Opens a dialog box for adding XSLT stylesheets (on page 1007) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

**XSLT Parameters**

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the Parameters button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 1007), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

**Example:**

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

**Note:**
1. The `doc` function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (on page 176) (such as `${cfdu}` [current file directory]) to specify other locations:
   
   `doc('${cfdu}/test.xml')`/*

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable (on page 176) can be inserted in the text box using the ✂️ Insert Editor Variables button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable (on page 176) can be inserted in the text box using the ✂️ Insert Editor Variables button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- Editor Variables (on page 176)

**XSLT Extensions**

The **Extensions** button opens a dialog box that allows you to specify the JARS (on page 2135) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:** You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).
An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the ↑ Move up or ↓ Move down buttons.

**Additional XSLT Stylesheets**

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

- **Add**
  Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (on page 176) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

- **Remove**
  Deletes the selected stylesheet from the Additional XSLT stylesheets list.

- **Up**
  Moves the selected stylesheet up in the list.

- **Down**
  Moves the selected stylesheet down in the list.

**Advanced Saxon HE/PE/EE XSLT Transformation Options**

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 168) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 9.9.1.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Mode ("-im")**
  A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 1008), the value in this option takes precedence.

- **Template ("-it")**
  A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 1008), the value in this option takes precedence.
Tip: If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Editor Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

Use a configuration file (`-config`)

Select this option if you want to use a Saxon 9.9.1.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger (on page 1541) to step into XPath expressions.

Enable Optimizations (`-opt`)

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering (`-l`)

Line numbers where errors occur are included in the output messages.

Expand attributes defaults (`-expand`)

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source (`-dtd`)

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors (`-warnings`)

Specifies how dynamic errors are handled. The following options can be selected:

- **Recover silently** ("silent") - Continues processing without reporting the error.
- **Recover with warnings** ("recover") - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery** ("fatal") - Issues an error and stops processing.
Strip whitespaces ("-strip")

Specifies how the strip whitespaces operation is handled. You can choose one of the following values:

- **All ("all")** - Strips all whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document.
- **Ignore ("ignorable")** - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips no whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.9.1.5 Professional Edition (PE) and Enterprise Edition (EE) only:

**Register Saxon-JS extension functions and instructions**

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.9.1.5 processors.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

**Allow calls on extension functions ("-ext")**

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

**Enable assertions ("-ea")**

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 9.9.1.5 Enterprise Edition (EE) are as follows:

**XML Schema version**

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (on page 47) and go
to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 155).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor Eclipse plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:
1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
                throws XPathException {
                long v0 = ((IntegerValue)arguments[0].next()).longValue();
                long v1 = ((IntegerValue)arguments[1].next()).longValue();
                long result = v0 << v1;
                return Value.asIterator(Int64Value.makeIntegerValue(result));
            }
        };
    }
}
```

2. Compile the class and add it to a JAR file.

3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

   Note: To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Editor Eclipse plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:
• If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 66).
• In a validation scenario (on page 488), you can use the Extensions button to open a dialog box where you can add libraries.
• In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1005) to open a dialog box where you can add libraries.

**FO Processor Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

• **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.
• **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 143).

**Output Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.
Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 129).
- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.
Attention: If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Oxygen XML Editor Eclipse plugin Browser View

The Oxygen XML Editor Eclipse plugin Browser view is automatically displayed in the views pane of the Eclipse window to display HTML output from XSLT transformations. It contains a tab for each file with HTML results displayed in the view.

![Figure 371. Browser View](image)

Oxygen XML Editor Eclipse plugin Text View

The Oxygen XML Editor Eclipse plugin Text view is automatically displayed in the views pane of the Eclipse window to display text output from XSLT transformations, FO processor info, warnings, and error messages. It contains a tab for each file with text results displayed in the view.

![Figure 372. Text View](image)

Text View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

- **Clear**
Removes all content from the view.

_copy_

Copies the selected content to the clipboard.

Select All

Selects all content in the view.

_Format and Indent_

Formats (pretty-prints (on page 2137)) the content in this view.

Find/Replace

Allows you to perform search and replace operations.

Save Results

Saves the content in the view to a file in text format.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor Eclipse plugin.

Supported XSLT Processors

Oxygen XML Editor Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2 - Xalan-Java** is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5 - Saxon 6.5.5** is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies version="1.0".

- **Saxon 9.9.1.5 Home Edition (HE), Professional Edition (PE) - Saxon-HE/PE** implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term basic XSLT 2.0 / 3.0 processor is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 9.9.1.5 Enterprise Edition (EE) - Saxon EE** is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

  The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 154).
Note: Oxygen XML Editor Eclipse plugin implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

Note: Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor Eclipse plugin.

• Saxon-CE (Client Edition) is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor Eclipse plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Note: A specific template, named Saxon-CE stylesheet, is available in the New from Templates wizard (on page 206).

• Xsltproc (libxslt) - Libxslt is the XSLT C library developed for the Gnome project. Libxslt is based on libxml2, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions. Oxygen XML Editor Eclipse plugin uses Libxslt through its command-line tool (Xsltproc). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the xsltproc executable is located.

Tip: As an example, a Windows installation of the Xsltproc engine would follow these steps:
1. Go to http://ftp.zlatkovic.com/libxml.en.html and download the following ZIP files:
   - iconv-1.9.2.win32.zip, libxml2-2.7.8.win32.zip, libxslt-1.1.26.win32.zip, zlib-1.2.5.win32.zip.
2. Unzip all of them into the same folder of your choice.
3. Edit the **PATH** environment variable and add the `bin` folder for all four archives:

```
D:\apache-maven-3.1.1\bin
D:\Python27
%PATH%
C:\Users\Desktop\abclibxslt-1.1.26.win32\bin
C:\Users\Desktop\abclibxml2-2.7.8.win32\bin
C:\Users\Desktop\abciconv-1.9.2.win32\bin
C:\Users\Desktop\abc\lib-1.2.5\bin
```

4. Restart Oxygen XML Editor Eclipse plugin.

**Result:** You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

**Note:** The Xsltproc processor can be configured from the **XSLTPROC options page** (on page 172).

**CAUTION:** There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in **XML Catalog (on page 2139)** files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in **XML catalog** files are stored in the `{OXYGEN_INSTALL_DIR}/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for **transformation (on page 1003)** and validation of XSLT stylesheets (on page 566).

Oxygen XML Editor Eclipse plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from [Microsoft web-site](http://www.microsoft.com).

- **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for **transformation (on page 1003)** and validation of XSLT stylesheets (on page 566).

Oxygen XML Editor Eclipse plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the `nxslt` command-line utility. The `nxslt` version included in Oxygen XML Editor Eclipse plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

You can get the .NET Framework version 1.0 from the [Microsoft website](http://www.microsoft.com).

- **.NET 1.0** - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft ([http://msdn.microsoft.com/xml/](http://msdn.microsoft.com/xml/)). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.
You can get the .NET Framework version 1.0 from the Microsoft website.

- **.NET 2.0** - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

### Configuring Custom XSLT Processors

Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to XML > XSLT-FO-XQuery > Custom Engines.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 158).
4. Click **OK**.

**Note:** You can not use these custom engines in the Debugger perspective (on page 1524).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor Eclipse plugin linked message (on page 484), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

**Related Information:**

- Custom Engines Preferences (on page 158)

### Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Saxon 6.5.5** - http://saxon.sourceforge.net/saxon6.5.5/extensions.html
- **Saxon 9.9.1.5** - http://www.saxonica.com/documentation9.5/index.html#extensibility
To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 1005) in the Edit scenario dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the XML transformation with XQuery scenario to apply a transformation to have an XQuery file query an XML file for the output results.

To create an XML transformation with XQuery scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XML transformation with XQuery.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1083). Click the New Scenario drop-down menu button and select XML transformation with XQuery.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 176) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 171), the XML input of the transformation is passed to that URI resolver.

**XQuery URL**

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 176) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver.
resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 158). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

*Advanced options*

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1022) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 168). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box (on page 1020) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you cannot use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes (on page 1021) that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**

For example, you can use expressions such as:

```xml
  doc('test.xml')//entry
  //person[@atr='val']
```
Note:

1. The doc function solves the argument relative to the XQuery file location. You can use full paths or editor variables (on page 176) (such as ${cfdu} [current file directory]) to specify other locations:
   \[ \text{doc('${cfdu}/test.xml')} // * \]
2. Only XPath functions are allowed.

Below the XPath functions are allowed.

New

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 176) can be inserted in the text box using the \[ \mathbb{A} \] Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 176) can be inserted in the text box using the \[ \mathbb{A} \] Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

- Editor Variables (on page 176)

XQuery Extensions

The Extensions button is used to specify the JAR (on page 2135) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.
An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the ⬆️ Move up or ⬇️ Move down buttons.

**Advanced Saxon HE/PE/EE XQuery Transformation Options**

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 163) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

**Saxon-HE/PE/EE Options**

The advanced options for Saxon 9.9.1.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

- **Use a configuration file (“-config”)**
  
  Sets a Saxon 9.9.1.5 configuration file that is used for XQuery transformation and validation scenarios.

- **Enable Optimizations (“-opt”)**
  
  This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

- **Use linked tree model (“-tree:linked”)**
  
  This option activates the linked tree model.

- **Recoverable errors (“-warnings”)**
  
  Specifies how dynamic errors are handled. The following options can be selected:

  - **Recover silently (“silent”)** - Continues processing without reporting the error.
  - **Recover with warnings (“recover”)** - Issues a warning but continues processing.
  - **Signal the error and do not attempt recovery (“fatal”)** - Issues an error and stops processing.

- **Strip whitespaces (“-strip”)**
  
  Specifies how the strip whitespaces operation is handled. You can choose one of the following values:

  - **All (“all”)** - Strips all whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document.
• **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

• **None ("none")** - Strips no whitespace before further processing.

### Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.9.1.5 Professional Edition (PE) and Enterprise Edition (EE) only:

- **Allow calls on extension functions ("-ext")**
  
  If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

### Saxon-EE Options

The advanced options that are specific for Saxon 9.9.1.5 Enterprise Edition (EE) are as follows:

- **Validation of the source file ("-val")**

  Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

  • **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

  • **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.

  • **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

### Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

### Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

### Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

### Backup files updated by XQuery ("-backup:(on|off)")
If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the Enable XQuery update option is selected.

### Other Options

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

### FO Processor Tab (XQuery Transformations)

When you [create a new transformation scenario](on page 1003) or [edit an existing one](on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor](on page 143).
Output Tab (XQuery Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Output tab contains the following options:

- **Present as a sequence**
  Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

- **Prompt for file**
  At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

- **Save As**
  The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the `Insert Editor Variables (on page 176)` button, or the `Browse` button.

- **Open in Browser/System Application**
  If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

  - **Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to `Window > Preferences > General > Web Browser` and specify it there.

  - **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

  - **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the `Insert Editor Variables (on page 176)` button, or the `Browse` button.

- **Open in editor**
  When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

- **Show in results view as**
  You can choose to view the results in one of the following:

  - **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 129).
• XHTML - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

• Image URLs are relative to - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

XML to PDF Transformation with CSS

This type of transformation uses the Oxygen PDF Chemistry processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an XML to PDF transformation with CSS scenario, use one of the following methods:

  • Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XML to PDF transformation with CSS.

  • Go to Window > Show View and select Transformation Scenarios to display this view (on page 1083). Click the New Scenario drop-down menu button and select XML to PDF transformation with CSS.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

For more information about the Oxygen PDF Chemistry processing engine and numerous tips for customizing the output, see the Oxygen Chemistry User Guide.

CSS Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The CSS tab contains the following options:

  XML URL
Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the \icon{Insert Editor Variables (on page 176)} button, or the browsing actions in the \icon{Browse} drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**CSS URL**

Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its history drop-down, the \icon{Insert Editor Variables (on page 176)} button, or the browsing actions in the \icon{Browse} drop-down list.

**Apply CSS stylesheets set in the current framework**

If selected, CSS stylesheets that are specified in the framework (in the Document Type configuration CSS subtab (on page 67)) are applied to the transformation in addition to any CSS referenced directly in the document or specified in the CSS URL field (on page 1027).

**Note:** If CSS files are specified in multiple ways, the transformation applies the CSS in the following order (from lowest priority to highest):

- CSS files that are specified in the framework (in the Document Type configuration CSS subtab (on page 67)).
- CSS files referenced directly in the document.
- CSS files specified in the CSS URL field (on page 1027).

**Processor options link**

Opens the CSS-based Processors preferences page (on page 146) where you can configure some options for generating PDF output.

### Output Tab (XML to PDF Transformation with CSS)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output tab** contains the following options:

**Output File section**

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the \icon{Insert Editor Variables (on page 176)} button, or the \icon{Browse} button.

**Open in Browser/System Application**
If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows PDF files are often opened in Acrobat Reader).

**Debugging section**

**Dump the intermediate annotated XML**
Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

**Dump the FO file**
Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

**Console options link**
Opens the CSS-based Processors preferences page (on page 146) where you can configure some options for generating PDF output.

**DITA-OT Transformation**
This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor Eclipse plugin includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a DITA-OT Transformation scenario, use one of the following methods:

• Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the DITA Maps Manager toolbar, main toolbar, or the XML menu. Then click the New button and select DITA-OT Transformation.

• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1083). Click the New Scenario drop-down menu button and select DITA-OT Transformation.

Both methods open the DITA Transformation Type dialog box that presents the list of possible outputs.

**Figure 373. DITA Transformation Type Dialog Box**
Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Skins Tab (DITA-OT Transformations)**

When you create a new transformation scenario ([on page 1003](#)) or edit an existing one ([on page 1075](#)), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA-OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A **skin** is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

**Figure 374. Skins Tab**

The **Skins** tab includes the following sections:

**Built-In Skins**

This section presents the built-in skins that are included in Oxygen XML Editor Eclipse plugin. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the skin looks when applied on a sample documentation project that is stored on the Oxygen XML Editor Eclipse plugin website, click the **Online preview** link.

**Custom Skins**

You can use this section to customize the look of the output.
CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

Note: The output can also be styled by setting the `args.css` parameter in the Parameters tab. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the Skins tab.

Create custom skin

Use this link to open the WebHelp Skin Builder (on page 1240) tool.

Templates Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1129). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 375. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your
default browser providing a sample of how the main page will look when that particular template is used to generate the output.

**Built-in Templates Locations**

Oxygen XML Editor Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

**Custom Templates Locations**

Oxygen XML Editor Eclipse plugin scans the locations specified in the *DITA* > *Publishing* preferences page *(on page 59)* to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

**Selecting Custom Templates**

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template. You can also add your custom templates *(on page 1163)* to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the *DITA* > *Publishing* preferences page *(on page 59)* where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

**Save Template As Button**

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template *(on page 1281)*. Clicking this button will open a template package configuration dialog box *(on page 2062)* that contains some options and displays the parameters that will be exported to your template package.

**Template Errors**

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.
Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

**Sharing Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing** *(on page 59)* and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:

[https://www.youtube.com/embed/zNmXfKWXwO8](https://www.youtube.com/embed/zNmXfKWXwO8)

**Template Package Configuration Dialog Box**

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to **create your own custom template** *(on page 1281)*. The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the
template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 983) or [DITA Map to PDF - based on HTML5 & CSS](on page 990)). This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For [WebHelp Responsive](DITA Map WebHelp Responsive (on page 983)) customizations, select this option if you want to copy the default [HTML Page Layout Files](on page 1144) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map WebHelp Responsive](on page 983) or [DITA Map to PDF - based on HTML5 & CSS](on page 990)). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.
Related Information:

- Publishing Templates (on page 1129)
- Publishing Template Package Contents for PDF Customizations (on page 1275)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1132)

**FO Processor Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA-OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.
You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Editor Eclipse plugin.

**XEP**

The [RenderX](https://www.renderx.com) XEP processor. If XEP is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (on page 143).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor Eclipse plugin installation directory.

**Antenna House**

The [Antenna House](https://www.antennahouse.com) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor Eclipse plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters tab (on page 2065)**.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

**Related Information:**
- FO Processors Preferences (on page 143)
- XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 1059)

### Parameters Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs. The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (on page 176) selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the *ask editor variable (on page 177)* in the *Value* column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the *Value* of the parameter by using the **Insert Editor Variables (on page 176)** button or the **Browse** button.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

**Delete**
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

**Parameters Contributed by an Oxygen Publishing Template**

Transformation parameters that are defined in an Oxygen Publishing Template (on page 1274) descriptor file are displayed in italics. After creating a publishing template (on page 1281) and adding it to the templates gallery (on page 1163), when you select the template in the Templates tab (on page 2059), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:
- DITA Open Toolkit Documentation

**Feedback Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Feedback tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the DITA Map WebHelp Responsive transformation type. To add a comments component in the output, you need to use Oxygen Feedback to create a site configuration for the website where your WebHelp output is published and use this Feedback tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the Oxygen Feedback administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the Edit button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an Oxygen Publishing Template (on page 1274), either as an HTML fragment extension point (on page 1138) or as a transformation parameter (on page 1136) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the Feedback tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

**Filters Tab (DITA Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.
You can choose one of the following options to define filters:

**Use DITAVAL file**

If you already have a DITAVAL file associated with the DITA map (on page 2134), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 176) button, or the browsing actions in the Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

⚠️ **Attention:** If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2065)), that file takes precedence over a DITAVAL file specified here.

**Use profiling condition set**

Sets the profiling condition set (on page 2090) that will be applied to your transformation.

**Exclude from output all elements with any of the following attributes**

By using the New, Edit, or Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

### Advanced Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.
You can specify the following parameters:

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the Parameters tab (on page 2065) is used. You can specify the path by using the text field, the ![Insert Editor Variables](on page 176) button, or the ![Browse](button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as `-verbose`).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you
encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the **Java Home** text field.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (`OutOfMemoryError`).

**Libraries**

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR files or additional class paths) to be used by the transformer.

**Tip**: You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

**Output Tab (DITA-OT Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the Insert Editor Variables button, or the Browse button.

**Note:** If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).
Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Ant Transformation

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Editor Eclipse plugin runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (Apache Ant (on page 2132) version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

Tip: Certain Ant tasks require additional JAR libraries (for example, Ant mail tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the Output tab, click the Libraries button (on page 1042) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see https://ant.apache.org/manual/install.html#librarydependencies.

To create an Ant transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select ANT transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1083). Click the New Scenario drop-down menu button and select ANT transformation.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.
Options Tab (Ant Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Options tab allows you to specify the following options:

**Working directory**

The path of the current directory of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

**Build file**

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as -verbose ).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.

**Java Home**

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

**JVM Arguments**

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to -Xmx384m, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError).

**Libraries**

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR (on page 2135) files or additional class paths) to be used by the transformer.

**Tip:** You can specify the path to the additional libraries using wildcards (for example, ${oxygenHome}/lib/*.jar ).
Parameters Tab (Ant Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs. The Parameters tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable (on page 176) selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the ask editor variable (on page 177) in the Value column.

Below the table, the following actions are available for managing parameters:

New

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. You can specify the Value of the parameter by using the Insert Editor Variables (on page 176) button or the Browse button.

Edit

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Output Tab (Ant Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs. The Output tab contains the following options:

Open
Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

- **In System Application** - The file specified in the Open text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows PDF files are often opened in Acrobat Reader).
- **In Editor** - The file specified in the Open text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

### Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

### XSLT Transformation

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an XSLT transformation scenario, use one of the following methods:

- Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XSLT transformation.
- Go to Window > Show View and select Transformation Scenarios to display this view (on page 1083). Click the New Scenario drop-down menu button and select XSLT transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

### XSLT Tab

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XSLT tab contains the following options:

- **XML URL**
Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 176) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page (on page 171), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template (on page 1004) is specified in the scenario, the XML URL field can be empty. The XML URL field can also be empty if you use external XSLT processors (on page 1018). Otherwise, a value is mandatory in this field.

### XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 176) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the xml-stylesheet processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the XSL URL field.

### Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 158). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1007) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 168). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

### Parameters

Opens a Configure parameters dialog box (on page 1005) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets (on page 1005). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions.
and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XSLT extension JARS or classes (on page 1006) that define extension Java functions or extension XSLT elements used in the transformation.

**Additional XSLT stylesheets**

Opens a dialog box for adding XSLT stylesheets (on page 1007) that are applied on the main stylesheet specified in the XSL URL field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

**XSLT Parameters**

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the XSLT tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets (on page 1007), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

**Example:**

For example, you can use expressions such as:

```xml
<doc('test.xml')//entry
//person[@atr='val']
```

**Note:**

1. The `doc` function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (on page 176) (such as `$cfdu` [current file directory]) to specify other locations:

   ```xml
doc('$cfdu/test.xml')/*
```

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the Add Parameter dialog box that allows you to add a new parameter to the list. An editor variable (on page 176) can be inserted in the text box using the button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Edit**
Opens the Edit Parameter dialog box that allows you to edit the selected parameter. An editor variable (on page 176) can be inserted in the text box using the ➔ Insert Editor Variables button. If the Evaluate as XPath option is selected, the parameter will be evaluated as an XPath expression.

**Unset**
Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**
Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**
- Editor Variables (on page 176)

### XSLT Extensions

The Extensions button opens a dialog box that allows you to specify the JARS (on page 2135) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

**Tip:** You can specify the path to the resources using wildcards (for example, ${oxygenHome}/lib/*.jar).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the ↑ Move up or ↓ Move down buttons.

### Additional XSLT Stylesheets

Use the Additional XSLT Stylesheets button in the XSLT tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

**Add**

Adds a stylesheet in the Additional XSLT stylesheets list using a file browser dialog box. You can type an editor variable (on page 176) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

**Remove**
Deletes the selected stylesheet from the Additional XSLT stylesheets list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 168) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.9.1.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a configuration file (on page 1008), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a configuration file (on page 1008), the value in this option takes precedence.

Tip: If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Editor Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 9.9.1.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, by using the Insert Editor Variables button, or using the browsing actions in the Browse drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger (on page 1541) to step into XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important,
optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

**Line numbering ("-l")**

Line numbers where errors occur are included in the output messages.

**Expand attributes defaults ("-expand")**

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

**DTD validation of the source ("-dtd")**

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:** Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

**Recoverable errors ("-warnings")**

Specifies how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

**Strip whitespaces ("-strip")**

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.9.1.5 Professional Edition (PE) and Enterprise Edition (EE) only:
Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.9.1.5 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using http://[URL]). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 9.9.1.5 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the Preferences dialog box (on page 47) and go to XML > XML Parser > XML Schema and use the Default XML Schema version option (on page 155).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")
Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable streaming mode**

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

**Other Options**

**Initializer class**

Equivalent to the `--init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**Using Saxon Integrated Extension Functions**

Saxon, the transformation and validation engine used by Oxygen XML Editor Eclipse plugin, can be customized by adding custom functions (called Integrated Extension Functions) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```java
private static class ShiftLeft extends ExtensionFunctionDefinition {

    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[]{SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }
}
```
```java
public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
    return SequenceType.SINGLE_INTEGER;
}

@Override
public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
        public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
            throws XPathException {
            long v0 = ((IntegerValue)arguments[0].next()).longValue();
            long v1 = ((IntegerValue)arguments[1].next()).longValue();
            long result = v0<<v1;
            return Value.asIterator(Int64Value.makeIntegerValue(result));
        }
    };
}
```

2. Compile the class and add it to a JAR file.
3. Add a file called `net.sf.saxon.lib.ExtensionFunctionDefinition` that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

Note: To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Editor Eclipse plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the Classpath tab (on page 66).
- In a validation scenario (on page 488), you can use the Extensions button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the Extensions button in the XSLT tab (on page 1005) to open a dialog box where you can add libraries.

**FO Processor Tab (XSLT Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The FO Processor tab contains the following options:

- **Perform FO Processing**

  Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in Preferences) during the transformation.
Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the XSLT tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 143).

Output Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs. The Output tab contains the following options:

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the ✌️ Insert Editor Variables (on page 176) button, or the ✽️ Browse button.

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

ивают:

To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ✌️ Insert Editor Variables (on page 176) button, or the ✽️ Browse button.
Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting (on page 129).

- **XHTML** - This option is only available if Open in Browser/System Application is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  **Important:** When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the Open in Browser/System Application option instead.

- **Image URLs are relative to** - If Show in results view as XHTML is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

  **Attention:** If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this Output tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor Eclipse plugin.

Supported XSLT Processors

Oxygen XML Editor Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2 - Xalan-Java** is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.

- **Saxon 6.5.5 - Saxon 6.5.5** is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were
first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies version="1.0".

- **Saxon 9.9.1.5 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term **basic XSLT 2.0 / 3.0 processor** is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.

- **Saxon 9.9.1.5 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences (on page 154).

**Note:** Oxygen XML Editor Eclipse plugin implements a Saxon framework that allows you to create Saxon configuration files. Two templates are available: Saxon collection catalog and Saxon configuration. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:** Saxon can use the ICU-J localization library (saxon9-icu.jar) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the XSLT tab, click the Extensions button to open the list of additional libraries used by the transformation process.
4. Click Add and browse to the folder where you unpacked the downloaded archive and choose the saxon9-icu.jar file.

Note that the saxon9-icu.jar should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor Eclipse plugin.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor Eclipse plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

**Note:** Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.
**Note:** A specific template, named **Saxon-CE stylesheet**, is available in the **New from Templates wizard (on page 206)**.

- **Xsltproc (libxsit)** - **Libxsit** is the XSLT C library developed for the Gnome project. **Libxsit** is based on **libxml2**, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Editor Eclipse plugin uses **Libxsit** through its command-line tool (**Xsltproc**). Depending on your operating system, you must download the Libxsit libraries on your machine from [http://xmlsoft.org/XSLT/downloads.html](http://xmlsoft.org/XSLT/downloads.html) and place them in a local folder. Then you need to update the **PATH** environmental variable to contain the parent folder where the **xsltproc** executable is located.

**Tip:** As an example, a Windows installation of the Xsltproc engine would follow these steps:

1. Go to [http://ftp.zlatkovic.com/libxml.en.html](http://ftp.zlatkovic.com/libxml.en.html) and download the following ZIP files:
   - iconv-1.9.2.win32.zip
   - libxml2-2.7.8.win32.zip
   - libxsit-1.1.26.win32.zip
   - zlib-1.2.5.win32.zip
2. Unzip all of them into the same folder of your choice.
3. Edit the **PATH** environment variable and add the **bin** folder for all four archives:

   ![Edit environment variable](image)

4. Restart Oxygen XML Editor Eclipse plugin.

**Result:** You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

**Note:** The Xsltproc processor can be configured from the **XSLTPROC options page (on page 172)**.

**CAUTION:** There is a known problem where file paths that contain spaces are not handled correctly in the Libxsit processor. For example, the built-in **XML Catalog (on page 2139)** files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by Libxsit if Oxygen XML Editor Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in **XML catalog** files are stored in the **[OXYGEN_INSTALL_DIR]/frameworks** subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - **MSXML 4.0** is available only on Windows platforms. It can be used for **transformation (on page 1003)** and **validation of XSLT stylesheets (on page 566)**.

Oxygen XML Editor Eclipse plugin uses the Microsoft XML parser through its command-line tool **msxsl.exe**.

Since **msxsl.exe** is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from **Microsoft web-site**.
• **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation (on page 1003) and validation of XSLT stylesheets (on page 566).

Oxygen XML Editor Eclipse plugin performs XSLT transformations and validations using the .NET Framework XSLT implementation (System.Xml.Xsl.XslTransform class) through the nxslt command-line utility. The nxslt version included in Oxygen XML Editor Eclipse plugin is 1.6.

You should have the .NET Framework version 1.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 1.0** - A transformer based on the System.Xml 1.0 library available in the .NET 1.0 and .NET 1.1 frameworks from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

You should have the .NET Framework version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.

You can get the .NET Framework version 1.0 from the Microsoft website.

• **.NET 2.0** - A transformer based on the System.Xml 2.0 library available in the .NET 2.0 Framework from Microsoft. It is available only on Windows.

You should have the .NET Framework version 2.0 already installed on your system. Otherwise, you will get the following warning: MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.

You can get the .NET Framework version 2.0 from the Microsoft website.

### Configuring Custom XSLT Processors

Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to XML > XSLT-FO-XQuery > Custom Engines.
2. Click the + New button at the bottom of the dialog box.
3. Configure the parameters for the custom engine (on page 158).
4. Click OK.

**Note:** You can not use these custom engines in the Debugger perspective (on page 1524).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor Eclipse plugin linked message (on page 484), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.
Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- Saxon 6.5.5 - http://saxon.sourceforge.net/saxon6.5.5/extensions.html

To set an XSLT processor extension (a directory or a jar file), use the Extensions button (on page 1005) in the Edit scenario dialog box.

XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Editor Eclipse plugin installation package is distributed with the Apache FOP that is a Formatting Objects processor for transforming your XML documents to PDF. FOP is a print and output independent formatter driven by XSL Formatting Objects. FOP is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to Help > About > Libraries and search for Apache FOP.

Other FO processors can be configured in the FO Processors preferences page (on page 143).

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP (on page 1060).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)

   a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

   ```xml
   <fop version="1.0">
   <renderers>
   ```
b. Open the Preferences dialog box (on page 47), go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

2. Set the font on the document content.
   This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.
   - For DocBook documents you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1003) and set the font name (for example, Arial Unicode MS) to the body.font.family and title.font.family parameters.
   - For TEI documents you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (on page 1003) and set the font name (for example, Arial Unicode MS) to the bodyFont and sansFont parameters.
   - For DITA transformations to PDF using DITA-OT you should modify the following two files:
     - DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml - The <font-face> element included in each <physical-font> element that has the char-set="default" attribute must contain the name of the font (for example, Arial Unicode MS)
     - DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf - An <auto-detect> element must be inserted in the <fonts> element, which is inside the <renderer> element that has the mime="application/pdf" attribute:

Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

Important: On Windows, fonts are located into the C:\Windows\Fonts directory. On Mac, they are placed in /Library/Fonts. To install a new font on your system, it is enough to copy it in the Fonts
directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP (on page 1059).

1. Locate the font.

First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

**Note:** DITA PDF transformations have their own fop.xconf (DITA-OT-DIR/plugins/org.dita.pdf2/fop/fop/conf/fop.xconf). If the font is not installed in the system, it needs to be referenced in the fop.xconf.

   a. For information about registering the font in the FOP Configuration, see: https://xmlgraphics.apache.org/fop/2.3/fonts.html.

   b. Open the Preferences dialog box (on page 47), go to XML > XSLT/FO/XQuery > FO Processors, and enter the path of the FOP configuration file in the Configuration file text field.

3. Set the font on the document content.

This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

**DocBook Example:** For DocBook documents, you can start with the built-in scenario called DocBook PDF, edit the XSLT parameters (on page 1003), and set the font name (for example, Arialuni) to the body.font.family and title.font.family parameters.

**TEI Example:** For TEI documents, you can start with the built-in scenario called TEI PDF, edit the XSLT parameters (on page 1003), and set the font name (for example, Arialuni) to the bodyFont and sansFont parameters.

**DITA Example:** For DITA to PDF transformations using DITA-OT modify the following two files:

   • DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml - The <font-face> element included in each <physical-font> element that has the char-set="default" attribute must contain the name of the font.

   • DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf - A <font> element must be inserted in the <fonts> element, which is inside the <renderer> element that has the mime="application/pdf" attribute.

For more information, see: https://xmlgraphics.apache.org/fop/2.1/fonts.html.

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Editor Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Editor Eclipse plugin, use the following procedures to enable such support.
Adding Hyphenation Support for XML with XSLT Transformation Scenarios
If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Editor Eclipse plugin, follow this procedure:

1. Create a folder called `fop` in the `{OXYGEN_INSTALL_DIR}/lib` folder.
2. Download the compiled JAR (on page 2135) from OFFO.
3. Copy the `fop-hyph.jar` file into the `{OXYGEN_INSTALL_DIR}/lib/fop` folder.
4. Restart Oxygen XML Editor Eclipse plugin.

Adding Support for PDF Images
To add support for PDF images in an older version of Oxygen XML Editor Eclipse plugin, follow these steps:

1. Create a folder called `fop` in the `{OXYGEN_INSTALL_DIR}/lib` folder.
2. Download the `fop-pdf-images` JAR libraries.
3. Copy the libraries into the `{OXYGEN_INSTALL_DIR}/lib/fop` folder.
4. Restart Oxygen XML Editor Eclipse plugin.

How to Enable Debugging for FO Processor Transformations
If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:

1. Locate and edit the following configuration file: `{OXYGEN_INSTALL_DIR}/tools/config/log4j.xml`.
2. Note: You need write access to this folder, so if you do not have administrator permissions, you may first need to copy the file to another location where you have write access.
3. Edit the `<priority>` element (inside the `<root>` element) and change its value to `debug`.
4. Save the file in the original location.
5. Restart Oxygen XML Editor Eclipse plugin and re-run the transformation.
6. Tip: It is recommended that you use a small input file when trying to reproduce the problem, to make it easier to analyze the data in the log.
7. Once you are finished with the debugging session, remember to edit the `log4j.xml` file and change the `<priority>` element back to its original value. Otherwise, performance could be affected.

XProc Transformation
This type of transformation specifies the parameters and location of an XProc script.
A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an XProc transformation scenario, use one of the following methods:
• Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XProc transformation.
• Go to Window > Show View and select Transformation Scenarios to display this view (on page 1083). Click the + New Scenario drop-down menu button and select XProc transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:
• Integrating an External XProc Engine (on page 1066)
• Editing XProc Scripts (on page 789)

XProc Tab

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XProc tab contains the following options:

XProc URL

Specify the source XSL file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 176) button, or the browsing actions in the Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor

Allows you to select the XProc engine to be used for the transformation. You can select the Add-on for Calabash XProc engine or a custom engine that is configured in the XProc Preferences page (on page 157).

Inputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Inputs tab contains a list with the ports that the XProc script uses to read input data. Use the Filter text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the URL column.

The following actions are available for managing the input ports:
New

Opens an Edit dialog box that allows you to add a new port and its URL. The built-in editor variables (on page 176) and custom editor variables (on page 183) can be used to specify the URL.

Edit

Opens an Edit dialog box that allows you to modify the selected port and its URL. The built-in editor variables (on page 176) and custom editor variables (on page 183) can be used to specify the URL.

Delete

Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Parameters tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

List of Ports

In this section, you can use the New and Delete buttons to add or remove ports.

List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire parameters collection. You can use the New and Delete buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

Editor Variable Information

The built-in editor variables (on page 176) and custom editor variables (on page 183) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Outputs tab displays a list of output ports (along with the URL) collected from the XProc script. Use the Filter text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:
New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An editor variable *(on page 176)* can be inserted for the URL by using the ✂️. **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view** *(on page 281)*.

Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An editor variable *(on page 176)* can be inserted for the URL by using the ✂️. **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results view** *(on page 281)*.

Delete

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

**Open in Editor**

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

**Open in Browser/System Application**

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the ✂️. **Insert Editor Variables** *(on page 176)* button, or the browsing actions in the 📥. **Browse** drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

**Figure 381. XProc Transformation Results View**
Options Tab (XProc Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Options tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

- **List of Options**
  This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the Filter text box to search for a specific term in the entire options collection. You can use the New and Delete buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

- **Editor Variable Information**
  The built-in editor variables (on page 176) and custom editor variables (on page 183) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Calabash XProc Processor for Generating PDF Output

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="..//..//tools/xep/xep.xml"/>` system property. Edit the @file attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Editor Eclipse plugin.

Integrating an External XProc Engine

Oxygen XML Editor Eclipse plugin includes a bundled version of the Calabash XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a Processor drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the XProc preferences page (on page 157). Otherwise, if the external engine is Java-based, or it has validation support, or it has the ability to receive
parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Editor Eclipse plugin: https://github.com/xml-project/support-for-xmleditor. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: xprocAPI.zip.

To create an XProc integration project, follow these steps:

1. Move the oxygen.jar file from {OXYGEN_INSTALL_DIR}/lib to the lib folder of your project.
2. Implement the ro.sync.xml.transformer.xproc.api.XProcTransformerInterface interface.
3. Create a Java archive (JAR) (on page 2135) from the classes you created.
4. Create an engine.xml file according to the engine.dtd file. The attributes of the <engine> element are as follows:
   a. name - The name of the XProc engine.
   b. description - A short description of the XProc engine.
   c. class - The complete name of the class that implements ro.sync.xml.transformer.xproc.api.XProcTransformerInterface.
   d. version - The version of the integration.
   e. engineVersion - The version of the integrated engine.
   f. vendor - The name of the vendor / implementer.
   g. supportsValidation - true if the engine supports validation (otherwise, false).

   The <engine> element has only one child, <runtime>. The <runtime> element contains several <library> elements with the @name attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named MyXprocEngine) and place the engine.xml and all the libraries necessary to run the new integration in that folder.
6. Place that new folder (e.g. MyXprocEngine) inside a new plugin folder. This new plugin folder should also contain a plugin.xml file that points to the new engine folder (e.g. MyXprocEngine).

The plugin.xml file would look like this:

```xml
<plugin
  id="morgana.xproc.addon"
  name="Contribute Morgana XProc"
  description="Contribute Morgana XProc"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="AdditionalXProcEngine" path="MyXprocEngine/"/>
</extension>
```
Related Information:

- Editing XProc Scripts *(on page 789)*
- Creating an XProc Transformation Scenario *(on page 1062)*

**XQuery Transformation**

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

**Note:** When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()` . When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

1. Use the Configure Transformation Scenario(s) *(Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu. Then click the New button and select XQuery transformation.
2. Go to Window > Show View and select Transformation Scenarios to display this view *(on page 1083)*. Click the + (Create a new transformation scenario) drop-down menu button and select XQuery transformation.

Both methods open the New Scenario dialog box.

The upper part of the dialog box allows you to specify the Name of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**XQuery Tab**

When you create a new transformation scenario *(on page 1003)* or edit an existing one *(on page 1075)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The XQuery tab contains the following options:

**XML URL**

Specifies the source XML file. You can specify the path by using the text field, its history dropdown, the Insert Editor Variables *(on page 176)* button, or the browsing actions in the Browse dropdown list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:** If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page *(on page 171)*, the XML input of the transformation is passed to that URI resolver.

**XQuery URL**
Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the ➔ Insert Editor Variables (on page 176) button, or the browsing actions in the ➔ Browse drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

**Transformer**

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page (on page 158). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

**Advanced options**

Allows you to configure the advanced options of the Saxon HE/PE/EE engine (on page 1022) for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page (on page 168). For the current transformation scenario, these Advanced options override the options configured in that preferences page.

**Parameters**

Opens the Configure parameters dialog box (on page 1020) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you cannot use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

**Extensions**

Opens a dialog box for configuring the XQuery extension JARS or classes (on page 1021) that define extension Java functions or extension XSLT elements used in the transformation.

**XQuery Parameters**

The global parameters of the XQuery file used in a transformation scenario can be configured by using the Parameters button in the XQuery tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the Filter text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the XPath column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

**Example:**
For example, you can use expressions such as:

\[
\text{doc('test.xml')//entry \\
  //person[@atr='val']}
\]

**Note:**

1. The `doc` function solves the argument relative to the XQuery file location. You can use full paths or **editor variables (on page 176)** (such as `$(cfdu)` [current file directory]) to specify other locations: `doc('$cfdu/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An **editor variable (on page 176)** can be inserted in the text box using the ✖️ **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Edit**

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An **editor variable (on page 176)** can be inserted in the text box using the ✖️ **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

**Unset**

Resets the selected parameter to its default value. Available only for edited parameters with set values.

**Delete**

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

**Related Information:**

- **Editor Variables (on page 176)**
XQuery Extensions

The Extensions button is used to specify the JAR (on page 2135) and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the Add, Edit, and Remove buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the ↑ Move up or ↓ Move down buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the Saxon HE/PE/EE preferences page (on page 163) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.9.1.5 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 9.9.1.5 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Recoverable errors ("-warnings")

Specifies how dynamic errors are handled. The following options can be selected:

- Recover silently ("silent") - Continues processing without reporting the error.
- Recover with warnings ("recover") - Issues a warning but continues processing.
- Signal the error and do not attempt recovery ("fatal") - Issues an error and stops processing.

Strip whitespaces ("-strip")
Specifies how the strip whitespaces operation is handled. You can choose one of the following values:

- **All** ("all") - Strips all whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document.
- **Ignore** ("ignorable") - Strips all ignorable whitespace text nodes from source documents before any further processing, regardless of any @xml:space attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None** ("none") - Strips no whitespace before further processing.

**Saxon-PE/EE Options**

The following advanced options are specific for Saxon 9.9.1.5 Professional Edition (PE) and Enterprise Edition (EE) only:

**Allow calls on extension functions** (-ext)

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

**Saxon-EE Options**

The advanced options that are specific for Saxon 9.9.1.5 Enterprise Edition (EE) are as follows:

**Validation of the source file** (-val)

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation** ("strict") - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation** ("lax") - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

**Validation errors in the result tree treated as warnings** (-outval)

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

**Write comments for non-fatal validation errors of the result document**

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

**Enable XQuery update** (-update:(on|off))
This option controls whether or not XQuery update syntax is accepted. The default value is off.

**Backup files updated by XQuery ("-backup:(on|off)")**

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

**Other Options**

**Initializer class**

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

**FO Processor Tab (XQuery Transformations)**

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

**Perform FO Processing**

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external processor defined in Preferences) during the transformation.

**Input**

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the XQuery tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

**Method**

The output format of the FO processing. The available options depend on the selected processor type.

**Processor**

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor (on page 143).
Output Tab (XQuery Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

**Present as a sequence**

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

**Prompt for file**

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

**Save As**

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the [Insert Editor Variables (on page 176)] button, or the [Browse button].

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).

**Note:** To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

- **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the [Insert Editor Variables (on page 176)] button, or the [Browse button].

**Open in editor**

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

**Show in results view as**

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting (on page 129)].
• **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:** When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

• **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** (on page 176) button, or the **Browse** button.

### SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the **XML** menu. Then click the **New** button and select **SQL transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view (on page 1083). Click the **New Scenario** drop-down menu button and select **SQL transformation**.

Both methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

**Name**

The unique name of the SQL transformation scenario.

**SQL URL**

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 176) button, or the browsing actions in the **Browse** drop-down list.

**Connection**

Allows you to select a connection from a drop-down list. To configure a connection, use the **Advanced options** button to open the **Data Source** preferences page (on page 51).

**Parameters**

Allows you to add or configure parameters for the transformation.
Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

Note: Since transformation scenarios that are associated with built-in frameworks (on page 2135) are read-only, to edit one of these scenarios you will need to duplicate it and edit the duplicated scenario (on page 1077).

To configure an existing transformation scenario, follow these steps:

1. Select theConfigure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.

   Step Result: The Configure Transformation Scenario(s) dialog box (on page 1078) is opened.

2. Select the particular transformation scenario and click theEdit button at the bottom of the dialog box or from the contextual menu.

   Tip: You could also select the scenario and theEdit button in theTransformation Scenarios view (on page 1083) to achieve the same result.

Result: This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

Figure 382. Edit Scenarios Configuration Dialog Box

Transformation Types

The Configure Transformation Scenario(s) dialog box (on page 1078) contains a Type column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA-OT** - This type of transformation includes configurable options in the following tabs:
  - Templates Tab (on page 2059)
  - FO Processor Tab (on page 2063) (Available for PDF output)
Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.

   **Step Result:** The Configure Transformation Scenario(s) dialog box (on page 1078) is opened.

2. Select the particular transformation scenario and click the Duplicate button at the bottom of the dialog box or from the contextual menu.
Tip: You could also select the scenario and the Duplicate button in the Transformation Scenarios view (on page 1083) to achieve the same result.

Result: This will open an Edit scenario configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section (on page 1076).

Related Information:
- Creating New Transformation Scenarios (on page 1003)
- Editing a Transformation Scenario (on page 1075)

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the Configure Transformation Scenario(s) dialog box (on page 1078) or Transformation Scenarios view (on page 1083)), Oxygen XML Editor Eclipse plugin included an Apply Transformation Scenario(s) action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the Configure Transformation Scenario(s) dialog box (on page 1078) where you can choose the scenarios you want to apply.

The Apply Transformation Scenario(s) action can be initiated from any of the following methods:

- Use the Alt + Shift + T, T (Command + Alt + T, T on OS X) keyboard shortcut.
- Click the Apply Transformation Scenario(s) button on the main toolbar.
- Click the Apply Transformation Scenario(s) button on the toolbar in the Transformation Scenarios view (on page 1083).
- Right-click a file in the Navigator view (on page 221) and select Transform > Apply Transformation Scenario(s).
- Use the Apply Associated button in the Configure Transformation Scenario(s) dialog box (on page 1078).

Related Information:
- Creating New Transformation Scenarios (on page 1003)
- Editing a Transformation Scenario (on page 1075)
- Configure Transformation Scenario(s) Dialog Box (on page 1078)
- Transformation Scenarios View (on page 1083)
Configure Transformation Scenario(s) Dialog Box

You can use the Configure Transformation Scenario(s) dialog box for editing existing transformation scenarios (on page 1075) or creating new ones (on page 1003).

To open this dialog box, use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.

**Figure 383. Configure Transformation Scenario(s) Dialog Box**

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the Settings button allows you to configure the following options:

**Show all scenarios**
Select this option to display all the available scenarios, regardless of the document they are associated with.

**Show only the scenarios available for the editor**
Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

**Show associated scenarios**
Select this option to only display the scenarios associated with the document you are editing.

**Import scenarios**
This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:
- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds `imported` to the name of the imported scenario.

**Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a `scenarios` file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

**Middle Section**

The middle section of the dialog box displays the scenarios that you can apply to the current document. The following columns are used to display the transformation scenarios:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the **Show Type** contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Editor Eclipse plugin, see the Transformation Types section (on page 1076).
- **Storage** - If the **Show Storage** contextual menu option is selected, this column displays where a transformation scenario is stored.

To sort each column you can left-click its header. The contextual menu of each header also includes the following actions:

**Show Type**

Use this option to display the transformation type of each scenario.

**Show Storage**

Use this option to display the storage location of the scenarios.

**Group by Type**

Select this option to group the scenarios by their type.

**Group by Storage**

Select this option to group the scenarios by their storage location.

**Ungroup all**

Select this option to ungroup all the scenarios.

**Reset Layout**

Select this option to restore the default settings of the layout.

Each transformation scenario listed in the middle section of the dialog box also includes the following contextual menu actions:
Edit

This button opens the **Edit Scenario configuration dialog box** *(on page 1075)* that allows you to configure the options of the transformations scenario.

Duplicate

Use this button to create a **duplicate transformation scenario** *(on page 1077)*.

Remove

Use this button to remove custom transformation scenarios.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the *scenarios* file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds *imported* to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a *scenarios* file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Bottom Section

The bottom section of the dialog box contains the following actions and information:

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

**Note:** When this option is selected, the **Association** column is hidden.

New

This button allows you to **create a new transformation scenario** *(on page 1003)*.

Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the **Transformation Types section** *(on page 1076)*.
Oxygen XML Editor Eclipse Plugin 22.0 | 11 - Publishing | 1082

**Note:** If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Editor Eclipse plugin displays a warning message to inform you that this is not possible and gives you the option to create a duplicate transformation scenario (on page 1077) to edit instead.

**Duplicate**

Use this button to create a duplicate transformation scenario (on page 1077).

**Remove**

Use this button to remove transformation scenarios.

**Note:** Removing scenarios associated with a defined document type is not allowed.

**Associated scenarios section**

Displays the scenarios that are associated with the current document. Selecting a checkbox in the Association column (on page 1080) in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon (X) to the right of the scenario name.

**Save and close**

Saves the current configuration and closes the dialog box.

**Apply associated**

Use this button to apply the associated scenarios and run the transformation on the current document.

**Cancel**

Cancels any changes made in the dialog box and reverts to the previously saved association.

Your selections in the Configure Transformation Scenarios(s) dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

**Related Information:**

- Editing a Transformation Scenario (on page 1075)
- Duplicating a Transformation Scenario (on page 1077)
- Applying Associated Transformation Scenarios (on page 1078)
- Creating New Transformation Scenarios (on page 1003)
- Sharing Transformation Scenarios (on page 1083)
Batch Transformations

A transformation action can be applied on a batch of selected files from the contextual menu of the Navigator view (on page 225) without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. Select the files you want to transform and from the contextual menu, select Transform > Configure Transformation Scenario(s) to choose one or more transformation scenarios to be applied on all the files in the logical folder.

2. Use Oxygen XML Editor Eclipse plugin editor variables (on page 176) to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
   a. Edit the transformation scenario to make sure the appropriate editor variable (on page 176) is assigned for the input file. For example, for a DocBook PDF transformation, make sure the XML URL input box is set to the ${currentFileURL} editor variable (on page 180). For a DITA PDF transformation, make sure the args.input parameter is set to the ${cf} editor variable (on page 180).
   b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an XML transformation with XSLT, switch to the Output tab and set the path of the output file using a construct of editor variables (on page 176), such as ${cfd}/${cfn}.html.

3. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select Transform > Transform with from the contextual menu and the same previously associated scenario(s) will be applied.

4. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select Transform > Apply Transformation Scenario(s) from the contextual menu of the logical folder.

Related Information:
- Editor Variables (on page 176)

Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by exporting them to a specialized scenarios file (on page 175) that can then be imported.

Transformation Scenarios View

You can manage the transformation scenarios by using the Transformation Scenarios view. To open this view, select Window > Show View > Transformation Scenarios.
Oxygen XML Editor Eclipse plugin supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the Configure Transformation Scenario(s) dialog box (on page 1078).

By default, Oxygen XML Editor Eclipse plugin presents the items in the following order:

1. Scenarios that match the current framework (on page 2135).
2. Scenarios that match the current project.
3. Scenarios that match other frameworks.

**Toolbar/Contextual Menu Actions and Options**

The following actions and options are available on the toolbar or in the contextual menu:

- **Apply selected scenarios**
  Select this option to run the current transformation scenario.

- **Debug selected scenario**
  Select this option to switch to the Debugger perspective (on page 2137) and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).
This drop-down menu contains a list of the **scenarios that you can create** *(on page 1003).* Oxygen XML Editor Eclipse plugin determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

**Duplicate**

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

**Edit**

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the **Transformation Types section** *(on page 1076).*

**Remove**

Removes the current scenario from the list. This action is also available by using the **Delete** key.

**Import scenarios**

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

**Note:** When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds **imported** to the name of the imported scenario.

**Export selected scenarios**

Use this option to export transformation and validation scenarios individually. Oxygen XML Editor Eclipse plugin creates a **scenarios** file that contains the scenarios that you export.

**Settings**

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

- **Show all scenarios**

  Select this option to display all the available scenarios, regardless of the document they are associated with.

- **Show only the scenarios available for the editor**

  Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

- **Show associated scenarios**
Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the Import scenarios dialog box that allows you to select the scenarios file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds imported to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a scenarios file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

Your selections in the Transformation Scenarios view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

Related Information:

- Editing a Transformation Scenario (on page 1075)
WebHelp Output Customization

**Oxygen XML WebHelp** provides the ability to generate two different types of output, **WebHelp Responsive** and **WebHelp Classic**. Each type has its own set of options and features. The **WebHelp Responsive** variant is available for DITA documents while the **WebHelp Classic** variants are available for DocBook.

**WebHelp Responsive Output for DITA**

**WebHelp Responsive** features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the **Bootstrap** responsive front-end framework and is available for DITA document types.

WebHelp Responsive output can be generated by using the **DITA Map WebHelp Responsive** (on page 983) transformation scenario.

**WebHelp Responsive Output Layout and Features**

This section contains information about the layout and features of the WebHelp Responsive output.
Layout of the Responsive Page Types

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.

**Figure 385. WebHelp Responsive Output on a Normal Screen**
Main Page

The **Main Page** is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

**Main Page - Tiles Layout**

In the *tiles* presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.
Figure 387. Main Page -Tiles Layout

1. Logo Component (on page 1091)
2. Title Component (on page 1091)
3. Search Input Component (on page 1092)
4. Menu Component (on page 1091)
5. Index Terms Link Component (on page 1092)
6. Topic Tiles Component (on page 1092)
7. Footer Component (on page 1092)

Main Page - Tree Layout

In the tree presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.
Main Page Components

The layout components displayed in the main page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1219). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1219).

**Menu**
Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1178) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter (on page 1221).

**Search Input**

An input text field where you can enter search queries.

**Topic Tiles**

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

**Topic Tile Title**

Presents the navigation title of the associated topic.

**Topic Tile Short Description**

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

**Topic Tile Image**

Presents an image associated with the topic. The image association (on page 1178) is done in the DITA map.

**Tree Table of Contents**

An area containing topic titles from first and second level of your publication.

**Page Footer**

WebHelp Responsive output footer.

**Topic Page**

The Topic Page is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.
Figure 389. Topic Page

1. Logo Component (on page 1093)
2. Title Component (on page 1093)
3. Search Input Component (on page 1094)
4. Menu Component (on page 1094)
5. Index Terms Link Component (on page 1094)
6. Expand/Collapse All Sections Component (on page 1094)
7. Navigation Links Component (on page 1094)
8. Print Link Component (on page 1094)
9. Breadcrumb Component (on page 1094)
10. Publication Table of Contents Component (on page 1094)
11. Footer Component (on page 1095)
12. Topic Content Component (on page 1094)
13. Topic Table of Contents Component (on page 1094)

**Topic Page Components**

The layout components displayed in this page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.
The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1219). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1219).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1178) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1221).

**Search Input**

An input text field where you can enter search queries.

**Navigation Links**

The navigation links (Previous / Next arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence` parameter and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

**Tip:** To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links` parameter to `no`.

**Expand/Collapse Sections Button**

Icon that expands or collapses sections listed in the side table of contents within a topic.

**Print Link**

A print icon that opens the print dialog box for your particular browser.

**Breadcrumb**

Presents the path of the current displayed DITA topic in documentation.

**Topic Content**

Presents the content of the associated DITA topic.

**Publication Table of Contents**

A Table of Content for the publication displayed in the left side.

**Topic Table of Contents (On this page links)**

A table of contents for the topic displayed on the right side with a heading named On this page and it contains links to each section within the current topic and the section corresponding to
the current scroll position is highlighted. This component is generated for any topic that contains at least two `<section>` elements and each `<section>` must have an `@id` attribute.

**Page Footer**
WebHelp Responsive output footer.

**Search Page**
The *Search Page* presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the *Search* field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the 📢 **Toggle Highlights** button at the top-right side of the page. The *Search* field also includes an *autocomplete* feature.

**Figure 390. Search Results Page**

1. Logo Component  *(on page 1096)*
2. Title Component  *(on page 1096)*
3. Search Input Component  *(on page 1096)*
4. Menu Component  *(on page 1096)*
5. Index Terms Link Component  *(on page 1096)*
6. Search Results Component  *(on page 1096)*
7. Footer Component  *(on page 1096)*
Search Page Components

The layout components displayed in the search page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1219). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1219).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1178) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1221).

**Search Input**

An input text field where you can enter search queries.

**Search Results**

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

**Page Footer**

WebHelp Responsive output footer.

**Autocomplete Suggestions in the Search Text Field**

When you are typing in the search text field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```xml
<prolog>
  <metadata>
    <keywords>
      <indexterm>databases</indexterm></keywords>
    <keyword>installing</keyword>
  </metadata>
</prolog>
```
Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Related Information:
- WebHelp Responsive Search Engine (on page 1098)

Index Terms Page

The Index Terms Page page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure 391. Index Terms Page

1. Logo Component (on page 1098)
2. Title Component (on page 1098)
3. Menu Component (on page 1098)
4. Index Terms Link Component (on page 1098)
5. Index Terms Component (on page 1098)
Index Terms Page Components

The layout components displayed in this page are:

**Publication Title**

The title of the publication. It is usually taken from the DITA map title.

**Logo**

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1219). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1219).

**Menu**

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu (on page 1178) topic.

**Index Terms Link**

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1221).

**Index Terms Alphabet**

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

**Index Terms**

The first letter of the index along with the list of index terms.

**Page Footer**

WebHelp Responsive output footer.

Search Engine

Search engine has two main components:

**Search indexer**

It is also known as a *spider*. This component is active when you publish your documentation to WebHelp and it is responsible for creating the *search index*. This component traverses all HTML pages (for DITA topics) to gather information.
This component is an interface between the user and the search index. It helps the user to search through the search index and displays results in the search page.

**Search Field and Results Page**

When you enter search terms in the Search field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the Toggle Highlights button at the top-right side of the page. The Search field also includes an autocomplete feature.

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

**5-Star Rating Mechanism and Sorting**

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

- The search term is included in a meta keyword.
- The search term is in the title of the page.
- The search term is in bold text in a paragraph.
- The search term is in normal text in a paragraph.

**Tag Element Scoring Values**

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1190).

**Search Rules**

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.
- **Boolean Search** is supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).
• The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
• Words composed by merging two or more words with colon (":") minus ("-"), underline ("_"), or dot ("."), characters count as a single word.
• Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
• When searching for multi-word phrases in CJK (Chinese, Japanese, Korean) languages that often have multiple words appear in strings without a space separator, you need to add a space to separate the words. Otherwise WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for *开始之前* (it translates as "before you begin" or "before start"), you have to enter *开始之前* (notice the space between the second and third symbols) in the search field.

**Tip:** The `<indexterm>` and `<keywords>` DITA elements are an effective way to increase the ranking of a page (for example, content inside a `keywords` element weighs more than an *H1* HTML element).

### Excluded Terms

To improve performance, the Search feature excludes certain *stop words*. For example, the English version of the *stop words* includes: *a*, *an*, *and*, *are*, *as*, *at*, *be*, *but*, *by*, *for*, *if*, *in*, *into*, *is*, *it*, *no*, *not*, *of*, *on*, *or*, *such*, *that*, *the*, *their*, *then*, *there*, *these*, *they*, *this*, *to*, *was*, *will*, *with*.

### Oxygen Feedback Comments Component

You can add a comments component in your WebHelp Responsive output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by **Oxygen Feedback**, a modern comment management system that can be integrated with your WebHelp Responsive output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

**Oxygen Feedback** includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software. You simply need to create an **Oxygen Feedback site configuration in the administration interface**, copy the HTML installation fragment that is generated at the end of the creation process, and paste the generated fragment in the **Feedback** tab in the WebHelp Responsive transformation scenario dialog box *(on page 2066)*.

An add-on is also available that contributes a **Feedback Comments Manager** view in *Oxygen XML Editor/Author* where the documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.
Adding the Feedback System to WebHelp Responsive Documentation

Prerequisites

• To install and manage Oxygen Feedback, you need to obtain a license for the product. For details, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

• If this is your first time using Oxygen Feedback, you need to sign up for a Feedback account from the administration login page (https://feedback.oxygenxml.com/login). To do this, you can click on Log in with Google or Log in with Facebook to create an account using your Google or Facebook credentials, or click the Sign Up tab to create an account using your name and email address.

Installation Procedure

1. Log in to your Feedback account from the administration login page (https://feedback.oxygenxml.com/login).
2. Click the Add site button to create a site (a Feedback configuration).
3. In the Settings page, enter a Name and Description for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the Site Settings topic.
4. Click Continue.
5. In the Initial version page, enter the Base URL for your website (you can add additional URLs by clicking the Add button). You can also specify an Initial version if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the Initial Version topic.
6. Click Continue.
7. In the Installation page, choose a site generation option:
   a. If you will generate the documentation using a transformation scenario in Oxygen XML Editor/Author, select the Oxygen XML Editor option. Then, click Finish, open Oxygen XML Editor/Author, and continue with these steps:
      i. Open the Configure Transformation Scenario(s) dialog box.
      ii. Select and duplicate the DITA Map WebHelp Responsive scenario.
      iii. Go to the Feedback tab.
      iv. Click the Edit button and paste the generated installation fragment.
   b. If you will generate the documentation using a command-line script, select the Oxygen XML WebHelp option and continue with these steps:
      i. Create an XML file (for example, feedback-install.xml) with the generated installation fragment. The required content for the file is displayed on-screen.
      ii. Use the webhelp.fragment.feedback parameter in your command-line script to specify the path to the file you just created. For example:

\[
\text{dita.bat -Dwebhelp.fragment.feedback=c:\path\to\feedback-install.xml}
\]

For more details about Oxygen Feedback, how to configure settings, moderate comments, view statistics, and much more, see the Oxygen Feedback user guide.
Context-Sensitive Help System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `<appContext>` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
  ...
</map>
```

The possible attributes are as follows:

**helpID**

A Unique ID provided by a topic from two possible sources ( `<resourceid>` element or `@id` attribute):

**resourceid**

The `<resourceid>` element is mapped into the `<appContext>` element and can be specified in either the `<topicref>` within a DITA map or in a `<prolog>` within a DITA topic. The `<resourceid>` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty (" ").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `@appid` attribute is used.

**Note:** Multiple `@appid` values can be associated with a single `appname` value (and multiple `@appname` values can be associated with a single `@appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `@appid` and `@appname` attributes should be unique within the context of a single root map (on page 2138). For example, suppose that you need two different functions of an application to both open the same WebHelp page.

**Example:** `<resourceid> Specified in a DITA Map`

The `<resourceid>` element can be specified in a `<topicmeta>` element within a `<topicref>`.

```
<map title="App Help">
```
Example: <resourceid> Specified in a DITA Topic

The <resourceid> element can be specified in a <prolog> element within a DITA topic.

For more information about the <resourceid> element, see DITA Specifications: <resourceid>.

id

If a <resourceid> element is not declared in the DITA map or DITA topic (as described above), the @id attribute that is set on the topic root element is mapped into the <appContext> element.

Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

path

The path to a corresponding WebHelp page. This path is relative to the location of the context-help-map.xml mapping file.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the contextId value and will look it up in the XML file.
- Invoke the index.html WebHelp system file and pass the contextId parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the contextId parameter.
Note: The `contextId` parameter is not case-sensitive.

### Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

**contextId**

The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

**Note:** You can use an anchor (on page 2132) in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

**appname**

You can use this parameter in conjunction with `contextId` to search for this value in the corresponding `appname` attribute value in the mapping file.

Another parameter indicates the search query:

**searchQuery**

You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

### Accessibility

**Oxygen XML WebHelp Responsive** output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

### Related Information:

- DITA-OT Day 2017 Presentation: Accessibility in DITA-OT
Writing Guidelines for Accessible Documentation

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

Accessible Images

Images must have text alternatives that describe the information or function represented by them.

