (on page 275)**, use the actions available in the Link drop-down menu from the toolbar (or the Link submenu in the contextual menu or **DITA** menu). You can choose between the following types of inline links:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 2543) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure.

Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `<xref>` - Used to link to other topics or another location within the same topic and points to the target using the `@href` or `@keyref` attribute.
- `<fragref>` - A logical reference to a fragment element within a syntax diagram and points to the target using the `@href` or `@keyref` attribute.

**File Reference**

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure.

It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select Location for the target, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key button to use the Choose Key dialog box (on page 2544).

**Web Link**

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure.

It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select URL for the target resource, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key button to use the Choose Key dialog box (on page 2544).

**Related Link to Topic**

Opens the Cross Reference (xref) dialog box (on page 2543) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can
be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element.

Tip: You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select Location for the target, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2544).

Related Link to Web Page

Opens the Web Link dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select URL for the target resource, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2544).

Cross Reference (xref) Dialog Box

The Cross Reference (xref) dialog box is displayed when you insert a Cross Reference or Related Link to Topic (from the Link drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.
This dialog box includes the following sections and fields:

**Choose the Target Resource Section**

**Location**

If you select **Location** for the target, the link is expressed in an `@href` attribute.

**Key**

If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can use the `Choose Key Reference` button to open the `Choose Key` dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2648) (you can also select one from the drop-down list in the **Key** field).

**Tip:** You can also use the DITA Reusable Components view (on page 2530) for similar purposes.
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to **select a root map (on page 2396)**.
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the **DITA map (on page 2643)** where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

**Select the Target Element Section**

This section can be used to target a specific element inside the target resource.

**Show elements of type**

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.
Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference.

Preview Pane

Displays the content that will be references.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click Insert or Insert and close, the configured cross reference is inserted into your document.

Tip: You can easily insert multiple cross references by keeping the dialog box opened, using the Insert button.

Using Copy/Paste or Drag/Drop Actions to Insert a Cross Reference

Oxygen XML Editor also includes support for inserting cross reference links with simple copy/paste or drag/drop actions (additionally, you can insert them using the Paste as Link or Paste as Link (keyref) actions found in the Paste Special submenu from the contextual menu). The copied/dragged content must be an entire DITA XML element with an @id attribute or a <topicref>. Also, the location in the document where you paste or drop the link must be valid, although as long as the Smart paste and drag and drop option (on page 124) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

When the link is inserted, Oxygen XML Editor automatically tries to populate certain attributes based on detected values. The @format, @scope, and @type attributes are populated if their corresponding options are selected in the Insert Link section of the DITA preferences page (on page 204). Even if their corresponding options are not selected, the @format and @scope attributes are populated if their detected values are different than the default values.

Note: For the sake of performance, the @type attribute is never automatically computed in the following cases:

- Drag/drop or copy/paste actions from the DITA Maps Manager view (on page 2381) or from the Keys tab of the DITA Reusable Components view (on page 2530).
- Paste as Link or Paste as Link (keyref) from the DITA Maps Manager view (on page 2381) with <topicref> elements that do not have the @type attribute defined.

Typically, cross reference links are inserted with an @href attribute, but it is also possible to insert them with a @keyref attribute using the Paste as Link (keyref) contextual menu action or copy/paste or drag/drop actions. For the latter method, follow these steps:

1. In the DITA Maps Manager view (on page 2381), make sure that the Root map combo box (on page 2384) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 2381), select Edit Properties, and enter a value in the Keys field.

3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a <topicref> from a DITA map.

4. Place the cursor at a location, where you want to insert the link.

5. Select the Paste as Link (keyref) action from the Paste Special submenu from the contextual menu.

• Defining Keys in DITA Maps (on page 2411)
• DITA Reusable Components View (on page 2530)

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:

1. If the map is currently open in the DITA Maps Manager (on page 2381), double-click the map icon (Ξ) to open the map in Author mode. If it opens in Text mode, click Author at the bottom left to switch to Author mode.

2. Move the insertion point inside the map root element (usually <map>, but it might be <bookmap>, or another specialization of the <map> element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the map root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the map root element.

3. Select the Insert Relationship Table action on the toolbar or from the Relationship Table submenu of the contextual menu. The Insert Relationship Table dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click Insert.
5. Enter the type of the topics in the header of each column.
   The header of the table (the `<relheader>` element) already contains a `<relcolspec>` element for each table column. You should set the value of the `@type` attribute of each `<relcolspec>` element to a value such as `concept`, `task`, or `reference`. When you click in the header cell of a column (that is a `<relcolspec>` element), you can see all the attributes of that `<relcolspec>` element, including the `@type` attribute in the Attributes view (on page 518). You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select Insert Reference (on page 2438) from the contextual menu or the DITA Map toolbar.

7. To add a new row to the table or remove an existing row use Insert Relationship Row or Delete Relationship Row from the contextual menu or the DITA Map toolbar.

8. To add a new column to the table or remove an existing column, use Insert Relationship Column or Delete Relationship Column contextual menu or the DITA Map toolbar. If you double-click the relationship table (or select it and press Enter, or choose Open from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.

9. To add topic references to your relationship table, drag and drop topics from the DITA Maps Manager (on page 2381) or the Project (on page 316) view into the appropriate cell in the relationship table. See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the Relationship Table submenu of the contextual menu) or by editing the underlying XML in Text mode.

10. Save the DITA map.

   Relationship tables are also displayed in the DITA Maps Manager view (on page 2381), along with the other elements in its DITA map.

   **Figure 723. Relationship Table**

   ![Relationship Table](image)

   You can open the DITA map to edit the relationship table by doing one of the following:
   - Double-click the appropriate relationship table in the DITA Maps Manager (on page 2381).
   - Select the relationship table in the DITA Maps Manager (on page 2381) and press Enter.
   - Select Open from the contextual menu of the relationship table in the DITA Maps Manager (on page 2381).
Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (on page 2643) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Editor publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA-OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Editor using a transformation scenario or you can run it directly from a command line: http://www.dita-ot.org/dev/topics/building-output.html.

The DITA-OT that comes bundled with Oxygen XML Editor contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output.

You can download and install extra publishing plugins either from the DITA Open Toolkit registry or from the list of free plugins (on page 2620) on the Oxygen XML Editor GitHub account.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (on page 2643) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor also includes a special Run DITA-OT Integrator (on page 1206) that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1290).

A variety of transformations scenarios are available for DITA maps (on page 2643):

- Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- Run DITA-OT Integrator (on page 1206) - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2616). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- DITA Map Metrics Report - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Processing instructions.
  - External links.
  - All @outputclass attribute values gathered from the DITA project.
**Important:** If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

Related Information:
- Editing a Transformation Scenario (on page 1287)

## DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 1300) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1373).

### WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 2643) as WebHelp Responsive output, follow these steps:

1. Select the [Configure Transformation Scenario(s)](on page 2381) action from the DITA Maps Manager (on page 2381) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

**Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:
- **Templates Tab** (on page 2566) - This tab contains a set of built-in publishing templates (on page 1341) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1373).
- **Parameters Tab** (on page 2572) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Feedback Tab** (on page 2573) - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** (on page 2573) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** (on page 2574) - This tab allows you to specify some advanced options for the transformation scenario.
• **Output Tab (on page 2576)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

**Result:** When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

**General Parameters for Customizing WebHelp Responsive Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

**default.language**

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

**clean.output**

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

**editlink.remote ditamap.url**

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

**editlink.web.author.url**

This parameter needs to be used in conjunction with `editlink.remote ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

**editlink.present only.path.to.topic**

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.remote ditamap.url` and `editlink.web.author.url` parameters are ignored.

**fix.external.refs.com.oxygenxml** (Only supported when the DITA-OT transformation process is started from Oxygen XML Editor)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).
**force.unique**

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a `favicon` in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the `Kuromoji` morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the `Search` tab (default setting is `true`).

**webhelp.show.changes.and.comments**

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.
webhelp.sitemap.base.url

Base URL for all the <loc> elements in the generated sitemap.xml file. The value of a <loc> element is computed as the relative file path from the @href attribute of a <topicref> element from the DITA map, appended to this base URL value. The <loc> element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

webhelp.sitemap.change.frequency

The value of the <changefreq> element in the generated sitemap.xml file. The <changefreq> element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the <changefreq> element is not added in sitemap.xml. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

webhelp.sitemap.priority

The value of the <priority> element in the generated sitemap.xml file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The <priority> element is optional in sitemap.xml. If you leave this parameter set to its default empty value, then the <priority> element is not added in sitemap.xml.

Parameters Specific to Oxygen WebHelp Responsive

webhelp.fragment.feedback

You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

webhelp.default.collection.type.sequence

Specifies if the sequence value will be used by default when the @collection-type attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

webhelp.enable.search.autocomplete

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title
In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.after.top_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.logo_and_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.before.top_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.footer**
In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Important: This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor (do not use it with a trial license).

**webhelp.fragment.head**

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if, for, is).

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.
webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each <section> within the current topic that contains an @id attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for chunked topics. The default value is yes.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- chapter (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor’s siblings), and the parent chapter.
- topic - The TOC will only include links for the current topic and its direct children.
- all - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a <shortdesc> element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- left (default)
- right
webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Editor includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Editor also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

• Oxygen PDF Chemistry - A built-in processor that is bundled with Oxygen XML Editor. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.
• Prince Print with CSS (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
• Antenna House Formatter (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

How to Create the Transformation Scenario

To create a DITA Map PDF - based on HTML5 & CSS transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2381) toolbar.
2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 2566)** - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.
- **Parameters Tab (on page 2572)** - This tab includes numerous parameters that can be set to customize the transformation.
- **Filters Tab (on page 2573)** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 2574)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 2576)** - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

   - **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the **dita.css.list** parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
   - **css.processor.type** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
   - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the **CSS-based Processors preferences page (on page 197)**.
   - **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
   - **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
   - **show.changes.and.comments** - When set to **yes**, user comments, replies to comments, and **tracked changes** are published in the PDF output. The default value is **no**.
   - **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

**Customizing the Output**

For information about customizing the output, see **CSS-based DITA to PDF Customization (on page 1476)**.
DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a DITA Map PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - **show.changes.and.comments** - If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
   - **customization.dir** - Specifies the path to a customization directory.
   - **editlink.remote.ditamap.url** - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click OK and then the Apply Associated button to run the transformation scenario.

DITA Map MS Office Word Transformation

Oxygen XML Editor comes bundled with a transformation scenario that allows you to convert DITA maps to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named Normal.docx (located in: \[OXYGEN_INSTALL_DIR\]/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources) that is used by the transformation scenario as a template to generate the final Word document.

Tip: You can make general modifications to the Normal.docx template file to alter the published output.
Configuring the Transformation Scenario

To configure a DITA Map to MS Office Word transformation scenario, follow these steps:

1. Open the DITA map in the DITA Maps Manager (on page 2381).
2. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 2381) toolbar.
3. Select DITA Map MS Office Word.
4. For advanced customizations, in the Parameters tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the Normal.docx file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
   - `footnotes.xsl` - Specifies the path to a footnote stylesheet.
   - `document.xml.xsl` - Specifies the path to a document relations metadata stylesheet.
   - `inkscape.exec` - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click OK and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

Related Information:
- Editing a Transformation Scenario (on page 1287)
- Configure Transformation Scenario(s) Dialog Box (on page 1290)
- Migrating MS Office Documents to DITA (on page 2635)

DITA Map CHM (Compiled HTML Help) Transformation

To perform a Compiled HTML Help (CHM) transformation, Oxygen XML Editor needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Editor automatically detects if HTML Help Workshop is installed and uses it.