Short Text Equivalents for Images

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```

Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdescref>` element.

```xml
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdescref href="http://www.example.org/birds/puffin.html" scope="external" format="html"/>
</image>
```

Related Information:

- Darwin Information Typing Architecture (DITA) Specification `<image>` element
- Web Accessibility Tutorials: Alt Decision Tree

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```xml
<imagemap id="gear_pump_map">
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
  </area>
</imagemap>
```
Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `@scope`, `@id`, and `@headers` attributes.

When you implement the table, it is best to use the `<table>` element (CALS table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

Related Information:
- Darwin Information Typing Architecture (DITA) Specification `<imagemap>` element

Table with Header Cells in the Top Row Only

For this type of table, you have to embed the table rows in the `<thead>` element.

Table 36. Example: Oxygen Events

<table>
<thead>
<tr>
<th>Event</th>
<th>Date</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evolution of TC 2018</td>
<td>May 31 - June 1, 2018</td>
<td>Sofia, Bulgaria</td>
</tr>
<tr>
<td>Markup UK</td>
<td>June 9 - 10, 2018</td>
<td>London, United Kingdom</td>
</tr>
<tr>
<td>Balisage 2018 - The Markup Conference</td>
<td>July 31 - August 3, 2018</td>
<td>Rockville, Maryland, USA</td>
</tr>
</tbody>
</table>

```xml
<table colsep="1" rowsep="1" frame="all">
  <title>
    <b>Oxygen Events</b>
  </title>
  <group cols="3">
    <colspec colname="COLSPEC0" colwidth="1"/>
```
Table with Header Cells in the First Column Only

For this type of table, you have to set the `rowheader="firstcol"` attribute on the `<table>` element to identify the header column.

<table>
<thead>
<tr>
<th>Event</th>
<th>Evolution of TC 2018</th>
<th>Markup UK</th>
<th>Balisage 2018 - The Markup Conference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>May 31 - June 1, 2018</td>
<td>June 9 - 10, 2018</td>
<td>July 31 - August 3, 2018</td>
</tr>
<tr>
<td>Location</td>
<td>Sofia, Bulgaria</td>
<td>London, United Kingdom</td>
<td>Rockville, Maryland, USA</td>
</tr>
</tbody>
</table>
Table with Header Cells in the Top Row and First Column

For this type of table, you can use `<thead>` to identify header rows and `<rowheader>` to identify a header column.

**Table 38. Example: Bus Timetable**

<table>
<thead>
<tr>
<th>Time</th>
<th>Monday</th>
<th>Tuesday</th>
<th>Wednesday</th>
<th>Thursday</th>
<th>Friday</th>
</tr>
</thead>
<tbody>
<tr>
<td>09:00 - 11:00</td>
<td>Closed</td>
<td>Open</td>
<td>Open</td>
<td>Closed</td>
<td>Closed</td>

WebHelp Responsive VPAT Accessibility Conformance Report

International Edition
VPAT® Version 2.3 – April 2019

Product Name/Version
Oxygen XML WebHelp Responsive

Product Description
Oxygen XML WebHelp Responsive enables you to publish DITA content on the web and present it in a user-friendly interface that is easy to navigate. You can design your WebHelp Responsive output to be available on desktop systems or various mobile devices. With Oxygen XML WebHelp Responsive, your published content is accessible, interactive, and convenient.

Date
May 2019

Contact Information
support@oxygenxml.com

Notes
Oxygen XML WebHelp Responsive has been designed and enhanced to adhere to the U.S. Government Section 508 accessibility standards and the Web Content Accessibility Guidelines (WCAG). For details, see WebHelp Responsive Accessibility (on page 1104).

Evaluation Methods Used:
The following applications were used for testing Oxygen XML WebHelp Responsive:
Desktop browsers: Chrome, Firefox, Safari, Edge, and Internet Explorer
Assistive technologies: NVDA, VoiceOver, JAWS, Microsoft Narrator

Applicable Standards/Guidelines

This report covers the degree of conformance for the following accessibility standards/guidelines:

<table>
<thead>
<tr>
<th>Standard/Guideline</th>
<th>Included In Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Content Accessibility Guidelines 2.0</td>
<td>Level A - Yes, Level AA - Yes, Level AAA - No</td>
</tr>
<tr>
<td>Web Content Accessibility Guidelines 2.1</td>
<td>Level A - Yes, Level AA - Yes, Level AAA - No</td>
</tr>
<tr>
<td>Revised Section 508 standards published January 18, 2017 and corrected January 22, 2018</td>
<td>Yes</td>
</tr>
<tr>
<td>EN 301 549 Accessibility requirements suitable for public procurement of ICT products and services in Europe - V2.1.2 (2018-08)</td>
<td>No</td>
</tr>
</tbody>
</table>

Terms

The terms used in the Conformance Level information are defined as follows:

- **Supports**: The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.
- **Partially Supports**: Some functionality of the product does not meet the criterion.
- **Does Not Support**: The majority of product functionality does not meet the criterion.
- **Not Applicable**: The criterion is not relevant to the product.
- **Not Evaluated**: The product has not been evaluated against the criterion. This can be used only in WCAG 2.0 Level AAA.

WCAG 2.x Report

Tables 1 and 2 also document conformance with:

Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

**Note**: When reporting on conformance with the WCAG 2.x Success Criteria, they are scoped for full pages, complete processes, and accessibility-supported ways of using technology as documented in the [WCAG 2.0 Conformance Requirements](https://www.w3.org/WAI/conformance/).

<td></td>
<td>programmatically-determined link context. The authors can create hypertext links using text that describes the purpose of the hypertext. There is no control that allows the user to choose between short or long link text (G189 / SCR30).</td>
</tr>
</tbody>
</table>

2.5.1 Pointer Gestures (Level A 2.1 only)
Also applies to:
Revised Section 508 – Does not apply
Supports
The WebHelp Responsive output does not rely on path-based or multi-point gestures and does not provide controls that require complex gestures.

2.5.2 Pointer Cancellation (Level A 2.1 only)
Also applies to:
Revised Section 508 – Does not apply
Supports
The product has operations that are activate on the pointer up event.

2.5.3 Label in Name (Level A 2.1 only)
Also applies to:
Revised Section 508 – Does not apply
Supports
The names of the user interface components contain the text that is presented visually.

2.5.4 Motion Actuation (Level A 2.1 only)
Also applies to:
Revised Section 508 – Does not apply
Supports
The product does not contain functionality that can be operated by device or user motion.

3.1.1 Language of Page (Level A)
Also applies to:
Revised Section 508
Supports
The web pages indicate the language of the content when the content language has been specified by authors.

3.2.1 On Focus (Level A)
Also applies to:
Revised Section 508
Supports
No changes of context occur when any component receives focus.

### Publishing Templates

An **Oxygen Publishing Template** defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, Favicons, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for **Oxygen Publishing Template** packages:
For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: Creating Custom Publishing Templates for WebHelp and PDF Output. The Webinar slides and sample project are also available from that webpage.

Related Information:
- How to Create a Publishing Template (on page 1161)
- How to Edit a Packed Publishing Template (on page 1163)
- How to Add a Publishing Template to the Publishing Templates Gallery (on page 1163)
- How to Share a Publishing Template (on page 1284)

Publishing Templates Gallery

Oxygen XML Editor Eclipse plugin comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Built-in Templates

There are two categories of templates, Tiles and Tree. You can see the built-in templates in the Templates tab when editing a WebHelp Responsive transformation scenario in Oxygen XML Editor/Author. Each one also
includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.

Built-in Templates Location

All built-in templates are stored in the following directory: DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template (on page 1281). You can store all of your custom templates in a particular directory. Then, go to Options > Preferences > DITA > Publishing and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's Template tab along with all the built-in templates.
Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

Publishing Template Package Contents for WebHelp Responsive Customizations

An Oxygen Publishing Template package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the .opt file extension and must be located in the template's root folder.

A template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>

    <preview-image file="flowers-tree.png"/>

</publishing-template>

Tip: It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

**Template Name and Description**

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```
<publishing-template>
  <name>Lorem Ipsum</name>
  <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
  ...
</publishing-template>
```

**Template Author**

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>` information.

```
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
</publishing-template>
```
Webhelp Element

The `<webhelp>` element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this `<webhelp>` section specify the template tags (on page 1134), template preview image (on page 1135), resources (on page 1135) (such as CSS, JS, fonts, logos), transformation parameters (on page 1136), HTML fragment extensions (on page 1138) (used to add fragments to placeholders), XSLT extensions (on page 1137), or HTML page layout files (on page 1144).

```xml
<webhelp>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>

  <resources>
    ...
  </resources>

  <html-page-layouts>
    ...
  </html-page-layouts>

  <parameters>
    ...
  </parameters>
</webhelp>
```

Template Tags

The `<tags>` section provides meta information about the template (such as layout type or color theme). Each tag is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```xml
<publishing-template>
  ...
  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>dark</tag>
    </tags>
  </webhelp>
</publishing-template>
```
Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be \(200 \times 115\) pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <preview-image file="ashes/ashes-tree.png"/>
    <online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>
  </webhelp>
</publishing-template>
```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

This section is defined using the `resources` element and the types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the `<css>` element.
- **Favicon** - You can specify the path to an image for the favicon associated with your website. It is referenced using the `<favicon>` element.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the `<logo>` element. Optionally, you can also specify:
  - `<target-url>` - will redirect the user to the specified URL if they click the logo in the output.
  - `<alt>` - provides an alternate text for the logo image.
- **JavaScript AMD module** - The path to a JavaScript module that uses the AMD (Asynchronous Module Definition) format. This module will be loaded in the output HTML pages using the RequireJS library. It can be referenced using the `<js-amd-module>` element. For more information, see How to Insert JavaScript AMD Modules in WebHelp Responsive Output (on page 1174).
- **Additional Resources (graphics, JS, fonts)** - For other resources (such as images referenced in CSS, JS, fonts, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to be copied to the output folder by using the `<fileset>` element and you can use one or more `<include>` and `<exclude>` elements. This semantic is similar to the ANT FileSet.
<publishing-template>

<webhelp>

<resources>
  <css file="css/custom_styles.css"/>
  <css file="css/custom_fonts.css"/>
  
  <favicon file="images/favicon.png"/>
  
  <logo>
    file="images/logo.png"
    target-url="http://www.example.com"
    alt="Alternate text for the logo image"/>
  
  <js-amd-module file="js/template-main.js"/>

  <fileset>
    <include name="common/**/*"/>
    <include name="JS/**/*"/>
    <exclude name="**/*.svn"/>
    <exclude name="**/*.git"/>
  </fileset>
</resources>

</webhelp>

Note: All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder: 
![WebHelp_OUTPUT_DIR]/oxygen-webhelp/template. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

Figure 394. Template Resources Mapping
Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```xml
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter
                name="webhelp.show.main.page.toc"
                value="yes"/>
            <parameter
                name="webhelp.top.menu.depth"
                value="3"/>
            <parameter
                name="webhelp.fragment.welcome"
                value="html-fragment/webhelp.fragment.welcome.html"
                type="filePath"/>
        </parameters>
    </webhelp>
</publishing-template>
```

The following information can be specified in the `<parameter>` element:

**Parameter name**

The name of the parameter. It may be one of the WebHelp Responsive transformation parameters (*on page 1218*) or a DITA-OT HTML-based output parameter.

- **Note:** It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

- **Attention:** JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

**Parameter Value**

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

**Parameter Type**

The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (*on page 1281*) and adding it to the templates gallery (*on page 1163*), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.
XSLT Extension Points

The publishing templates support one or more XSLT extension points. They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```xml
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension id="com.oxygenxml.webhelp.xsl.dita2webhelp" file="xsl/customDita2webhelp.xsl"/>
            <extension id="com.oxygenxml.webhelp.xsl.createMainPage" file="xsl/customMainPage.xsl"/>
        </xslt>
    </webhelp>
</publishing-template>
```

For more information, and a full list of the available extension points, see: XSLT-Import and XSLT-Parameter Extension Points (on page 1224).

**Note:** You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

HTML Fragment Extension Points

The HTML pages contain component placeholders that can be used to insert custom HTML fragments (either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment). These fragments and their placeholder location are defined in the descriptor file using a `<fragment>` element inside the `<html-fragments>` section.

You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```xml
<publishing-template>
    ...
    <webhelp>
        ...
        <html-fragments>
            <fragment file="html-fragments/webhelp_fragment_welcome.html" placeholder="webhelp.fragment.welcome"/>
            <fragment file="html-fragments/webhelp_fragment_footer.html"/>
        </html-fragments>
    </webhelp>
</publishing-template>
```
Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. These predefined placeholders are illustrated and described below.

**Figure 395. Predefined Placeholders Diagram**

1. **Header** *(on page 1139)*
2. **Before Body** *(on page 1140)*
3. **Before Logo and Title** *(on page 1140)*
4. **After Logo and Title** *(on page 1140)*
5. **Before Top Menu** *(on page 1140)*
6. **After Top Menu** *(on page 1140)*
7. **Before Main Page Search Input** *(on page 1140)*
8. **Welcome Message** *(on page 1140)*
9. **After Main Page Search Input** *(on page 1140)*
10. **Before Tiles or TOC** *(on page 1140)*
11. **After Tiles or TOC** *(on page 1141)*
12. **Footer** *(on page 1141)*
13. **After Body** *(on page 1141)*

Each of these placeholders can hold either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

1. `webhelp.fragment.head`
In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

2- webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

3- webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

4- webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

5- webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

6- webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

7- webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

8- webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

9- webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

10- webhelp.fragment.before.toc_or_tiles
In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

11- webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

12- webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Important: This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

13- webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Related Information:

- How to Insert HTML Content in WebHelp Responsive Output (on page 1170)

WebHelp Responsive Macros

You can use the `whc:macro` layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

```
${macro-name}
```

or

```
${macro-name(macro-parameter)}
```

A macro name can accept any alphanumeric characters, as well as the following characters: - (minus), _ (underscore), . (dot), : (colon). The value of a parameter may contain any character except the } (close curly bracket) character.

Implementations

The following macros are supported:

i18n

For localizing a string.

```
${i18n(string.id)}
```
param

Returns the value of a transformation parameter.

${param(webhelp.show.main.page.tiles)}

env

Returns the value of an environment variable.

${env(JAVA_HOME)}

system-property

Returns the value of a system property.

${system-property(os.name)}

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT function specification.

${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the oxygen-webhelp subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

${path(oxygen-webhelp-template-dir)}

**Note:** New paths IDs can be added by overriding the *wh-macro-custom-path* template from com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.
Tip: Available in all template layout HTML pages.

`$\{map-xpath(/map/title)\}`

topic-xpath

Can be used to execute an XPath expression over the current topic.

Tip: Available only in the topic HTML page template (`wt_topic.html`).

`$\{topic-xpath(string-join(/shortdesc/text(), ' '))\}`

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

`$\{oxygen-webhelp-build-number\}`

Extensibility

To add new macros, you can add an XSLT extension to overwrite the `wh-macro-extension` template from the `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl` file.

```xml
<xsl:template name="wh-macro-extension">
  <xsl:param name="name"/>
  <xsl:param name="params"/>
  <xsl:param name="contextNode"/>
  <xsl:param name="matchedString"/>

  <xsl:choose>
    <xsl:when test="$contextNode instance of attribute()">
      <xsl:value-of select="$matchedString"/>
    </xsl:when>
    <xsl:otherwise>
      <xsl:message>Cannot expand macro: [</xsl:message>
      <xsl:value-of select="$matchedString"/>
      <xsl:message>]</xsl:message>
      <xsl:copy-of select="$contextNode"/>
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>
```

The `wh-macro-extension` template has the following parameters:

- **name** - The name of the current macro.
- **params** - List of parameters of the current macro as string sequence. The current macros parsing mechanism only allows macros with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the macro was declared.
- **matchedString** - The entire value of the matched macro as specified in the HTML template page.
HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (main, search, topic, index) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

⚠️ Warning: It is no longer recommended for you to customize these files because if you upgrade to a newer version of Oxygen, those files may no longer produce the desired results and if new components have been added, you won't have access to them.

If you do choose to customize these HTML files, each type of page is defined inside an `<html-page-layout-files>` element in the descriptor file.

```
<publishing-template>
  ...
  <webhelp>
  ...
  <!-- HTML page layout files -->
  <html-page-layout-files>
    <page-layout-file page="main" file="page-templates/wt_index.html"/>
    <page-layout-file page="search" file="page-templates/wt_search.html"/>
    <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
    <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
  </html-page-layout-files>
</publishing-template>
```

If you do use the `html-page-layout-files` element, you must specify all four types of pages (main, search, topic, index). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

**HTML Page Components**

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed DITA map (on page 2134).

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the Publication Title component can be used in all pages, but the Navigation Breadcrumb component can only be used in the Topic Page.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the `<whc:component_content>` element as
a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```xml
<whc:webhelp_search_input class="navbar-form wh_main_page_search"
    role="form">
    <div class="custom-content-before">Enter search terms here:</div>
    <div class="custom-wrapper">
        <whc:component_content/>
    </div>
    <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

**Main Page**

The *Main Page* is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

**Figure 396. Examples of Main Page Components for a Tiles Style of Layout**

1. Publication Logo *(on page 1146)*
2. Publication Title *(on page 1146)*
3. Search Input *(on page 1147)*
4. Main Menu *(on page 1147)*
5. Index Terms Link *(on page 1148)*
6. Topic Tiles (on page 1147)
7. Print Link (on page 1147)

Figure 397. Examples of Main Page Components for a Tree Style of Layout

The following components can be referenced in the Main Page (wt_index.html) file:

**Publication Title** (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```html
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo** (webhelp_logo)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_logo>`
In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1178).

**Main Page Topic Tiles (webhelp_tiles)**

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `<whc:webhelp_tiles>` element must be specified in the HTML file as in the following example:
In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `<whc:webhelp_tile>` component, as in the following example:

```xml
<whc:webhelp_tile class="col-md-4">
  <!-- Place holder for tile's image -->
  <whc:webhelp_tile_image/>

  <div class="wh_tile_text">
    <!-- Place holder for tile's title -->
    <whc:webhelp_tile_title/>

    <!-- Place holder for tile's shordesc -->
    <whc:webhelp_tile_shortdesc/>
  </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see How to Configure the Tiles on the WebHelp Responsive Main Page (on page 1183).

**Main Page Table of Contents (webhelp_main_page_toc)**

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `<whc:webhelp_main_page_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_main_page_toc
```

In the output, you will find an element with the class: `wh_main_page_toc`.

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Link to Skins Resources (webhelp_skin_resources)**
This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Topic Page**

The **Topic Page** is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

**Figure 398. Examples of Topic Page Components**

1. Publication Logo *(on page 1150)*
2. Publication Title *(on page 1150)*
3. Search Input *(on page 1150)*
4. Main Menu *(on page 1152)*
5. Index Terms Link *(on page 1152)*
6. Expand/Collapse All Sections *(on page 1152)*
7. Navigation Links *(on page 1151)*
8. Print Link *(on page 1151)*
9. Breadcrumb *(on page 1150)*
The following components can be referenced in the **Topic Page** (`wt_topic.html`) file:

### Publication Title (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the `whc:webhelp_publication_title` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

### Publication Logo (webhelp_logo)

This component generates a logo image in the output. To generate this component, the `whc:webhelp_logo` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

### Search Input (webhelp_search_input)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `whc:webhelp_search_input` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

### Topic Breadcrumb (webhelp_breadcrumb)

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `whc:webhelp_breadcrumb` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_breadcrumb
```

In the output, you will find an element with the class: `wh_breadcrumb`. This element will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the
main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

**Navigation Links (webhelp_navigation_links)**

This component generates navigation links to the next and previous topics. To generate this component, the `<whc:webhelp_navigation_links>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_navigation_links
```

In the output, you will find an element with the class `wh_navigation_links`. This element will contain the links to the next and previous topics.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class `wh_print_link`.

**Topic Content (webhelp_topic_content)**

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `<whc:webhelp_topic_content>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_content
```

In the output, you will find an element with the class `wh_topic_content`.

**Publication TOC (webhelp_publication_toc)**

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of current topic, its siblings, and all of its ancestors. To generate this component, the `<whc:webhelp_publication_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_toc
```

In the output, you will find an element with the class `wh_publication_toc`. This element will contain links to the topics that are close to the current topic.

**Topic TOC (webhelp_topic_toc)**

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and the
section corresponding to the current scroll position is highlighted. The topic must contain at least two `<section>` elements and each `<section>` must have an `@id` attribute. To generate this component, the `<whc:webhelp_topic_toc>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topic_toc
```

In the output, you will find an element with the class: `wh_topic_toc`. This element will contain links to the topics that are close to the current topic.

**Expand/Collapse Sections (webhelp_expandCollapseSections)**

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `<whc:webhelp_expandCollapseSections>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_expandCollapseSections
```

In the output, you will find an element with the class: `webhelp_expandCollapseSections`.

**Topic Feedback (webhelp_feedback)**

This component generates a placeholder for where the comments section will be presented. To generate this component, the `<whc:webhelp_feedback>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_feedback
```

**Main Menu (webhelp_topMenu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_topMenu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_topMenu
```

In the output, you will find an element with the class: `wh_topMenu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1178).

**Index Terms Link (webhelp_indextermsLink)**

This component can be used to generate a link to the index terms page (indexterms.html). If the published documentation does not contain any index terms, then the link will not be
generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Child Links (**`webhelp_child_links`**)**

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `<whc:webhelp_child_links>` element must be specified in the HTML file as in the following example:

```xml
```

**Related Links (**`webhelp_related_links`**)**

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `<whc:webhelp_related_links>` element must be specified in the HTML file as in the following example:

```xml
```

**Link to Skins Resources (**`webhelp_skin_resources`**)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Search Results Page**

The *Search Results Page* is the page generated that present search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.
Figure 399. Examples of Search Results Page Components

1. Publication Logo (on page 1154)
2. Publication Title (on page 1154)
3. Search Input (on page 1155)
4. Main Menu (on page 1155)
5. Index Terms Link (on page 1156)
6. Search Results (on page 1155)
7. Print Link (on page 1155)

The following components can be referenced in the Search Results Page (wt_search.html) file:

Publication Title (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the <whc:webhelp_publication_title> element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: wh_publication_title.

Publication Logo (webhelp_logo)

This component generates a logo image in the output. To generate this component, the <whc:webhelp_logo> element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_logo
```
In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Search Results (webhelp_search_results)**

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `<whc:webhelp_search_results>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
```

In the output, you will find an element with the class: `wh_search_results`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).
For information about customizing the menu, see How to Customize the Menu (on page 1178).

**Index Terms Link ( `webhelp_indexterms_link` )**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_indexterms_link
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Link to Skins Resources ( `webhelp_skin_resources` )**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Index Terms Page**

The Index Terms Page is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.
The following components can be referenced in the Index Terms Page (wt_terms.html) file:

**Publication Title (webhelp_publication_title)**

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_publication_title
```

In the output, you will find an element with the class: `wh_publication_title`.

**Publication Logo (webhelp_logo)**

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```html
<whc:webhelp_logo
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the Parameters tab in the transformation scenario). You can set
the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

**Search Input (webhelp_search_input)**

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_search_input
```

In the output, you will find an element with the class: `wh_search_input`.

**Print Link (webhelp_print_link)**

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_print_link
```

In the output, you will find an element with the class: `wh_print_link`.

**Main Menu (webhelp_top_menu)**

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_top_menu
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the Parameters tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu (on page 1178).

**Index Terms Link (webhelp_indexterms_link)**

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```xml
<whc:webhelp_indexterms_link
```
In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

**Link to Skins Resources (webhelp_skin_resources)**

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

**Combining WebHelp Responsive and PDF Customizations in a Template Package**

An *Oxygen Publishing Template* package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>
```
Generating WebHelp Responsive Output

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author, from a command line outside Oxygen XML Editor/Author, or from an integration server.

Running from Oxygen XML Editor/Author

To publish a DITA map as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

   **Step Result:** This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

   - **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
   - **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
   - **Feedback Tab** - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
   - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click Apply associated to process the transformation.
Result: When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

### Automating the WebHelp Responsive Output for DITA

DITA-based WebHelp output can be generated from an automated publishing process using a command line outside of **Oxygen XML Editor/Author** or an automatic publishing system, such as **Jenkins** or **Travis**. However, to do this, you must purchase an additional **Oxygen XML WebHelp license**.

<tbody>
<tr>
<td>Generating WebHelp Responsive Output for DITA</td>
</tr>
</tbody>
</table>

### Customizing the WebHelp Responsive Output

**Oxygen XML Editor Eclipse plugin** provides support for customizing the **WebHelp Responsive** output to suit your specific needs. The **WebHelp Responsive** output is based upon the **Bootstrap** responsive front-end framework and is available for DITA document types.

To change the overall appearance of your **WebHelp Responsive** output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

### Working with Publishing Templates

An **Oxygen Publishing Template (on page 2136)** defines all aspects of the layout and styles of the **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the **WebHelp Responsive** output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.

### How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.
Creating a Template Starting from Scratch

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.
3. Save the .opt file into your customization directory.
4. Open the .opt file in the editor and customize it to suit your needs.

Creating a Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2136) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. Optional: You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the Save template as button.
   
   Step Result: This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.
4. Specify a name for the new template.
5. **Optional**: Specify a template description.

6. **Optional**: The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.

7. **Optional**: For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files (on page 1144) in your template package. They are helpful if you want to change the structure of the generated HTML pages.

8. In the Save as field, specify the name and path of the ZIP file where the template will be saved.

   **Step Result**: A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

**Related Information:**

- Publishing Template Package Contents for PDF Customizations (on page 1275)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1132)

### How to Edit a Packed Publishing Template

To edit an existing Oxygen Publishing Template (on page 2136) package, follow these steps:

1. Unzip the ZIP archive associated with the Oxygen Publishing Template in a separate folder.
2. Link the folder associated with the template in the Navigator view.
3. Using the Navigator view, you can modify the resources (CSS, JS, fonts) within the Oxygen Publishing Template folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify to suit your needs.
5. **Optional**: Once you finish your customization, you can archive the folder as a ZIP file.

**Related Information:**

- Publishing Template Package Contents for PDF Customizations (on page 1275)
- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1132)

### How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.
2. In the Templates tab, click the Configure Publishing Templates Gallery link to.
This will open the preferences page.

3. Click the Add button and specify the location of your template directory.  
   Your template directory is now added to the Additional Publishing Templates Galleries list.

4. Click OK to return to the transformation scenario dialog box.
   All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from a Command Line

Before you run the transformation, you need to know if the publishing template has a single or multiple template descriptor files (on page 1132). If you don't know, open the ZIP archive or folder and check for files with the .opt extension.

Using a Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the webhelp.publishing.template parameter (on page 1218). This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Command-Line Example:

- Windows:
  
  dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template

- Linux/Mac OS X:

  dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template

Tip: You can also start the dita process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the webhelp-responsive transformation type the WebHelp-related parameters.

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.
Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the `webhelp.publishing.template (on page 1218)` and `webhelp.publishing.template.descriptor (on page 1218)` parameters.

The `webhelp.publishing.template (on page 1218)` parameter specifies the path to the ZIP archive (or root folder) while the `webhelp.publishing.template.descriptor (on page 1218)` parameter specifies the name of the descriptor you want to use.

**Command-Line Example:**

- **Windows:**

  ```bash
  dita.bat
  --format=webhelp-responsive
  --input=c:\path\to\mySample.ditamap
  --output=c:\path\to\output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```

- **Linux/Mac OS X:**

  ```bash
  dita
  --format=webhelp-responsive
  --input=/path/to/mySample.ditamap
  --output=/path/to/output
  -Dwebhelp.publishing.template=custom-template
  -Dwebhelp.publishing.template.descriptor=flowers.opt
  ```

**Tip:** You can also start the `dita` process by passing it a DITA OT Project File. Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

**How to Share a Publishing Template**

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (.xpr).

**Troubleshooting: Errors Encountered when Loading Templates**

When the Templates tab of a WebHelp Responsive transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template
descriptor file (on page 1132) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

![Some templates could not be loaded. More details](image)

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure (on page 1132).

Also, if a template could be loaded, but certain elements could not be found in the descriptor file (on page 1132), a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element (on page 1135) cannot be found.

Converting Old Templates to Newer Versions

WebHelp templates that were created in older versions of Oxygen XML Editor Eclipse plugin can be converted to the Publishing Template format that was introduced in Oxygen XML Editor Eclipse plugin version 20.0. This section contains several procedures for converting old templates depending on the version they were created in.

Convert Version 21 Publishing Templates to Version 22

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 21.0 or 21.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 22:

1. In the Navigator view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 221) and the easiest way to do this is to drag and drop the folder).

   ![Note:](image)

   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the page-templates subfolder, and select Refactoring > XML Refactoring.

3. In the XML Refactoring dialog box, scroll to the Publishing Template section and select Migrate HTML Page Layout Files to v22, then click Next.

4. The Scope should be left as Selected project resources.

5. You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click Finish to perform the conversion.

Result: The converted Publishing Template can now be used in version 22.

Related Information:

- Convert Version 20 Publishing Templates to Version 21 (on page 1166)
- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 1167)
Convert Version 20 Publishing Templates to Version 21

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 20.0 or 20.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 21.0 or 21.1:

1. In the **Navigator** view, add the root directory for your custom Publishing Template (you can use a linked folder (on page 221) and the easiest way to do this is to drag and drop the folder).

   ![Note](image)
   
   If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the **page-templates** subfolder, and select **Refactoring > XML Refactoring**.

3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v21**, then click **Next**.

4. The **Scope** should be left as **Selected project resources**.

5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

6. Click **Finish** to perform the conversion.

**Result:** The converted Publishing Template can now be used in version 21.0 or 21.1.

### Related Information:

- Convert Version 21 Publishing Templates to Version 22 (on page 1166)
- Convert Version 19 (and Older) Publishing Templates to Version 20 (on page 1167)

Convert Version 19 (and Older) Publishing Templates to Version 20

With the introduction of the Publishing Template concept in Oxygen XML Editor Eclipse plugin version 20.0, the old WebHelp output template formats (version 19.1 and older) are no longer supported. However, they can be easily converted to the new format (version 20.0 or 20.1) by following this procedure:

1. Set Oxygen XML Editor Eclipse plugin to point to the DITA-OT distribution that contains your old template:
   a. Go to **Options > Preferences > DITA**.
   b. Select **Custom** in the **DITA Open Toolkit** section and specify the DITA-OT directory that contains your old template.

2. Edit a **WebHelp Responsive** transformation scenario.

3. Select your old custom template in the **Templates** tab.

4. Click on the **Save Template as** button, complete the required fields, and save the template.

5. Reset the option set in step 1 to its previous value.

6. Edit the **WebHelp Responsive** transformation scenario again.

7. This time, use the **Choose custom template** button to select your converted template.

8. Save the scenario and use it to generate the WebHelp Responsive output.

**Result:** The converted template is now in a Publishing Template format for version 20.
Convert Version 19 (and Older) Publishing Templates to Version 21

If you have a custom template that was created in Oxygen XML Editor Eclipse plugin version 19.1 or older and you want to convert it to be compatible with Oxygen XML Editor Eclipse plugin version 21.0 or 21.1, you need to apply two conversion procedures:

Result: The converted Publishing Template can now be used in version 21.0 or 21.1.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Use CSS Styling to Customize the Output

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using an Oxygen Publishing Template (on page 2136) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using F12 or by selecting Inspect Element (or simply Inspect) from the contextual menu.

Tip: When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting Show Develop menu in menu bar. Then you can select Show Web Inspector from the Develop menu or click Command + Option + I.
Create the Custom CSS

As a practical example, the following procedure would change the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

```css
.wh_footer {
  font-size: 15px;
  line-height: 1.7em;
  background-color: #000;
}
```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.

3. Create a custom CSS file and paste or enter the copied code. For example:

```css
.wh_footer {
  background-color: #255890;
}
```

4. Save the custom CSS file at a location of your convenience.

5. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1169) or the `args.css` parameter (on page 1170).

Referencing the CSS Using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1161).

2. Using the Navigator view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).

3. Open the template descriptor file (on page 1132) associated with your publishing template and add your custom CSS in the `resources` section.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
      <css file="resources/MyCustom.css"/>
    </resources>
  </webhelp>
  ...
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.

5. Click the Choose Custom Publishing Template link and select your template.

6. Click OK to save the changes to the transformation scenario.

7. Run the transformation scenario.
Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the args.css Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the args.css parameter to the path of your custom CSS file.
3. Set the args.copycss parameter to yes to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Insert HTML Content in WebHelp Responsive Output

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file that will be referenced in the transformation (either from an Oxygen Publishing Template (on page 2136) or using one of the HTML fragment parameters (on page 1219)). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the file is not a Well-formed XML document (on page 474) (or fragments are not well-formed), the transformation will fail.

  A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `_${oxygen-webhelp-output-dir}_` macro to specify their paths relative to the output directory:

```xml
<html>
  <script type="text/javascript" src="_${oxygen-webhelp-output-dir_}/js/test.js"/>
  <link rel="stylesheet" type="text/css"
       href="_${oxygen-webhelp-output-dir_}/css/test.css"/>
</html>
```

If you want that the path of your resource to be relative to the templates directory (on page 1129), you can use the `_${oxygen-webhelp-template-dir}_` macro.
To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1185).

• **Inline JavaScript or CSS Content:**

  **JavaScript:**

  ```html
  <script type="text/javascript">
  /* Include JavaScript code here. */
  function myFunction() {
    return true;
  }
  </script>
  ```

  **CSS:**

  ```html
  <style>
  /* Include CSS style rules here. */
  *
  color:red
  }
  </style>
  ```

  **Note:** If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

  ```html
  <!--
  /* Include JavaScript code here. */
  function myFunction() {
    return true;
  }
  --><!--
  </script>
  ```

**Using WebHelp Macros Inside an HTML Fragment File**

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

There are two possibilities for using macros:

• **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

  ```html
  <script type="text/javascript" src="$\{\text{path(oxygen-webhelp-template-dir)}/\""></script>
  ```
• In text content - Using the `<whc:macro>` template component:

```javascript
<script type="text/javascript" xmlns:whc="http://www.oxygenxml.com/webhelp/components">
    var outDirPath = '<whc:macro value="${path(oxygen-webhelp-output-dir)}"/>'; 
    console.log("The output directory path is:", outDirPath);
</script>
```

The following macros are supported:

**i18n**

For localizing a string.

```whl
${i18n(string.id)}
```

**param**

Returns the value of a transformation parameter.

```whl
${param(webhelp.show.main.page.tiles)}
```

**env**

Returns the value of an environment variable.

```whl
${env(JAVA_HOME)}
```

**system-property**

Returns the value of a system property.

```whl
${system-property(os.name)}
```

**timestamp**

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or picture string as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

```whl
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

**path**

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the oxygen-webhelp subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

```whl
${path(oxygen-webhelp-template-dir)}
```
Note: New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```xml
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
    <xsl:param name="pathId"/>
    <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip: Available in all template layout HTML pages.

```xml
${map-xpath(/map/title)}
```

topic-xpath

Can be used to execute an XPath expression over the current topic.

Tip: Available only in the topic HTML page template (`wt_topic.html`).

```xml
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

```xml
${oxygen-webhelp-build-number}
```

Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1161).
2. Insert the HTML content in a well-formed XML file (for example, `custom-html.html`).
3. Using the Navigator view, copy your custom HTML fragment in a folder inside publishing the template root folder (for example, in the `custom_footer_template/html-fragments` folder).
4. Open the template descriptor file (on page 1132) associated with your publishing template and add a reference to the custom HTML fragment in the `html-fragments` section.

```xml
<publishing-template>
    ...
    <webhelp>
        ...
        <html-fragments>
            ...
            <fragment file="html-fragments/custom-html.html" placeholder="webhelp.fragment.head"/>
        </html-fragments>
    </webhelp>
    ...
</publishing-template>
```
Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1138).

5. Open the DITA Map WebHelp Responsive transformation scenario.
6. Click the Choose Custom Publishing Template link and select your template.
7. Click OK to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the `<head>` element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points (on page 1138).

4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: Your additional content will be included at the end of the `<head>` element of your output document.

How to Insert JavaScript AMD Modules in WebHelp Responsive Output

In the WebHelp Responsive output, you may want to include a JavaScript module that uses the Asynchronous Module Definition (AMD) format. Unlike the traditional JavaScript resources that are loaded using `<script>` tags, these modules are loaded using the RequireJS library. For the traditional JavaScript libraries, the standard procedure to contribute your script to the output would be to use an HTML fragment file as described here (on page 1170).

Although following the procedure that uses HTML fragments (on page 1170) would result in having your JS file included in the output, loading the JS code in the browser will result in an error. Since your JS module uses the AMD API, it cannot be loaded using a `<script>` element. For example, because many jQuery plugins use the AMD format, it will be difficult for you to use those libraries in your custom WebHelp output.

Normally, a JavaScript AMD module can be loaded in one of the following ways:

- **As a top-level script**, using the `data-main` attribute of the `<script>` element used to load the RequireJS library.