Note: HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.
Changing the Output Encoding

Oxygen XML Editor uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the *DITA Map CHM* transformation scenario that comes bundled with Oxygen XML Editor has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the ☑ Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the toolbar or the Document > Transformation menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:** The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (e.g., `en` for example) and `CC` represents the country code (e.g., `US` for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
  1. Create the custom CSS.
  2. Select the DITA Map CHM transformation scenario and click the Edit button.
  3. In the Parameter tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to yes to instruct the transformation to copy the custom CSS to the output folder.
  4. Run the transformation.

- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT3.x/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
  - `map2hhclmpl.xsl` - This file is used to compile the table of contents.
  - `map2hphpimpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the HTML Help Workshop when creating the output.

DITA Map Kindle Transformation

Oxygen XML Editor requires *KindleGen* to generate Kindle output from *DITA maps (on page 2643)*. To install *KindleGen* for use by Oxygen XML Editor, follow these steps:
1. Go to [www.amazon.com/kindleformat/kindlegen](http://www.amazon.com/kindleformat/kindlegen) and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor and open a DITA map in the [DITA Maps Manager](on page 2381) view.
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and click the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.

Run DITA-OT Integrator Transformation

Oxygen XML Editor comes bundled with a transformation scenario designed to integrate DITA-OT plugins ([on page 2646]). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box ([on page 1290]).

⚠️ Attention: The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page ([on page 201]).

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:

1. If Oxygen XML Editor was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) ([on page 1290]) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view ([on page 1296])).
3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.
4. Apply the scenario ([on page 1289]).
5. Check the Results panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Editor with your normal permissions.

DITA Topic Transformation Scenarios

Oxygen XML Editor includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (on page 1290).

The available transformation scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.

- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.

- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Editor also supports some third-party processors.

  For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. Another advantage of this transformation scenario is that you can use the same customization CSS (on page 1504) or publishing template (on page 1486) that you use for converting entire DITA maps.

  The transformation scenario automatically detects the currently selected context DITA map (root map) (on page 2384) so that keys and references are properly resolved (the detected context map is set as the value of the args.root.map parameter (this can be changed in the Parameters tab). It also automatically detects the currently applied profiling condition set (on page 2597) to be used as the default filtering option in the transformation scenario (this can be changed in the Filters tab).

  The transformation scenario also supports a parameter named args.enable.root.map.key.processing that can be used to specify whether or not the values for @keyref and @conkeyref attributes within the transformed topics are resolved. The possible values are:

  - no - This means that the values for all @keyref and @conkeyref attributes are ignored in the transformation. This results in lower processing times.
  - yes - This means that the values for any @keyref and @conkeyref attributes found in the transformed topic are processed and resolved using the value of the args.root.map parameter.
  - auto - This means that the process will search for any @keyref and @conkeyref attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the args.root.map parameter. If none are found, the @keyref and @conkeyref attributes are ignored.

- **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an xsl:fo processor.

Related Information:

- Editing a Transformation Scenario (on page 1287)
- Configure Transformation Scenario(s) Dialog Box (on page 1290)
- Applying Associated Transformation Scenarios (on page 1289)
Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button on the DITA Maps Manager toolbar (on page 2382). The **Configure Transformation Scenario(s)** dialog box (on page 1290) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.

2. Select the transformation scenario you want to run and click **Apply Associated**. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor while the transformation is running. If there are errors or warnings, Oxygen XML Editor displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor opens the output in the appropriate application.

3. To rerun the same scenario again, click the **Apply Transformation Scenario(s)** button.

Creating or Editing a DITA-OT Transformation

Creating a DITA-OT Transformation Scenario

To create a DITA-OT Transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (Ctrl + Shift + C (Command + Shift + C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu. Then click the **New** button and select DITA-OT Transformation.

- Go to Window > Show View and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select DITA-OT Transformation.

Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.
Figure 724. DITA Transformation Type Dialog Box

Select the desired type of output and click OK. This opens the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario and the following Storage options:

- **Project Options** *(on page 2647)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(on page 2644)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Editing a DITA-OT Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the DITA Maps Manager toolbar, main toolbar, or the Document > Transformation menu.
   - **Step Result:** The **Configure Transformation Scenario(s)** dialog box *(on page 1290)* is opened.
2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.
Note: Since transformation scenarios that are associated with built-in frameworks (on page 2643) are read-only, these scenarios will prompt you to use the Duplicate button and then edit the duplicated scenario (on page 1289).

Result: This will open an Edit scenario configuration dialog box (on page 1287) that contains several tabs that allow you to configure the options that control the transformation.

- DITA Open Toolkit Documentation

Templates Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1214) or edit an existing one (on page 1287), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1341). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 725. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your
default browser providing a sample of how the main page will look when that particular template is used to generate the output.

**Built-in Templates Locations**

Oxygen XML Editor scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.  
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

**Custom Templates Locations**

Oxygen XML Editor scans the locations specified in the [DITA > Publishing preferences page](on page 205) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

**Selecting Custom Templates**

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 1375) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the [DITA > Publishing preferences page](on page 205) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

**Save Template As Button**

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1493). Clicking this button will open a template package configuration dialog box (on page 2568) that contains some options and displays the parameters that will be exported to your template package.

**Template Errors**

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

- Some templates could not be loaded. More details

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.
Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template’s image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

**Sharing Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 205) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

[https://www.youtube.com/embed/zNmXfKWXw08](https://www.youtube.com/embed/zNmXfKWXw08)

**Template Package Configuration Dialog Box**

The Save template as button (at the bottom-left of the transformation dialog box for WebHelp Responsive or PDF - based on HTML5 & CSS transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1493). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the Save template as button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the
template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1194) or [DITA Map to PDF - based on HTML5 & CSS](on page 1201)). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For WebHelp Responsive customizations, select this option if you want to copy the default [HTML Page Layout Files](on page 1356) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 1194) or [DITA Map to PDF - based on HTML5 & CSS](on page 1201)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.
Figure 726. Template Package Configuration Dialog Box

FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1214) or edit an existing one (on page 1287), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab is available for DITA-OT transformations with a PDF output type.
This tab allows you to select an FO Processor to be used for the transformation.
Figure 727. FO Processor Configuration Tab

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Editor.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (on page 194).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor installation directory.

**Antenna House**

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the Parameters tab (on page 2572).

3. Add the env.AXF_OPT parameter and point to the Antenna House configuration file.

Related Information:

- FO Processors Preferences (on page 194)
- XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 1270)

Parameters Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1214) or edit an existing one (on page 1287), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Parameters tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (on page 249) selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the ask editor variable (on page 250) in the Value column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 249) button or the Browse button. You can also use the Open in editor button to open the specified file in the editor panel.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.
Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an Oxygen Publishing Template (on page 1486) descriptor file are displayed in italics. After creating a publishing template (on page 1493) and adding it to the templates gallery (on page 1375), when you select the template in the Templates tab (on page 2566), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:
- DITA Open Toolkit Documentation

Feedback Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1214) or edit an existing one (on page 1287), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Feedback tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the DITA Map WebHelp Responsive transformation type. To add a comments component in the output, you need to use Oxygen Feedback to create a site configuration for the website where your WebHelp output is published and use this Feedback tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the Oxygen Feedback administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the Edit button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an Oxygen Publishing Template (on page 1486), either as an HTML fragment extension point (on page 1350) or as a transformation parameter (on page 1348) (the webhelp.fragment.feedback parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the Feedback tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1214) or edit an existing one (on page 1287), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2643), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 249) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

⚠️ **Attention:** If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2572)), that file takes precedence over a DITAVAL file specified here.

**Use profiling condition set**

Sets the profiling condition set (on page 2597) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

**Advanced Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1214) or edit an existing one (on page 1287), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.
You can specify the following parameters:

**Custom build file**
If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the Parameters tab (on page 2572) is used. You can specify the path by using the text field, the Insert Editor Variables (on page 249) button, or the Browse button.

**Build target**
Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional arguments**
You can specify additional command-line arguments to be passed to the transformation (such as `-verbose`).

**Ant Home**
You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page (on page 198).

**Java Home**
You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.
Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the Java Home text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to -Xmx384m, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError).

Libraries

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 2644) files or additional class paths) to be used by the transformer.

Tip: You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1214) or edit an existing one (on page 1287), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab allows you to configure options that are related to the location where the output is generated.
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the Insert Editor Variables (on page 249) button, or the Browse button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the Insert Editor Variables (on page 249) button, or the Browse button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 249) button, or the Browse button.

>Note: If the DITA map (on page 2643) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).
Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Options > Preferences > Global, and set it in the Default Internet browser field.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.

- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ➔ Insert Editor Variables (on page 249) button, or the ➔ Browse button.

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the Console options (on page 205) preferences page that contains options to control the display of the console output received from the publishing engine.

### Customizing DITA Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- **Most transformations are configurable by passing parameters to the transformation script.** Oxygen XML Editor allows you to set parameters (on page 2572) on a transformation scenario and you can save and share them with others (on page 1295). You can also use the ${ask} editor variable (on page 250) in the Parameters tab to instruct Oxygen XML Editor to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.

- If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file (on page 2580). Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor provides full editing and debugging support from XSLT and CSS stylesheets (on page 1743), which you can use to modify transformation code.

- You can also write your own transformation code (and execute it using a custom build file (on page 2580)) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:
• **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section (on page 1299).

• **PDF** - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (on page 1632).

### Publishing Customizations

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually \OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT3.x) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (on page 2616).

2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Editor at anytime without affecting the publishing system.

3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

### Customizing XHTML-based Output

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you edit an XHTML transformation scenario (on page 2564), there is a parameter called args.css that can be set to point to your custom CSS and a parameter called args.copy.css that as long as it is set to yes, the CSS is copied to the output folder.

You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For more information, see: [http://blog.oxygenxml.com/2013/12/creating-simple-dita-open-toolkit.html](http://blog.oxygenxml.com/2013/12/creating-simple-dita-open-toolkit.html). A list with all DITA-OT XSLT extension points can be found here: [http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html](http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html).

### Customizing WebHelp-based Output

The DITA-OT that comes bundled in Oxygen XML Editor includes specific plugins that provide the ability to publish DITA content to WebHelp Responsive (on page 1300) output.

For information about customizing WebHelp Responsive output, see Customizing the WebHelp Responsive Output (on page 1373).

### Customizing PDF-based Output

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA-OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (on page 1632).
There is also a book called DITA For Print that contains details about how to customize various aspects.

**Customizing PDF Output with CSS**

Oxygen XML Editor also includes a transformation scenario called DITA Map PDF - based on HTML5 & CSS (on page 2557) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (on page 2643) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (on page 1504).

---

**Related Information:**

- DITA Open Toolkit Documentation

---

**Using a Custom Build File**

You can use a Custom Build File to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the ![Configure Transformation Scenario(s)](Configure Transformation Scenario(s) dialog box (on page 1290).
2. Select the transformation scenario and click Edit.
3. Go to the Advanced (on page 2574) tab and change the Custom build file path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA-OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">
<!--The DITA-OT default build file-->
<import file="build.xml"/>
<target name="dist">
<!-- You could run your script here -->
<!--<exec></exec>-->
<!--Call the DITA-OT default target-->
<antcall target="init"/>
</target>
</project>
```

**Note:** If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor, it is located in the [OXYGEN_INSTALL_DIR]/tools/ant directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor Ant lib directory.
Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a DITA map (on page 2643) transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

```html
body {
  background-image: url(MyWatermarkImage.png);
}
```

2. Edit a DITA Map XHTML transformation scenario and in the Parameters tab set the value of the args.css parameter as the path to your watermark image.

3. Set the value of the args.copycss parameter to yes.

4. Apply the transformation scenario.

5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:
- Adding a Watermark to PDF Output (on page 1636)

Adding Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. Oxygen XML Editor provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the @outputclass attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the @outputclass attribute on the `<codeblock>` element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the @outputclass attribute in Text mode but there are also two very simple ways to set the value in Author mode:

- Select the `<codeblock>` element in the editor and in the Attributes view, click on the Value cell for the @outputclass attribute and select one of the predefined values (for example, language-xml).
- Select the `<codeblock>` element in the editor and use the Alt + Enter keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

- language-bourne
- language-c
- language-cpp
- language-csharp
• language-css
• language-ini
• language-java
• language-javascript
• language-json
• language-lua
• language-perl
• language-php
• language-python
• language-ruby
• language-sql
• language-xml
• language-xquery

**Attention:** It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

**Example:**

This codeblock:

```<codeblock outputclass="language-xml">
<p>This code is an example of how to use a coderef.</p>
<coderef href="MyExternalCode.xsl"/></codeblock>
```

would look like this in the output:

```<p>This code is an example of how to use a coderef.</p>
<coderef href="MyExternalCode.xsl"/></codeblock>```

**Publishing with a DITA-OT Project File**

The *DITA Open Toolkit* project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: https://www.dita-ot.org/dev/topics/using-project-files.html.