```html
<script data-main="js/template-main.js" src="js/require.js"></script>
```
However, since WebHelp already loads its internal JS modules using RequireJS, a top-level script is already specified and you cannot specify another top-level script in the same page. Therefore, this approach cannot be used to load your custom JS module in Oxygen XML WebHelp, leaving you with only the following option.

- **As a dependency module**, using a `require()` call from the top level (main) script or from one of its dependency modules. This means that you would have to alter one of the WebHelp core JS libraries and inject a `require()` call to load your custom module:

  ```javascript
  require(['js/template-main.js']);
  ```

**Note**: Altering the WebHelp core libraries is not recommended because when you will upgrade the WebHelp plugin to a newer version, those modifications will be lost.

### Contributing JavaScript AMD Modules Using a Publishing Template

Oxygen XML WebHelp provides the ability to contribute a custom JavaScript Asynchronous Module Definition (AMD) resource in the output by referencing it in the Publishing Template descriptor file ([on page 1132](#)). This module is automatically copied to the output directory and it is automatically loaded in the output HTML pages using a `require()` call. Thus, you can include your scripts in the output without altering WebHelp's core JavaScript libraries.

This module may contain all of your custom functionality or can be used to load other AMD JavaScript modules. The additional sub-modules can be stored either locally in your custom Publishing Template or on a remote web server.

**Important**: To enable loading of a JS module you should set the `webhelp.enable.template.js.module.loading` parameter to `yes` (the default value is `no`) in the Publishing Template descriptor file or in the transformation scenario.

### The JavaScript Modules

The **JS Modules** sample template contains a main JavaScript module (`template-main.js`) that loads other modules stored in the template package or in a remote location on the Internet.

```javascript
define(['require'], function (require) {
  require(['./red', './italic', './tables']);
});
```

Besides the main JavaScript example, the template contains 3 other sub-modules:

- **red.js** - Changes the font color of the publication title.

  ```javascript
  define(['jquery'], function ($) {
    $(document).ready(function () {
      // Make the title red
      $('.' + wh_publication_title + a').attr('style', 'color:red');
    });
  });
  ```

- **italic.js** - Changes the font style of your publication title.
```javascript
define(['jquery'], function ($) {
    $(document).ready(function () {
        // Make the title italic
        $('a.wh_publication_title a').wrapInner('<i></i>');
    });
});
```

• tables.js - Loads the DataTables jQuery plugin from a CDN.
```javascript
define(['jquery',
    'https://cdn.datatables.net/1.10.16/js/jquery.dataTables.min.js'], function ($) {
    $(document).ready(function () {
        $('.table').DataTable();
    });
});
```

The JavaScript modules are stored in the Publishing Template package as follows:
```
[template-dir]
[js]
  template-main.js
  italic.js
  red.js
  tables.js
```

Notes:

• The main module should be referenced in the Publishing Template descriptor file (on page 1132) by specifying its path relative to the base directory of the template.

```xml
<js-amd-module file="js/template-main.js"/>
```

• The main JS module is copied automatically to the output directory, but the sub-modules are not. To instruct the Publishing Template engine to copy those modules to the output directory you should include a <fileset> section in the Publishing Template descriptor file (on page 1132).

```xml
<fileset>
  <include name="js/*.js"/>
</fileset>
```

• The main module can reference other modules bundled in the publishing template package as follows:
  ◦ Relative to template directory - Prefix their paths with the ID of the template directory: template-base-dir (for example: template-base-dir/js/italic).
  ◦ Relative to the name of the current JS module - Use ./ to prefix the paths of the referenced modules.
  ◦ The .js extension should be omitted for local modules, because the RequireJS library will add it automatically.
How to Change Numbering Styles for Ordered Lists

Ordered lists (<ol>) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom @outputclass value and set it as an attribute of the ordered list, as in the following example:

   ```xml
   <ol outputclass="number-alpha">
     <li>A</li>
     <li>B</li>
     <li>C</li>
   </ol>
   ```

2. Add the following code snippet in a custom CSS file:

   ```css
   ol.number-alpha{
     list-style-type:lower-alpha;
   }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1177) or the args.css parameter (on page 1178).

Referencing the Custom CSS from a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1161).
2. Using the Navigator view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the custom_footer_template/resources folder).
3. Open the template descriptor file (on page 1132) associated with your publishing template and add your custom CSS in the resources section.

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <resources>
         ...
         <css file="resources/MyCustom.css"/>
       </resources>
     </webhelp>
   </publishing-template>
   ```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.
Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the `args.css` Parameter

1. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Show or Hide Navigation Links in Topic Pages

The topic pages (on page 1092) in WebHelp Responsive output can contain navigation links (Previous / Next arrows) that can be used to navigate to the previous or next topic.

How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the `@collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```xml
<map id="example_map" title="Example Map">
  <topicref href="../topics/ParentTopic.dita" collection-type="sequence">
    <topicref href="../topics/Childtopic.dita"/>
  </topicref>
</map>
```

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the `webhelp.default.collection.type.sequence` parameter in the transformation and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the `webhelp.show.navigation.links` parameter in the transformation and set its value to `no`.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.
How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the DITA map (on page 2134) and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics will not be displayed in the menu, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the topicref element (or any of its specializations) for each topic you do not want to be displayed in the menu:

   ```
   <topicmeta>
   <data name="wh-menu">
       <data name="hide" value="yes"/>
   </data>
   </topicmeta>
   ```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID growing-flowers in the following example). The CSS file should have content that is similar to this:

   ```
   .wh_top_menu *[data-id='growing-flowers'] { display:none; }
   ```

3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1169) or the args.css parameter (on page 1170).

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template

To hide the menu using an Oxygen Publishing Template (on page 1129), follow this procedure:
1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1161).

2. Open the template descriptor file (on page 1132) associated with your publishing template and add the `webhelp.show.top.menu` parameter in the `parameters` section with its value set to `no`.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.show.top.menu" value="no"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.

4. Click the Choose Custom Publishing Template link and select your template.

5. Click OK to save the changes to the transformation scenario.

6. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To hide the menu using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.

2. Open the Parameters tab and set the `webhelp.show.top.menu` parameter to `no`.

3. Click OK to save the changes to the transformation scenario.

4. Run the transformation scenario.

**How to Add a Welcome Message in the WebHelp Responsive Main Page**

The main page of the WebHelp Responsive output contains a set of empty placeholders (on page 1138) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

**Using a Publishing Template**

To add a customized welcome message in the main page of the WebHelp Responsive output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1161).

2. Open the template descriptor file (on page 1132) associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the `parameters` section with its value set to one of the following:

   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
• A path to a file that contains well-formed XHTML content.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.fragment.welcome" value="c:\myMessage.xhtml"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, your custom message will be displayed above the search box in the main page.

### Using a Transformation Scenario in Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.fragment.welcome` parameter with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.

**Result:** In the WebHelp output, your custom message will be displayed above the search box in the main page.

### How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of empty placeholders (on page 1138) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.footer` parameter displays the custom content at the bottom of the page.
Using a Publishing Template
To create a custom footer in the WebHelp Responsive output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. If you haven’t already created a Publishing Template, see Working with Publishing Templates (on page 1161).
2. Open the template descriptor file (on page 1132) associated with your publishing template and add the webhelp.fragment.footer parameter in the parameters section with its value set to one of the following:
   - A small well-formed XHTML fragment.
   - A path to a file that contains well-formed XHTML content.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="webhelp.fragment.footer" value="c:\myFooter.xhtml"/>
    </parameters>
  </webhelp>
</publishing-template>
```

**Important:** This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, your custom footer will be displayed at the bottom of the page.

Using a Transformation Scenario in Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To create a custom footer in the WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.fragment.footer parameter with its value set to one of the following:
   - A small well-formed XHTML fragment.
A path to a file that contains well-formed XHTML content.

3. Click OK to save the changes to the transformation scenario.

4. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The tiles version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the DITA map (on page 2134). However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the tiles either by setting metadata information in the DITA map or by customizing the CSS that is associated with the DITA map.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the DITA map and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the DITA map to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the <topicref> element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

   ```xml
   <topicmeta>
     <data name="wh-tile">
       <data name="hide" value="yes"/>
     </data>
   </topicmeta>
   ```

Customizing the CSS

To customize the CSS to control which topics on the first level of the DITA map will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID growing-flowers). The CSS file should have content that is similar to this:
3. Reference the CSS file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1169) or the args.css parameter (on page 1170).

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the DITA map, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the DITA map to set an image to be displayed in a tile, follow these steps:

1. Open the DITA map in the Text editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the <topicref> element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

   ```xml
   <topicmeta>
   <data name="wh-tile">
     <data name="image" href="img/tile-image.png" format="png">
       <data name="attr-width" value="64"/>
       <data name="attr-height" value="64"/>
     </data>
   </data>
   </topicmeta>
   
   Note: The @attr-width and @attr-height attributes can be used to control the size of the image, but they are optional.
   
Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

   ```css
   .wh_tile[data-id='growing-flowers'] > div {
     background-image: url('resources/flower.png');
   }
   ```

3. Reference the file in a WebHelp Responsive transformation using an Oxygen Publishing Template (on page 1169) or the args.css parameter (on page 1170).
Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS, or other resources) to the output directory either by using an Oxygen Publishing Template (on page 2136) or the webhelp.custom.resources parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1161).
2. Add a new <fileset> element in the resources section of the template descriptor file (on page 1135).

   ```xml
   <publishing-template>
     ...
     <webhelp>
       ...
       <resources>
         <fileset>
           <include name="custom-resources/**/**/"/>
           <exclude name="**/*.git"/>
         </fileset>
       </resources>
     </webhelp>
     ...
   </publishing-template>
   ```
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

   **Results:** All files from the custom resources directory will be copied to the WebHelp Output Directory/Oxygen-Webhelp/template folder.

Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the DITA Map WebHelp Responsive transformation scenario and open the Parameters tab.
3. Edit the value of the webhelp.custom.resources parameter and set it to the absolute path of the directory in step 1.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.

   **Results:** All files from the new directory will be copied to the root of the WebHelp output directory.
How to Add a Logo Image in the Title Area

You can customize WebHelp Responsive output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. If you haven’t already created a Publishing Template, see Working with Publishing Templates (on page 1161).
2. Open the template descriptor file (on page 1132) associated with your publishing template and add the `webhelp.logo.image` parameter in the `parameters` section with its value set to path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.

```xml
<publishing-template>
   ...
   <webhelp>
      ...
      <parameters>
         <parameter name="webhelp.logo.image" value="c:\myLogo.jpg"/>
         <parameter name="webhelp.logo.image.target.url" value="http://sample.com"/>
      </parameters>
   </webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click OK to save the changes to the transformation scenario.
5. Run the transformation scenario.
How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image.

This customization can be done using an Oxygen Publishing Template or using a transformation scenario from within Oxygen XML Editor/Author.

Using a Publishing Template
To add a favicon to your WebHelp output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1161).
2. Open the template descriptor file (on page 1132) associated with your publishing template and add the webhelp.favicon parameter in the parameters section with its value set to path of your image.

```xml
<publishing-template>
  ... 
  <webhelp>
    ... 
    <parameters>
      <parameter name="webhelp.favicon" value="c:\myFavicon.jpg"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** Browsers that provide favicon support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Transformation Scenario in Oxygen XML Editor/Author
To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.
2. Open the Parameters tab and set the webhelp.favicon parameter to the path of your image.
3. Click OK to save the changes to the transformation scenario.
4. Run the transformation scenario.
How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the Insert Media Object toolbar action (on page 1949).
   - Drag (or copy) the video file from your system explorer or the Navigator view (on page 221) and drop (or paste) it into your document.
   - Manually add an <object> element, as in one of the following examples:

```
<object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
```

or, instead of the @data attribute, you can specify the video using a parameter like this:

```
<object outputclass="video">
  <param name="src" value="videos/MyVideo.mp4"/>
</object>
```

2. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the <object> element to an HTML5 <video> element.

```
<video controls="controls">
  <source type="video/mp4" src="MyVideo.mp4"/>
</video>
```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the Insert Media Object toolbar action (on page 1949).
   - Drag (or copy) the audio file from your system explorer or the Navigator view (on page 221) and drop (or paste) it into your document.
   - Manually add an <object> element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the @data attribute, you can specify the video using a parameter like this:

```
<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3"/>
</object>
```

2. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the <object> element to an HTML5 <audio> element.

```
<audio controls="controls">
  <source type="audio/mpeg" src="MyClip.mp3"/>
</audio>
```
Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the Insert Media Object toolbar action (on page 1949) or by manually adding an <object> element, as in one of the following examples:

```xml
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the @data attribute, you can specify the object using a parameter like this:

```xml
<object outputclass="iframe">
  <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
</object>
```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an allowfullscreen parameter and set its value to true:

```xml
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4">
  <param name="allowfullscreen" value="true"/>
</object>
```

Tip: If you copy the embed code from the source and paste it into the Insert Media dialog box (see the specific instructions: here (on page 1952)), the allowfullscreen parameter will automatically be added and all you have to do is set the value to true.

3. Apply a DITA to WebHelp transformation to obtain the output.

Result: The transformation converts the <object> element to an HTML5 <iframe> element.

```html
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4"/>
</iframe>
```

For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

- Adding Video, Audio, and Embedded HTML Resources in DITA Topics (on page 1949)

How to Add MathML Equations in WebHelp Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:
Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: DITA-OT-DIR/plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties.

The values that can be edited in the scoring.properties file:

```plaintext
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i = 3
u = 3
div.toc = -10
title = 20
div.ignore = ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc = 25
```
2. Save your changes to the file.

3. Re-run your WebHelp transformation.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your DITA map (on page 2134) structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as ‘*’ (matches zero or more characters) or ‘?’ (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   Example: Suppose that in your project, you want to exclude all files located in the resources directory and all files located in the topics directory that have a .bak file extension. You could create a simple text file (for example, named exclude.properties), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Set the webhelp.search.custom.excludes.file parameter to specify the path to the file that contains the excluded file patterns (for example, exclude.properties in step 1). The parameter can be specified in the parameters section of the template descriptor file (on page 1136) associated with your publishing template or in the Parameters tab of the transformation scenario dialog box in Oxygen XML Editor/Author.

3. Run the transformation.

Search Attribute Method

The WebHelp Search engine does not index DITA topics that have the @search attribute set to no.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the DITA map and for any <topicref> that you want to exclude from search results, set the @search attribute to no. For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the DITA map.

3. Run your WebHelp system transformation.
How to Optimize Search Results

A DITA Map WebHelp transformation scenario can be configured to produce a sitemap.xml file that is used by search engines to aid crawling and indexing mechanisms. A sitemap lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the sitemap.xml file looks like this:

```xml
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
    <url>
        <loc>http://www.example.com/topics/introduction.html</loc>
        <lastmod>2014-10-24</lastmod>
        <changefreq>weekly</changefreq>
        <priority>0.5</priority>
    </url>
    <url>
        <loc>http://www.example.com/topics/care.html#care</loc>
        <lastmod>2014-10-24</lastmod>
        <changefreq>weekly</changefreq>
        <priority>0.5</priority>
    </url>
    ...
</urlset>
```

Each page has a <url> element structure containing additional information, such as:

- **loc** - The URL of the page. This URL must begin with the protocol (such as http), if required by your web server. It is constructed from the value of the webhelp.sitemap.base.url parameter from the transformation scenario and the relative path to the page (collected from the href attribute of a topicref element in the DITA map).

  **Note:** The value must have fewer than 2,048 characters.

- **lastmod** (optional) - The date when the page was last modified. The date format is YYYY-MM-DD.

- **changefreq** (optional) - Indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: always, hourly, daily, weekly, monthly, yearly, and never. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.change.frequency parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

  **Note:** The value always should be used to describe documents that change each time they are accessed. The value never should be used to describe archived URLs.

- **priority** (optional) - The priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets
the search engines know which pages you deem most important for the crawlers. The first time the sitemap.xml file is generated, the value is set based upon the value of the webhelp.sitemap.priority parameter in the DITA WebHelp transformation scenario. You can change the value in each url element by editing the sitemap.xml file.

Creating and Editing the sitemap.xml File
Follow these steps to produce a sitemap.xml file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. Edit the transformation scenario you currently use for obtaining your WebHelp output. This opens the Edit DITA Scenario dialog box.
2. Open the Parameters tab and set a value for the following parameters:
   - webhelp.sitemap.base.url - The URL of the location where your WebHelp system is deployed.
     
     Note: This parameter is required for Oxygen XML Editor Eclipse plugin to generate the sitemap.xml file.
   - webhelp.sitemap.change.frequency - How frequently the WebHelp pages are likely to change (accepted values are: always, hourly, daily, weekly, monthly, yearly, and never).
   - webhelp.sitemap.priority - The priority of each page (value ranging from 0.0 to 1.0).
3. Run the transformation scenario.
4. Look for the sitemap.xml file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

How to Index Japanese Content
To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor/Author installation kit.

Using a Publishing Template
To add a logo in the title area of your WebHelp output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates (on page 1161).
2. Open the template descriptor file (on page 1132) associated with your publishing template and add the default.language parameter in the parameters section with its value set to ja-jp.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="default.language" value="ja-jp"/>
    </parameters>
  </webhelp>
</publishing-template>
```
3. Open the DITA Map WebHelp Responsive transformation scenario.
4. Click the Choose Custom Publishing Template link and select your template.
5. Click OK to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a DITA to WebHelp transformation scenario and in the Parameters tab, set the value of the default.language parameter to ja-jp.

   Note: Alternatively, you could set the @xml:lang attribute on the root of the DITA map (on page 2134) and the referenced topics to ja-jp. Another alternative for DITA output is to use the webhelp.search.japanese.dictionary parameter to specify a path to a Japanese dictionary that will be used by the Kuromoji morphological engine (note that the encoding for the dictionary must be UTF8).

2. Run the WebHelp transformation scenario to generate the output.

Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize the Interface of WebHelp Responsive Output

Static labels used in the WebHelp output are stored in translation files that have the strings-lang1-lang2.xml name format, where lang1 and lang2 are ISO language codes. For example, the US English labels are kept in the strings-en-us.xml file.

These translation files are collected from two locations:

- DITA-OT-DIR/plugins/org.dita.basexsl/common folder - DITA-OT’s default translations (generated text for <note>, <fig>, and <table> elements).
- DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

Related Information:

- How to Index Japanese Content (on page 1193)
- Customizing Generated Text
Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the \textit{dita.xsl.strings} extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a \texttt{com.oxygenxml.webhelp.localization} plugin directory inside the \texttt{DITA-OT-DIR/plugins/} location.
2. Create a \texttt{plugin.xml} file inside that \texttt{com.oxygenxml.webhelp.localization} directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
     <require plugin="com.oxygenxml.webhelp.responsive"/>
     <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
   </plugin>
   ```

3. Create a \texttt{webhelp-extension-strings.xml} file with the following content:

   ```xml
   <langlist>
     <lang xml:lang="en" filename="strings-en-us.xml"/>
     <lang xml:lang="en-us" filename="strings-en-us.xml"/>
   </langlist>
   ```

4. Copy the strings you want to change from the translation files (on page 1194) to the \texttt{strings-en-us.xml} file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

   ```xml
   <strings xml:lang="en-US">
     <str name="Figure">Fig</str>
     <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
   </strings>
   ```

5. Use the Run DITA-OT Integrator transformation scenario (on page 995) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1078).

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the \textit{dita.xsl.strings} extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a \texttt{com.oxygenxml.webhelp.localization} plugin directory inside the \texttt{DITA-OT-DIR/plugins/} location.
2. Create a \texttt{plugin.xml} file inside that \texttt{com.oxygenxml.webhelp.localization} directory with the following content:

   ```xml
   <plugin id="com.oxygenxml.webhelp.localization">
     <require plugin="com.oxygenxml.webhelp.classic"/>
   </plugin>
   ```
3. Create a `webhelp-extension-strings.xml` file with the following content:

```xml
<langlist>
  <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
  <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
</langlist>
```

5. In the `strings-pl-pl.xml` file, change the `@xml:lang` attribute on the root element that conforms with the new language.

```xml
<strings xml:lang="pl-PL">
  ...
</strings>
```

6. Translate the content of each `<str>` element (make sure to leave the `name` attribute unchanged).

```xml
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
  ...
</strings>
```

7. Copy the common DITA-OT strings defined in the `DITA-OT-DIR/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML-based transformations (such as `<note>`, `<fig>`, and `<table>`) elements. Translate the content of each `<str>` element.

```xml
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for "Content".</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</str>
  ...
  <str name="Figure">Polish translation for "Figure"</str>
  <str name="Table">Polish translation for "Table"</str>
  ...
</strings>
```

8. Use the **Run DITA-OT Integrator** transformation scenario (on page 995) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1078).
How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the DITA map (on page 2134) and set the @xml:lang attribute on its root element (<map>). The corresponding attribute value can be set for following RTL languages:

• ar-eg - Arabic
• he-il - Hebrew
• ur-pk - Urdu

Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook™ into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook Like widget to your WebHelp output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a <div> element inside an XML file called facebook-widget.xml. Make sure you follow these rules:
   • The file must be well-formed.
   • The code for each <script> element must be included in an XML comment.
   • The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
      })(document, 'script', 'facebook-jssdk'));
    -->
</div>
```
4. Open the template descriptor file (on page 1132) associated with your publishing template.
5. Use one of the parameters that begin with `webhelp.fragment` (on page 1138) in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="HTML-fragments/facebook-widget.xml"
        placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
  </webhelp>
</publishing-template>
```

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To add a Facebook Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   • The file must be well-formed.
   • The code for each `<script>` element must be included in an XML comment.
   • The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      {function(d, s, id) {
          js, fjs = d.getElementsByTagName(s)[0];
          if (d.getElementById(id)) return;
          js.src = "https://connect.facebook.net/en_US/all.js#xfbml=1";
      }
    -->
  </script>
</div>
```
4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.

5. Switch to the Parameters tab. Depending on where you want to display the button, edit one of the parameters that begin with webhelp.fragment (on page 1138). Set that parameter to reference the facebook-widget.xml file that you created earlier.

6. Click Ok and run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

It is possible to integrate Twitter into your WebHelp Responsive output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Twitter Tweet widget to your WebHelp Responsive output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a <div> element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each <script> element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:
4. Open the template descriptor file (on page 1132) associated with your publishing template.
5. Use one of the parameters that begin with webhelp.fragment (on page 1138) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the tweet-button.xml file that you created earlier.

6. Open the DITA Map WebHelp Responsive transformation scenario.
7. Click the Choose Custom Publishing Template link and select your template.
8. Click OK to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author
To add a Twitter Tweet widget to your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a <div> element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each <script> element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="twitter">
```
4. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.

5. Switch to the Parameters tab. Depending on where you want to display the button, edit one of the parameters that begin with webhelp.fragment (on page 1138). Set that parameter to reference the tweet-button.xml file that you created earlier.

6. Click Ok and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use Google Analytics to track and report site data for your WebHelp Responsive output.

Using a Publishing Template

To integrate Google Analytics into your WebHelp Responsive output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]|||
function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=!1;a.src=g;m.parentNode.insertBefore(a,m)
})(window,document,'script','//www.google-analytics.com/analytics.js','ga');
</script>
```
4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.

5. Open the template descriptor file (on page 1132) associated with your publishing template.

6. Use the webhelp.fragment.after.body parameter (on page 1219) in the html-fragments section of the descriptor file. Set the value of that parameter to reference the googleAnalytics.xml file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending <body> element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

7. Open the DITA Map WebHelp Responsive transformation scenario.

8. Click the Choose Custom Publishing Template link and select your template.

9. Click OK to save the changes to the transformation scenario.

10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author
To integrate Google Analytics into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.

2. Choose the Analytics solution that best fits the needs of your website.

3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script', '//www.google-analytics.com/analytics.js', 'ga'))

ga('create', 'UA-XXXXXXXX-X', 'auto');

ga('send', 'pageview');
</script>
```
4. Save the Tracking Code (obtained in the previous step) in a new XML file called googleAnalytics.xml. Note that the file should only contain the tracking code.

5. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.

6. Switch to the Parameters tab. Edit the webhelp.fragment.after.body parameter (on page 1219) and set it to reference the googleAnalytics.xml file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending <body> element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

7. Click Ok and run the transformation scenario.

**How to Integrate Google Search in WebHelp Responsive Output**

It is possible to integrate the Google Search Engine into your WebHelp Responsive output and you can specify where you want the results to appear in your WebHelp page.

**Using a Publishing Template**

To integrate the Google Search Engine into your WebHelp Responsive output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```javascript
   (function() {
     var cx = '00088821088977588983:8mn4x_mf-yg';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.async = true;
     var s = document.getElementsByTagName('script')[0];
     s.parentNode.insertBefore(gcse, s);
   })();
   </script>
   ``
4. Save the script into a well-formed HTML file called googlecse.html.
5. Open the template descriptor file (on page 1132) associated with your publishing template and add the `webhelp.google.search.script` parameter in the `parameters` section with its value set to reference the `googlecse.html` file that you created earlier.

```xml
<publishing-template>
  ...
  <webhelp>
  ...
  <parameters>
    <parameter name="webhelp.google.search.script" value="resources/googlecse.html"/>
  </parameters>
  </webhelp>
</publishing-template>
```

6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.

   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

7. Open the DITA Map WebHelp Responsive transformation scenario.
8. Click the Choose Custom Publishing Template link and select your template.
9. Click OK to save the changes to the transformation scenario.
10. Run the transformation scenario.

---

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the Google Search Engine into your WebHelp Responsive output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```javascript
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
```
4. Save the script into a well-formed HTML file called googlecse.html.

5. Edit the DITA Map WebHelp Responsive transformation scenario and choose a template.

6. Switch to the Parameters tab and edit the webhelp.google.search.script parameter to reference the googlecse.html file that you created earlier.

7. You can also use the webhelp.google.search.results parameter to choose where to display the search results.

   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

   b. Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

8. Click Ok and run the transformation scenario.

XSLT Extensions for WebHelp Responsive Transformations

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use XSLT-import extension points from an Oxygen Publishing Template (on page 2136).

  Note: Use this method if you want to affect only the transformations that use this publishing template.

- Use XSLT-import extension points from a DITA-OT extension plugin.

  Note: This method will affect all the outputs generated with the WebHelp system.

Related Information:

- WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points (on page 1224)
How to Use XSLT Extension Points from a Publishing Template

This example demonstrates how to use WebHelp XSLT-import Extension Points from an Oxygen Publishing Template (on page 1274).

Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure 402. Example: Copyright information added in the WebHelp footer

The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template (on page 1145) to expand its components. The main page template declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
  <whc:include_html href="${webhelp.fragment.footer}"
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">

  <!-- Apply the default processing -->
```
To add this functionality using a *Oxygen Publishing Template*, follow these steps:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(on page 1161)*.

2. Link the folder associated with the publishing template to your current project in the *Navigator* view.
   
   You should have the `custom_footer_template` folder linked in your project.

3. Using the *Navigator* view, create an `xslt` folder inside the project root folder.
   
   You should have the `custom_footer_template/xsl` folder in your project.
4. Create your customization stylesheet (for example, `custom_mainpage.xsl`) in the `custom_footer_template/xsl` folder. Edit it to override the template that produces the footer section:

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
        </span>
      </xsl:when>

      <!-- Adds only the first year if last is not defined. -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
        </span>
      </xsl:when>
    </xsl:choose>

    <!-- Adds the organization if defined. -->
    <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
      <span class="organization">
        <xsl:text>©</xsl:text>
        <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
        <xsl:text>. All rights reserved.</xsl:text>
      </span>
    </xsl:if>
  </div>
</xsl:template>
```

5. Open the template descriptor file (on page 1132) associated with your publishing template and set the XSLT stylesheet created in previous step with the `com.oxygenxml.webhelp.xsl.createMainPage` XSLT extension point.
6. Open the *DITA Map WebHelp Responsive* transformation scenario.

7. Click the **Choose Custom Publishing Template** link and select your template.

8. Click **OK** to save the changes to the transformation scenario.

9. Run the transformation scenario.

**Use Case 2: Add generation time in the output footer**

Another possible customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

![Figure 403. Generation time added in the WebHelp footer](image)

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), modify the template by adding the following XSLT code at the end.

```xsl
<xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of select="format-dateTime(
      current-dateTime(),
      '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
  </div>
</xsl:if>
```

**Note:** You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the [functions namespace](http://www.oxygenxml.com/).

2. Open the **template descriptor file (on page 1132)** associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.
3. Open the *DITA Map WebHelp Responsive* transformation scenario.

4. In the **Parameters** tab, you can change the value of the `webhelp.footer.add.generation.time` parameter.

5. Click **OK** to save the changes to the transformation scenario.

6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.

**Note:** This customization is available as a GitHub project at: [https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer](https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer).

**Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap**

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```xml
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```
The XSLT stylesheet that generates the main page is located in: DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl. This XSLT stylesheet declares the copy_template mode that processes the main page template to expand its components. The main page template (on page 1145) declares a component for the footer section that looks like this:

```xml
<div class="footer-container text-center">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```xml
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
          -
          <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
        </span>
      </xsl:when>
      <!-- Adds only the first year if last is not defined. -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
        <span class="copyright_years">
          ©<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
        </span>
      </xsl:when>
    </xsl:choose>
  </div>
</xsl:template>
```
You can implement this functionality with a WebHelp extension plugin that uses the `com.oxygenxml.webhelp.xsl.createMainPage` extension point (on page 1225). This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.footer`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
     <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"
               file="custom_mainpage.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, `custom_mainpage.xsl`), and edit it to override the template that produces the footer section:

   ```xml
   <xsl:if test="exists($toc/*/topicmeta/*:bookrights/*:bookowner/*:organization)">
     <span class="organization">
       <xsl:text>&lt;</xsl:text>
       <xsl:value-of select="$toc/*/topicmeta/*:bookrights/*:bookowner/*:organization"/>
       <xsl:text>. All rights reserved.&lt;/xsl:text>
     </span>
   </xsl:if>
   </div>
   </xsl:template>

   <!-- Apply the default processing -->
   <xsl:next-match/>

   <!-- Add a div containing the copyright information -->
   <div class="copyright_info">
     <xsl:choose>
       <!-- Adds the start-end years if they are defined -->
       <xsl:when test="exists($toc/*/topicmeta/*:bookrights/*:copyrfirst) and exists($toc/*/topicmeta/*:bookrights/*:copyrlast)"

               file="custom_mainpage.xsl"/>
   ```
4. Use the **Run DITA-OT Integrator** transformation scenario (on page 995) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1078).

5. Run a **DITA Map WebHelp Responsive** transformation scenario to obtain the customized side TOC.

**Use-Case 2: WebHelp XSLT-Parameter extension point to control if generation time is displayed in the output**

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control whether or not this customization is active. In this case, you can use the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point (on page 1226).

Figure 405. Generation time added in the WebHelp footer

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above (on page 1210).
2. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end:

```xml
<webhelp:footer add:generation:time.gep "yes"/>
```
3. Edit the plugin.xml file to specify the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point and a custom parameter file by adding the following line:

```xml
<feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/>
```

4. Create a custom parameter file (for example, `params.xml`). It should look like this:

```xml
<dummy>
  <param name="webhelp.footer.add.generation.time" expression="${webhelp.footer.add.generation.time}" if="webhelp.footer.add.generation.time"/>
</dummy>
```

5. Use the Run DITA-OT Integrator transformation scenario (on page 995) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1078).

6. Edit a DITA Map WebHelp Responsive transformation scenario and in the Parameters tab (on page 2065), specify the desired value (yes or no) for your custom parameter (`webhelp.footer.add.generation.time`).

7. Run the transformation scenario.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed Edit links in the DITA WebHelp Responsive output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then click the link to open the particular file in Oxygen XML Web Author where they can make or propose changes.

Using a Publishing Template

To embed an Edit link in the DITA Map WebHelp Responsive output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. If you have not already created a Publishing Template, see Working with Publishing Templates (on page 1161).

2. Open the template descriptor file (on page 1132) associated with your publishing template and add the following parameters with their values set to the URLs:
• **editlink.remote.ditamap.url** - The URL of the DITA map suitable for opening in Oxygen XML Web Author.
• **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="editlink.remote.ditamap.url" value="webdav-https://dav.box.com/dav/my.ditamap"/>
      <parameter name="editlink.web.author.url" value="https://www.oxygenxml.com/webauthor.html"/>
    </parameters>
  </webhelp>
</publishing-template>
```

3. Open the **DITA Map WebHelp Responsive** transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

**Result:** In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

• **Windows:**
  

• **Mac OS X/ Linux:**
  

**Using a Transformation Scenario in Oxygen XML Editor/Author**

To embed an **Edit** link in the DITA Map WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
2. Set values for the following parameters:
   • **editlink.remote.ditamap.url** - The URL of the DITA map suitable for opening in Oxygen XML Web Author.
   • **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.
3. Run the transformation scenario.
Result: In the WebHelp output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

How to Flag DITA Content in WebHelp Output
Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for block elements (on page 2132) (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

Using a Publishing Template
To flag content in DITA Map to WebHelp output using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the audience attribute set to programmer, the content of the DITAVAL file should look like this:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
   <prop att="audience" val="programmer" action="flag" img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note: For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Open the template descriptor file (on page 1132) associated with your publishing template and add the args.filter parameter in the parameters section with its value set to the path of the DITAVAL file you created.

   ```xml
   <publishing-template>
   ...
   <webhelp>
   ...
   <parameters>
   <parameter name="args.filter" value="resources/myFile.ditaval"/>
   </parameters>
   </webhelp>
   ```
4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author
To flag content in the DITA Map to WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow these steps:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named myFile.ditaval).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
  img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

**Note:** For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Edit a DITA Map to WebHelp transformation scenario.
4. Specify the DITAVAL file in the Filters tab (with the Use DITAVAL File option).
5. Run the transformation scenario.

**Related Information:**
- Filtering Profiling Values with a DITAVAL File (on page 2101)

How to Deploy the Output on a SharePoint Site
Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using a Script Outside of Oxygen XML Editor/Author
To publish WebHelp Responsive output on a SharePoint site using an Oxygen Publishing Template (on page 1129), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from `.html` to `.aspx.`
3. Open the template descriptor file (on page 1132) associated with your publishing template and add the `args.outext` parameter in the `parameters` section with its value set to `.aspx`.

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <parameters>
      <parameter name="args.outext" value=".aspx"/>
    </parameters>
  </webhelp>
</publishing-template>
```

4. Open the DITA Map WebHelp Responsive transformation scenario.
5. Click the Choose Custom Publishing Template link and select your template.
6. Click OK to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from `.html` to `.aspx`. Fortunately, this can be done in the transformation.
   a. Edit the WebHelp transformation scenario and open the Parameters tab.
   b. Set the `args.outext` parameter to `.aspx`.
   c. Run the transformation scenario.