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the **Configure Transformation Scenario(s) dialog box** (on page 1290):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:
• **project.file** - Specifies the path to the project file.
• **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
• **additional.args** - Specifies the additional arguments used in transformation.
• **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the Publish DITA-OT Project (select deliverable) transformation.

Related Information:
- [DITA Open Toolkit Project (on page 2623)](https://www.dita-developer.org/)

### Troubleshooting DITA Transformation Problems

This section contains some topics to help you troubleshoot DITA transformation issues.

#### DITA Map Transformation Fails (Cannot Connect to External Location)

**Problem**

_DITA map (on page 2643)_ transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the [Proxy preferences page (on page 229)](https://www.dita-developer.org/)

#### DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

_DITA Map WebHelp_ transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the **force-unique** parameter set to **true** to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique **@copy-to** attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
...
<topicref href="../topics/MyTopic.dita"/>
```
DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

• If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).

• If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.

• Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.

• You can increase the memory available to Oxygen XML Editor (on page 2344). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.

• You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.

• You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.

• If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.
DITA PDF Transformation Fails

Problem
The DITA to PDF transformation fails.

Cause
To generate the PDF output, Oxygen XML Editor uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2585).

Solution
If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 2421). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2643), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:
• How to Enable Debugging for FO Processor Transformations (on page 1273)

DITA PDF Processing Common Errors
There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF
The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
.............
Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `<colspec>` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2381)) to find the original DITA topic where the table was generated.

Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
```
Solution: Broken Link
To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 2381) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 2381)) to find the original DITA topic where the table was generated.

Related Information:
- How to Enable Debugging for FO Processor Transformations (on page 1273)

DITA to CHM Transformation Fails - Cannot Open File

Problem
The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

Cause
This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution
To solve this issue, close the CHM help file and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2643) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2421). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
- DITA Map CHM (Compiled HTML Help) Transformation (on page 2560)
DITA to CHM Transformation Fails - Compilation Failed

Problem
The DITA to CHM transformation fails with the following error:  [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1
One possible cause for this error is that the processed file does not exist.

Solution 1
To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2
Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2
To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2643) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 2421). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
• DITA Map CHM (Compiled HTML Help) Transformation (on page 2560)

Solving DITA Transformation Errors
If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 2421) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 2381) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 1238).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 445) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   • Severity - The first column displays the following icons that indicate the severity of the problem:
     ◦ Informational - The transformation encountered a condition of which you should be aware.
Warning - The transformation encountered a problem that should be corrected.

Error - The transformation encountered a more severe problem, and the output is affected or cannot be generated.

Info - You can click the See More icon to open a web page that contains details about DITA-OT error messages.

Description - A description of the problem.

Resource - The name of the transformation resource.

System ID - The path of the transformation resource.

5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.

6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA-OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
   d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. The profiling configuration can also be shared between content authors through the project file and there is no need for coding or editing configuration files.

Oxygen XML Editor includes a Profiling/Conditional Text preferences page (on page 129) where you can create and manage profiling attributes and condition sets. Oxygen XML Editor also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (on page 2605) or DITAVAL file (on page 2609).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (@product, @platform, @audience, @rev, @props, and @otherprops). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.
For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the @platform profiling attribute:

```
<section platform="windows">
```

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (on page 2590) (for information about sharing them, see Sharing Profiling Attribute Configurations (on page 2593)).

**Profiling Conditions**

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (on page 2595) (for information about sharing them, see Sharing Condition Set Configurations (on page 2597)).

For more information about DITA profiling, watch our video demonstration:

https://www.youtube.com/embed/Gfyd4TkRQAw

**Creating and Editing Profiling Attributes in DITA**

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (on page 2595).

**Defining Profiling Attributes for DITA Content**

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 72) and go to Editor > Edit modes > Author > Profiling / Conditional Text.

   **Information:** The Profiling Attributes section (on page 130) is used to define the attributes and their values. For DITA documents, the default attributes are included ( @audience, @platform, @product, @props, @otherprops, and @rev ), but if a Subject Scheme Map (on page 2605) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.

2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
Figure 731. Profiling Attribute Dialog Box

The following options are available in this dialog box:

**Document type**

Select the document type (*framework (on page 2643)*).

**Tip:** You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**

The name of the profiling attribute.

**Display name**

This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (*New, Edit, Delete*).

The columns are as follows:

- **Value** - The attribute value. You can also define profiling attribute groups using the following format: ParentAttrValue(SubAttrValue1 SubAttrValue2). For more information, see *Conditional Profiling Attribute Groups (on page 2603)*.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in *Author mode* (*Edit Profiling Attributes* dialog box (*on page 2593*), *Condition Set* dialog box (*on page 2595*), *Profiling* tab in the *Edit Properties*).
dialog box (on page 2418), DITA Maps Manager (on page 2381)). If the **Label** is not specified, the **Value** will be used as its rendered name.

- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

3. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.

4. Click **Apply** to save the changes.

**Result:** You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets** section to apply more complex filters on your DITA content.

**Adding Profiling Attribute Values Directly in a Document**

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (on page 502) in **Author** mode, the **Attributes view** (on page 518), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the **Profiling / Conditional Text** preferences page (on page 129) where you can edit the profiling configuration.

**Note:** If the **Allow contributing extra profiling attribute values** (on page 130) option is not selected in the **Profiling / Conditional Text** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this automatically adding value not be possible.
Sharing Profiling Attribute Configurations

Your profiling configuration can be shared with other users through a project file. If you select Project Options (on page 2647) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 328).

- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2602)
- Conditional Profiling Attribute Groups (on page 2603)

Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes (on page 2590) as follows:

[Continue Reading]
To profile DITA topics, right-click a topic reference in the DITA Maps Manager (on page 2381), select Edit Properties from the contextual menu, go to the Profiling tab, and select the appropriate values.

**DITA Content**

To profile DITA content in Author mode, highlight the content and select Edit Profiling Attributes from the contextual menu and select the appropriate values in the Edit Profiling Attributes dialog box.

**DITA Elements**

To profile specific XML elements in Author mode, position the cursor inside the element, right-click, select Edit Profiling Attributes (you can also right-click the element in the breadcrumb (on page 495) or Outline (on page 436) view), and select the appropriate values in the Edit Profiling Attributes dialog box. You can also use the Attributes view (on page 518) to set the profiling attributes on the element at the current cursor position.

Figure 733. Edit Profiling Attributes Dialog Box

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the Expand All/Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your root map (on page 2648) references a DITA subject scheme map (on page 2648) that defines values for the profiling attributes (on page 2605), those values are used. Oxygen XML Editor collects all the profiling values from the subject scheme map that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2381) (or set as the root map (on page 2396)). In the image above
(on page 2594) (taken from the Oxygen XML Editor documentation project), you see values for eight products. They are the only values that are defined in the subject scheme map and thus, are the only ones that appear in the dialog box.

- If you have defined profiling attribute values (on page 2590) for the DITA document type in the **Profiling/Conditional Text** preferences page (on page 129) and you store them at project-level (on page 2647), those values are displayed in the dialog box.
- If you have defined profiling attribute values (on page 2590) for the DITA document type in the **Profiling/Conditional Text** preferences page (on page 129) and you store them at global-level (on page 2644), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the **Show Profiling Attributes** option (on page 564) (available in the \( \text{Profiling / Conditional Text} \) toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 734. Profiling Attribute Value Form Control Pop Up**

![Form Control Pop Up](image)

Related Information:

- Creating and Editing Profiling Attributes in DITA (on page 2590)
- Creating and Editing Profiling Condition Sets in DITA (on page 2595)
- Applying Profiling Condition Sets in DITA (on page 2597)
- Showing and Filtering Profiled Content in DITA (on page 2599)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2602)
Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (Options > Preferences) (on page 72) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

   Information: The Profiling Condition Sets section (on page 130) is used to define condition sets.

2. To add new condition set, click the New button at the bottom of the Profiling Condition Sets table. To customize existing condition sets, select an existing condition set and click the Edit button.

   Step Result: In either case, this opens a Condition Set configuration dialog box where you can define attributes that exist in your schema.

   ![Figure 735. Condition Set Configuration Dialog Box](image)

   The following options are available in this dialog box:

   **Name**

   The name of the new condition set.

   **Document type**
Select the document type (framework (on page 2643)) that has profiling attributes defined.

**Use DITAVAL file**

For DITA projects, select this option if you want the Profiling Condition Set to reference a DITAVAL file (on page 2609). You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 249) button, or the browsing actions in the Browse drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

**Shortcut key**

You can click the Choose button to open a dialog box that allows you to define a shortcut key for this particular condition set. You can then use that shortcut key anytime you want to select this condition set to filter content.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the Condition Set configuration dialog box.

4. Click **Apply** to save the condition set.

**Sharing Condition Set Configurations**

Your condition set configuration can be shared with other users through a project file. If you select Project Options (on page 2647) at the bottom of the Profiling/Conditional Text preferences page, your configuration is stored in the project file and can be shared with others. For instance, if your project file is saved on a version control system (such as SVN, CVS, or Source Safe) or in a shared folder, your team will have the same option configuration that you stored in the project file.

For more information about sharing project files, see Sharing a Project - Team Collaboration (on page 328).

**Related Information:**

- Applying Profiling Condition Sets in DITA (on page 2597)
- Creating and Editing Profiling Attributes in DITA (on page 2590)
- Applying Profiling Attributes in DITA (on page 2593)
- Showing and Filtering Profiled Content in DITA (on page 2599)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2602)

**Applying Profiling Condition Sets in DITA**

All defined Profiling Condition Sets (on page 2595) are available as shortcuts in the Profiling / Conditional Text toolbar menu (on page 564). Select a menu entry to apply the condition set. The filtered content is then
grayed-out in the Author mode, **Outline view (on page 436)**, and **DITA Maps Manager view (on page 2381)**. Your selection will also be used as the default condition set (on page 2612) in transformation scenarios (this can be changed in the Filters tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

**EXAMPLE:**

Suppose that you have the following document:

```
Spray painting
```

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

```
The garage is a good place to spray paint.
```

Step 1

Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2

Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3

Place the object to be painted on the covered area. Audience [expert] Other [prop1]

Step 4

Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5

Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the expert value for the @audience attribute and content that has the prop1 value for the @other attribute.
This is how the document looks in **Author** mode after you apply the condition set:

![Spray painting](image)

**Related Information:**

- Creating and Editing Profiling Condition Sets in DITA *(on page 2595)*
- Creating and Editing Profiling Attributes in DITA *(on page 2590)*
- Applying Profiling Attributes in DITA *(on page 2593)*
- Showing and Filtering Profiled Content in DITA *(on page 2599)*
- Customizing Colors and Styles for Rendering Profiling in Author Mode *(on page 2602)*

**Showing and Filtering Profiled Content in DITA**

You can visualize the effect of profiling content by using the profiling tools in the **Profiling/Conditional Text** drop-down menu that is located on the **DITA Maps Manager** *(on page 2381)* toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in **Author** mode and the **DITA Maps Manager** *(on page 2381)*. You can configure the colors and styles or specify whether or not this option is selected by default in the **Profiling/Conditional Text > Colors and Styles** preferences page *(on page 131)*.

**Show Profiling Attributes**

Select this option to display the values of the profiling attributes at the end of profiled content in **Author** mode and next to the nodes in the **DITA Maps Manager** *(on page 2381)*. You can specify whether or not this option is selected by default in the **Profiling/Conditional Text > Attributes Rendering** preferences page *(on page 132)*.
Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager (on page 2381), and the Outline (on page 436) view. When this option is selected and a condition set is selected in this drop-down menu (on page 2600), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 2600), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 131).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager (on page 2381) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 2600) to access a dialog box that presents all of them.

Profiling Settings

Opens the Profiling/Conditional Text preferences page (on page 129) where you can add and edit profiling attributes and condition sets.

Figure 736. Example: Profiling Controls in Author Mode

```
Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
  - Remove the oil fill cap;
  - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;

  - product [Gasoline]

- Sharpen the blades:
  - Clamp the blade to a vice or to the edge of a solid surface;
  - Using an electric grinder or a file, grind the length of the blade until it is sharp;

- Check the electric cable for any signs of wear. Replace it if worn: product [Electric]
- Clean the mower's underside for debris: product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower: product [Manual]
```

If the Show Profiling Attributes option is selected, a green border is painted around profiled text in the Author mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and
in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 737. Profiling Attribute Value Form Control Pop Up

Also, the following icons are used to mark profiled and non-profiled topics in the DITA Maps Manager:

- ■ - The topic contains profiling attributes.
- □ - The topic inherits profiling attribute from its ancestors.
- ○ - The topic contains and inherits profiling attributes.
- - (dash) - The topic neither contains, nor inherits profiling attributes.

Figure 738. Rendering Profiled Topics in DITA Maps Manager
Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in Author mode and the DITA Maps Manager so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in Author mode and excluded nodes are grayed-out or hidden in the DITA Maps Manager.

Figure 739. Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.
Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the Show Profiling Colors and Styles option (on page 564) from the Profiling / Conditional Text toolbar drop-down menu.
2. Select Profiling Settings (on page 565) from the Profiling / Conditional Text toolbar drop-down menu. This is a shortcut to the Profiling/Conditional Text preferences page (on page 129).
3. Go to the Colors and Styles preferences page (on page 131) to configure the colors and styling for the profiling attributes.
4. Go to the Attributes Rendering preferences page (on page 132) to configure how you want the profiling attributes to appear in Oxygen XML Editor.

Result: The styling is now applied in the Author editing mode, the Outline view (on page 436), and in the DITA Maps Manager view (on page 2381). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the Edit Profiling Attributes dialog box (on page 555) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

![Profiling Attribute Value Form Control Pop Up](image)

Alternate Method with a DITAVAL File: If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2611) topic.

- Showing and Filtering Profiled Content in DITA (on page 2599)
Conditional Profiling Attribute Groups

Overview

Conditional processing attributes can be specified using grouped values. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (operations and support) and they use the `@audience` attribute with the values `ops` and `support`, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (L1, L2, and L3) as subcategories for the `support` value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as `@product`, `@audience`, `@otherprops`) and specify multiple attribute subcategories.

Creating a Conditional Profiling Attribute Group

To create a group in Oxygen XML Editor:

1. Open the Preferences dialog box (Options > Preferences) (on page 72) and go to Editor > Edit modes > Author > Profiling / Conditional Text.
2. To add new attributes and values, click the New button at the bottom of the Profiling Attributes table. To customize existing attributes and their values, select an attribute and click the Edit button.
   
   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
3. Specify the appropriate values for the Document type, Attribute name, and Display name.
   
   For information about the Profiling Attribute configuration dialog box, see Defining Profiling Attributes for DITA Content (on page 2590).
4. Click the New button at the bottom of the attribute values table.
5. In the Value field of the resulting dialog box, define groups using the following format:

```
ParentAttrValue(SubAttrValue1 SubAttrValue2)
```

   For example:

```
support(L1 L2 L3)
```
6. Click OK and Apply to save and apply the changes.

Using Conditional Groups in Conjunction with a DITAVAL File

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2609) the values. For example, suppose the company described in the example in the Overview section (on page 2604) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```xml
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
```
That DITAVAL file could then be used for a condition set on page 2595 to filter content in Author mode or during the transformation stage to filter content in the output on page 2612 and content profiled with the L1 and L2 values would be included while content with the L3 value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (L1, L2, L3) by simply excluding the support value (since L1, L2, and L3 are subcategories of it).

```
<val>
  <prop action="exclude" att="support"/>
</val>
```

For more information about creating conditional profiling attribute groups, watch our video demonstration:

https://www.youtube.com/embed/YRi9XPK6CcY

### Customizing Profiling Values with a Subject Scheme Map

#### Overview

A subject scheme map on page 2648 allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.

The highest level of map main DITA map on page 2648) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the @type attribute needs to be set to subjectScheme for the reference, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

#### Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.
Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:

1. Use the New Document wizard (on page 287) to create a new Subject Scheme document (Framework templates > DITA Map > map > Subject Scheme).
2. Use the controls in Author mode to define the hierarchical tree of values for your subject scheme (see the Author mode example below (on page 2607)) or switch to Text mode and define it there if you prefer (see the Text mode example below (on page 2608)).

   Note: The pre-defined subject scheme template includes Navigation Titles ( <navtitle> element). This element is not required, but if you use it, the text that you enter for the <navtitle> will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Editor (on page 2609). An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Editor.

3. Bind the particular attribute to the key you define for the tree of values using the <attributedef> and <subjectdef> elements inside the <enumerationdef> element. Notice that in the examples below (on page 2607), the audience attribute is bound to the audienceKey value.

   Tip: By default, attributes can accept multiple values, but you can use outputclass="single_value" to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Editor with radio buttons instead of checkboxes. For example:

   ```xml
   <enumerationdef outputclass="single_value">
     <attributedef name="audience"/>
     <subjectdef keyref="audienceKey"/>
   </enumerationdef>
   ```

4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the props and otherprops attributes in the examples below (on page 2607)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Editor (on page 2609).
5. Save your subject scheme file.
6. Reference your subject scheme in the highest level of map (main DITA map (on page 2648)) that will use the set of profiling values and set its type to subjectScheme. The easiest way to do this is:
   a. With your subject scheme file opened in the editor, go to the DITA Maps Manager view, right-click the main DITA map, and select Append Child > Reference to the currently edited file.
   b. In the Insert Topic Reference dialog box, go to the Attributes tab and in the Type field, enter or select subjectScheme.
   c. Click the Insert and Close button and save your main DITA map.

Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2609) the entire tree of values. For example, suppose one of the values for the audience attribute in a hierarchical subject scheme is surgeon and it has two
subordinate values of neuro-surgeon and plastic-surgeon (see the examples below (on page 2607)). You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 2595) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2612) and the neuro-surgeon and plastic-surgeon values would be excluded by the filter since the subject scheme defines them as subordinate values of the surgeon value.

**Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute**

This example uses typical audience values for medical personnel (therapist, oncologist, physicist, radiologist, surgeon, and so on). The audience attribute is bound to the audienceKey value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (props and otherprops) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Editor (on page 2609).

**Example using Author mode controls:**
Example code in Text mode:

```xml
<subjectScheme>
  <!-- A scheme that defines audience user values -->
  <subjectdef keys="audienceKey">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physicist"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
  <!-- Binding the audience attribute to the values defined in the key -->
  <enumerationdef>
    <attributedef name="audience"/>
    <subjectdef keyref="audienceKey"/>
  </enumerationdef>
</subjectScheme>
```

Figure 741. Subject Scheme Author Mode Controls

- A scheme that defines audience user values

- Binding the audience attribute to the values defined in the key

- Reject all possible values for other profiling attributes
Where the Profiling Attributes are Available in Oxygen XML Editor

When you edit a DITA topic in the Text or Author mode, Oxygen XML Editor collects all the profiling values from the subject scheme map (on page 2648) that is referenced in the map that is currently opened in the DITA Maps Manager (on page 2381) (or set as the root map (on page 2396)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Editor (regardless of their mapping in the Profiling/Conditional Text preferences page (on page 129)):

- The Profiling tab of the Edit Properties dialog box (on page 2418).
- The Edit Profiling Attribute dialog box (on page 2594).
- The inline profiling controls in Author mode (on page 2600).
- The proposals for the attribute values in the Content Completion Assistant (on page 2642).

For more information about using a DITA subject scheme map, watch our video demonstration:

https://www.youtube.com/embed/RgkVRg6k6zo

Related Information:

- Filtering Profiling Values with a DITAVAL File (on page 2609)
- DITA 1.3 Specifications: Subject Scheme Maps

Filtering Profiling Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

DITAVAL Filtering Use-Case

Suppose that a medical publication uses the audience profiling attribute to profile the content for the following types of users: therapist, physician, and surgeon. Suppose that in the output, you want to exclude any content that is profiled as surgeon value for the @audience attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as surgeon.
If you then transform the main DITA map (on page 2643) and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as surgeon.

**DITAVAL Filter File Editor in Author Mode**

The Author editing mode in Oxygen XML Editor offers a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

**Figure 742. DITAVAL File Editor in Author Mode**

Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the **DITAVAL FILTER File** title, allows you to insert the following elements:

- **Style Conflict** - Inserts a `<style-conflict>` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the @foreground-conflict-color and @background-conflict-color attributes.

- **Filter** - Inserts a `<prop>` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are include, exclude, passthrough, and flag. If you select the flag action, you can use the drop-down menus to select values for the @style, @color, and @background attributes.

- **Flag** - Inserts a `<revprop>` element that identifies a value in the @rev attribute that should be flagged in some manner. The allowed actions are include, passthrough, and flag. If you select the flag action, you can use the drop-down menus to select values for the @style, @color, @background, and @changebar attributes.

See the DITAVAL Element Specifications for more details about the allowed filters and flags.

**How to Create a DITAVAL Filter File**

To create a DITAVAL filter file, follow these steps:
1. Go to File > New.
2. Scroll to the Framework templates > DITAVAL folder.
3. Select the Filter template file and click Create.
4. Define your filters in the DITAVAL file (in Text or Author mode).
5. Save the DITAVAL file.

Result: The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a Profiling Condition Set using the Use DITAVAL File option in the Condition Set configuration dialog box (on page 2595).
- You can use the Import from DITAVAL option (on page 129) in the Profiling/Conditional Text preferences page (on page 129) to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the DITAVAL file in the transformation scenario (on page 2574).
- You can use the filter file in the DITA Map Completeness Check dialog box (on page 2422) when validating your DITA map (on page 2643).
- DITAVAL files are also used when working with the DITA 1.3 Branch Filtering mechanism. For more details, see: Working with DITA 1.3 Branch Filtering (on page 2529).
- You can define the colors and styles to be used for rendering profiled condition sets (on page 2611) in Author mode and the DITA Maps Manager (on page 2381) view by using a Flag filter in the DITAVAL file.

Related Information:
- DITAVAL Element Specifications
- Working with DITA 1.3 Branch Filtering (on page 2529)
- Customizing Profiling Values with a Subject Scheme Map (on page 2605)
- Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2611)
- Conditional Profiling Attribute Groups (on page 2603)

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager (on page 2381) by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file (on page 2610) to define your profiling condition set (on page 2595).
2. In Author mode, define the filters for your condition set (on page 2610).
3. Select **Flag** from the drop-down menu on in a particular **Filter** or **Flag Revision** to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.

4. Save the DITAVAL file.

**Result:** Test your changes by opening profiled content in **Author** mode or the **DITA Maps Manager** *(on page 2381)* and use the options in the **Profiling / Conditional Text** drop-down menu to see how the changes in your DITAVAL flag are rendered.

**EXAMPLE:**

Using a **Flag** on a **Filter** to define the styling for a condition set like this:

```
DITAVAL Filter file ...
```

```
Filter exclude @ product = editor
eclipse

Filter flag @ product = editor

<table>
<thead>
<tr>
<th>style</th>
<th>color</th>
<th>background</th>
</tr>
</thead>
<tbody>
<tr>
<td>bold</td>
<td>maroon</td>
<td>silver</td>
</tr>
</tbody>
</table>
```

will render the styling of the profiled content in **Author** mode to look like this:

```
> Shortcut Keys 4 - Many of the shortcut keys
Markdown editor, product [editor]
```

and will render the styling in the **DITA Maps Manager** view *(on page 2381)* to look like this:

```
Editing Schematron Quick Fixes  product [developer developer]
Editing SVG Files:  product [author developer editor]
```

**Related Information:**

- Filtering Profiling Values with a DITAVAL File *(on page 2609)*

**Publishing Profiled DITA Content**

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current **profiling condition set** *(on page 2597)* into account during the transformation, as defined in the **Filters tab** *(on page 2573)* when creating a DITA transformation *(on page 1238)*. You can also specify a **DITAVAL file** *(on page 2609)* that defines filters for your profiled content.
DITA Open Toolkit Support

The DITA Open Toolkit is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Editor includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA-OT plugin (on page 2646), and how to use an external instance of the DITA Open Toolkit.

Related Information:
• DITA Open Toolkit Documentation

DITA-OT Plugins

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Editor already has lots of plugins pre-installed but you can also install additional plugins (on page 2646) or create your own.

Creating a DITA-OT Plugin

Oxygen XML Editor provides the ability to install additional DITA Open Toolkit plugins (on page 2616) that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the plugins folder located in your DITA-OT directory (for example, if you are using DITA 3.4, the path would look like this: \[OXYGEN_INSTALL_DIR\]/frameworks/dita/DITA-OT3.x/plugins/MyNewPlugin).
2. Create a plugin.xml file in that same folder. This file will contain the extension points for the plugin. For example, references to the XSLT stylesheets that will be used to style the output.

Note: You can easily create this file by using the DITA-OT Plugin new document template that is included in Oxygen XML Editor (from the New document wizard (on page 287) you can find this template in Framework templates > DITA > plugin.

Example:
<plugin id="org.metadita.specialization.music">
  <feature extension="dita.specialization.catalog.relative" file="catalog-dita.xml"/>
  <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl"/>
</plugin>

Tip: Oxygen XML Editor includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press Ctrl+Space, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Install the newly created DITA-OT plugin (on page 2616) by running the built-in transformation scenario called Run DITA-OT Integrator (on page 2562) from the Apply Transformation Scenario(s) (on page 1192) or Configure Transformation Scenario(s) dialog box (on page 1290).

Note: If the integrator is not visible, select the Show all scenarios option in the Settings drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions (on page 2616).

Related Information:
- DITA Open Toolkit Documentation
- Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 2618)

Example: Creating a DITA-OT Plugin for Embedding Video Resources

To offer a detailed example of the steps required to create a new DITA Open Toolkit plugin (on page 2646), this topic uses an example of creating an XSLT customization plugin that provides support for referencing video and audio content using the DITA object element and then publishing to HTML and PDF output formats. This plugin (com.oxygenxml.media) is available in the DITA Open Toolkit distribution that comes bundled with the latest version of Oxygen XML Editor, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA-OT plugins folder (DITA-OT-DIR/plugins/).
2. Create a plugin.xml file (in the same plugin folder) that contains the extension points of the plugin.

Note: You can easily create this file by using the DITA-OT Plugin template that is included in Oxygen XML Editor (from the New document wizard (on page 287) you can find this template in Framework templates > DITA > plugin).

Example: Media Plugin File
The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other DITA-OT plugin extension points here: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called `xhtmlMedia.xsl` (in the same plugin folder).

Tip: You can use the Find/Replace in Files action (on page 346) to find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet.

For example, suppose you want to overwrite HTML content produced from a DITA `codeblock` element. Since a DITA `object` element has the `@class` attribute value `- topic/object`, you can take part of the class attribute value (`topic/object`) and search the DITA-OT resources for a similar stylesheet. The search might find the XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xslhtml/dita2htmlImpl.xsl`.

You can use it as a starting point to overwrite the `xhtmlMedia.xsl` stylesheet. For example, the results might be:

```xsl
<xsl:template
    match="*[contains(@class, 'topic/object')][contains(@outputclass, 'video')]">
    <video class="embed-responsive-item">
        <xsl:call-template name="commonattributes" />
        <xsl:call-template name="setidaname" />
        <xsl:call-template name="copySource" />
    </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called `pdfMedia.xsl` (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl` to use as a starting point to overwrite the `pdfMedia.xsl` stylesheet, with results looking something like this:

```xsl
<!--Treat video, audio or iframe objects as links--> 
<xsl:template
    match="*[contains(@class, 'topic/object')][@outputclass = 'video']">
```
5. To install the created plugin in the DITA-OT, run the built-in transformation scenario called Run DITA-OT Integrator (on page 2562) by executing it from the Apply Transformation Scenario(s) dialog box (on page 1192). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu. For more information, see Installing a DITA-OT Plugin (on page 2616).

Results of running the integrator using the media plugin example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl, a new import automatically appeared:

```xml
<xsl:import href="../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: http://www.w3.org/TR/xslt#import.

b. Likewise, for the PDF output, in the top-level stylesheet DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl, a new import statement appeared:

```xml
<xsl:import href="../../../com.oxygenxml.media/pdfMedia.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA-OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA-OT distribution to the other.

Related Information:

- DITA Open Toolkit Documentation
Installing a DITA-OT Plugin

Oxygen XML Editor comes bundled with various DITA-OT plugins (on page 2646), but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins).

Warning: Oxygen XML Editor has only been tested with DITA-OT plugins that come bundled with the product. Be aware that installing additional plugins or modifying the bundled plugins may affect the default functionality of the application.

Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, DITA-OT-\plugins directory).

   Note: If the plugin is only supported in DITA-OT 3.4 version, make sure that you copy the plugin to the \{OXYGEN_INSTALL_DIR\}/frameworks/dita/DITA-OT3.x directory.

2. Select the Configure Transformation Scenario(s) (on page 1290) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1296)).

3. Select the Run DITA-OT Integrator transformation scenario (on page 2562). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu.

   Important: The folder where the DITA-OT is located needs to have full write access permissions set to it. For example, in Windows, if you are integrating plugins in the DITA-OT folder bundled with Oxygen XML Editor and your application is installed in the Program Files folder, you can start the Oxygen XML Editor main executable with administrative rights for the integrator process to be able to modify resources in the DITA-OT folder.

4. Apply the scenario (on page 1289).

5. Check the Results panel at the bottom of the application to make sure the build was successful.

Note: Starting with version 17.0, if the DITA-OT plugin declares a transtype (transformation type), Oxygen XML Editor detects that transformation type declaration from the DITA-OT plugin and presents descriptions in the DITA Transformation Type dialog box (on page 1238). Oxygen XML Editor also shows the contributed parameters from the plugin in the transformation scenario's Parameters tab (on page 2572).

Tip: You can declare the transformation type and allowed parameters by following the procedure found in: Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 2618).

Related Information:

- Creating a DITA-OT Plugin (on page 2613)
- Installing the DITA For Publishers Package
- DITA Open Toolkit Documentation
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin

Custom DITA-OT plugins may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a transtype, Oxygen XML Editor detects that transformation type declaration and presents descriptions in the DITA Transformation Type dialog box (on page 1238) and the contributed parameters in the transformation scenario's Parameters tab (on page 2572).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, create a DITA-OT plugin.xml file (on page 2613) (you can easily create this file by using the DITA-OT Plugin new document template in the New document wizard (on page 287)).

2. In the plugin.xml file, define the transformation type details by using the <transtype> element to specify a name, description, and the transtype it extends.

3. Define allowed parameters by using the <param> element to specify the name, description, and information about the default and allowed set of values. For more information, see: https://www.dita-ot.org/3.1/topics/plugin-configfile.html.

4. You can also extend various extension points in your plugin.xml. For more information, see: https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html.

   Plugin Extension Example - Promote Parameters:
   It is possible to promote certain transformation parameters so that they appear above the table of allowed parameters and values in the Parameters tab of the transformation scenario configuration dialog box. To do this, you could create a pluginExtension.xml file in the root folder of the DITA-OT plugin and use the <promotedParams> element to define the promoted parameters. Here is an example:

   <extensionPlugin>
     <transtype name="pdf-css-html5">
       <promotedParams>
         <param name="args.css" promotedName="CSS"/>
       </promotedParams>
     </transtype>
   </extensionPlugin>
The example above results in the Parameters tab looking like this:

![Figure 744. Promoted Parameters](image)

5. Install the plugin (on page 2616).

Note: If the plugin is installed using an external command line, you may need to restart Oxygen XML Editor to properly re-detect the newly contributed transtypes and parameters.

Example of a plugin.xml File:

```xml
<plugin id="com.oxygenxml.pdf.prince">
    <!-- extensions -->
    <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
    <feature extension="dita.conductor.target.relative" value="integrator.xml"
              type="file"/>
    <feature extension="dita.transtype.print" value="pdf-prince"/>
    <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
        <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
    </transtype>
</plugin>
```

**Built-in Third-Party DITA Open Toolkit Plugins**

The DITA Open Toolkit 3.4 distribution that is bundled with Oxygen XML Editor includes some pre-installed third-party open-source plugins (on page 2646) that add extra publishing formats and functionality.
The plugins that come bundled with Oxygen XML Editor include:

- **DITA For Publishers** - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** - This plugin allows users to publish DITA content to MS Word.
- **DITA Community** - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

**Extra Free Publishing Plugins**

The DITA Open Toolkit publishing engine comes with support for predefined output formats such as HTM5, PDF, and Eclipse Help. As the architecture of the publishing engine is plugin-based, over time we have developed lots of useful plugins in the Oxygen XML GitHub account that enhance the publishing and in this blog post, I will enumerate some of them. For the plugins that are already installed within Oxygen XML Editor's DITA Open Toolkit engine, I added the **[Bundled]** marker.

**Plugin that Converts DITA Maps to PDF Using CSS 3 [Bundled]**

Maybe our most important work so far, this plugin can publish DITA to PDF using CSS. As a publishing engine, it can use either our Oxygen XML Chemistry processor (freely bundled with Oxygen XML Editor) or the Antenna House or Prince XML engines.

**DITA Metrics Report [Bundled]**

This is a very useful open-source plugin that generates an HTML report from an existing DITA project and contains a lot of useful information, including:

- Total number of maps and topics that are part of the project.
- Total number of elements used in topics and maps along with a table presenting all element names and their usage counter.
- The used elements for each DITA domain.
- Total number of attributes used in topics and maps along with a table presenting all attribute names and their usage counter.
- Statistics about the conditional attributes used in the project.
- Information about content reuse.
- Text and content statistics, including both total words (word count) and unique words (vocabulary).
- List of largest and smallest topics and the number of words each one uses.
- Listing of all links to resources outside of the project.
- A metrics evolution report between different versions of your documentation.

**Export DITA Map Plugin [Bundled]**

You can use this free plugin to create a ZIP file from your entire DITA project. The plugin also takes filters/profiling into account when including topics.
Publish DITA Content with References to Video and Audio Resources. [Bundled]

A DITA Open Toolkit plugin that converts the DITA <object> element to various HTML 5 structures such as <video>, <audio>, or <iframe>.