WebHelp Responsive Transformation Parameters

In addition to the common DITA-OT transformation parameters and the HTML-based Output Parameters, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

Publishing Template Parameters

`webhelp.publishing.template`

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

**Note:** The built-in templates are stored in the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates` folder.

**Note:** Relative paths are resolved based on the current working directory.

`webhelp.publishing.template.descriptor`
Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

**Custom Resource Parameters**

- **webhelp.custom.resources**
  The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

- **webhelp.favicon**
  The file path that points to an image to be used as a favicon in the WebHelp output.

- **webhelp.logo.image.target.url**
  Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

- **webhelp.logo.image**
  Specifies a path to an image displayed as a logo in the left side of the output header.

- **webhelp.logo.image.alt**
  Specifies a value that will be set in the `@alt` attribute of the logo image. If the parameter is not specified, the `@alt` attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the `webhelp.logo.image` parameter.

**Oxygen Feedback Parameter**

- **webhelp.fragment.feedback**
  You can integrate Oxygen Feedback with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an Oxygen Feedback site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**HTML Fragment Extension Parameters**

- **webhelp.fragment.after.body**
  In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

- **webhelp.fragment.after.logo_and_title**
  In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.
In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.top_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.logo_and_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.top_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.footer**

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Important:** This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).
webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a well-formed XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Output Component Parameters

webhelp.default.collection.type.sequence

Specifies if the sequence value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have Next and Previous navigational buttons generated for all HTML pages. Allowed values are no (default) and yes.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is yes.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.full.size.image

Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is yes.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a tree style layout, this parameter should be set to no.

webhelp.show.main.page.toc
Specifies if the table of contents will be presented in the main page of the output. The default value is \textit{yes}.

\texttt{webhelp.show.navigation.links}

Specifies if navigation links will be presented in the output. The default value is \textit{yes}.

\texttt{webhelp.show.print.link}

Specifies if a print link or icon will be presented within each topic in the output. The default value is \textit{yes}.

\texttt{webhelp.show.publication.toc}

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is \textit{yes}.

\texttt{webhelp.show.topic.toc}

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each \texttt{<section>} within the current topic that contains an \texttt{@id} attribute and the section corresponding to the current scroll position is highlighted. The default value is \textit{yes}.

\texttt{webhelp.show.top.menu}

Specifies if a menu will be presented at the topic of the main page in the output. The default value is \textit{yes}.

\texttt{webhelp.publication.toc.hide.chunked.topics}

Specifies if the table of contents will contain links for \textit{chunked} topics. The default value is \textit{yes}.

\texttt{webhelp.publication.toc.links}

Specifies which links will be included in the table of contents. The possible values are:

- \texttt{chapter} (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor’s siblings), and the parent chapter.
- \texttt{topic} - The TOC will only include links for the current topic and its direct children.
- \texttt{all} - The TOC will include all links.

\texttt{webhelp.publication.toc.tooltip.position}

By default, if a topic contains a \texttt{<shortdesc>} element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- \texttt{left} (default)
- \texttt{right}
- \texttt{top}
- \texttt{bottom}
- \texttt{hidden} - The tooltip will not be displayed.
webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

Search-Related Parameters

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

webhelp.search.ranking

If this parameter is set to false then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is true).

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if,for,is).

webhelp.sitemap.base.url

Base URL for all the <loc> elements in the generated sitemap.xml file. The value of a <loc> element is computed as the relative file path from the @href attribute of a <topicref> element from the DITA map, appended to this base URL value. The <loc> element is mandatory in sitemap.xml. If you leave this parameter set to its default empty value, then the sitemap.xml file is not generated.

webhelp.enable.search.autocomplete

Specifies if the Autocomplete feature is enabled in the WebHelp search text field. The default value is yes.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

webhelp.search.page.numberOfLines

Specifies the number of search results items displayed on each page. This parameter is only used when the webhelp.search.enable.pagination parameter is enabled.

webhelp.sitemap.change.frequency
The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), always, hourly, daily, weekly, monthly, yearly, never.

`webhelp.sitemap.priority`

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

`webhelp.google.search.results`

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `@linkTarget` attribute to `frm` for frameless (`iframe`) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used: `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

`webhelp.google.search.script`

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

⚠️ **Note:** The `fix.external.refs.com.oxygenxml` parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

- Setting DITA-OT Parameters

**WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points**

XSLT extension points can be used from either from an Oxygen Publishing Template or from a DITA-OT extension plug-in.

**Extension Points from an Oxygen Publishing Template**

The publishing template allows you to specify one or more XSLT extension points. These extension points will affect only the transformations that use the particular template.
For an example of how to use these extensions in a publishing template, see: How to Use an XSLT Extension Point from a Publishing Template (on page 1206) topic.

Example:

```xml
<publishing-template>
  ...
  <webhelp>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.webhelp.xsl.createMainPage"
        file="xsl/customMainPage.xsl"/>
    </xslt>
  </webhelp>
</publishing-template>
```

Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```xml
<plugin id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.xsl.dita2webhelp"
    file="xsl/fixup.xsl"/>
</plugin>
```

XSLT-Import Extension Points

The following extension points are available:

- **com.oxygenxml.webhelp.xsl.dita2webhelp**
  
  Extension point to override the XSLT stylesheet (dita2webhelp.xsl) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

- **com.oxygenxml.webhelp.xsl.createMainPage**
  
  Extension point to override the XSLT stylesheet (createMainPage.xsl) that produces the WebHelp Responsive main HTML page (index.html). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

- **com.oxygenxml.webhelp.xsl.createNavLinks**
  
  Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the navLinks folder: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks`

- **com.oxygenxml.webhelp.xsl.createSearchPage**
Extension point to override the XSLT stylesheet (`createSearchPage.xsl`) that produces the WebHelp Responsive search HTML page (`search.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createSearchPage.xsl`

`com.oxygenxml.webhelp.xsl.createIndexTermsPage`

Extension point to override the XSLT stylesheet (`createIndextermsPage.xsl`) that produces the WebHelp Responsive index terms HTML page (`indexterms.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndextermsPage.xsl`

`com.oxygenxml.webhelp.xsl.createTocXML`

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the `DITA map (on page 2134)` and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\tocDita.xsl`.

**XSLT-Parameter Extension Points**

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

`com.oxygenxml.webhelp.xsl.dita2webhelp.param`

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.dita2webhelp` extension point (on page 1225).

`com.oxygenxml.webhelp.xsl.createMainPage.param`

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createMainPage` extension point (on page 1225).

`com.oxygenxml.webhelp.xsl.createNavLinks.param`

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createNavLinks` extension point (on page 1225).

`com.oxygenxml.webhelp.xsl.createSearchPage.param`

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createSearchPage` extension point (on page 1225).

`com.oxygenxml.webhelp.xsl.createIndexTermsPage.param`

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createIndexTermsPage` extension point (on page 1226).

`com.oxygenxml.webhelp.xsl.createTocXML.param`

Use this extension point to pass parameters to the stylesheet specified using the `com.oxygenxml.webhelp.xsl.createTocXML` extension point (on page 1226).
WebHelp Classic Output for DocBook

The WebHelp Classic variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook. The WebHelp Classic with Feedback variant also includes a feedback system that allows your users to make comments and allows you to manage and reply to them. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using one of the following transformation scenarios:

- DocBook WebHelp Classic transformation scenario (on page 998)
- DocBook WebHelp Classic with Feedback transformation scenario (on page 998)

WebHelp Classic Output Layout and Features

Layout of the WebHelp Classic System Interface

The layout of the WebHelp Classic system consists of the following components:

Left Pane or Frame

This section on the left side of the help system includes the following tabs:

Content

A typical table of contents style presentation of your content. You can use the Expand all/Collapse all buttons to expand or collapse all the topics presented in the Table of Contents.

Note: You can enhance the appearance of items in the Table of Contents. See the Customizing WebHelp Classic Output chapter (on page 1239) for more details.

Index

Presents the index terms for your content. If your content does not contain any \texttt{<indexterm>} elements, this tab is not generated.

Search Results

This tab is generated when the Search field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the Search Feature section (on page 1231).

Upper Pane or Frame
The upper section of the help system includes the following features:

**Search Field**

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the Search Results tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section (on page 1231).

- **Frames Option**
  
  Click on this option to display the output rendered in HTML frames.

- **Print Option**
  
  Opens a dialog box with various printing options and a print preview.

**Navigation Links**

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the Parent topic, Previous topic, or Next topic. Links to the parent topics of the current open topic are also presented at the top of the page.

*Tip:* To hide the Parent, Next, and Previous links, you can edit the transformation scenario and set the value of the `args.hide.parent.link` parameter to `yes`.

**Main Pane or Frame**

The content of the help pages are rendered and displayed in this main section.
WebHelp Classic with Feedback Enabled

The WebHelp Classic with Feedback variant also contains a Comments section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see Deploying a Feedback-Enabled System.
To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

**Note:** The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System.
WebHelp Classic Search Engine

Search Rules

Rules that are applied during a search include:

• You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a phrase search.

• Boolean Search is supported using the following operators: and, or, not. When there are two adjacent search terms without an operator, or is used as the default search operator (for example, grow flowers is the same as grow or flowers).

• The space character separates keywords (an expression such as grow flowers counts as two separate keywords: grow and flowers).

• Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot ("." ) characters count as a single word.

• Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

• When searching for multi-word phrases in CJK (Chinese, Japanese, Korean) languages that often have multiple words appear in strings without a space separator, you need to add a space to separate the words. Otherwise WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始 之前 (notice the space between the second and third symbols) in the search field.

5-Star Rating Mechanism and Sorting

The Search feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

• Search entries that satisfy the phrase search criterion are presented first.

• The number of keywords found in a single page (the higher the number, the better).

• The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

◦ The search term is included in a meta keyword.

◦ The search term is in the title of the page.

◦ The search term is in bold text in a paragraph.

◦ The search term is in normal text in a paragraph.

Excluded Terms

To improve performance, the Search feature excludes certain stop words. For example, the English version of the stop words includes: a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with.
WebHelp Classic Search Results Tab

When you enter search terms in the Search field at the top of the help system, the results are displayed in the Search Results tab in the left section. When you click on a result in the Search Results tab, that result is displayed in the main pane with the search terms highlighted. If you press Enter with the Search field empty, the highlights are removed.

Figure 408. WebHelp Classic Search Results Tab

Missing Terms

If you enter multiple search terms (other than stop words), for any result that the search engine found at least one term but not one or more of the other terms, the Missing terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results (on page 1251).

Browser Compatibility
This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 11 or newer)
- Chrome
- Firefox
- Safari
- Opera

**Important:** Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the `file://...` format) may not work properly. It is recommended that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

**Warning:** Due to some restrictions in web browsers regarding JavaScript code, the *frameless* version (`index.html` start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`). When loading WebHelp Classic pages from the local file system, the *frameset* version (`index_frames.html` start page) of the WebHelp Classic system should be used instead (`file://...`).

**Deploying a Feedback-Enabled System**

**System Requirements**
The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as Apache Web Server)
- A MySQL or MariaDB database server
- A database admin tool (such as phpMyAdmin)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

**Create WebHelp with Feedback Database**
The *WebHelp with Feedback* system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.
Example:

The following procedure uses phpMyAdmin to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using phpMyAdmin to create a database:

1. Access the phpMyAdmin instance running on your server.
2. Click Databases (in the right frame) and then create a database. You can give it any name you want (for example comments).
3. Create a user with connection privileges for this database.
4. Under localhost, in the right frame, click Privileges and then at the bottom of the page click the reload the privileges link.

Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the WebHelp with Feedback output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as DOCUMENT_ROOT) of your server.
3. Copy the transformation output folder into the DOCUMENT_ROOT folder.
4. Rename it to something relevant (for example, myProductWebHelp).
5. Open the output folder (for example, http://[YOUR_SERVER]/myProductWebHelp/). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Click Start Installation.
   c. Configure the Deployment Settings section. Default values are provided, but you should adjust them as needed.

   Tip: You can change some of the options later. The installation creates a config.php file in [OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php where all your configuration options are stored.

   d. Configure the MySql Database Connection Settings section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section to fill in the appropriate text boxes.

   Warning: Selecting the Create new database structure option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the WebHelp with Feedback system, but you do not want to select this option on subsequent deployments.

   e. If you are using a domain (such as OpenLDAP or Active Directory) to manage users in your organization, select the Enable LDAP Authentication option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
f. If the **Create new database structure** option is selected, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple **WebHelp with Feedback** deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

**Note:** You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

g. Click **Next Step**.

h. Remove the installation folder from your web server.

**Important:** When you publish subsequent iterations of your **WebHelp with Feedback** system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

i. In your Web browser, go to your **WebHelp with Feedback** system main page.

### Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

**Note:** To read debug messages generated by the system:

1. Enable **JavaScript** logging by doing one of the following:
   - Open the `log.js` file, locate the `var log = new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
   - Append `?log=true` to the WebHelp URL.

2. Inspect the PHP and Apache server log files.

### Documentation Product ID and Version

When you run a **WebHelp with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a **product**. If you have three different WebHelp outputs, you have three different **products** (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

**Note:** The **WebHelp with Feedback** installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified **products**.
Related Information:

- Managing Users and Comments in a Feedback-Enabled System

**Refreshing the Content of a Feedback-Enabled System**

It is common to update the content of an existing installation of a WebHelp with Feedback system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the WebHelp with Feedback output directory.
2. Go to the output directory (specified in the Output tab of the transformation scenario), locate the `feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your WebHelp with Feedback system installation directory, overwriting the existing content.

**Managing Users and Comments in a Feedback-Enabled System**

When you installed the WebHelp with Feedback system the first time (assuming the Create new database structure option was selected), you should have been prompted to create an administrator account (or a user named administrator was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic, there is a Comments navigation bar and on the right side there is a Log in button. Click this button and log in with your administrator credentials. This gives you access to an Admin Panel button.
2. Click the Admin Panel button to display an administration page.

**Figure 409. Administrative Page**

![Administrative Page]

3. Use this page to manage the following options:
Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

Set Version

Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- User - Regular user, able to post comments and receive e-mail notifications.
- Moderator - In addition to the regular User rights, this type of user has access to the Admin Panel where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- Admin - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company

The name of the organization associated with the user.

E-Mail

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

WebHelp Notification

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.
Reply Notification

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

Page Notification

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

Date

The date the user registered is displayed.

Status

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

**Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within Oxygen XML Editor/Author or from a command line outside Oxygen XML Editor/Author.

Running from Oxygen XML Editor/Author

To publish DocBook content to WebHelp Classic output from a transformation scenario inside Oxygen XML Editor/Author, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DocBook document as a WebHelp Classic system, follow these steps:

1. Click the [Configure Transformation Scenario(s)](#) action from the toolbar.
2. Select the [DocBook WebHelp Classic](#) scenario from the [DocBook 4](#) or [DocBook 5](#) section.
3. Click [Apply associated](#).
When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

**WebHelp Classic with Feedback Output**

To publish a DocBook document as a **WebHelp Classic with Feedback** system, follow these steps:

1. Click **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the **installation.html** file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

**Automating the WebHelp Classic Output for DocBook**

DocBook-based WebHelp output can be generated from an automated publishing process using a command line outside of **Oxygen XML Editor/Author**. However, to do this, you must purchase an additional **Oxygen XML WebHelp license**.

**Related Information:**
- Generating WebHelp Classic Output for DocBook

**Customizing WebHelp Classic Output**

**Oxygen XML WebHelp** provides support for customizing the **WebHelp Classic** output to suit your specific needs. The **WebHelp Classic** type of output is designed for desktop systems and features a familiar *tri-pane* layout. You can use this system to publish DocBook documents. The **WebHelp Classic with Feedback** variant allows your users to add comments to your output.

To change the overall appearance of the **WebHelp Classic** output, you can use the visual **WebHelp Skin Builder tool (on page 1240)**, which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.
Changing the Layout and Styles

This section contains some topics that explain how to customize the layout and style of your WebHelp Classic output using custom CSS, inserting custom HTML content, and more.

WebHelp Skin Builder

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the Oxygen XML website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to Oxygen XML website.
- A late version web browser.

To start the **Skin Builder**, use a web browser to go to [https://www.oxygenxml.com/webhelp-skin-builder](https://www.oxygenxml.com/webhelp-skin-builder).

Skin Builder Layout

The left side panel of the **Skin Builder** is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - **Import** - Opens an Import CSS dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - **Export** - Saves all properties as a CSS file.

- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.

- **Customize** - Provides a series of customizable elements organized under four main categories:
  - **Header**
  - **TOC Area**
  - **Vertical Splitter**
  - **Content**

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

Creating a Customization Skin

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the **Import** button.
2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the **Add** button and choosing from the available properties.

   **Note:** If you want to revert a particular property to its initial value, click the **Reset** button.

3. When you are happy with the skin customizations you have made, click the **Export** button. All settings will be saved in a CSS file.

### Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor Eclipse plugin.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the **Parameters** tab, set the `webhelp.skin.css` parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: `webhelp.logo.image` and `webhelp.logo.image.target.url`.
5. Run the transformation to obtain the WebHelp output.

For more information about using the WebHelp Skin Builder, watch our video demonstration:

[https://www.youtube.com/embed/32PGX--PQx0](https://www.youtube.com/embed/32PGX--PQx0)

### How to Use CSS Styling to Customize WebHelp Output

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

### Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

**Tip:** When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

### Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

**Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To use a custom CSS to style WebHelp output and use a script outside of **Oxygen XML Editor/Author (on page 1238)**, follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

**How to Add Custom HTML Content in WebHelp Classic Output**

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

**Using Oxygen XML Editor/Author**

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the file is not a *Well-formed XML document (on page 474)* (or fragments are not well-formed), the transformation will fail.
     
     A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.
   - **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:
To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1250).

**Inline JavaScript or CSS Content:**

**JavaScript:**

```html
<script type="text/javascript">
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
</script>
```

**CSS:**

```html
<style>
    /* Include CSS style rules here. */

    *{
        color:red
    }
</style>
```

---

**Note:** If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

```html
<script type="text/javascript">
    <!--
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
    --/>
</script>
```

2. Edit the WebHelp Classic transformation scenario.
3. Go to the Parameters tab.
4. Edit the value of the `webhelp.head.script` parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note**: If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

5. Click **OK** to save the changes and run the transformation scenario.

## Using a Script Outside of Oxygen XML Editor/Author

**Important**: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To include custom HTML content in the WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1238), follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the file is not a Well-formed XML document (on page 474) (or fragments are not well-formed), the transformation will fail.

   A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.
   - **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css" href="${oxygen-webhelp-output-dir}/css/test.css"/>
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory (on page 1250).

- **Inline JavaScript or CSS Content**:

  JavaScript:

  ```javascript
  /* Include JavaScript code here. */
  ```
function myFunction() { 
    return true;
}
</script>

CSS:
<style>
    /* Include CSS style rules here. */

    *{
        color:red
    }
</style>

**Note:** If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place this content inside an XML comment:

```xml
<script type="text/javascript">
    <!--
    /* Include JavaScript code here. */

    function myFunction() {
        return true;
    }
    -->
</script>
```

2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:** If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

- [How to Copy Additional Resources to Output Directory (on page 1250)](Oxygen%20XML%20Editor%20Eclipse%20Plugin%2022.0%20|%2011%20-%20Publishing%20|%201250)

How to Change Number Styles for Ordered Lists

Ordered lists (`<ol>`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:
1. Define a custom \texttt{outputclass} value and set it as an attribute of the ordered list, as in the following example:

\begin{verbatim}
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
\end{verbatim}

2. Add the following code snippet in a custom CSS file:

\begin{verbatim}
ol.number-alpha{
  list-style-type:lower-alpha;
}
\end{verbatim}

3. Edit the WebHelp transformation scenario and open the \textbf{Parameters} tab. Set the \texttt{html.stylesheet} parameter to the path of your custom CSS file.

4. Run the transformation scenario.

\section*{How to Change the Icons in a WebHelp Classic Table of Contents}

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

\begin{verbatim}
.hasSubMenuClosed{
  background: url('../img/book_closed16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}
\end{verbatim}

\begin{verbatim}
.hasSubMenuOpened{
  background: url('../img/book_opened16.png') no-repeat;
  padding-left: 16px;
  cursor: pointer;
}
\end{verbatim}

\section*{Using Oxygen XML Editor/Author}

To assign other icons and use a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the \texttt{.hasSubMenuClosed} and \texttt{.hasSubMenuOpened} properties.

\begin{verbatim}
.hasSubMenuClosed{
  background: url('TOC-my-closed-button.png') no-repeat;
}
\end{verbatim}
2. It is recommended that you store the image files in the same directory as the default icons

`{OXYGEN_INSTALL_DIR}\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.

3. Edit the WebHelp transformation scenario and open the Parameters tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.

4. Run the WebHelp transformation scenario to generate the output.

### Using a Script Outside of Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To assign other icons and use a script outside of Oxygen XML Editor/Author ([on page 1238](#)), follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```css
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}
.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons (`{DocBook XSL directory}\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`).

3. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.

4. Execute the transformation script.

### How to Customize the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:
1. Locate the `toc.css` file in the following directory: ```{DocBook XSL directory}\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css```.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.
3. Run the transformation.

**Note:** You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by using the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

### Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published WebHelp Class output or to the output directory.

### How to Add a Favicon in WebHelp Systems

You can add a custom favicon to your WebHelp output by simply using a parameter in the transformation scenario to point to your favicon image. This is available for DocBook WebHelp output using WebHelp Classic or WebHelp Classic with Feedback transformations.

**Using Oxygen XML Editor/Author**

To add a favicon to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit the WebHelp transformation scenario and open the Parameters tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the favicon.
3. Run the transformation scenario.

**Result:** Browsers that provide favicon support will display the favicon (typically in the browser's address bar, in the list of bookmarks, and in the history).

**Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a favicon to your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the file path that points to the image that will be used as the favicon using the `webhelp.favicon` parameter.
2. Execute the transformation script.

**Result:** Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

### How to Add a Logo Image in the Title Area

You can customize WebHelp Classic output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within Oxygen XML Editor/Author or using a command-line script outside of Oxygen XML Editor/Author.

**Using Oxygen XML Editor/Author**

To add a logo in the title area of your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Edit a WebHelp Classic transformation scenario, then open the Parameters tab.
2. Specify the path to your logo in the `webhelp.logo.image` parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
4. Run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a logo in the title area of your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Specify the path to your logo using the `webhelp.logo.image` parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the `webhelp.logo.image.target.url` parameter.
3. Execute the transformation script.

### How to Add Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to WebHelp Classic output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.
To add videos in the **WebHelp Classic** output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using an `<mediaobject>` element, as in the following example:

   ```xml
   <mediaobject>
     <videoobject>
       <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
     </videoobject>
   </mediaobject>
   ```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

### How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

**Using Oxygen XML Editor/Author**

To copy additional resources to the output directory using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the **Parameters** tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

**Result:** All files from the new directory will be copied to the root of the WebHelp output directory.

**Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To copy additional resources to the output directory using a script outside of Oxygen XML Editor/Author (*on page 1238*), follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.
Result: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add MathML Equations in WebHelp Output

Currently, only Firefox can render MathML equations embedded in the HTML code. MathJax is a solution to properly view MathML equations embedded in HTML content in a variety of browsers.

If you have DocBook content that has embedded MathML equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the head element of all HTML files that have the equation embedded.

For example:

```html
<script type="text/javascript"
     src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML">
</script>
```

Result: The equation should now be properly rendered in the WebHelp output for other browsers.

Searching the Output

This section contains topics that explain how to customize some of the search features in WebHelp Classic output.

How to Change Element Scoring in Search Results

The WebHelp Search feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag elements for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DocBook WebHelp systems ([DocBook XSL directory]\com.oxygenxml.webhelp.classic\indexer\scoring.properties). The properties file includes instructions and examples to help you with your customization.

The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
```
2. Save your changes to the file.

3. Re-run your WebHelp transformation.

**How to Index Japanese Content in WebHelp Classic**

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the Oxygen XML Editor/Author installation kit.

**Using Oxygen XML Editor/Author**

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Set the language for your content to Japanese. Edit a DocBook to WebHelp transformation scenario and in the Parameters tab, set the value of the `l10n.gentext.default.language` parameter to `ja`.
2. Run the WebHelp transformation scenario to generate the output.

**Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To activate the Japanese indexing in your WebHelp output using a script outside of Oxygen XML Editor/Author, follow this procedure:

1. Set the language for your content to Japanese. Use the `l10n.gentext.default.language` parameter in your transformation script and set its value to `ja`.
2. Execute the transformation script.
Related Information:

- How to Localize the Interface of DocBook to WebHelp Classic Output (on page 1254)

Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DocBook WebHelp Classic transformations.

How to Localize Email Notifications of WebHelp Classic with Feedback Output

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using Oxygen XML Editor/Author

To change the language of the emails for WebHelp Classic with Feedback output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create the following directory: [DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code] (where the Language code is the 2-digit code, such as nl for Dutch).
2. Copy all English template files from the following directory and paste them into the directory you just created: [DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en.
3. Edit the HTML files from the following directory and translate the content into your language: [DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code] (where the Language code is the 2-digit code, such as nl for Dutch).
4. Edit a WebHelp Classic with Feedback transformation scenario and open the Parameters tab.
5. In the Parameters tab, look for the default.language parameter and set its value to the appropriate language code (for example, nl for Dutch).
6. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To change the language of the emails for WebHelp Classic with Feedback output using a script outside of **Oxygen XML Editor/Author (on page 1253)**, follow this procedure:

1. Create the following directory: `[DocBook XSL directory]/com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the Language code is the 2-digit code, such as nl for Dutch).
2. Copy all English template files from the following directory and paste them into the directory you just created: `[DocBook XSL directory]/com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`.
3. Edit the HTML files from the following directory and translate the content into your language: `[DocBook XSL directory]/com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the Language code is the 2-digit code, such as nl for Dutch).
4. Use the `args.default.language` parameter in your transformation script and set its value to the appropriate language code (for example, nl for Dutch).

**Note:** If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, en-us), the transformation scenario will only use the language code.

5. Execute the transformation script.

### How to Localize the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where lang1 and lang2 are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`. For example, a Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml">`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the `l10n.gentext.default.language` parameter to the code of the language you want to localize (for example, fr-ca for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.
How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, set the \texttt{@xml:lang} attribute with the corresponding attribute value:

- \texttt{ar-eg} - Arabic
- \texttt{he-il} - Hebrew
- \texttt{ur-pk} - Urdu

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Editor Eclipse plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook into your WebHelp Classic output and the widget will appear in the footer sections of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Facebook Like widget to your WebHelp output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the Get Code button.
3. Copy the two code snippets and paste them into a \texttt{<div>} element inside an XML file called \texttt{facebook-widget.xml}. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each \texttt{<script>} element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="facebook">
     <div id="fb-root"/>
     <script>
       <!--
         \{function(d, s, id) {
             var js, fjs = d.getElementsByTagName(s)[0];
             if (d.getElementById(id)) return;
             js = d.createElement(s); js.id = id;
             js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
         \}
       -->
     </script>
   </div>
   ```
4. In Oxygen XML Editor/Author, click the **Configure Transformation Scenario(s)** action from the toolbar.

5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.

6. Switch to the **Parameters** tab and edit the **webhelp.footer.file** parameter to reference the **facebook-widget.xml** file that you created earlier.

7. Click **Ok** and run the transformation scenario.

### Using a Script Outside of Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a Facebook **Like** widget to your WebHelp output using a script outside of Oxygen XML Editor/Author *(on page 1238)*, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called **facebook-widget.xml**. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```xml
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
    (function(d, s, id) {
      var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.jsxfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs);
    }(document, 'script', 'facebook-jssdk'));
    -->
  </script>
</div>
```
4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `facebook-widget.xml` file that you created earlier.

5. Execute the transformation script.

How to Add Tweet Button in WebHelp Classic Output

It is possible to integrate Twitter into your WebHelp Classic output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Twitter Tweet widget to your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `<script>` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

   ```xml
   <div id="twitter">
     <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
     <script type="text/javascript">
       !function(d, s, id) {
         var js, fjs = d.getElementsByTagName(s)[0], p = /^http/.test(d.location) ? 'http' : 'https';
         if (! d.getElementById(id)) {
           js = d.createElement(s); js.id = id;
           js.src = p + '//platform.twitter.com/widgets.js';
           fjs.parentNode.insertBefore(js, fjs);
         }
     </script>
   </div>
   ```
4. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
6. Switch to the Parameters tab and edit the webhelp.footer.file parameter to reference the tweet-button.xml file that you created earlier.
7. Click Ok and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin (https://www.oxygenxml.com/buy_webhelp.html).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To add a Twitter Tweet widget to your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1238), follow this procedure:

1. Go to the Tweet button generator page.
2. Fill in the displayed form. The Preview and code area displays the code that you will need.
3. Copy the code snippet displayed in the Preview and code area and paste it into a <div> element inside an XML file called tweet-button.xml. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each <script> element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:
4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.

5. Execute the transformation script.

---

**How to Integrate Google Analytics in WebHelp Classic Output**

You can use Google Analytics to track and report site data for your WebHelp Classic output.