Show Consecutive Codeblocks in Multiple Tabs for WebHelp Output

This open-source plugin allows you to display consecutive DITA <codeblock> elements in separate tabs.

Add Edit Links in HTML or PDF-based Outputs [Bundled]

This plugin adds edit links in the HTML or PDF-based outputs allowing subject matter experts to give feedback on the published content directly using a DITA web editing tool (such as Oxygen XML Web Author).

Create Single Merged XML Document From Entire DITA Project [Bundled]

This plugin produces a merged output from the entire DITA map structure without further processing. It is useful if you want to further process the merged XML document for producing various reports.

Dynamically Publish Excel Content as DITA

A DITA Open Toolkit plugin that dynamically converts to DITA Excel files referenced with format="excel" in DITA maps.

Dynamically Use JSON Content in DITA Topics

A DITA Open Toolkit plugin that dynamically converts to DITA JSON files referenced with format="json" in DITA maps.

Dynamically Publish ASCIIDoc content as DITA

A DITA Open Toolkit plugin that dynamically converts to DITA ASCIIDoc files referenced with format="ant-parser" in DITA Maps.

Embed HTML Content in DITA Topics [Bundled]

A plugin that allows embedding well-formed HTML content in a DITA topic inside a special element.

Embed LateX Equations in DITA Content

A DITA Open Toolkit plugin that allows publishing embedded Latex mathematical equations to HTML and PDF.

Embed UML Diagrams in DITA Content

A DITA Open Toolkit plugin that allows publishing embedded UML diagrams equations to HTML and PDF.

Float Images in HTML and PDF Outputs

A plugin that allows floating an image referenced in a DITA topic left or right depending on the @outputclass attribute value specified on it.
Embed Referenced MathML and SVGZ Images in HTML Output

A DITA Open Toolkit plugin that allows you to embed referenced MathML and SVG images in the HTML5 and XHTML output.

Dynamically Convert DITA Tables to Graphs

A DITA Open Toolkit plugin that converts DITA tables having a certain structure to SVG graphs.

Show Oxygen Change Tracking Information in the PDF Output [Bundled]

This plugin allows you to see Oxygen XML Editor track changes (insertions, deletions, or comments) in the PDF output.

Sample Customization Plugin for Classic PDF (XSL-FO) Output

This sample DITA Open Toolkit PDF customization plugin is a good starting point if you want to:

- Customize fonts
- Customize a cover page to provide custom logos and coloring
- Customize page headers and footers

PDF (XSL-FO) - Generate Numbers Before Topic's Title

A DITA-OT PDF2 customization plugin that can be installed to generate numbers before each topic's title.

Presents Chapters With Landscape Orientation in PDF (XSL-FO) output

A PDF customization folder that allows you to define landscape orientation for a certain chapter.

Using an External DITA Open Toolkit in Oxygen XML Editor

Oxygen XML Editor comes bundled with a DITA Open Toolkit, located in the DITA-OT-DIR directory. Starting with Oxygen XML Editor version 17, if you want to use an external DITA-OT for all transformations and validations, you can open the Preferences dialog box (Options > Preferences) (on page 72) and go to the DITA page (on page 201), where you can specify the DITA-OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the Parameters tab change the value for the dita.dir parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the Advanced tab, click the Libraries button and deselect Allow Oxygen to add high priority libraries to classpath.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Document Type Association preferences page (on page 85), edit the DITA and DITA Map document types and modify the catalog entry in the Catalogs tab to point to the custom catalog file catalog-dita.xml.
DITA Open Toolkit Project

The *DITA Open Toolkit* project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: [https://www.dita-ot.org/dev/topics/using-project-files.html](https://www.dita-ot.org/dev/topics/using-project-files.html).

Oxygen XML Editor has special support for creating, editing, validating, and publishing DITA Open Toolkit project files represented in XML format. It can also use such files to detect connections between DITA resources in the entire project and to apply root map and filter pairs when editing.

Editing DITA Open Toolkit Project Files

The *New Document* wizard ([on page 287](#)) includes a template to help you create DITA Open Toolkit project files (with an `.xml` file extension). The template is located in the *Framework templates* > *DITA-OT* folder. There is also a sample project file that can be found in the application samples folder: `OXYGEN_INSTALL_DIR/samples/dita/mobile-phone/mobilePhoneProjectFile.xml`.

Content completion is done according to the associated schema and it is enhanced with proposals for ID references, available transformation types, parameter names, and values.

The validation support has enhanced Schematron rules that report invalid references to non-existing contexts.

When working with a DITA-OT project file in the *Author* visual editing mode, you can see a compact representation of the file by default. You can switch to the *Edit* style in the *Styles* toolbar drop-down menu to edit the file using form controls and inline buttons. The additional *View as YAML* style can be selected to see a visual representation of the same document in YAML.

Publishing DITA Open Toolkit Project Files

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the *Configure Transformation Scenario(s)* dialog box ([on page 1290](#)):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
• **additional.args** - Specifies the additional arguments used in transformation.
• **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the **Publish DITA-OT Project (select deliverable)** transformation.

**Master Files Support for DITA Open Toolkit Project Files**

If you enable master files support at project level ([on page 2628](#)), you can choose to detect all top-level DITA Open Toolkit project files and to add them to the Master Files folder. You could also manually add the top-level files for your DITA-OT project in the Master Files folder. The benefit of this is that whenever you rename or move files in the **Project** view, the references to those resources will automatically be updated.

**Tip:** The Resource Hierarchy/Dependencies view ([on page 2631](#)) also works for DITA-OT project files.

**Editing Contexts Detected from DITA Open Toolkit Project Files**

Once a DITA-OT project file is added to the Master Files folder, the root map drop-down menu on the **DITA Maps Manager** toolbar will contain context DITA maps defined in the project file and the **Profiling/Conditional Text** menu will contain filter pairs gathered from the project file. When you select one of them in the drop-down menu, the application gathers the keys from the context DITA map and applies the filters specified in that context.

**DITA Specialization Support**

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see **DITA 4 Practitioners: DITA Configuration and Specialization Tutorials**.

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor.

**Integrating a DITA Specialization**

A DITA specialization can have its document type defined with any of the following:

• **DTD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).
• **XSD** - For configuration and specialization tutorials, see [http://dita4practitioners.github.io/dita-specialization-tutorials/](http://dita4practitioners.github.io/dita-specialization-tutorials/).
A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the @class attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor, use one of the following methods:

**DITA-OT Plugin Method**

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, \DITA-OT\plugins directory).
   - **Important:** The application needs to have full write access permissions to the DITA-OT directory.
2. If Oxygen XML Editor was installed in the default location, you may need to restart and run it as an administrator.
3. Select the Configure Transformation Scenario(s) (on page 1290) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1296)).
4. Select the Run DITA-OT Integrator transformation scenario (on page 2562).
   - **Tip:** If you don't see that scenario in the Configure Transformation Scenario(s) (on page 1290) dialog box or Transformation Scenarios view (on page 1296), click the Settings button and select the Show all scenarios option, but don't forget to change it back to Show only the scenarios available for the editor after you are finished with this procedure.
5. Apply the scenario (on page 1289).
6. Check the Results panel at the bottom of the application to make sure the build was successful.
7. Restart Oxygen XML Editor with your normal permissions.
   - **Tip:** Oxygen XML Editor detects new document templates (on page 294) contributed by the DITA-OT plugin as long as you do the following:

      1. Create a new folder called template_folders inside your DITA OT plugin's folder. For example: \DITA-OT\plugins\my_custom_plugin\template_folders.
      2. Create one or more subfolders inside the template_folders directory that contain the new document templates. The new document templates found in those subfolders will be available in the New document wizard.

**Alternative Methods**

If the DITA specialization is not available as a DITA-OT plugin, you have the following options:
• If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA-OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the DITA maps or topics. The DITA-OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.

• If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA-OT, these new stylesheets must be called from the DITA-OT Ant build scripts.

**Important:** If you are using DITA specialization elements in your DITA files, it is recommended that you activate the Enable DTD/XML Schema processing in document type detection option in the Document Type Association preferences page (on page 85).

• You could create your own document templates (on page 294), store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Editor uses by adding the directory to the list in the Document Templates Preferences (on page 110) page.

**Editing DITA Map Specializations**

In addition to recognizing the default DITA map (on page 2643) formats (`<map>` and `<bookmap>`), the DITA Maps Manager view (on page 2381) can also be used to open and edit specializations of DITA maps.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the DITA Maps Manager view (on page 2381) are collected from the target files by matching the `@class` attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the DITA Map document type from the Document Type Association preferences page (on page 85) and edit the table actions to insert the element names as specified in your specialization. See Creating/Extending a Custom Framework (on page 1772) for more details.

**Related Information:**

• DITA Configuration and Specialization Tutorials

• Integrating a DITA Specialization (on page 2624)
Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (on page 85) and edit the actions to insert the element names, as specified in your specialization. See Creating/Extending a Custom Framework (on page 1772) for more details.

Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (on page 2502).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

Note: If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, https://www.maxprograms.com/products/fluenta.html).

Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: https://lists.oasis-open.org/archives/dita/201301/msg00029.html.

3. Avoid profiling/filtering content at inline level, for similar reasons.

**General DITA Project Structure**

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

**General Translation Workflow**

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The DITA Translation Package Builder Add-on (on page 2105) could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as “localization service provider”).
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder (on page 2628).

**Publishing Translated Content**

All of your translated DITA maps and topics should have the xml:lang attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA <note> element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages: Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language (on page 1407).

**Liability**

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.

**Other Resources**

Here are some links to other resources that might help you with translating DITA projects:

- DITA Translation: Organizing Your DITA Files
- DITA Translation: Using XLIFF to Translate DITA Projects
- WhP Localization Services Blog Page
Master Files Support in DITA

Oxygen XML Editor includes a feature that allows you to define Master Files (on page 2645) at project level. This feature is typically used in Oxygen XML Editor for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (on page 2381), the root map (on page 2648) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Master Files support in DITA to update all the references to moved or renamed resources in the scope of the Master Files, and since the root map (on page 2648) will be set as the Master File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Project view (on page 316), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Master Files Support in DITA

To use the Master Files support in DITA, follow these steps:

1. Go to the Project view (on page 316) and enable Master Files support with one of the following methods:
   - Select Enable Master Files Support from the ☰, Settings menu in the top-right corner.
   - Select Enable Master Files Support from the contextual menu of the project root folder. If a disabled Master Files folder exists, you can also select that option from its contextual menu.
   - Click the Enable button in the tooltip located at the bottom. This tooltip window is displayed when the Master Files support is disabled. Clicking the Read more link takes you to the user guide. Clicking the Enable button opens the Enable Master Files dialog box. This dialog box contains general information about the Master Files Support and allows you to enable it.

   **Warning:** Once you close this window tip, Oxygen XML Editor hides it for all projects. You can make the window tip reappear by resetting Oxygen XML Editor to its default settings (on page 241). However, doing so will result in you losing your customized options.

2. Add the main DITA map (root map) (on page 2648) to the Master Files folder by doing one of the following:
   - Right-click the project root folder and select ⚒ Detect Master Files.
   - Right-click the Master Files folder and select ⚒ Detect Master Files from Project.
   - If you enabled the Master Files support from the tooltip at the bottom of the Project view, you can also use the Detect and Enable button in the resulting dialog box to detect the master files from the current project.
   - Manually add the root map (on page 2648) to the Master Files folder by doing one of the following:
     - Right-click a file from your project and select 🔄 Add to Master Files from the contextual menu (or simply drag and drop it into the Master Files folder).
Select Add Files or Add Edited File from the contextual menu of the Master Files folder.

Tip: You can set multiple maps in the Master Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (on page 2384).

3. [Alternative] If you have a defined DITA Open Toolkit project XML file (on page 2624) you can add it to the Master Files folder. Once you do that the application will know the dependencies between all resources directly and indirectly referenced from the project file, including DITA maps, topics, binary resources and DITAVAL filter files.

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Master Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the Project view (on page 316) and Oxygen XML Editor will offer the option of updating all the references to the moved or renamed resources in the scope of the Master Files (in this case, the main DITA map (root map) (on page 2648)).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable Master Files support and add your root DITA map (on page 2648) to the Master Files folder as described in the How to Enable Master Files Support in DITA (on page 2629) section above.
2. Go to the Project view (on page 316), and use one of the following methods to move or rename the resources:

   **Moving Resources**

   To move resources in the Project view (on page 316), do one of the following:
   - Simply drag and drop the resource to the new location in the tree structure (the Enable drag-and-drop in Project view option must be selected in the View preferences page (on page 234)).
   - Use the Cut, Copy, and Paste actions from the contextual menu.
   - Right-click the resource and select Refactoring > Move resource action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the Move resource dialog box.

   **Result:** In all cases, a Move resource dialog box will be presented.

   **Renaming Resources**

   To rename resources in the Project view (on page 316), do one of the following:
   - Select the resource and press F2, or simply left-click again, until the in-place editor allows you to change the file name.
   - Right-click the resource and select Rename or Refactoring > Rename resource.

   **Result:** In all cases, a Rename resource dialog box will be presented.
3. Make sure the **Update references of the moved resource(s)** option is selected in the resulting **Move** or **Rename** dialog box and keep the scope as **master files** to make sure all the references to the moved or renamed resource are updated.

**DITA Resource Hierarchy/Dependencies View**

The **Resource Hierarchy/Dependencies** view displays the hierarchy or dependencies for resources included in an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the hierarchy or dependencies for a DITA resource (maps or topics), right-click a resource in the **Project view (on page 316)** and either select **Resource Hierarchy** or **Resource Dependencies**.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the **Show Dependencies** button on the toolbar of the **Resource Hierarchy/Dependencies** view, select the **All files** filter in the file browser, find the particular resource, and double-click it.

**Figure 745. Resource Hierarchy/Dependencies View**

The following actions are available on the toolbar of the **Resource Hierarchy/Dependencies** view:

- **Refresh**
  
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  
  Stops the hierarchy/dependencies from computing.

- **Show Hierarchy**
  
  Compute the hierarchy structure.

- **Show Dependencies**
  
  Compute the dependencies structure.
Configure dependencies search scope

Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple working sets (on page 2649). If the Use only Master Files, if enabled checkbox is selected, the scope of the search is restricted to the Master Files directory (on page 2628).

History

Provides access to the list of previously computed dependencies. Use the Clear history button to remove all items from this list.

The contextual menu for a resource listed in the Resource Hierarchy/Dependencies view contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Opens the Move resource dialog box where the following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - As long as Master Files support is enabled (on page 2628), you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A Preview option is available that allows you to see what will be updated before selecting Move to process the operation.

Rename resource

Opens the Rename resource dialog box where the following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - As long as Master Files support is enabled (on page 2628), you can select this option to update the references to the resource you are renaming. A Preview option is available that allows you to see what will be updated before selecting Rename to process the operation.

Resource Hierarchy
Shows the hierarchy for the selected resource.

**Resource Dependencies**

Shows the dependencies for the selected resource.

**Add to Master Files**

Adds the currently selected resource in the Master Files directory.

**Expand All**

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

**Collapse All**

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon.

## Search and Rename Actions for IDs in DITA

Oxygen XML Editor allows you to search references to ID attributes (either direct references using the @href and @conref attributes or indirect references using @keyref or @conkeyref attributes) or to rename the id attribute in all the declared and referenced locations. The main benefit of this feature is the fact that it allows you to rename @id attributes (or search for their references) in the scope of the entire project. It also works for IDs defined inside DITA maps and then referenced in maps and topics.

In **Author** mode, these operations are available for DITA documents in the contextual menu (grouped in the Manage IDs submenu). In **Text** mode, these actions are also available in the Quick Assist menu. To access it, place the cursor inside the value of an @id attribute and click the yellow light bulb icon.

The possible actions include:

**Rename in**

Renames the ID and all of its occurrences. Selecting this action opens a dialog box where you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

**Rename in File (Available in the Text mode only)**

Renames the ID you are editing and all its occurrences in the current file.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project.

**Search References in**

Searches for the references of the ID and you can choose the scope of the operation or configure working sets to use for the scope.

**Search Declarations (Available in the Text mode only)**
Searches for the declaration of the ID reference. By default, the scope of this action is the current project.

**Search Declarations in (Available in the Text mode only)**

Searches for the declaration of the ID reference and you can choose the scope of the operation or configure working sets to use for the scope.

**Search Occurrences in file**

Searches for the declaration and references of the ID in the current document and presents the results in the message panel at the bottom of the application.

**Change scope (Available in the Quick Assist menu in Text mode only)**

Opens a dialog box where you can choose the scope of the operation or configure working sets to use for the scope.

**Tip:** A quick way to go to the declaration of an ID in Text mode is to move the cursor over an ID reference and use the Ctrl + Single-Click (Command + Single-Click on OS X) navigation.

Selecting an ID that you use for search or refactor operations differs between the Text and Author modes. In the Text mode, you position the cursor inside the declaration or reference of an ID. In the Author mode, Oxygen XML Editor collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

**Related Information:**
- Master Files Support in DITA (on page 2628)

## Metadata

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

### Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `<prolog>` element of a topic or inside the `<topicref>` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

### Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using
subject scheme maps (on page 2648). When you are authoring, many of the values you choose from have been defined in subject scheme maps.

Migrating MS Office Documents to DITA

Oxygen XML Editor integrates the entire DITA for Publishers plugins suite and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see Migrating Various Document Formats to DITA (on page 2637).

Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Oxygen XML Editor Batch Converter Add-on (Multiple Documents)

1. Use the Oxygen Batch Converter add-on (on page 2101) to convert each Word document to a DITA topic.
2. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.
3. If the converted DITA topic contains multiple sections inside and you want to split the sections in multiple topics, you can use the Convert Sections to New Topics refactoring action (on page 2446) to do that.

Smart Paste (Single Document)

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor and create a new DITA topic.
3. Paste the selected content in Author mode. The Smart Paste functionality (on page 505) will attempt to convert the content to DITA.

HTML to DITA (Single Document)

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   • In Oxygen XML Editor, select File > Import > HTML File to import it as XHTML. Then, open the XHTML in Oxygen XML Editor and use one of the XHTML to DITA Transformation Scenarios (on page 1136) to convert the content to DITA.
   • Open the HTML file in any Web browser, select all of its content, and copy it. Then, open Oxygen XML Editor, create a new DITA topic, and paste the selected content in Author mode. The Smart Paste functionality (on page 505) will attempt to convert the HTML content to DITA.

Word to LibreOffice to DITA (Single Document)

1. Open the document in the free LibreOffice application and save it as DocBook.
2. Open the DocBook document in Oxygen XML Editor.
3. Run the built-in transformation scenario called DocBook to DITA (on page 1212).
4. You may need to make some manual adjustments for elements that couldn't be mapped.

**Word to DITA using DITA For Publishers (Single Document)**

1. Save the document in the MS Word DOCX format.
2. Open it in the Archive Browser view (on page 1654) in Oxygen XML Editor and then open the document.xml file contained in the archive.
3. Run the built-in transformation scenario (on page 2564) called DOCX DITA. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a DITA map and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content. The XSLT conversion is part of the DITA For Publishers plugins and there is documentation for it available here: http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html.

**Word to DocBook to DITA (Multiple Documents)**

1. Use a tool to convert the documents to DocBook. For example, Pandoc is a free document converter engine that can convert DOCX documents to DocBook and according to Pandoc's manual, you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted DocBook documents somewhere in your project.
3. Perform a batch transformation (on page 1294) on all the newly converted DocBook documents:
   a. Select all the DocBook documents in the Project view (on page 316).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (on page 1212).
4. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

**Word to HTML/Markdown to DITA (Multiple Documents)**

1. Use a tool to convert the documents to HTML or Markdown. For example, Pandoc is a free document converter engine that can convert DOCX documents to those formats.
2. Use Oxygen's Batch Converter add-on (on page 2101) to convert the documents to DITA.
3. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

**Migrating Excel and Other Types of Spreadsheets to DITA**

There are two possibilities for converting Microsoft Excel (or other similar types of documents) to DITA:

- Copy the spreadsheet content and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 505) will attempt to convert the content to DITA.
- Use Oxygen's Batch Converter add-on (on page 2101) to convert one or more spreadsheet documents to DITA.
Migrating Various Document Formats to DITA

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Migrating Microsoft Office and Other Similar Types of Documents to DITA

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see Migrating MS Office Documents to DITA (on page 2635).

Migrating DocBook Content to DITA.

Since DocBook content is already in XML format, migrating it to DITA is more straightforward than with other non-XML formats:

1. Convert the DocBook content to a single large DITA composite file by performing a batch transformation (on page 1294) on all the DocBook documents:
   a. Select all the DocBook documents in the Project view (on page 316).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (on page 1212).
2. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Tip: There is also a utility XSLT stylesheet available on the Oxygen XML GitHub account that can be used convert a DITA composite file to a DITA map with separate DITA topic files. It can be found here: https://github.com/oxygenxml/old-userguide-docbookbased/blob/master/split-DITA-topic.xsl.

Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:

• Copy the content from Google Docs and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 505) will attempt to convert the content to DITA.
• Save the Google document as OpenDocumentFormat (ODF), then open it in the free LibreOffice application and save it as DocBook. Next, open the DocBook document in Oxygen XML Editor and run the built-in transformation scenario called DocBook to DITA (on page 1212).
• If you want to convert multiple Google documents at once, save the documents as HTML, then use Oxygen's Batch Converter add-on (on page 2101) to convert the documents to DITA.

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

**Migrating Markdown Content to DITA**

There are several possibilities to convert Markdown content to DITA:

• The DITA Open Toolkit publishing engine bundled with Oxygen XML Editor allows you to reference Markdown files directly in a DITA map and either publish them directly or export the Markdown files to DITA one by one. For details, see Working with Markdown Documents in DITA (on page 2495).
• If you want to convert multiple Markdown files at once, you can use Oxygen's Batch Converter add-on (on page 2101) to convert the documents to DITA.

**Migrating HTML Content to DITA**

There are several possibilities to convert HTML content to DITA:

• Copy the HTML content and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 505) will attempt to convert the content to DITA.
• Convert the HTML file to XHTML by selecting File > Import > HTML File. Then, open the XHTML file and use one of the XHTML to DITA Transformation Scenarios (on page 1136) to convert the content to DITA.
• If you want to convert multiple HTML files at once, you can use Oxygen's Batch Converter add-on (on page 2101) to convert the documents to DITA.

**Migrating Unstructured FrameMaker to DITA**

There is a FrameMaker plugin that can be used for this type of conversion: http://leximation.com/tools/info/fm2dita.php.

**Migrating MadCap Content to DITA**

Some recent MadCap versions seem to have facilities to export content directly to DITA. Otherwise, you will need to convert XHTML content to DITA with a custom XSLT stylesheet to preserve variable references.

**Migrating Other Formats to DITA**

You may find third-party applications (such as Pandoc) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.
**DITA 1.3 Support**

Starting with version 17.1, Oxygen XML Editor includes support for some DITA 1.3 features.

The Oxygen XML Editor publication of the full DITA 1.3 specifications can be found at [https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html](https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html).