**Using Oxygen XML Editor/Author**

To integrate Google Analytics into your WebHelp Classic output using a transformation scenario from within Oxygen XML Editor/Author, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a Tracking Code that contains your Tracking ID. A Tracking Code looks like this:

```html
<script>
(function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
(i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
}(window,document,'script','//www.google-analytics.com/analytics.js','ga'));

ga('create', 'UA-XXXXXXX-X', 'auto');
ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. In Oxygen XML Editor/Author, click the ✈ Configure Transformation Scenario(s) action from the toolbar.
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.
7. Switch to the Parameters tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.
8. Click Ok and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

**Important:** Running WebHelp transformations from a script outside of *Oxygen XML Editor/Author* requires an additional license and some additional setup:

- You must have a valid license for the *Oxygen XML WebHelp Plugin* (https://www.oxygenxml.com/buy_webhelp.html).
- The *Oxygen XML WebHelp Plugin* must be installed and integrated.

To integrate *Google Analytics* into your WebHelp Classic output using a *script outside of Oxygen XML Editor/Author* (on page 1238), follow this procedure:

1. Create a new *Google Analytics account* (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your **Tracking ID**. A **Tracking Code** looks like this:

   ```html
   <script>
   (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
   (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

   ga('create', 'UA-XXXXXXXX-X', 'auto');
   ga('send', 'pageview');
   </script>
   ```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called *googleAnalytics.xml*. Note that the file should only contain the tracking code.
5. Use the ```webhelp.footer.file``` parameter in your transformation script and set its value to reference the *googleAnalytics.html* file that you created earlier.
6. Execute the transformation script.

**How to Integrate Google Search in WebHelp Classic Output**

It is possible to integrate the *Google Search Engine* into your *WebHelp Classic* output and you can specify where you want the results to appear in your WebHelp page.

**Using Oxygen XML Editor/Author**

To integrate the *Google Search Engine* into your WebHelp output using a transformation scenario from within *Oxygen XML Editor/Author*, follow this procedure:

1. Go to the *Google Custom Search Engine page* using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
  var cx = '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.

5. In Oxygen XML Editor/Author, click the Configure Transformation Scenario(s) action from the toolbar.

6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the Duplicate button to open the Edit Scenario dialog box.

7. Switch to the Parameters tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.

   a. Create an HTML file with the following content:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>  
   ```

   (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used:

   ```html
   <div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>
   ```

9. Click Ok and run the transformation scenario.

**Using a Script Outside of Oxygen XML Editor/Author**

1. Important: Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

   a. You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
   
   b. The Oxygen XML WebHelp Plugin must be installed and integrated.
To integrate the Google Search Engine into your WebHelp Classic output using a script outside of Oxygen XML Editor/Author (on page 1238), follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the Create a custom search engine button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```html
<script>
(function() {
    var cx = '000888210889775888983:8mn4x_mf-yg';
    var gcse = document.createElement('script');
    gcse.type = 'text/javascript';
    gcse.async = true;
    var s = document.getElementsByTagName('script')[0];
    s.parentNode.insertBefore(gcse, s);
})();
</script>
```
4. Save the script into a well-formed HTML file called googlecse.html.
5. Use the webhelp.google.search.script parameter in your transformation script and set its value to reference the googlecse.html file that you created earlier.
6. You can also use the webhelp.google.search.results parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the webhelp.google.search.results parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
7. Execute the transformation script.

**Miscellaneous Customization Topics**

This section contains miscellaneous topics about how to customize the WebHelp Classic output.
How to Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon reloading it in a Web browser on the client side, rather than re-using an outdated cached version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following file: 
   ```text
   [OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl
   com.oxygenxml.webhelp.classic/xsl/createMainFiles.xsl
   ```
2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:
   ```xml
   <meta http-equiv="Pragma" content="no-cache" />
   <meta http-equiv="Expires" content="-1" />
   ```

   **Note:** The code should look like this:
   ```html
   <html>
     <head>
       <xsl:if test="$withFrames">
         <base target="contentwin"/>
       </xsl:if>
       <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
       <!-- Disable caching of WebHelp pages in web browser. -->
       <meta http-equiv="Pragma" content="no-cache" />
       <meta http-equiv="Expires" content="-1" />
     </head>
     ....
   </html>
   ```
3. Save your changes to the file.
4. Re-run your WebHelp transformation scenario.

How to Publish WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using Oxygen XML Editor/Author

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: [https://support.microsoft.com/en-us/kb/2616712](https://support.microsoft.com/en-us/kb/2616712).
2. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.ext` parameter to `.aspx`.
3. Run the WebHelp transformation scenario to generate the output.
Using a Script Outside of Oxygen XML Editor/Author

**Important:** Running WebHelp transformations from a script outside of Oxygen XML Editor/Author requires an additional license and some additional setup:

- You must have a valid license for the Oxygen XML WebHelp Plugin ([https://www.oxygenxml.com/buy_webhelp.html](https://www.oxygenxml.com/buy_webhelp.html)).
- The Oxygen XML WebHelp Plugin must be installed and integrated.

To publish WebHelp Classic output on a SharePoint site and use a script outside of Oxygen XML Editor/Author (on page 1238), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: [https://support.microsoft.com/en-us/kb/2616712](https://support.microsoft.com/en-us/kb/2616712).
2. Use the `html.ext` parameter in your transformation script and set its value to `.aspx`.
3. Execute the transformation script.

DITA to PDF Output Customization

Oxygen XML Editor Eclipse plugin provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Editor Eclipse plugin supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.

CSS-based DITA to PDF Customization

Oxygen XML Editor Eclipse plugin comes bundled with a DITA-OT CSS-based PDF Publishing Plugin for transforming DITA maps or single topics to PDF, while styling the resulting output using CSS. It is the base of two types of transformation scenarios:

**DITA Map Transformation Type (DITA Map PDF - based on HTML5 & CSS)**

This transformation type converts DITA maps to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5` transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

**Single Topic Transformation Type (DITA PDF - based on HTML5 & CSS)**

This transformation type converts a single DITA topic to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5-single-topic` transtype is used. This transformation is derived from the DITA Map PDF - based on HTML5 & CSS transformation type but applies on a single topic.
Overview

This section contains topics that provide a basic overview of the DITA-OT CSS-based PDF Publishing Plugin, technical details, and some additional resources to help you with your customizations.

Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS** - You can find a good tutorial here: https://developer.mozilla.org/en-US/docs/Learn/CSS/Introduction_to_CSS. Also, the specification is available on the W3C website: https://www.w3.org/Style/CSS/Overview.en.html.

- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: https://www.w3.org/TR/CSS2/page.html. Also, there is a set of hands-on examples in the Oxygen PDF Chemistry user guide: https://www.oxygenxml.com/doc/ug-chemistry/.

- **HTML5** - For the DITA Map PDF - based on HTML5 & CSS transformation type, you will need a good knowledge of HTML5. You can find resources here: https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5

Related Information:

- DITA-OT DAY 2017: Using CSS to Style PDF Output

Supported Processors

The DITA-OT CSS-based PDF Publishing Plugin supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, metadata extraction (on page 1320) only functions with this processor. If the plugin is started from an Oxygen XML Editor/Author distribution, a Chemistry installation is not needed.

Technical Details

It has the following transformation types:

• **pdf-css-html5** (*DITA Map PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA map converted to HTML5).

• **pdf-css-html5-single-topic** (*DITA PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA topic converted to HTML5).

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. For the single topic transformation the result is a file with the keys and content resolved.
2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. When transforming a single topic, the TOC and Index are not added to the merged file, this includes only the contents of the topic.

3. Then it post-processes the merged map. It fixes some of the structure in the TOC and index, moves the frontmatter and backmatter to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. The result is another merged map.
Note: In the single topic transformation type (DITA PDF - based on HTML5 & CSS), these steps are simplified.

4. When using the DITA map transformation type (DITA Map PDF - based on HTML5 & CSS), the merged DITA map is transformed to a single HTML5 file.

When using the single topic transformation type (DITA PDF - based on HTML5 & CSS), the DITA topic is transformed to an HTML5 file.

The generated HTML elements copy the class attributes from the original DITA elements. In this way you can either use selectors that were designed for DITA structure, or ones for the HTML structure - see: Reusing the Styling for WebHelp and PDF Output (on page 1396). This step can apply customization XSLT extension points (on page 1284) that change the default processing.

5. In the last phase, it uses a collection of CSS files to style the merged map (or for the DITA map transformation type (DITA Map PDF - based on HTML5 & CSS), the merged map in HTML5 format with the help of the CSS processor). References to the CSS files are collected from the publishing template (on page 1275).
Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated to the Java process that performs the publishing.

When the Transformation is Started from Oxygen

It is possible to alter the memory allocation setting from the transformation scenario:

1. Open the Configure Transformation Scenario(s) dialog box.
2. Select your transformation scenario, then click Edit.
3. Go to the Advanced tab.
4. Locate the JVM Arguments and increase the default value. For instance, to set 1GB as maximum of memory, you can specify: -Xmx1024m.

Note: This memory setting is used by both the DITA-OT process and the Chemistry CSS processor.

When the Transformation is Started from the Command Line

There can be two situations where an out of memory error can be triggered:

- From the DITA-OT basic processing (the preparation of the merged XML document).
- From the Chemistry PDF CSS processor (the transformation of the merged XML document to PDF).

To solve both of them, you can change the value of the ANT_OPTS environment variable from a command line for a specific session.

Example: To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

- Windows
Tip: To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.

If the Chemistry PDF CSS processor is failing with `OutOfMemoryError`, try adding the `baseJVMArgLine` parameter to the DITA-OT command line. For example:

```
-DbaseJVMArgLine=-Xmx984m
```

Transformation Parameters

This list includes the most common customization parameters that are available in the DITA Map PDF - based on HTML5 & CSS transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are still supported.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>args.allow.external.coderefs</code></td>
<td>Enables the inclusion of code files that are located outside the DITA map folder hierarchy, referenced using the DITA <code>&lt;coderef&gt;</code> element. Allowed values are <code>yes</code> or <code>no</code> (default).</td>
</tr>
<tr>
<td><code>args.chapter.layout</code></td>
<td>Specifies whether chapter-level TOCs are generated for bookmaps. When set to <code>MINITOC</code>, a small section with links is added at the beginning of each chapter. The default is <code>BASIC</code>. For details, see: Table of Contents for Chapters (Mini TOC) (on page 1353). Allowed values:</td>
</tr>
<tr>
<td></td>
<td>• <code>BASIC</code> - No chapter TOC is created.</td>
</tr>
<tr>
<td></td>
<td>• <code>MINITOC</code> - A chapter level TOC will be generated.</td>
</tr>
<tr>
<td></td>
<td>• <code>MINITOC-BOTTOM-LINKS</code> - A chapter level TOC will be generated, with the links under the chapter description.</td>
</tr>
<tr>
<td><code>args.css</code></td>
<td>You can use this to specify a list of CSS URLs to be used in addition to those specified in the <code>dita.css.list</code> parameter or publishing template. The files must have URL syntax and be separated using semicolons.</td>
</tr>
<tr>
<td><code>args.css.param.*</code></td>
<td>You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (on page 1415).</td>
</tr>
<tr>
<td><code>args.css.param.numbering</code></td>
<td>You can use this parameter to change the numbering of the first-level topics (chapters) and nested topics. Allowed values:</td>
</tr>
</tbody>
</table>
- **shallow** - Only the topics from the first level will be numbered (chapters). This is the default.
- **deep** - All the topics from the map will be numbered (nested topics up to level 3).
- **deep-chapter-scope** - Similar to deep, but in addition, the page numbers, figures, and table numbers are reset at the start of each first-level topic (chapter). The table and figure titles (and the links to them) are prefixed with the chapter numbers. The generic cross reference links contain both the first-level topic (chapter) numbers and the page numbers to avoid ambiguity. This parameter value is only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- **deep-chapter-scope-no-page-reset** - Similar to **deep-chapter-scope**, but the page numbers do not reset at the start of each first-level topic (chapter). The generic cross reference links contain only the page number. This parameter value is only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

For more details, see **Numbering Types (on page 1342)**.

| **args.css.param.show-on-page-lbl** | Controls if the links will have an on page NN label after them. This parameter has different defaults, depending on the transformation type. For map transformations (**pdf-css-html5 trans type**), the default is **yes**. For topic transformations (**pdf-css-html5-single-topic trans type**), the default is **no**.

| **args.css.param.title.layout** | Changes the structure of the title element. In the output, the title area consists of two parts: one is the number of the chapter (and optionally the sections number), and one is the title text. This parameter allows a switch between normal text flow (in-line flow), and a table layout where the number is placed in one cell and the text in the other, avoiding wrap thus of text under the chapter number.

- **normal**
- **table** (avoid wrapping text under counter)

| **args.draft** | Specifies whether or not the content of **<draft-comment>** and **<required-cleanup>** elements is included in the output.

Allowed values:

- **no** - No draft information is shown in the output. This is the default.
- **yes** - The draft information is shown in the output.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args.figurelink.style</td>
<td>Specifies how cross references to figures are styled in output. Allowed values:</td>
</tr>
<tr>
<td></td>
<td>• NUMBER - Only the number of the figures will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>• TITLE - Only the title of the figures will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>• NUMTITLE (default) - Both the title and number of the figures will be shown in links.</td>
</tr>
<tr>
<td>args.gen.task.lbl</td>
<td>Specifies whether or not to generate headings for sections within task topics. Allowed values: YES or NO (default). When set to yes, headings like &quot;About this task&quot;, &quot;Procedure&quot;, or &quot;What to do next&quot;, are shown in the task contents.</td>
</tr>
<tr>
<td>args.input</td>
<td>Specifies the master DITA map file for your documentation project.</td>
</tr>
<tr>
<td>args.keep.output.debug.files</td>
<td>Specifies whether or not the debug files generated during the transformation should be kept in the output folder. Allowed values: YES (default) or NO.</td>
</tr>
<tr>
<td>args.output.base</td>
<td>Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it.</td>
</tr>
<tr>
<td>args.tablelink.style</td>
<td>Specifies how cross references to tables are styled in output. Allowed values:</td>
</tr>
<tr>
<td></td>
<td>• NUMBER - Only the number of the tables will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>• TITLE - Only the title of the tables will be shown in links.</td>
</tr>
<tr>
<td></td>
<td>• NUMTITLE (default) - Both the title and number of the tables will be shown in links.</td>
</tr>
<tr>
<td>clean.temp</td>
<td>Specifies whether the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: yes (default) / no</td>
</tr>
<tr>
<td>css.processor.path.antenna-house</td>
<td>Path to the Antenna House executable file that needs to be run to generate the PDF (for example, C:\path\to\AHFCmd.exe on Windows).</td>
</tr>
<tr>
<td>css.processor.path.chemistry</td>
<td>Path to the Oxygen PDF Chemistry executable file that needs to be run to generate the PDF (for example, C:\path\to\chemistry.bat on Windows). If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start Oxygen PDF Chemistry.</td>
</tr>
<tr>
<td>css.processor.path.prince</td>
<td>Path to the Prince executable file that needs to be run to generate the PDF (for example, C:\path\to\prince.exe on Windows).</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>css.processor.type</td>
<td>Specifies the processor to use for the transformation. Allowed values: chemistry (default) / antenna-house / prince.</td>
</tr>
<tr>
<td>default.language</td>
<td>Specifies the default language for source documents. Examples: fr, de, zh, etc. Depending on the transformation type, the actual number of supported languages can vary, see: Localization (on page 1386).</td>
</tr>
</tbody>
</table>
| drop.block.margins.at.page-boundary | Specifies that the top and bottom margins associated with a block element should be discarded when the block is at the top or bottom of the page. Allowed values:  
  - yes (default)  
  - no |
| editlink.remote.ditamap.url | Use this parameter in conjunction with editlink.web.author.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap. |
| editlink.web.author.url | This parameter needs to be used in conjunction with editlink.remote.ditamap.url to add an Edit link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/. |
| figure.title.placement | Controls the title placement of the figures, relative to the image. Possible values include top (default) and bottom. |
| fix.external.refs.com.oxygenxml | The DITA Open Toolkit usually has problems processing references that point to locations outside of the processed DITA map directory. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values:  
  - true  
  - false (default) |
| generate.named.destinations | When set to yes (default), the @id attributes from the DITA content are used as PDF named destinations |
When set to **yes**, the generated structures (table of contents, index list, front page, etc.) are removed from the output. The default is **no**.

When set to **yes**, the user comments, colored highlights and tracked changes are shown in the output.

When set to **yes** (default) and the `show.changes.and.comments` parameter is also set to **yes**, the user comments and tracked changes are shown in the PDF output as stick note annotations. When set to **no**, the comments and tracked changes are left in the document model and are styled by the default CSS rules as footnotes. You can override this from your customization CSS *(on page 1292)*.

The following parameters can be used to specify a publishing template:

- **pdf.publishing.template**
  Specifies the path to the folder containing the custom PDF template.

- **pdf.publishing.template.descriptor**
  Specifies the name of the descriptor to be loaded from the PDF template folder or package. If it is not specified, the first encountered descriptor will be loaded.

The following parameters are only available for the **DITA PDF - based on HTML5 & CSS** single DITA topic transformation scenario (`pdf-css-html5-single-topic` trans type):

- **args.root.map**
  Specifies the path of the root map file used to expand the key references in the published topic.

- **args.enable.root.map.key.processing**
  Indicates whether or not the keys should be processed using the root map parameter.

  **Allowed values:**

  - **auto** (default)
  - **yes**
  - **no**

### License Key

**Chemistry License**

If you have an Oxygen PDF Chemistry license key, you will be able to generate PDF output that is not stamped with the Chemistry logo image.

To install your Chemistry license key:

- If you are using the version of Chemistry that comes bundled in Oxygen XML Editor/Author, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry` folder.
• If you are using another Chemistry installation, make sure you place the licensekey.txt file in that folder.

Oxygen Publishing Engine License

If you have purchased a license for the Oxygen Publishing Engine, you will be able to produce both PDF and WebHelp output without any restrictions.

To install your Oxygen Publishing Engine license key, save the license key text in a file with the name licensekey.txt and place it in the DITA-OT-DIR folder.

Publishing Templates

An Oxygen Publishing Template defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

• WebHelp Responsive
• DITA Map PDF - based on HTML5 & CSS

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customization methods include:

• Add additional template resources to customize the output (such as logos, Favicons, or CSS files).
• Extend the default processing by specifying one or more XSLT extension points.
• Specify one or more transformation parameters to customize the output.
• Customize various aspects of the output through simple CSS styling.
• For WebHelp Responsive output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for Oxygen Publishing Template packages:
For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: Creating Custom Publishing Templates for WebHelp and PDF Output. The Webinar slides and sample project are also available from that webpage.

Related Information:
- How to Create a Publishing Template (on page 1161)
- How to Edit a Packed Publishing Template (on page 1163)
- How to Add a Publishing Template to the Publishing Templates Gallery (on page 1163)
- How to Share a Publishing Template (on page 1284)

Publishing Template Package Contents for PDF Customizations

An Oxygen Publishing Template for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.
Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the templates’ root folder.

A PDF template descriptor might look like this:

```xml
<publishing-template>
  <name>Flowers</name>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers.css"/>
    </resources>
    <parameters>
      <parameter name="figure.title.placement" value="top"/>
    </parameters>
  </pdf>
</publishing-template>
```

Tip: It is recommended to edit the template descriptor in Oxygen XML Editor/Author because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light colored template</description>
  ...
</publishing-template>
```
Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>`.

```
<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...
</publishing-template>
```

PDF Element

The `<pdf>` element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this `<pdf>` section specify the template tags (on page 1277), template preview image (on page 1278), resources (on page 1278) (such as CSS files), transformation parameters (on page 1278), or XSLT extensions (on page 1279).

```
<pdf>
  <tags>
    ...
  </tags>
  ...
  <preview-image file="MyPreview.png"/>
  ...
  <resources>
    ...
  </resources>
  ...
  <parameters>
    ...
  </parameters>
</pdf>
```

Template Tags

The `<tags>` section provides meta information about the template (such as color theme). Each `tag` is displayed at the top of the Templates tab window in the transformation scenario dialog box and they help the user filter and find particular templates.
<publishing-template>
  ...
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
  </pdf>
</publishing-template>

**Template Preview Image**

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an Online preview icon in the bottom-right corner of the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

<publishing-template>
  ...
  <pdf>
    ...
    <preview-image file="ashes/ashes-tree.png"/>
    <online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>
  </pdf>
</publishing-template>

**Template Resources**

The `<resources>` section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included (using the `<css>` element).

<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom_styles.css"/>
      <css file="css/custom_fonts.css"/>
    </resources>
  </pdf>
</publishing-template>

 cig Note: All relative paths specified in the descriptor file are relative to the template root folder.

**Transformation Parameters**

You can also set one or more transformation parameters in the descriptor file.
The following information can be specified in the `<parameters>` element:

**Parameter name**

The name of the parameter. It may be one of the transformation parameters listed in the Parameters tab of the DITA Map PDF - based on HTML5 & CSS transformation scenario or a DITA-OT PDF-based output parameter.

**Note:** It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

**Attention:** JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

**Parameter Value**

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

**Parameter Type**

The type of the parameter: string or filepath. The string value is default.

After creating a publishing template (on page 1281) and adding it to the templates gallery (on page 1283), when you select the template in the transformation scenario dialog box, the Parameters tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

**XSLT Extension Points**

The publishing templates support one or more XSLT extension points. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <parameters>
      <parameter name="show.changes.and.comments" value="yes"/>
    </parameters>
  </pdf>
</publishing-template>
```
file="xslt/merged2mergedExtension.xsl"/>
</xslt>

For more information about the available extension points, see: XSLT Extensions for PDF Transformations (on page 1284).

Combining PDF and WebHelp Responsive Customizations in a Template Package

An Oxygen Publishing Template package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```xml
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-wh.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no"/>
      <parameter name="webhelp.show.main.page.toc" value="yes"/>
    </parameters>
  </webhelp>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png"/>
    <resources>
      <css file="flowers-pdf.css"/>
      <css file="flowers-page-styling.css"/>
    </resources>
  </pdf>
</publishing-template>
```
How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Template Starting from Scratch

To create a new Oxygen Publishing Template, follow these steps:

1. Create a folder that will contain all the template files.
2. In Oxygen XML Editor/Author, open the new document wizard (use File > New or the New toolbar button), then choose the Publishing Template Descriptor template.

3. Save the .opt file into your customization directory.
4. Open the .opt file in the editor and customize it to suit your needs.
Creating a Template Starting from an Existing Template

If you are using a WebHelp Responsive or DITA Map PDF - based on HTML5 & CSS transformation, the easiest way to create a new Oxygen Publishing Template (on page 2136) is to select an existing template in the transformation scenario dialog box and use the Save template as button to save that template into a new template package that can be used as a starting point.

To create a new Oxygen Publishing Template, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. **Optional**: You can set one or more transformation parameters from the Parameters tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the Save template as button.  
   **Step Result:** This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.
4. Specify a name for the new template.
5. **Optional**: Specify a template description.
6. **Optional**: The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (DITA Map WebHelp Responsive or DITA Map to PDF - based on HTML5 & CSS). You can use the Include WebHelp customization and Include PDF customization options to specify whether your custom template will include both types of customizations.
7. **Optional**: For WebHelp Responsive customizations, you can select the Include HTML Page Layout Files option if you want to copy the default HTML Page Layout Files (on page 1144) in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the Save as field, specify the name and path of the ZIP file where the template will be saved.  
   **Step Result:** A new ZIP archive will be created on disk in the specified location with the specified name.
9. Open the .opt file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

https://www.youtube.com/embed/zNmXfKWXwO8

**Related Information:**

- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1132)

How to Edit a Packed Publishing Template

To edit an existing Oxygen Publishing Template (on page 2136) package, follow these steps:

1. Unzip the ZIP archive associated with the Oxygen Publishing Template in a separate folder.
2. Link the folder associated with the template in the Navigator view.
3. Using the Navigator view, you can modify the resources (CSS, JS, fonts) within the Oxygen Publishing Template folder to fit your needs.

4. Open the publishing template descriptor file (.opt extension) in the editor and modify to suit your needs.

5. Optional: Once you finish your customization, you can archive the folder as a ZIP file.

How to Use a Publishing Template in a PDF Transformation

From Oxygen XML Editor/Author

A publishing template can be used for PDF output from the DITA Map PDF - based on HTML5 & CSS transformation scenario (or from the DITA PDF - based on HTML5 & CSS transformation scenario).

The Templates tab in the transformation scenario dialog box displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a DITA Map PDF - based on HTML5 & CSS transformation (or a DITA PDF - based on HTML5 & CSS transformation scenario).
2. In the Templates tab, click the Configure Publishing Templates Gallery link to.
   
   **Step Result:** This will open the preferences page.
3. Click the Add button and specify the location of your template directory.
   
   **Step Result:** Your template directory is now added to the Additional Publishing Templates Galleries list.
4. Click OK to return to the transformation scenario dialog box.

**Result:** All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

From Command Line

You can use the simpler form, meaning you only use the pdf.publishing.template parameter to point to the *.opt (publishing template) file:

dita.bat
--input=map\test.ditamap*
"-Dpdf.publishing.template=full_path_to_template_dir/my_template.opt"
--format=pdf-css-html5
...
Or use the two parameters to indicate the folder containing the publishing templates and the name of the publishing template file relative to that folder:

```
dita.bat
--input=map\test.ditamap
"-Dpdf.publishing.template=full_path_to_template_dir"
"-Dpdf.publishing.template.descriptor=my_template.opt"
--format=pdf-css-html5
...
```

**Tip:** You can also start the `dita` process by passing it a [DITA OT Project File](on page 1269). Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

**Related Information:**
- [Transformation Parameters](on page 1269)

### How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`*.xpr`).

### XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1:** Makes some changes on the [merged map](on page 1293) and the result is a modified merged map. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

   **Note:** Use this when you need to filter DITA content.

2. **Stage 2:** Transforms the [merged map](on page 1293) to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

   **Note:** Use this when you need to change the HTML structures generated for a specific DITA element.
These extension points can be used either from a Publishing Template or a DITA-OT extension plugin.

**How to Use XSLT Extension Points for PDF Output from a Publishing Template**

The examples in this section demonstrate how to use XSLT extension points from an Oxygen Publishing Template.

**How to Style Codeblocks with a Zebra Effect**

Suppose you want your codeblocks to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the codeblock is wrapped.

This effect can be done by altering the HTML5 output, creating a div for each line from the code block, then styling them.

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1281).
2. Link the folder associated with the publishing template to your current project in the Navigator view.
3. Using the Navigator view, create an xslt folder inside the project root folder.
4. In this folder, create an XSL file (for example, named merged2html5Extension.xsl) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">
    <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
        <div class='zebra'>
            <xsl:analyze-string regex="\n" select=".">
                <xsl:matching-substring/>
                <xsl:non-matching-substring>
                    <div><xsl:value-of select="."/></div>
                </xsl:non-matching-substring>
            </xsl:analyze-string>
        </div>
    </xsl:template>
</xsl:stylesheet>
```
5. Open the template descriptor file (on page 1276) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in previous step with the com.oxygenxml.pdf.css.xsl.merged2html5 XSLT extension point:
6. Create a `<css>` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the `codeblock` structure. For example:

```css
div.zebra {
  font-family: courier, fixed, monospace;
  white-space: pre-wrap;
}

div.zebra > *:nth-of-type(odd){
  background-color: silver;
}
```

7. Open the *template descriptor file (on page 1276)* associated with your publishing template (the `.opt` file) and reference your custom CSS file in the `resources` element:

```xml
<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>
  </pdf>
  ...
</publishing-template>
```

8. Edit the *DITA Map PDF - based on HTML5 & CSS* transformation scenario.
9. In the *Templates* tab, click the *Choose Custom Publishing Template* link and select your template.
10. Click *OK* to save the changes to the transformation scenario.
11. Run the transformation scenario.

**How to Remove the Related Links Section**

Suppose that you want the `related links` sections to be removed from the PDF output.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see *How to Create a Publishing Template (on page 1281).*
2. Link the folder associated with the publishing template to your current project in the *Navigator* view.
3. Using the *Navigator* view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' topic/related-links ')]">
        <!-- Remove. -->
    </xsl:template>

</xsl:stylesheet>
```

5. Open the template descriptor file (on page 1276) associated with your publishing template (the .opt file) and set the XSLT stylesheet created in previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```xml
<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.merged2merged"
                file="xslt/merged2mergedExtension.xsl"/>
        </xslt>
    </pdf>
</publishing-template>
```

6. Edit the DITA Map PDF - based on HTML5 & CSS transformation scenario.

7. In the Templates tab, click the Choose Custom Publishing Template link and select your template.

8. Click OK to save the changes to the transformation scenario.

9. Run the transformation scenario.

**How to Wrap Words in Markup**

Suppose you want compound words that contain hyphens (or any other criteria) to be wrapped with inline elements (such as the HTML `<code>` element).

To add this functionality using an Oxygen Publishing Template, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see How to Create a Publishing Template (on page 1281).

2. Link the folder associated with the publishing template to your current project in the Navigator view.

3. Using the Navigator view, create an `xslt` folder inside the project root folder.

4. In this folder, create an XSL file (for example, named `merged2htmlExtension.xsl`) with the following content:

```xml
<xsl:template match="text()">
```
5. Open the **template descriptor file (on page 1276)** associated with your **publishing template** (the .opt file) and set the XSLT stylesheet created in previous step with the **com.oxygenxml.pdf.css.xsl.merged2merged** XSLT extension point:

```
<extension id="com.oxygenxml.pdf.css.xsl.merged2merged"
file="xslt/merged2mergedExtension.xsl"/>
```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.

8. Click **OK** to save the changes to the transformation scenario.

9. Run the transformation scenario.
How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin

The examples in this section demonstrate how to use XSLT extension points from a DITA-OT plugin.

How to Style Codeblocks with a Zebra Effect

Suppose you want your codeblocks to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the codeblock is wrapped.

This effect can be done by altering the HTML5 output, creating a `<div>` for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the DITA-OT-DIR\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.pdf.custom.codeblocks).

2. Create a plugin.xml file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.codeblocks">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5">
       file="custom_codeblocks.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, custom_codeblocks.xsl) with the following content:

   ```xml
   <?xml version="1.0" encoding="UTF-8"?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                  xmlns:xs="http://www.w3.org/2001/XMLSchema"
                  exclude-result-prefixes="xs"
                  version="2.0">
    
    <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
      <div class='zebra'>
        <xsl:analyze-string regex="\n" select="."/>
        <xsl:matching-substring/>
        <xsl:non-matching-substring>
          <div><xsl:value-of select="."/></div>
        </xsl:non-matching-substring>
        </div>
    </xsl:template>
   </xsl:stylesheet>
   ```

4. Use the Run DITA-OT Integrator transformation scenario (on page 995) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.

5. Create a custom CSS file with rules that style the codeblock structure. For example:
6. Edit a DITA Map PDF - based on HTML5 & CSS transformation scenario and reference your custom CSS file (using the `args.css` parameter).
7. Run the transformation scenario.

### How to Remove the Related Links Section

Suppose you want the `related links` sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a `plugin.xml` file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```xml
   <plugin id="com.oxygenxml.pdf.custom.related.links">
     <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged">
       file="custom_related_links.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, `custom_related_links.xsl`) with the following content:

   ```xml
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs" version="2.0">
     <xsl:template match="*[contains(@class, ' topic/related-links ')]">
       <!-- Remove. -->
     </xsl:template>
   </xsl:stylesheet>
   ```

4. Use the Run DITA-OT Integrator transformation scenario (on page 995) found in the DITA Map section in the Configure Transformation Scenario(s) dialog box.
5. Run the DITA Map PDF - based on HTML5 & CSS transformation scenario.
Sample Use-cases: Using XSLT and CSS for PDF Transformations

This section includes examples that can be used as a starting point for various customizations using XSLT and CSS.

How to Use a Bullet Instead of Numbers for Tasks Containing a Single Step

If a DITA Task only contains one step (\<step\> element), you probably want it to be rendered like an unordered list (displayed with a bullet instead of a number).

```
... 
<steps>
  <step>
    <cmd>The step</cmd>
  </step>
</steps>
...
```

Should be rendered as:

- The step

Instead of:

1. The step

To achieve this, you need to create an XSLT template that adds a special \@outputclass\ attribute (with its value set to \single\) for the single step, then you need to match this attribute from the CSS and change its aspect.

1. In the customization XSL, add:

```
<xsl:template match="*[contains(@class, ' task/step ')]*[contains(@class, ' task/step ')] = 1]"
  <xsl:copy>
    <xsl:copy-of select="@*"/>
    <xsl:attribute name="outputclass" select="concat(@outputclass, ' single ')"/>
    <xsl:apply-templates/>
  </xsl:copy>
</xsl:template>
```

2. In your customization CSS (on page 1292), add:

```
*[outputclass = "single"] {
  list-style-type: circle !important;
  margin-left: 2em;
}
```
DITA-OT Extension Points

The DITA-OT CSS-based PDF Publishing Plugin supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the plugin.xml file. For more information, see DITA Open Toolkit Extension Points.

How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the args.css parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the com.oxygenxml.pdf.css.init extension point and set the value of the extension.css ANT property to the path of the custom CSS file:

1. In your plugin.xml file, add:

   ```xml
   <feature extension="com.oxygenxml.pdf.css.init" file="init.xml"/>
   ```

2. Create a file named init.xml with the following ANT content:

   ```xml
   <root>
     <property name="extension.css">
       value="$\{dita.plugin.[com.my.plugin.id].dir}/css/my-custom.css"
     </property>
     <!-- add here more init stuff if needed -->
   </root>
   ```

   **Note:** The name of the root element does not matter. The content of this element will be copied in an initialization template.

   **Important:** Make sure all file references begin with the ANT variable that is expanded to the base directory of your plugin.
Customization CSS

The publishing process is driven by a customization CSS.

Tip: If you use the default Chemistry processor in Oxygen XML Editor/Author, you can use LESS instead of CSS. In this case, the customization files should have the .less extension.

To change the styling of the output for the DITA Map PDF - based on HTML5 & CSS and the DITA PDF - based on HTML5 & CSS transformation scenarios:

1. Create the CSS file that will contain all your customizations. It is recommended to create this file in your project directory so you can edit it easily.
2. Add the custom CSS rules. See the various topics in this section for assistance with specific types of customizations.
3. For linking the CSS file, you have two options:
   a. Create a publishing template, create the customization CSS file inside the template folder and link it into the publishing template descriptor. See Publishing Templates (on page 1129).
   b. Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the args.css parameter. The rules from custom CSS will override the rules from the template CSS files.
4. Run the transformation scenario.

Debugging the CSS

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.

Merged Map File

Depending on the type of transformation, one or more merged map files are created at some point during the transformation stages. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the merged map file. This can be found in the out/pdf-cs directory and it has the .merged.html file extension (you will also find a .merged.xml file that aggregates the entire ditamap structure). You can open the HTML files in Oxygen XML Editor/Author to examine the structure. Optionally, you can use the pretty print feature (Format and Indent) to make the structure easier to read.
2. Check that the CSS selectors are written correctly against the document structure.
3. If you still cannot identify the problem, then inspect how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using the Chrome Browser

To inspect the applied CSS styles using Chrome:

1. Open the file ending in .merged.html.
2. Click on the element you want to inspect.
3. Activate the **Chrome Developer Tools** by using \(\text{More Tools}>\text{Developer Tools}\), or press **CTRL+SHIFT** + 1.

4. Activate the **Rendering** pane by using \(\text{More Tools}>\text{Rendering}\):

![Developer Tools Interface]

5. In the **Rendering** pane, select **print** from the **Emulate CSS media** section. This will activate the CSS selectors enclosed in **@media print {..}**.

![Emulate CSS Media]

**Note:** This allows you to debug the styling of elements, table of contents, and index, but not the styles of the page margin boxes (headers, footers) or page breaks.

**Tip:** In the left pane of the **Developer Tools** interface, you can inspect elements and their styles in the **Elements** tab. You can click on any of the links to display the applied CSS files in the **Styles** tab in the right pane. Editing the styles in that pane results in a live preview of how the change will affect the output.
CAUTION: Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.

Inspecting the Applied Styles Using Oxygen XML Editor/Author

To inspect styles:

1. In Oxygen XML Editor/Author, open the file ending in .merged.html.
2. [Optional] From the Styles toolbar, choose the + Print Ready entry. This will activate certain CSS selectors enclosed in @media print { ... }.
3. Click on the element you want to style. Use the Inspect Styles action from the Contextual Menu. A specialized CSS Inspector view will show the built-in CSS rules.

Tip: With this file open in Author mode, it might be helpful to switch the Tags Display Mode to Full Tags with Attributes. You might be able to identify the selector you need to style without using the CSS Inspector view.

Note: This allows you to debug styling of elements, but not of the page margin boxes (headers, footers) or page breaks.

CAUTION: Do not modify the built-in rules directly in the CSS files from the Oxygen XML Editor/Author installation. Instead, copy the rules to your own customization CSS.

Other techniques

These are some other techniques you may find useful:

- Add background and borders properties to the specific CSS rule. If they do not appear in the output then there is a problem with the rule selector.
- Try to use the !important notation to the property that is not applied, or make the selector more specific (you can add more parent selectors).
- To figure out how the elements are mapped to PDF, you can use this fragment in the customization CSS:

```css
* {
    border: 1pt solid blue !important;
}

*:before(1000) {
    content: oxy_name() !important;
    color: orange;
}

*:before(999) {
    content: "[ class='" attr(class) '"] " !important;
    color: orange;
}
```
This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that were hidden.

**How to Speed up CSS Development and Debugging**

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can use the merged map (on page 1293) and transform it directly to PDF.

1. Transform your DITA Map to PDF using the DITA Map PDF - based on HTML5 & CSS transformation scenario.
2. Open the merged file (on page 1293) (*.merged.html) that is located in the output directory in the editor.
3. Configure an XML to PDF transformation with CSS scenario. Do not set CSS files here since the merged file already contains pointers to the stylesheets. This scenario uses the Chemistry CSS processor.
4. **Optional:** Enable the output of the CSS processor using the following preferences page: Options > Preferences > XML > PDF Processors > CSS Processor.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.

**Fastpath:** If your changes involve only element styling, with no specific paged media CSS rules and properties, you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: Debugging the CSS (on page 1293).

**How to Write XPath Expressions**

This topic contains some guidelines for writing XPath expressions. They are used to extract the content from the merged DITA map document.

This is an example where the product name meta-information is placed before the front page title:

```xml
*[class="front-page/front-page-title"]:before {
  text-align: left;
  content: oxy_xpath("(//*[contains(@class, 'topic/prodname')]/text())[1]");
  display: block;
}
```

**Notes:**

- Do not use the DITA element names directly. You must use the DITA @class attribute instead, as these attributes are propagated to the merged elements (including HTML `<div>` elements) while the element names can be lost. By using the class selectors, you also cover DITA specializations.
- Use the "[1]" XPath predicate to select the first value from the document. For example, oxy_xpath("(//*[contains(@class, 'topic/prodname')]/text())[1]"). The meta-information might be copied multiple...
times in the output, inherited by the `<topicref>` elements, so you can get many more values than expected.

- Do not use strings as values for the pseudo elements content, as the string values are not supported for pseudo elements. Instead, use the XPath directly.
- Use the Oxygen XPath Builder view to test the XPath expressions.

Related Information:

- How to Debug XPath Expressions *(on page 1297)*

How to Debug XPath Expressions

You can use the content extracted from the document using the `oxy(xpath)` function in your pseudo elements (`:before`, `:after`) or in `string-set` variables.

For example, the following XPath finds the publication author, set in the DITA map:

```
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
...