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 3.4 is used]</th>
</tr>
</thead>
<tbody>
<tr>
<td>DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.</td>
<td>New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3 Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements</td>
<td>N/A</td>
</tr>
<tr>
<td>Learning Object and Group maps</td>
<td>New document templates</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>Troubleshooting specialization</td>
<td>Create and edit new troubleshooting topics</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>XML markup domain</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Equation and MathML domain</td>
<td>Validation and content completion Display and Insert equations</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>SVG domain</td>
<td>Validation and content completion Display referenced SVG content</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Other new DITA 1.3 elements (div, strike-through, overline, etc)</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Feature</td>
<td>Editing</td>
<td>Publishing [DITA Open Toolkit 3.4 is used]</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td>Release management domain</td>
<td>Validation and Content Completion</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td><strong>Scoped keys (on page 2528)</strong></td>
<td>Define key scopes</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td></td>
<td>Validate and check for completeness</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Resolve <code>keyrefs</code> and <code>conkeyrefs</code> taking key scopes into account</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Key scope information is displayed in a tooltip when hovering over an item in the <strong>DITA Maps Manager</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Branch filtering (on page 2529)</strong></td>
<td>Display, create, and edit <code>ditavalref</code> elements</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td>Key-based cross deliverable addressing</td>
<td>Special display for references to <code>DITA maps</code> with <code>scope=&quot;peer&quot;</code> and a defined <code>keyscope</code></td>
<td>Not implemented.</td>
</tr>
<tr>
<td></td>
<td>Gather and present keys from peer maps</td>
<td></td>
</tr>
<tr>
<td>Shorthand to address syntax that identifies elements in the same topic</td>
<td>Properly resolved for validation, links, and conrefs</td>
<td>Implemented</td>
</tr>
<tr>
<td>Various table attributes (<code>orientation</code>, <code>rotation</code>, <code>scope</code>, and <code>headers</code> on cells)</td>
<td>Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view</td>
<td>Not implemented</td>
</tr>
<tr>
<td><strong>New Map <code>topicref</code> attributes (<code>cascade</code>, <code>deliveryTarget</code>)</strong></td>
<td>Allow setting new attributes, propose proper values for them</td>
<td>Implemented</td>
</tr>
</tbody>
</table>

Related Information:
- Watch our DITA 1.3 video tutorial for more information about key scopes and branch filtering.
Glossary

Active Cell

*Active cell* refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The *active cell* is bounded by a heavy border.

Alternate CSS Style

The *Alternate CSS Style* refers to the choices in the bottom half of *Styles* drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in *Author* mode and the output without having to edit the CSS stylesheets. By default, the *alternate styles* are applied like layers, they are merged sequentially with the *main CSS style (on page 2645)*, and you can activate any number of them. However, if you deselect the *Enable multiple selection of alternate CSSs option (on page 93)* in the *CSS* subtab of the *Document Type* configuration dialog box (on page 87), the *alternate styles* are treated like *main CSS styles (on page 2645)* and you can only select one at a time.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1810).

Anchor

An *Anchor* is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the *@href* attribute with a # symbol followed by the anchor that is defined in a target ID (for example: `href="MyTopic.dita#anchor"`).

Apache Ant

*Apache Ant* (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A *block element* is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.

Bookmap

A *bookmap* is a specialized *DITA map* used for creating books. A *bookmap* supports book divisions such as chapters and book lists such as indexes.
Callout

A callout is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor uses callouts to present comments and other types of review modifications.

Canonicalize

To canonicalize something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The Content Completion Assistant refers to a very helpful mechanism in Oxygen XML Editor that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode (on page 507)
- Content Completion Assistant in Text Mode (on page 429)
- Content Completion Assistant in Grid Mode (on page 481)
- Content Completion in XSLT Stylesheets (on page 749)
- Content Completion in Ant Build Files (on page 788)
- Content Completion in XML Schema (on page 840)
- Content Completion in XQuery (on page 878)
- Content Completion Assistance in WSDL Documents (on page 893)
- Content Completion in CSS Stylesheets (on page 916)
- Content Completion in LESS Stylesheets (on page 920)
- Content Completion in Relax NG Schemas (on page 927)
- Content Completion in NVDL Schemas (on page 942)
- Content Completion in JavaScript Documents (on page 987)
- Content Completion in Schematron Documents (on page 996)
- Content Completion in SQF (on page 1020)

Dockable

A Dockable window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.
Document Fragment

A **document fragment** represents a portion of an XML document's tree of nodes or content.

Document Type Association

In general terms, a **Document Type Association** is a set of rules that associate a document type with a framework (on page 2643). In Oxygen XML Editor, **Document Type Association** also specifically refers to a preferences page (on page 85) where you can create new custom frameworks or edit existing ones. Note that frameworks (document types) that come built-in with Oxygen XML Editor are read-only, but you can Extend (on page 85) or Duplicate (on page 85) them to configure them as custom frameworks.

DITA Map

A **DITA map** is a component of the DITA framework (on page 2643) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension .ditamap.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or bookmap (on page 2641) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA-OT-DIR

**DITA_OT_DIR** refers to the default directory that is specified for your DITA Open Toolkit distribution in the Options > Preferences > DITA preferences page (on page 201).

For example, if you are using DITA-OT 3.4 that comes bundled with Oxygen XML Editor, the default directory is: [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x. You can also specify a custom directory.

Foldable Element

A **foldable element** refers to elements that can be collapsed and expanded in Oxygen XML Editor. **Foldable elements** are marked with a small triangle (˄ / ˅) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (Collapse Other Folds, Collapse Child Folds, Expand Child Folds, Expand All).

Framework

A **framework** refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. A **framework** is associated to an XML document
type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Editor includes a Document Type Configuration Dialog Box (on page 87) that allows you to define the set of rules and customize various authoring mechanisms for new or existing frameworks.

For advanced details about customizing your own framework, see the Creating and Configuring Custom Frameworks (on page 1772) section.

Global Options

Global Options refers to the storage option (on page 238) in the Oxygen XML Editor preference pages (Options > Preferences). If you select Global Options (on page 239), the options in that particular preferences page are stored locally on your computer and are not accessible to other users (unless you export them into an XML options file (on page 240) that can then be shared).

IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An inline element is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a block element, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the jar command or an archive tool.

Key Space

The concept of a Key Space in DITA refers to a set of all possible keys that can be used in a DITA map structure. A Key Space is established when a root map (on page 2648) defines a set of effective key bindings. When Oxygen XML Editor processes key references, it determines the effective binding of a given key to a resource in the context of the specified root map (on page 2396).

Keystore

A Keystore is an encrypted file that contains private keys and certificates. There are two types of keystores that are supported in Oxygen XML Editor:

- Java Key Store (JKS)
• Public-Key Cryptography Standards version 12 (PKCS-12)

Main CSS Style

The **Main CSS Style** refers to the selection in the top half of the Styles drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in Author mode and the output without having to edit the CSS stylesheets. The main CSS applies to the whole document and you can also select one or more alternate styles ([on page 2641](#)) (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the main CSS style.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework ([on page 1810](#)).

Master File

A **Master File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the Master Files Support ([on page 330](#)) section.

Named User

**Named User** is defined as an individual full or part-time employee who is authorized by You (the individual or entity who owns the rights for Oxygen XML Editor) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, Named User licenses cannot be shared among multiple individuals and separate Named User licenses must be purchased for each individual user.

A Named User license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the Named User’s employment with your company.
- (b) Permanent reassignment of a Named User to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an Oxygen license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the Named User license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

**Note:** This definition is taken from the Oxygen XML Editor End User License Agreement.

**Oxygen Publishing Template**

**Oxygen Publishing Template** defines all the aspects related with the **look and feel** (layout and styles) for the **WebHelp Responsive** output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the WebHelp Responsive output.
Perspective

In Oxygen XML Editor, a **perspective** refers to an interface layout geared towards a specific editing environment. Each perspective includes a unique set of interface objects, toolbars, views, and features. You can change the perspective by selecting the respective icon in the top-right corner of Oxygen XML Editor or by selecting the perspective from the **Window > Open Perspective** menu.

The perspectives that are available in Oxygen XML Editor are:

- **Editor (on page 266)** - The most commonly used perspective and it is used to edit XML documents.
- **DITA (on page 268)** - Provides an editing environment with default side-views and other interface components that are optimal for working with DITA projects.
- **XSLT Debugger (on page 269)** - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.
- **XQuery Debugger (on page 270)** - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment.
- **Database (on page 271)** - Used to browse and manage databases.

Plugin

A **plugin** (also referred to as add-on or extension) is a component that adds specific features to an existing application. Oxygen XML Editor supports plugins to enable numerous customizations.

For more information, see the following topics:

- Installing and Updating Add-ons (on page 69)
- Packing and Deploying Plugins as Add-ons (on page 2034)
- Add-ons Preferences (on page 84)
- Extending Oxygen XML Editor with Plugins (on page 2003)
- General Configuration of an Oxygen XML Editor Plugin (on page 2003)

Pretty-Print

**Pretty-print** refers to formatting and indenting the source code in **Text** mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor include:

- **Format and Indent Element** - Available in the **Source** submenu of the contextual menu for the current element.
• **Format and Indent** - Available on the toolbar for the entire current document.
• **Format and Indent Files** - Available in the contextual menu of the Project view (on page 316) for one or more selected files.

**Project Options**

*Project Options* refers to the storage option (on page 238) in the Oxygen XML Editor preference pages (Options > Preferences). If you select *Project Options* (on page 239), the options in that particular preferences page are stored at project level in the project file (.xpr), which can easily be shared with other users (on page 240).

**QName**

*QName* stands for "qualified name" and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

**Quick Assist**

The *Quick Assist* feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help ( ⊱) placed at the current line in the stripe on the left side of the editor in Text mode. You can also invoke the quick assist menu by using the Alt + 1 (Meta + Alt + 1 on Mac OS X) keyboard shortcuts.

**Quick Fix**

The *Quick Fix* support in Oxygen XML Editor helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. *Quick Fixes* are available in Text mode and Author mode and they can be presented and activated in several ways.

• When hovering over an area of text where a validation error or warning occurs, the *Quick Fix* proposals can be presented as links in a tooltip pop-up window.
• When hovering over an error or warning in Author mode, the *Quick Fix* proposals are presented in a small drop-down menu.
• If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (❓) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
• If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the *Quick Fix* menu by pressing Alt + 1 (Command + Alt + 1 on OS X) on your keyboard.

Oxygen XML Editor also provides support for defining and customizing a library of *Quick Fixes* using the Schematron language (on page 1009).
Root Map

A **Root Map** (or master map) specifies a DITA map (on page 2643) that defines a hierarchical structure of submaps that are contained within the root map. Essentially, the root map defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a key space (on page 2644)).

In Oxygen XML Editor, the DITA Maps Manager includes an option on its toolbar where you can easily specify the root map (on page 2384), but there are also several other ways to select or change the root map (on page 2396).

Space-Preserved Element

A **spaced-preserved element** refers to elements that require white spaces and line endings to be preserved (for example, DITA `<codeblock>` and `<pre>` elements).

Subject Scheme Map

A **Subject Scheme Map** allows you to create custom controlled attribute values and to manage metadata. Subject scheme maps use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the subject scheme map where those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include therapist, oncologist, surgeon, radiologist, and so on).

In a subject scheme map, you can define a list of these audience values and you can then use these values to profile your content. For more information, see Customizing Profiling Values with a Subject Scheme Map (on page 2605).

Track Changes

The **Track Changes** feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the Review view (on page 550).

For more information about this feature, see Managing Tracked Changes (on page 532).

WebHelp Output Directory

*WebHelp_OUTPUT_DIR* refers to the output directory where WebHelp transformation files will be generated.
The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

**Working Set**

A **Working Set** refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more *working sets* to restrict the scope to that specified set of files.

**XML Catalog**

An **XML Catalog** maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an **XML Catalog** becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor includes default global catalogs as well as default catalogs for each of the built-in frameworks (on page 2643), and you can also create your own. Oxygen XML Editor uses these **XML Catalogs** to resolve references for document validation and transformations. For more information, see **Working with XML Catalogs** (on page 690).