:root {
  string-set: author oxy_xpath('//*[contains(@class, "front-page/front-page")]//*[contains(@class, "map/topicmeta")]//*[contains(@class, "topic/author")]//text()');
}
```

To debug an XPath expression:

1. Read the XPath Expressions Guidelines *(on page 1296)*.
2. Begin by transforming your document using your customization CSS.
3. In the output folder, you will find a `[MAP_NAME].merged.html` file (or if you are using the DITA Map PDF - based on HTML5 & CSS transformation, a `[MAP_NAME].merged.html` file).
4. Open the merged file in the Oxygen XML Editor/Author.
5. Activate the XPath Builder view *(Window > Show View > XPath/XQuery Builder)*.
6. Paste your XPath expression and click the Execute XPath button. Check if it returns the expected results.

The XPath builder has a function that allows it to display the document path of the current element from the editor *(Settings drop-down menu > Update on cursor move)*. Alternatively, you can right-click the element in the merged document and select the Copy XPath action, then paste it in the XPath builder.

Related Information:

- XPath Builder Documentation
Default Page Definitions

All page definitions are found in: [PLUGIN_DIR]css/print/p-pages-and-headers.css.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

There are pages for the default page, chapter page, front matter page, back matter page, blank pages, index page, and large tables page.

Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```xml
@page :left {  
   @top-left {  
       content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
       counter(page);  
       font-size:8pt;  
   }  
}

@page :right{  
   @top-right {  
       content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
       counter(page);  
       font-size:8pt;  
   }  
}
```

Tip: To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```xml
@page :left, table-of-contents:left, chapter:left {  
   @top-left {  
       content: "...";  
   }  
}

@page :right, table-of-contents:right, chapter:right{  
   @top-right {  
       content: "...";  
   }  
}
```
Chapter Page

This is inherited from the default page. The chapter page is associated to the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter.

```xml
@page chapter{
    /* Currently inherit from the default page. */
}

/* No headers on the chapter first page. */
@page chapter:first: left{
    @top-left {
        content: none;
    }
}
@page chapter:first: right{
    @top-right {
        content: none;
    }
}
```

Front Matter and Back Matter page

The bookmap front matter and back matter page. It clears the headers.

```xml
@page matter-page {
    @top-left-corner { content: none; }
    @top-left { content: none; }
    @top-center { content: none; }
    @top-right { content: none; }
    @top-right-corner { content: none; }
    @bottom-left-corner { content: none; }
    @bottom-left { content: none; }
    @bottom-center { content: none; }
    @bottom-right { content: none; }
    @bottom-right-corner { content: none; }
}
```

Blank Pages

The following example clears the header for the blank pages that may be created by a `page-break-before`, `page-break-after`, or by using double side pagination (on page 1360):

```xml
@page :blank{
    @top-left {
        content: none;
    }
```
Index Page
The page that contains the index terms (appears only if there are such items in your topics). It uses a lower roman page number in the footer:

```
@page index {
    @top-left-corner { content: none }
    @top-left { content: none }
    @top-center { content: none }
    @top-right { content: none }
    @top-right-corner { content: none }
    @bottom-left-corner { content: none }
    @bottom-left { content: none }
    @bottom-center { content: counter(page, lower-alpha) }
    @bottom-right { content: none }
    @bottom-right-corner { content: none }
}
```

When transformed, the page layout is spread on two columns.

Large Tables Page
The big tables are placed on a rotated page, with orientation landscape:

```
@page landscape-page :right {
    size: landscape;

    @top-left {
        content: none
    }
    @top-center {
        content: none
    }
    @top-right {
        content: none
    }
    @bottom-right {
        content: none
    }
```
Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The [PLUGIN_DIR]/css/print/p-page-size.css file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```css
@page { }
```
How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization CSS (on page 1292), use:

```css
@page {
  size: A4;
  margin: 2cm;
}
```

If you need different margins depending on the page side:

```css
@page {
  size: A4;
  margin: 2cm;
}
@page: left {
  margin-right: 4cm;
}
@page: right {
  margin-left: 4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization CSS (on page 1292), use:

```css
@page {
  size: us-letter landscape;
}
```
How to Change the Page Settings for a Specific Element

Suppose your publication is mainly using a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleeding outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, `wide`). You can set the attribute on the root element of the topic, or on the `<topicref>` element from the map.

   Note: The `@outputclass` values from the `<topicref>` automatically propagate to the root of the topic from the merged map (on page 1293).

2. In your customization CSS (on page 1292), match the output class and associate it with a named page. This page has landscape orientation and small margins. This technique works for any element (consider a table or a list) not necessarily a topic.

   ```
   *[outputclass = 'wide'] {
     page: wide-page;
   }
   
   @page wide-page {
     size: letter landscape;
     margin: 0.5in;
   }
   ```

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering CSS (on page 1338):

- `parttitle`  
  Set to the title of the current part (only for DITA bookmaps that use parts).

- `chaptertitle`  
  Set to the title of the current chapter (Shallow and Deep numbering).

- `sectiontitle`  
  Set to the title of each section (Deep numbering only).

Although you may define string sets in your customization CSS, you need to take into account the fact that the string-set CSS property is not additive, and matching the same elements will end up breaking the current definitions. A very common use-case is to match the title element that is also used in the default CSS. The best approach in this case is to take a look at the rules from the numbering CSS (on page 1338), copy the ones dealing with string sets to your customization, then alter the property definition by adding your definition to the existing ones (and not removing the existing ones).
Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: Default Page Definitions (on page 1298).

How to Position Text in the Headers and Footers

By default, the name of the publication and chapter titles are placed in the top-left or top-right page margin boxes:

```css
@page :left {
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
        " counter(page);
    }
}

@page :right{
    @top-right {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
        " counter(page);
    }
}
```

If you want to change this, you should use the content CSS properties of other page margin boxes, and inhibit the ones in the above content. For example, to set the chapter title in the page top left corner, you can use:

```css
@page :left {
    @top-left {
        content:none;
    }
    @top-left-corner {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " |
        " counter(page);
        white-space: nowrap;
        text-align: left;
    }
}

@page :right{
    @top-right {
```
Note: The corner page margin boxes are fixed and limited as the available space. Above, the text-align and white-space properties are used to make the text bleed out of these boxes towards the center of the page. If you plan to add an image or artwork background, you should consider using the technique described in: How to Decorate the Header by Using a Background Image on the Entire Page (on page 1313).

How to Change the Size of Headers and Footers

This is directly related to the page margins and size.

The headers and footers are placed in the so called page margin boxes, a series of rectangular areas residing in the page margins.

To affect the margins of all page definitions, you may use the following rule:

```
@page {
  margin-top: 3cm !important;
  margin-bottom: 3cm !important;
  margin-left: 2cm !important;
  margin-right: 2cm !important;
}
```

If you want to affect only a specific page, like the first page from chapters for instance, you must use more specific page selectors. See the Default Page Definitions (on page 1298) for details.

Note that the page margin boxes fill the entire page margin. This means the margin-top, for example, dictates the height of the @top-left-corner, @top-left, @top-center, @top-right, @top-right-corner margin boxes. These cannot have margins on themselves, so to change the position of the content inside them, you must use padding properties:

```
@page {
  @top-left {
    content: "...
    padding: 1cm;
  }
  ...
}
```
How to Change the Font of the Headers and Footers

To change the font for all the headers and footers, in your customization CSS (on page 1292), add a CSS rule similar to this:

```css
@page {
    font-size: 12pt;
    font-family: "Arial";
}
```

**Important:** These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```css
@page table-of-contents {
    font-size: 12pt;
    font-family: "Arial";
}
```

Related Information:

- How to Change the Header of the Table of Contents (on page 1350)

How to Change Header Text for Each Topic

It is possible to dynamically change the header depending on the content in a topic. The following example assumes that the data to be presented in the header is located in the metadata section of each topic. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<topicref>` topic reference:

```xml
<topicref href="topics/installing.dita">
    <topicmeta>
        <data name="header-data" value="ID778-3211"/>
    </topicmeta>

    ...
</topicref>
```

In the above example, there is set of key value pairs with the name `header-data`. This information is automatically copied into the content in the merged map file (on page 1293), like this:

```xml
<topic ... >
    <title class="- topic/title ">Installing</title>
    <shortdesc class="- topic/shortdesc ">You install components to make them available for your solution.</shortdesc>
    <prolog class="- topic/prolog ">
        ...
    </prolog>
    <data class="- topic/data " name="header-data" value="ID778-3211"/>
    ...
</topic>
```
This information can be extracted from the CSS:

```css
/* Define the string set variable that contains the text extracted from the data element */
*[class ~="topic/topic"] *[class = "topic/data"] [name="header-data"] {  
  string-set: hdrstr attr(value);  
}

/* Using the value='none' stops applying the image. */
*[class ~="topic/topic"] *[class = "topic/data"] [name="header-data"] [value="none"] {  
  string-set: hdrstr "";  
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {  
  @top-left-corner {  
    content: string(hdrstr);  
  }  
}
```

**Notes:** The string set is applied to all pages that follow the data element, until another data element changes it:

```xml
<topicref href="topics/installing.dita">
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="topics/change.dita">
  <topicmeta>
    <data name="header-data" value="ID990-3200"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
```

To clear the text, use the `none` value:

```xml
...
<topicref href="..."> <!-- The string set is void now -->
```
How to Change Header Images for Each Chapter

It is possible to dynamically change an image in the header depending on the chapter. For this, you need to define an image reference in the metadata section of each chapter. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<chapter>` topic reference:

```
...  
  <chapter href="topics/installing.dita">
    <topicmeta>
      <data name="header-image" value="img/installing.png"/>
    </topicmeta>
  </chapter>
...  
```

In the above example, there is set of key value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (on page 1293), like this:

```
<topic is-chapter="true" ... >
  <title class="- topic/title ">Installing</title>
  <shortdesc class="- topic/shortdesc ">You install components to make them available for your solution.</shortdesc>
  <prolog class="- topic/prolog ">
    ...
  </prolog>
  <data class="- topic/data * name="header-image" value="img/installing.png"/>
  ...

This information can be picked up from CSS:

```
/* Define the string set variable that contains a URL */
*[class =~ "topic/topic"] *[class =~ "topic/data"] [name="header-image"] {
  string-set: imgst oxy_url(oxy_xpath('/*/@xtrf'), attr(value));
}

/* Using the value='none' stops applying the image. */
*[class =~ "topic/topic"] *[class =~ "topic/data"] [name="header-image"] [value="none"] {
  string-set: imgst "";
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
  @top-left-corner {
    content: string(imgst);
    font-size:0; /* remove the font ascent and descent */
  }
```
Details: The @value attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the @xtrf attribute was used from the root element of the merged map document, extracted using the oxy_xpath function.

Notes:

- The image is always aligned vertically to the middle of available space from the page margin box.
- Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
- The image is applied to all pages that follow the data element, until another data element changes it:

```
...<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="img/installing.png"/>
  </topicmeta>
</chapter> ...
```

To clear the image, use the none value:

```
...<data name="header-image" value="none"/>
...```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

© 2017 - My Company Ltd
All rights reserved
For this, you need to specify a rule that matches all the right pages and adds that content in the bottom-center. In your customization CSS (on page 1292), add the following CSS rule:

```css
@page :right {
    @bottom-center {
        content: "© 2017 - My Company Ltd \A All rights reserved";
        font-size: 0.5em;
        color: silver;
    }
}
```

**Note:** Other page rules (such as the table-of-contents) override the contents of the @bottom-center because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```css
@page :right, table-of-contents:right {
    ...
}
```

**Note:** To use new lines (\n characters) in your headers or footers, use the \A notation, as in the example above.

### How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

**Method 1: Using the position:fixed CSS Property**

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map. For example, you can have the following map structure:

   ```
   ...
   End topic
   Footer container topic
   Footer content topic 1
   Footer content topic 2
   ```

2. Add an @outputclass = footer on the <topic> root element of the footer container topic, or on its <topicref> in the map.

3. Use the CSS position: fixed property to position this topic to the bottom of the page:

   ```
   *[outputclass ~="footer"] {
       position: fixed;
       bottom: 0.5in;
       left: 0.5in;
   }
   ```
Note: Make sure the width and height are enough for the content of the footer to fit. Be careful because the content might bleed out of the page. Use bottom and left values to position the block in the page.

Method 2: Using the float:footnote CSS Property

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

```css
*[outputclass ~="footer"] {
  float:footnote;
}

*[outputclass ~="footer"]:footnote-call{
  color:transparent;
  font-size:0;
}

*[outputclass ~="footer"]:footnote-marker{
  color:transparent;
  font-size:0;
}
```

Note: Use transparent colors and/or zero size font to avoid the display of the footnote counters.

How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```css
@page :left {
  @bottom-left-corner{
    content: " ";
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}
```

Important: Always specify a content property. If not, the page margin box will not be generated.
Another use-case is to use the @top-left or @top-right page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces (\A0) to increase the box width as in the following example (alternatively, you can use the technique described in How to Decorate the Header by Using a Background Image on the Entire Page (on page 1313)):

```xml
@page :left {
  @top-left{
    content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}
```

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Related Information:
- Images and Figures (on page 1402)
- How to Add a Background Image for the Cover (on page 1330)
- How to Add a Link in Headers and Footers (on page 1312)

How to Add a Link in Headers and Footers

Method 1: Using an SVG Link Attribute

It is possible to add a link inside the document header (or footer) by using the <a> element inside an SVG document. For example, suppose you have the following SVG document named custom.svg:

```xml
<svg viewBox="0 0 100 40" xmlns="http://www.w3.org/2000/svg">
    <text x="10" y="25">PDF Chemistry</text>
  </a>
</svg>
```

This creates an SVG link with PDF Chemistry displayed as its text (the content of the <text> element).

Note: If you just want to add a link without text, you can define a rectangle that contains the link instead of text.

To display the link, you just need to set your SVG file as the content of one of the page margin boxes:

```xml
@page {
  @top-left{
    content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
    background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}
```
Method 2: Using the CSS -oxy-link Property

It is also possible to add a link inside the document header (or footer) by using the -oxy-link property on the @page margin box declaration. The entire page margin box will behave as a link and will be clickable.

```css
@page {
  @top-left {
    content: "Link";
    -oxy-link: "https://www.oxygenxml.com/";
    color: blue;
  }
}
```

How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.

This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:

```css
@page :left, chapter: left, chapter:first: left {
  background-image: url('img/page_background_image_with_logos_and_artwork_for_left_page.svg');
  background-repeat: no-repeat;
  background-position: 50% 50%;
}
```

For a list of all the possible page names, see: Default Page Definitions (on page 1298).

Related Information:

• How to Add a Background Image for the Cover (on page 1330)

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

• Use an SVG image as background for a page margin box or for the entire page. See: How to Add a Background Image to the Header (on page 1311).
• Use the oxy_label constructor. This is a function that creates a text label with a set of styles.
You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```css
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; ");
```

**Note:** These functions work only with the Chemistry CSS processor.

**Note:** You cannot use `string()` inside an `oxy_label()`. As a workaround, to apply styling on the dynamic text retrieved by a `string()` function you can define some overall styles for the entire page margin box and then use the `oxy_label` to style differently the static text.

```css
@page {
    @top-right {
        color: red;
        content: oxy_label(text, "My Company", styles, "color:black")
    }
    string(chaptertitle); /* This inherits the styling from @top-right*/
}
```

• Use two adjacent page margin boxes, and style them differently:

```css
@page {
    @top-center { 
        content: "First part";
        color: red;
        text-align:right;
    }
    @top-left { 
        content: "- Second part";
        color: blue;
        text-align:left;
    }
}
```

**How to Simplify the Header (Keep Only the Chapter Title)**

The headers display information such as `map title`, `part title`, `chapter title`, and `section title`, ending in the page number.
This might be too much if you have long titles. The solution is to override the default header content.

In your customization CSS (on page 1292), add the following CSS rule:

```css
@page :left {
  @top-left {
    content: string(chaptertitle) " | " counter(page);
  }
}
@page :right{
  @top-right {
    content: string(chaptertitle) " | " counter(page);
  }
}
```

**Important:** Some of the CSS default page rules are more important. If you see that the content does not change:

- Try to also specify the name of the page, to increase the specificity of the rules:

```css
@page :left, table-of-contents:left, chapter:left{
...
}
@page :right, table-of-contents:right, chapter:right{
...
}
```

- Add an `!important` classifier just before the semi-colon.

```css
@top-right {
  content: string(chaptertitle) " | " counter(page) !important;
}
```

---

How to Change the Header Separators (Between Sections and Chapter Titles)

There are some strings defined for part, chapter, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

1. "My Publication" is the value of the `maptitle` string.
2. "Introduction" is the value of the `chaptertitle` string.
3. "Getting Started" is the value of the `sectiontitle` string.
There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization CSS (on page 1292), add the following CSS rule:

```css
/*
String-set: parttitle " - " counter(part, upper-roman) " - " content(), chaptertitle "" /*
Avoid propagating a past chapter title on a new part */
} 
*{class ~="topic/topic"}{is-part} > *{class ~="topic/title"} {
string-set: parttitle " - " counter(part, upper-roman) " - " content(), chaptertitle "";
} 
*{class ~="topic/topic"}{is-chapter}:not({is-part}) > *{class ~="topic/title"} {
string-set: chaptertitle " - " counter(chapter) " - " content();
}
```

If you enabled the deep numbering for chapters and subsections (on page 1342), then use:

```css
/*@page :left {
@top-left {
    color:navy;
    font-style:italic;
};
}
```

---

**How to Change the Header Styling Depending on Page Side**

To modify the styling of the default page headers, add the following CSS rule in your customization CSS (on page 1292):

```css
@page :left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```
If you intend to modify just the headers of the table of contents, use the `table-of-contents` page rule selector:

```xml
@page table-of-contents: left {
    @top-left {
        color: navy;
        font-style: italic;
    }
    @top-right {
        color: red;
    }
}
```

---

### How to Use XPath Computed Data or Images in the Header or Footer

A very simple approach is to use the `oxy_xpath` directly in the `content` property:

```xml
@page front-page {
    @top-center {
        content: "Created: " oxy_xpath('//*[contains(@class, " topic/created ")[1]');
    }
}
```

---

**Example 1: Compute the Number of Words**

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```xml
@page front-page {
    @bottom-center {
        content: "Number of words: "
        oxy_xpath("string-length(normalize-space(/)) - \n        string-length(translate(normalize-space(/),' ','')) +1");
    }
}
```

---

**Note:** The XPath expression from the page rules is evaluated in the context of the document root element, so you will need to use absolute expressions starting with `/` or `//`. This is different from the case when the `oxy_xpath` is used in CSS rules that match an element. In this case, the XPath expressions are evaluated in the context of the matched element and you can use relative paths.

**Tip:** XPath 2.0 is supported (not schema aware).

---

**Example 2: Retrieve Image from a Document and Insert it in the Header**

Another example is to use an image from the document in the publication header:

```xml
<bookmeta>
```
If the URL returned by `oxy_xpath` is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like `resolve-uri` and `document-uri`:

```css
@page {
  @top-center {
    content: url(oxy_xpath('resolve-uri(/*[contains(@outputclass, 'cover-image')]/@href), document-uri(/))'));
  }
}
```

**Example 3: Insert the Current Date in the Footer**

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```css
@page {
  @bottom-left {
    content: oxy_xpath('current-date()');
  }
}
```

**Example 4: Picking up Metadata from the Original Map**

Another example is to use the `oxy_xpath` function to extract the title, or any other element text value from the original processed DITA map file. For this, you can use the `@xtrf` attribute that is set on the root element of the merged map. This attribute contains the URL of the input map.

```css
:root{
  string-set: maptitle oxy_xpath('document(@xtrf)/*[contains(@class, " map/map ")]/*[contains(@class, " topic/title ")]/text()');
}
```
How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

**Method 1: Add a Border in the Page Margin Boxes**

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (top-left-corner, top-left, top-center, top-right, top-right-corner).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a `vertical-align: bottom;` declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```css
@page chapter, chapter:first: left: right, front-page{

  padding-top: 1em;

  @top-left {
    content: "Custom header";
    color: gray;
    border-bottom: 1px solid black;
    vertical-align: bottom;
  }

  @top-center{
    content: " ";
    border-bottom: 1px solid black;
    vertical-align: bottom;
  }

  @top-right{
    content: " ";
    border-bottom: 1px solid black;
    vertical-align: bottom;
  }

```
Method 2: Use a Background Image

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in How to Add a Background Image to the Header (on page 1311).

Metadata

DITA has a solid vocabulary for specifying metadata. There are <prolog> elements in the topics, and <topicmeta>, <bookmeta> elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - XML Fragment

In the merged map file (on page 1293), the metadata section is placed inside the <oxy:front-page> element. This is different from the original placement in the map or bookmark - after the title, but allows usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmark. It only contains some of the possible metadata elements. The bookmeta metadata section is inherited from topicmeta:

```xml
  xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
  class="- map/map bookmark/bookmap "
  ditaarch:DITAArchVersion="1.3" >

```

Note: The padding-top: 1em; is used to avoid the border at the bottom of the header that joins with the page content.
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA @class attribute values and add a new value derived from the DITA element name.
Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
     xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
     cascade="merge"
     ditaarch:DITAArchVersion="1.3">
    ...
</map>
```

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements:

```xml
     xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
     cascade="merge">
    ...
</div>
```
Metadata - Built-in CSS rules

The [PLUGIN_DIR]/css/print/p-meta.css file contains the rules that extract metadata.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `topicmeta` element in a `map` as in the following example:

```xml
<map>
  ...
  <topicmeta>
    ...
    <audience type="programmer" job="programming" experiencelevel="expert"/>
  </topicmeta>
</map>
```

To collect the `@type` attribute, add the following in your customization CSS (on page 1292):

```css
*[class == "map/map"] > *[class == "map/topicmeta"] > *[class == "topic/audience"] {
  -oxy-pdf-meta-custom: "Audience" attr(type);
}
```

**Note:** It is best to use the class selector (such as `*[class == "map/topicmeta"]` ) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps.

**Note:** The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

The metadata is displayed in the Custom tab of the Document Properties dialog box from Acrobat Reader:
How to Show Metadata in the Cover Page

Suppose you need to present the author and the ISBN just under the publication title. Your bookmap contains:

```xml
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tuduit</author>
    <critdates>
      <created date="1/1/2015"/>
      <revised modified="3/4/2016"/>
      <revised modified="3/5/2016"/>
    </critdates>
    <bookid>
      <isbn>071271271X</isbn>
      <booknumber>SG99-9999-00</booknumber>
    </bookid>
  </bookmeta>
</bookmap>
```
The entire `<booktitle>` element content is displayed on the first page of the PDF, so suppose you need to add the information after it.

In your customization CSS (on page 1292), add the following CSS rules:

```css
*[class ~="bookmap/booktitle"]:after {
    display: block;
    content: "by " oxy_xpath('//*[contains(@class, " bookmap/bookmeta ")]/*[contains(@class, " topic/author ")]/text()');
    margin-top: 4em;
    text-align: center;
    color: gray;
}
*[class ~="bookmap/booktitle"]:after(2) {
    display: block;
    content: "ISBN " oxy_xpath('//*[contains(@class, " bookmap/isbn ")]text()');
    text-align: center;
    color: gray;
}
```

The following CSS extensions were used in this example:

- **oxy_xpath** - Executes an XPath expression and returns a string content. Use this whenever you need to extract data from elements other than the one matched by the CSS rule selector.
- **:after(N)** - Creates more than one `after` pseudo element. The argument value represents how far the generated content is from the real content. In the example above, the content of the `:after` is closer to the title (upper) than the content of the `:after(2)`.

**Note:** The `attr()` CSS function can also be used but is limited to extracting attribute values from the matched element.

**Generating Synthetic Pages for Metadata.**

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content on it. In your customization CSS (on page 1292), add the following CSS rules:

```css
@page page-for-meta {
    background-color: yellow; /* Just to see it better*/
    @top-left-corner {
        content:""; /* Remove the default header */
    }
    @top-right-corner {
        content:""; /* Remove the default header */
    }
}
```
How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using string-sets.

If you need to add some of the map metadata to the header of the front page (for example, the creation date), add the following CSS rules in your customization CSS (on page 1292):

```
*{class =~ "bookmap/booktitle"}:after {
  page: page-for-meta;
}
*{class =~ "bookmap/booktitle"}:after(2) {
  page: page-for-meta;
}
```

Note: The front-page is the name of a page that used to present the element with the class "front-page/front-page". The above page rule is combined with the default styles.

How to Remove or Change the PDF Keywords

The keywords defined in the prolog sections of topics are automatically collected and set as PDF keywords. These are shown by the readers in the PDF document properties window.

If you need to remove them, you can use the following CSS snippet in your customization CSS (on page 1292):

```
:root {
  -oxy-pdf-meta-keywords:"";
}
```

To change them, if you have a hard-coded list, you just enumerate each of them in the property content, separating them with comma:
If you need to extract them by other criteria from the merged map, you can use the \texttt{oxy\_xpath()} function instead of the hard-coded list.

**How to Change the PDF Publication Title Property**

The \texttt{<title>} element of a bookmap is quite complex and contains elements for the book library and an alternate title:

```xml
<booktitle>
  <booklibrary>Retro Tools</booklibrary>
  <mainbooktitle>Main Book Title</mainbooktitle>
  <booktitlealt>Book Title Alternative</booktitlealt>
</booktitle>
```

For the publication title, the built-in CSS uses only the content of the \texttt{<mainbooktitle>}. If you want to collect all of the text from the \texttt{<booktitle>}, you can add the following rule to your customization CSS (on page 1292):

```css
:root {
  -oxy-pdf-meta-title: oxy_xpath('//*[@class = "bookmap/booktitlealt"]')[1]/text();
  -oxy-pdf-meta-description: "";
}
```

An XPath expression is used to collect all the \texttt{<booktitlealt>} elements from the merged map, select the first one, then use its text.

The built-in CSS uses the \texttt{<booktitlealt>} as the PDF description. In the example above, this property is cleared since it was moved as a title.

**How to Use a Key Value from the Map in the CSS**

To use a key value in the CSS, the key must be referenced from the content (either a topic or map).

If you do not have it referenced, you may force a reference by using the \texttt{<topicmeta>} or \texttt{<bookmeta>} section of your map and a \texttt{<data>} element. This has no effect on the published content, but allows the CSS rules to use its content.

```xml
<bookmeta>
  ....
  <data keyref="my_key"/>
  ....
</bookmeta>
```

This is expanded in the merged HTML file to:

```html
<div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
```

Suppose that you need the expanded key value in the footer of the publication. You can define a string-set on this data element:

```xml
*[class =~ "topic/data"]|keyref="my_key"] {
  string-set: key-string content(text);
}
```

Or you can use the value from a :before pseudo-element, like the one for the title:

```xml
*[class =~ "topic/title"]|:before {
  content: oxy_xpath("//*[@class, 'topic/data'][keyref='my_key']/text()");
}
```

Another use-case is to use the key as a source for a custom PDF document property:

```xml
*[class =~ "topic/data"]|keyref="my_key"] {
  -oxy-pdf-meta-custom: attr(keyref) content(text);
}
```

**Cover (Title) Page**

Customizing the cover page is one of the most requested customization requests.

**Cover Page - XML Fragment**

The merged map file (on page 1293) contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA @class attribute values and add a new value derived from the DITA element name.

```xml
<booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
<mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
<booktitlealt class="- topic/ph bookmap/booktitlealt ">Product tasks</booktitlealt>
</booktitle>
</oxy:front-page-title>
</oxy:front-page>
```

Cover Page - Built-in CSS rules

The element with the class `frontpage/frontpage` is associated with a page named `front-page` with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-front-page.css`.

```css
@media print {

  *[class="front-page/front-page"] {
    page: front-page;
  }

  *[class="front-page/front-page-title"] {
    display: block;
    text-align: center;
    margin-top: 3in;
    font-size: 2em;
    font-family: arial, helvetica, sans-serif;
    font-weight: bold;
  }
```

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the `front-page`. This makes it very easy to accomplish a good positioning of the graphical elements or artwork. In the foreground, you can place text fragments using a series of :after pseudo elements bound to the front page title.

To set the size to an SVG image, you should specify the `@width` and `@height` attributes on the `<svg>` root element using specified unit values (in, cm, etc.) This should be enough only if all the coordinates from your drawing have unit identifiers.

If you are using unit-less coordinates in your drawing like the following:

```
<polygon points="17.78 826.21 577.51 ..."
```

then make sure you also specify a `@viewBox` attribute on the `<svg>` root element that defines the abstract rectangle that contains the drawing:

```
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 600 850">
```

The following SVG document has the `@width`, `@height`, and `@viewBox` attributes. The width and height have physical units (in inches), while the view box and rectangle coordinates are unit-less.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
  "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 600 850">
<desc>A gradient as big as a page.</desc>
<defs>
  <linearGradient id="lc" x1="0%" y1="0%"
```
This example shows a gradient. It is the size of a US-LETTER page and can be used in a publication using this page size.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your customization CSS (on page 1292), add the following:

```css
@page front-page {
  background-image: url("us-letter.svg");
  background-position: center;
}
```

For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```css
@page front-page {
  background-image: url("company-logo.svg");
  background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis. */
  background-repeat: no-repeat;
}
```

Note: The text from the SVG or PDF background images are searchable in the PDF reader.

How to Change Styling of the Cover Page Title

Match the front page title element in your customization CSS (on page 1292) based on its class attribute:

```css
*{class =~ "front-page/front-page-title" {```
How to Add Text to the Cover Page

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization CSS (on page 1292), add the following:

```css
*[class =~ "front-page/front-page-title"]:after(1) {
  display: block;
  content: "DRAFT VERSION";
  font-size: large;
  color: red;
  text-align: center;
}

*[class =~ "front-page/front-page-title"]:after(2) {
  display: block;
  content: "DO NOT DISTRIBUTE WITHOUT PERMISSION";
  font-size: large;
  color: red;
  text-align: center;
  font-style: italic;
}
```

The result is:

![Cover Page Example]

To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic :after elements, see: How to Show Metadata in the Cover Page (on page 1324).

Related Information:

- How to Show Metadata in the Cover Page (on page 1324)
How to Place Cover on the Right or Left Side

In your customization CSS *(on page 1292)*, add the following CSS rules:

```css
*([class ~= "front-page/front-page"] {  
    page-break-before: left;  
})
```

**Note:** This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

How to Add a Specific Number of Empty Pages After the Cover Page

In your customization CSS *(on page 1292)*, add the following CSS rules:

```css
@page my-blank-page {  
    /* Hide the page numbers */  
    @top-left { content: none; }  
    @top-right { content: none; }  
}

*[class ~= 'front-page/front-page']::after(1){  
    page:my-blank-page;  
    display:block;  
    content: '\2002';  
    color:transparent;  
    page-break-after:always;  
}

*[class ~= 'front-page/front-page']::after(2){  
    page:my-blank-page;  
    display:block;  
    content: '\2002';  
    page-break-after:always;  
}

*[class ~= 'front-page/front-page']::after(3){  
    page:my-blank-page;  
    display:block;  
    content: '\2002';  
}
```
Note: The \2002 character is a space that is not shown on the pages, but gives a value for the content property.

- How to Force an Odd or Even Number of Pages in a Chapter (on page 1361)

How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA bookmap structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your customization CSS (on page 1292), declare a new page layout:

```css
@page copyright-notice-page {
  @top-left {
    content:none; /* Clear the headers for the copyright page */
  }
  @top-right {
    content:none;
  }
}
```

The element with the class `front-page/front-page` element contains the title of the publication and generates the cover page. A synthetic :after element is created that follows this element and it is placed on a different page.

```css
*[class~="front-page/front-page"]:after{
  display:block;
  page: copyright-notice-page; /* Moves the synthetic element on a new page. */
  margin-top:90%; /* use margins to position the text in the page */
  margin-left: 5em;
  margin-right: 5em;
  content: "Copyright 2018-2019 MyCorp Inc. \A All rights reserved";
  text-align:center; /* More styling */
  color:blue;
}
```
If you need to add more content as blocks, use the :after(2), :after(3) pseudo elements:

```
*{class="front-page/front-page"]:after(2) {
    display:block;
    page: copyright-notice-page; /* Continue on the same page as the first ':after'. */
    content: "Some more styled text";
    color:red;
}
```

If you want to extract information from the document, use the oxy_xpath() function. For example, if the copyright info is stored in the map like this:

```
<map ...>
<topicmeta>
  <copyright>
    <copyryear year="2018"/>
    <copyrholder>MyCorp Inc.</copyrholder>
  </copyright>
</topicmeta>
...
```

then use this:

```
*{class = "front-page/front-page"]:after(3) {
    display: block;
    page: copyright-notice-page;
    content: "Year: "
    oxy_xpath('//*[@class = "front-page/front-page"]/*[contains(@class, " map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyryear ")]/@year')
    "A Holder: "
    oxy_xpath('//*[@class = "front-page/front-page"]/*[contains(@class, " map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyrholder ")]/text()')
    color: green;
}
```

- How to Debug XPath Expressions (on page 1297)

**How to Remove the Cover Page and TOC**

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a "front-page/front-page" and "toc/toc" classes in your customization CSS (on page 1292):
Front Matter and Back Matter

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - XML Fragment

In the merged map file *(on page 1293)*, the frontmatter topic references are wrapped in a `<frontmatter>` element that has the class `bookmap/frontmatter`. Then, the referenced content is marked with the attribute `@is-frontmatter="true"`:

```xml
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page class="- front-page/front-page "> ...
</oxy:front-page>

<opentopic:map xmlns:ot-placeholder="http://suite-sol.com/namespaces/ot-placeholder" class="- toc/toc ">
  ...
  <frontmatter xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" class="- map/topicref bookmap/frontmatter ">
    ...
    <topicref class="- map/topicref " href="#unique_1" type="concept"> ...
  </frontmatter>
</opentopic:map>

<concept class="- topic/topic concept/concept "
  is-frontmatter="true"
  topicrefclass="- map/topicref bookmap/bookabstract " ...
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `<div>` attribute values and add a new value derived from the DITA element name.
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <div class=" front-page/front-page front-page">
    ...
  </div>
</div>

Note: The process also applies for the backmatter topic references inside a <backmatter> element with the bookmap/backmatter class and referenced content with the @is-backmatter="true" attribute both in the merged map and merged HTML files.

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in [PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css. By default, it associates the top-level topics that do not represent chapters to a matter-page style of page layout. Each child topic starts on a new page.

Related Information:
- Page Headers and Footers (on page 1303)

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap frontmatter start on a new page, you can disable this by using the following rules in your customization CSS (on page 1292):

```css
*[class =~ "map/map"] > *[class =~ "topic/topic"]{is-frontmatter}{
  page-break-before: auto;
}
```

How to Style the Front Matter and Back Matter Topics

Style all the Topics with the Same Aspect

All the topics referenced from the <frontmatter> and <backmatter> bookmark elements are formatted using the matter-page as defined in Default Page Definitions (on page 1298). In the merged file, the <backmatter> and <frontmatter> elements are omitted, and their child topic content is matched using a CSS rule like the one below:
Style the Topics Depending on Their Role

There might be cases when you need to distinguish between different topics having different roles in your publication:

- Preface
- Notice
- Abstract
- Copyright

These are referenced from the DITA map by specialized `<topicref>` elements, with different class attribute values.

The class attribute values are then passed by the transformation process onto the corresponding topic elements from the merged map content. For example, a topic that was referenced by a `<preface>` map element now has a "bookmap/preface" value in its `@topicrefclass` attribute:

```xml
<topic
  class="- topic/topic "
  id="unique_1"
  topicrefclass="- map/topicref bookmap/preface " .. >
  ...
</topic>
```

This can be used to match and apply different styling, or even a different page layout:

```xml
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
}

*[class =~ "topic/topic"][@topicrefclass =~ "bookmap/preface"] {
  page: preface-page;
}
```

Numbering

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.
Numbering - Built-in CSS

The built-in CSS rules are in:

- \[PLUGIN_DIR\]/css/print/p-numbering-shallow.css
- \[PLUGIN_DIR\]/css/print/p-numbering-deep.css
- \[PLUGIN_DIR\]/css/print/p-numbering-deep-chapter-scope.css
- \[PLUGIN_DIR\]/css/print/p-numbering-deep-chapter-scope-no-page-reset.css

The first CSS (shallow) contains rules that add a "Chapter NN" before the first-level topics from the publication, the second one (deep) contains rules that add a deep structure of counters on all topics referenced from the map (at any level), the third one (chapter-scope) creates a chapter scope-oriented numbering (meaning that the numbering for pages, tables, figures, and links to them are reset for each chapter), and the last one is similar to the third except that page numbers do not reset. For more details, see Numbering Types (on page 1342).

Numbering - Input XML Fragments

The numbering affects multiple logical parts of your publication, the table of contents, headers/footers, chapter titles, figures and tables titles:

The Table of Contents

The table of contents is a tree of \(<\texttt{topicref}>\) elements.

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    class=" front-page/front-page ">
    ...
  </oxy:front-page>

  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic"
    class=" toc/toc ">
    <title class="- topic/title ">Publication Title</title>
    <topicref is-chapter="true" class="- map/topicref ">
      <topicmeta class="- map/topicmeta ">
        <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>
        ...
      </topicmeta>
    </topicref>
    <topicref class="- map/topicref ">
      <topicmeta class="- map/topicmeta " data-topic-id="dcpp_resources">
        <navtitle href="#unique_2" class="- topic/navtitle ">Resources</navtitle>
        ...
      </topicmeta>
    </topicref>
    ...
  </opentopic:map>
```
Note: The `<opentopic:map>` element contains the effective table of contents structure.

Note: The TOC items are the elements with the class: `- map/topicref`.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```html
<div class="- map/map map" ...

  class=" front-page/front-page front-page">

    ...

  </div>

<div class=" toc/toc toc">

  <div class="- topic/title title">

    Publication Title

  </div>

  <div is-chapter="true" class="- map/topicref topicref" ...

    <div class="- map/topicmeta topicmeta" ...

      <div href="#unique_1" class="- topic/navtitle navtitle">Overview</div>

      ...

    </div>

  </div>

  <div class="- map/topicref " ...

    <div class="- map/topicmeta " data-topic-id="dcpp_resources">

      <div href="#unique_2" class="- topic/navtitle ">Resources</div>

      ...

    </div>

  </div>

  ...

</div>
```

**The Header and Footers**

These are based on string sets generated for the titles. The complete set of strings is defined in: `[INSTALLATION_DIR]/css/print/p-pages-and-headers.css`. The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.
For the **DITA Map PDF - based on HTML5 & CSS transformations**: 

```xml
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...
```

```xml
<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic"
```

```xml
<title is-chapter="true" oid="dcpp_overview">
    <body>
```

```xml
<title class="- topic/title ">Overview</title>
```

```xml
<title class="- topic/title " id="unique_2" oid="dcpp_resources">
    <body>
```

```xml
<title class="- topic/title ">Resources</title>
```

```xml
<title class="- topic/title " id="unique_2" oid="dcpp_parameters">
    <body>
```

```xml
<title class="- topic/title ">Parameters</title>
```

```xml
</body>
```

```xml
</map>
```

For the **DITA Map PDF - based on HTML5 & CSS transformations**: 

```xml
<div class=" map/map map" ...
```

```xml
<div class=" toc/toc toc">
```

```xml
<div is-chapter="true" oid="dcpp_overview" class="- topic/topic topic">
    <title class="- topic/title ">Overview</title>
```

```xml
<div class="- topic/title title">
```

```xml
<div class="- topic/body body">
```
Note: The topic content comes after the `<opentopic:map>` element.

Note: The child topics are the elements that have the class `topic/topic` included in the parents.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

The Titles of Chapters
The titles from the content are children of the topics:

```xml
<topic class="- topic/topic" id="unique_2" oid="dcpp_parameters">
  <title class="- topic/title">Parameters</title>
  ...
</topic>
```

For the DITA Map PDF - based on HTML5 & CSS transformations:

```xml
<topic class="- topic/topic" id="unique_2" oid="dcpp_parameters">
  <title class="- topic/title">Parameters</title>
  ...
</topic>
```

Note: The title elements have the class `- topic/title`. The actual element name can be different.

Numbering Types
The type of numbering is controlled by the parameter `args.css.param.numbering`.

This parameter activates various sets of CSS rules from the built-in CSS. By default, only the first-level topics (the chapters) are numbered (shallow numbering). The following values are accepted:
### Table 39. Types of Numbering

<table>
<thead>
<tr>
<th>Value</th>
<th>Chapters</th>
<th>Sections</th>
<th>Figures &amp; Tables</th>
<th>Pages</th>
</tr>
</thead>
<tbody>
<tr>
<td>shallow</td>
<td>numbered</td>
<td>no</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep</td>
<td>numbered</td>
<td>numbered</td>
<td>counted from the start of the publication</td>
<td>from the start of the publication</td>
</tr>
<tr>
<td>deep-chapter-scope</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>restarted at the beginning of each chapter</td>
</tr>
<tr>
<td>deep-chapter-scope-no-page-reset</td>
<td>numbered</td>
<td>numbered</td>
<td>numbering is restarted at the beginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sections</td>
<td>from the start of the publication</td>
</tr>
</tbody>
</table>

**Note:** The `deep-chapter-scope` and `deep-chapter-scope-no-page-reset` values are only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

### Examples

**Shallow**

Each chapter (or first-level topic) is numbered, but nested topics are not numbered. Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

1. First Chapter
   - Page 1
   - Topic
     - Table 1
     - Table 2
   - Topic
   - Page 2
     - Table 3
2. Second Chapter
   - Page 3
   - Topic
   - Table 4
Deep

Each chapter (or first-level topic) and nested topics are numbered (these are also prefixed with the chapter number). Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

1. First Chapter
   Page 1
   Topic 1.1
   Table 1
   Topic 1.2
   Table 2
   Page 2
   Table 3

2. Second Chapter
   Page 3
   Topic 2.1
   Table 4
   Table 5
   Topic 2.2
   Page 4

Deep Chapter Scope

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The nested topics, page, figure, and table counters (and links to them) restart at each chapter. The general cross reference links also display the chapter number before the page number to clearly specify the target.

1. First Chapter
   Page 1.1
   Topic 1.1
   Table 1.1
   Link to page 2.2
   Topic 1.2
   Page 1.2
   Table 1.2

2. Second Chapter
   Page 2.1
   Topic 2.1
   Table 2.1
   Table 2.2
Deep Chapter Scope No Page Reset

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The nested topics, figure, and table counters (and links to them) restart at each chapter, but the page numbers do not reset. The generic cross reference links contain only the page number.

1. First Chapter
   Page 1
   Topic 1.1
   Table 1.1
   Link to page 4
   Topic 1.2
   Page 2
   Table 1.2

2. Second Chapter
   Page 3
   Topic 2.1
   Table 2.1
   Table 2.2
   Table 2.3
   Topic 2.2
   Table 2.4
   Page 4
   Link to page 1

How to Remove the 'Chapter NN' Prefix from Table of Contents and Content.

If you are using the shallow numbering CSS (this is the default), and you want to hide the "Chapter" prefix, use the following rules in your customization CSS (on page 1292):

For the TOC:

```css
*[class ~= "map/topicmeta"] > *[class =~ "topic/navtitle"]:before {
  display: none !important;
}
```

For the titles in the content, change the content of the title :before (this example just uses the chapter number):

```css
*[class =~ "topic/topic"]*[is-chapter]:not([is-part]) > *[class =~ "topic/title"]:before {
```

How to Activate Continuous Page Numbering

The page numbers are reset to one of two cases:

- On the first topic that follows the TOC.
- On the first topic from the index.

To avoid the page counter from being reset, use the following rules in your customization CSS (on page 1292):

```css
*[class =~ "map/map"] > *[class =~ "toc/toc"] + *[class =~ "topic/topic"],
*[class =~ "index/groups"] {
  counter-reset: none;
}
```

The index page also changes the format of the page numbers to lower alpha characters. To switch to decimal characters, use:

```css
@page index {
  @bottom-center {
    content: counter(page, decimal)
  }
}
```

How to Use Part, Chapter, and Subtopics Numbers in Links

This topic is applicable if you have enabled deep numbering (on page 1342). Suppose you have a link in the third chapter that points to a paragraph in the second subtopic of the first chapter and you need this structural information (1.2) presented to the user, just after the link text. To do this, you can use the target-counters CSS function to extract the entire context of the counters from the target. The chapter-and-sections built-in counter is already updated with both the chapter number and the nested topics:

```css
*[class =~ "topic/xref"]:after {
  content: target-counters(attr(href), chapter-and-sections, ".") !important;
}
```

This counter does not include the part number, so take care when linking between parts (you may consider adding the target part number explicitly):

```css
*[class =~ "topic/xref"]:after {
  content: 
    target-counter(attr(href), part, upper-roman) "/" target-counters(attr(href), chapter-and-sections, ".") !important;
  color:blue;
}
```
Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

For plain maps, the TOC is automatically generated. For DITA bookmaps, you will need to add a `<toc>` element in the `<booklists>` element (inside the `<frontmatter>`):

```xml
<tablemap>
  ...
  <frontmatter>
    <booklists>
      <toc/>
      <figurelist/>
      <tablelist/>
    </booklists>
  </frontmatter>
  ...
  ...
</tablemap>
```

Related Information:
- Table of Contents for Chapters (Mini TOC) *(on page 1353)*
- List of Tables/Figures *(on page 1358)*
- Index *(on page 1365)*

Table of Contents - XML Fragment

In the merged map file *(on page 1293)*, the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a *metadata* section that includes the topic title.

```xml
<bookmap ...

<oxy:front-page> ... </oxy:front-page>
<oxy:front-matter> ... </oxy:front-matter>

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class="- toc/toc ">

<oxy:toc-title xmlns:oxy="http://www.oxygenxml.com/extensions/author" empty="true" class="- toc/title ">
```

---

**Related Information:**
- Numbering Types *(on page 1342)*
For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.
**Note:** The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo element, in the CSS.

### Table of Contents - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-toc.css`.

**Related Information:**
- Page Headers and Footers *(on page 1303)*

### How to Increase TOC Depth

By default, only the first two levels of topics are displayed in the Table of Contents of the PDF output.

The CSS rule (see Table of Contents - Built-in CSS *(on page 1349)*) that hides topics on higher levels is:

```css
/* Hide sections below level 3. */
*[class ~="map/topicref"] [is-chapter] >
  * [class ~="map/topicref"]:not([is-chapter]) >
  * [class ~="map/topicref"] >
  * [class ~="map/topicref"] {
    display: none;
  }
```

If you want to increase the TOC depth so that topic references on level 3 or higher are visible, you can overwrite this rule in your customization CSS like this:

```css
* [class ~="map/topicref"] [is-chapter] >
  * [class ~="map/topicref"]:not([is-chapter]) >
```
How to Style the Table of Contents Entries

**Note:** Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization CSS (on page 1292), add the following two selectors:

```css
/* The toc item label - the topic title */
*[class = "map/topicref"] *[class = "topic/navtitle"] {
  font-style: italic;
  color: navy;
}

/* The dotted line between the topic name and the page number. */
*[class = "map/topicref"] *[class = "topic/navtitle"]:after {
  content: leader('-') target-counter(attr(href), page);
  color: navy;
}
```

And if you need to alter the indent of the nested table of content items, use the following selector:

```css
*[class = "map/topicref"] *[class = "map/topicref"] {
  margin-left: 1em;
}
```

The numbers can be styled like this:

```css
*[class = "map/topicref"] > *[class = "map/topicmeta"]:before,
*[class = "map/topicref"]
  > *[class = "map/topicmeta"] > *[class = "topic/navtitle"]:before{
  color: blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```css
*[class = "map/topicref"] [is-chapter = "true"] > *[class = "map/topicmeta"] > *[class = "topic/navtitle"]{
  font-size: 2em;
}
```
How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named `table-of-contents`. The default is to have the word ‘Contents’ in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```css
@page table-of-contents:
  {left {
    @top-left {
      content: string(toc-header) " | " counter(page, lower-roman);
      font-size: 8pt;
    }
  }
  }

@page table-of-contents:
  {right {
    @top-right {
      content: string(toc-header) " | " counter(page, lower-roman);
      font-size: 8pt;
    }
  }
  }
```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your customization CSS (on page 1292):

```css
@page table-of-contents:
  {left {
    @top-left {
      content: "My publication table of contents | " counter(page, lower-roman);
      color:red;
    }
  }
  }

@page table-of-contents:
  {right {
    @top-right {
      content: "My publication table of contents | " counter(page, lower-roman);
      color:red;
    }
  }
  }
```

Related Information:
- Localization (on page 1386)

How to Make the Table of Contents Start on an Odd Page

In your customization CSS (on page 1292), add the following snippet for the `table-of-contents` page:

```css
@page table-of-contents{
  -oxy-initial-page-number: auto-odd;
}
```
How to Display a Topic Before the Table of Contents

To display a topic before the *table-of-contents* page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to `before-toc` on the `<topicref>`.

```xml
<topicref href="pathToMyTopic" outputclass="before-toc"/>
```

**Result:** When the PDF is processed, the topic will automatically appear before the table of contents.

Related Information:
- [Double Side Pagination](on page 1360)

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the `<shortdesc>` element visible.

The following example only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

In your *customization CSS* *(on page 1292)*, add the following CSS selector:

```css
*[[class =~ "map/topicref"]][is-chapter = "true"] > *[class =~ "map/topicmeta"] > *[class =~ "map/shortdesc"] {
  display:block; /* The default is none - the shortdesc is hidden. */
  color:gray;
}
```

**Note:** If you need all the TOC item short descriptions to be visible, remove the `[is-chapter]` condition.

How to Remove Entries from the TOC

To remove entries from the table of contents, set the `@toc="no"` attribute on the topicrefs from the map that need to be removed. This is sometimes desirable for the topics listed in the frontmatter or backmatter when using a bookmark.

How to Hide the TOC

To hide the TOC, you have multiple options:
• Use a DITA bookmap instead of a DITA map, and omit the `<toc>` element from the `<booklists>` element. An example bookmap can be found in the DITA 1.3 Spec. This is the best approach.

• Use the transformation parameter: `hide.frontpage.toc.index.glossary (on page 1273)`.

• Use a `display:none` property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

```html
/*[class =~ "map/map"] > /*[class =~ "toc/toc"] {
   display:none;
}

/*[class =~ "map/map"] > /*[class =~ "toc/toc"] > /*[class =~ "toc/title"],[
   bookmark-label: none;
   -ah-bookmark-label: none;
}
```

**Related Information:**

• Transformation Parameters (on page 1269)

---

**Table of Contents for Chapters (Mini TOC)**

To add a mini table of contents for each chapter, you need to:

• Use DITA bookmaps instead of regular maps.

• Set the `args.chapter.layout` transformation parameter to either of the following values: `MINITOC` or `MINITOC-BOTTOM-LINKS`.

**Note:** If the chapter does not have child topics, it will not have a mini TOC in the PDF output.

**Layout for MINITOC**

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a list of links pointing to the child topics, positioned in the left side of the page, and a description in the right side. This content is collected from the topic file referenced by the chapter `<topicref>` in the map.
Layout for MINITOC-BOTTOM-LINKS

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a chapter description and list of links pointing to the child topics, under the description. This description is collected from the topic file referenced by the chapter <topicref> in the map.

The above chapter example has the following DITA map fragment:
The `chapter-introduction.dita` file provides the description content that is in the right side of the page. The children `<topicref>` elements generate the mini TOC links.

### Table of Contents for Chapters (Mini TOC) - XML Fragment

In the merged XML file, the mini TOC is built from a related links section and some `<div>` elements that wrap the entire mini TOC and the description area.

- **chapter/minitoc**
  - Wraps the entire structure, including the content of the chapter `<topicref>`.

- **chapter/minitoc-links**
  - Wraps the `<related-links>` element. Note that the label of the related links list is internationalized.

- **chapter/minitoc-desc**
  - Contains the entire content of the topic file referenced by the chapter `<topicref>` element in the map.

```xml
    <related-links>
      <linklist>
        <desc>
          Topics: </desc>
          <link href="#unique_2" type="topic" role="child">
            About this framework. </link>
          <link href="#unique_3" type="topic" role="child">
            Description </link>
        </linklist>
      </related-links>
    </div>
```
The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

When using the pdf-css-html5 transformation, this structure is converted to a set of HTML elements, preserving the class values:

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture.
The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

**Table of Contents for Chapters (Mini TOC) - Built-in CSS**

The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-chapters-minitoc.css.

**How to Style the Table of Contents for Chapters (Mini TOC)**

Suppose that you do not want the links and the chapter description to be side by side, but instead place the links above the description. Also, you may choose to remove the label above the links, and put all the links in a colored rectangle, with decimal numbers before them.

In your customization CSS *(on page 1292)*, add the following selectors:

```css
/* Change from inline to blocks to stack them one over the other. */

*[class~="chapter/minitoc-desc"],
*[class~="chapter/minitoc-links"] {
  display: block;
  width: 100%;
}

/* No need for the 'Topics:' label. */

*[class="chapter/minitoc-links"] *[class="topic/desc"] {
  display:none;
}

/* Add background for the links list. */

*[class="chapter/minitoc-links"] {
  background-color:silver;
  padding:0.5em;
}

/* Remove the border and the padding from the description. We do not need that separator. */

*[class="chapter/minitoc-desc"] {
  border-left:none;
  padding-left:0;
}

/* Add a number before each of the links. */

*[class="chapter/minitoc-links"] *[class="topic/link"] {
  display:list-item;
```
List of Tables/Figures

To activate these:

1. The map must be a DITA bookmark.
2. There must be a `<figurelist>` or `<tablelist>` in the frontmatter or backmatter. In the following example, both of the lists are added just after the table of contents (the `<toc>` element is the placeholder where the table of contents will be created):

```xml
<frontmatter>
    <booklists>
        <toc/>
        <figurelist/>
        <tablelist/>
    </booklists>
</frontmatter>
```

How to Set a Header for a List of Tables/Figures

Suppose you want to set the headline "Figure List" on the second and subsequent pages associated to a list of figures and something similar for a list of tables.

Start by associating pages to the list of figures and tables from the merged file:

```css
*[@class~="placeholder/tablelist"] {
    page:tablelist;
    color:green;
}
*[@class~="placeholder/figurelist"]{
    page:figurelist;
    color:green;
}
```

Note: The "placeholder/tablelist" is the class name of the output generated from the `<tablelist>` bookmark element.

Then define the pages:
How to Remove the Numbers Before a List of Tables or Figures

Suppose you need to remove the "Figure NN" prefix before each entry of a list of figures.

An entry in the generated list of figures from the merged map looks like this:

```xml
<entry class="listentry/entry" href="#unique_6_Connect_42_fig_rjy_spn_xgb">
  <prefix class="listentry/prefix">Figure</prefix>
  <number class="listentry/number">4</number>
  <title class="topic/title">This is another figure</title>
</entry>
```

For the HTML merged map, the element names are all `<div>` elements but they have the same class.

So, to hide the label and the number, use:

```xml
*[class="listentry/prefix"],
*[class="listentry/number"] {
  display:none;
}
```

This works for both a list of tables and list of figures since the structure of each entry is the same.
To make it more specific (for example, to apply it only for the list of figures), you can add the selector:

```html
*[class~="placeholder/figurelist"] *[class~="listentry/prefix"],
*[class~="placeholder/figurelist"] *[class~="listentry/number"] {
  display: none;
}
```

### Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.

**Note:** For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: `[INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css`. You may choose to import this file from your customization CSS *(on page 1292)*.

### How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS *(on page 1292)*, add the following:

```css
@page chapter {
  -oxy-initial-page-number: auto-odd;
}
@page table-of-contents {
  -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: `auto`, `auto-even`, `auto-odd`, or a number.

### How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS *(on page 1292)*:

```css
@page chapter:blank, table-of-contents:blank {
  @top-left      { content: none; }
  @top-center    { content: none; }
  @top-right     { content: none; }
  @bottom-left   { content: none; }
```
Note: This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.

Related Information:
- How to Add a Background Image for the Cover (on page 1330)

How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization CSS (on page 1292), use the -oxy-force-page-count property with an even value:

```css
@page table-of-contents {
    -oxy-force-page-count: even;
}
```

Supported values for -oxy-force-page-count include: even, odd, end-on-even, end-on-odd, auto, no-force.

How to Style the First page of a Chapter

You can use the :first page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the maptitle string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization CSS (on page 1292), add the following:

```css
@page chapter:first {
    @top-right-corner { content: string(maptitle); }
    @top-left { content: none; }
}
```

Multiple Column Pages

This section contains information about how to handle pages that have multiple columns.

How to Use a Two Column Layout

Change Layout for Predefined Pages.

First you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: Default Page Definitions (on page 1298).
Next, add the `column-count` and `column-gap` properties to that page. For example:

```
@page chapter{
  column-count: 2;
  column-gap: 1in;
}
```

If you need some of the elements to expand on all the columns, use the `column-span: all` CSS property. The next snippet makes the chapter titles span both columns:

```
*[class =~ "topic/topic"] [is-chapter] > *[class =~ "topic/title"] {
  column-span: all;
}
```

⚠️ **Limitation:** You cannot use multiple column configurations on the same page. Oxygen XML Editor Eclipse plugin only takes the `column-count` and `column-gap` properties into account if they are set on `@page` rules, not on elements from the content.

### Change Layout for a Specific Topic.

If you need to have a different column layout just for one topic, you can use the following technique:

1. Define an `outputclass` on the topic root element.

   ```xml
   <topic outputclass="two_columns" ...>
   ````

2. Define a CSS rule that changes the `page` property for the matching element.

   ```css
   *[class =~ "two_columns"],
   *[outputclass =~ "two_columns"]{
     page: two_column_page !important;
   }
   ```

   **Tip:** In the selector, use the `class` attribute for the HTML transformation, or `outputclass` for the direct transformation, or leave them both if you are not sure.

   **Note:** The topics from the first level use the `chapter` page. You must use `!important` because the built-in rules are more specific and you need to override the `page` property.

3. Define a page layout.

   ```css
   @page two_column_page {
     column-count: 2;
   }
   ```

Note that the topic will be separated from other sibling topics with different page layouts by page breaks.

**Related Information:**

- Page Formatting in Oxygen PDF Chemistry
PDF Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: [PLUGIN_DIR]/css/print/p-bookmarks.css.

How to Change the Bookmark Labels using the Navigation Title

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.

This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:

1. Place a `<navtitle>` element in the topic reference in the DITA map:

   ```
   <topicref href="topics/my_topic.dita" locktitle="yes">
     <topicmeta>
       <navtitle>Introduction</navtitle>
     </topicmeta>
   </topicref>
   ```

   **Note:** As a best practice, a `@locktitle` attribute with the value ‘yes’ is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

   ```
   <topic id="other_topic" xml:lang="en-us">
     <title>Normal Title</title>
     <titlealts>
       <navtitle>Navigation Title</navtitle>
     </titlealts>
     <body>
     ...
   </topic>
   ```

How to Control the Depth of the Sections From the PDF Bookmarks.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example to 2 levels), you can use the following CSS rules in your customization CSS (on page 1292):

```
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
```
These rules clear the labels generated by the titles starting with the depth 3 (the topic nesting level is given by the selectors *[class="topic/topic"]).

**How to Specify the Open/Closed PDF Bookmark State**

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the `bookmark-state` property in your customization CSS (on page 1292).

For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

```
*[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"] *[class="topic/topic"] > *[class="topic/title"],
*[class="topic/topic"] *[class="topic/topic"] *[class="topic/topic"] > *[class="topic/title"] {
  bookmark-state:open;
}
```

**How to Remove the Numbering From the PDF Bookmarks**

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your customization CSS (on page 1292), add the following CSS rules:

```
*[class="topic/topic"] > *[class="topic/title"] {
  bookmark-label: content(text);
  -ah-bookmark-label: content();
}
```

**Important:** This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:
Index

The content of an `<indexterm>` element is used to produce an index entry in the generated index. You can nest `<indexterm>` elements to create multi-level indexes. The content is not output as part of the topic content, only as part of the index tree.

To add an index to your publication, you just need to add `<indexterm>` elements inside the `<prolog>` section (inside a `<metadata>` element):

```xml
<title>The topic title.</title>
<prolog>
  <metadata>
    <keywords>
      <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
    </keywords>
  </metadata>
</prolog>
<body>
  ....
</body>
```

or in the content itself:

```xml
...<p>Open the lid then turn the body pump to the right. <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm></p>...
```

If you are using a bookmap, you need to specify where the index list should be presented (for instance in the `backmatter` of the book. Technically, it is possible to also add it to the frontmatter, but this is unusual). This is done using an `<indexlist>` element in the `<booklists>` element (inside the `<backmatter>`):

```xml
<bookmap>
  ...
  <chapter href="tasks/troubleshooting.dita">
    ...
  </chapter>
  <backmatter>
    <booklists>
      <indexlist/>
    </booklists>
  </backmatter>
</bookmap>
```
For plain maps, the index list is automatically added at the end of the publication, with no need to modify the map.

**Index - XML Fragment**

In the merged map file *(on page 1293)*, the structure that holds the index tree is the `<opentopic-index:index.groups>` element.

```xml
<map class="- map/map ">
  <oxy:front-page>
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>
  <topic class="- topic/topic ">
    <title class="- topic/title ">Request Support</title>
    ...
  </topic>
  <opentopic-index:index.groups id="d16e5548">
    ...
  </opentopic-index:index.groups>
</map>
```

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `<opentopic-index:index.entry>` elements.

```xml
<opentopic-index:index.group>

  <opentopic-index:index.label>7</opentopic-index:index.label>

  <opentopic-index:index.entry value="table of contents">
    <opentopic-index:formatted-value>table of contents</opentopic-index:formatted-value>
  </opentopic-index:index.entry>

  <opentopic-index:index.entry value="change header">
    <opentopic-index:formatted-value>change header</opentopic-index:formatted-value>
  </opentopic-index:index.entry>
</opentopic-index:index.group>
```
Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID> / <oxy:index-link>`).
- Possibly other child entries.

For the DITA Map PDF - based on HTML5 & CSS transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```xml
<div class="- map/map map">
  <div class="front-page/front-page">
    ...
  </div>
  <div class="toc/toc toc">
    ...
  </div>
  <div class="- topic/topic topic">
    <div class="- topic/title title">Request Support</div>
    ...
  </div>
  <div class=" index/groups groups">
    ...
  </div>
</map>
```

The index group content becomes:
Index - Built-in CSS

All index styling is found in: [PLUGIN_DIR]css/print/p-index.css.

How to Style the Index Page Title and the Grouping Letters

In your customization CSS (on page 1292), add the following CSS rules:

```css
*{class ~="index/groups"] *{class ~="index/group"] *{class ~="index/label"] {  
  font-size:1.5em;  
  color:navy; 
}

*{class ~="index/groups"]:before {  
  content: "- Index - ";  
  color:navy;  
  font-size: 4em; 
```
How to Style the Index Terms Labels

In your customization CSS (on page 1292), add the following CSS rule:

```css
*[^class '~' 'index/groups'] *[^class '~' 'indexformatted-value'] { 
    font-style:oblique;
    color:gray;
}
```

The result is:

- Index -

How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry has the text justified.

In your customization CSS (on page 1292), add the following CSS rule:
The output now contains the dots:

```
F
footer ........................................ 37
H
header ........................................... 37
T
table of contents ................................ 32
change header .................................... 35
style ................................................ 34

The output now contains the dots:

How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```
If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```
*{class =~ "index/groups"} {
    counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization CSS (on page 1292):

```
@page index {
    @bottom-center { content: counter(page, decimal) }
}
```

**How to Impose a Table-like Index Layout**

In case you need to place the index labels and links on the same line but with some extra alignment constraints, you can use inline blocks to give the index a table-like appearance:

<table>
<thead>
<tr>
<th>Index</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
</tr>
<tr>
<td>Close programs 8</td>
</tr>
<tr>
<td>Computer cover 7,8</td>
</tr>
<tr>
<td>configure 10, 10, 10</td>
</tr>
<tr>
<td>D</td>
</tr>
<tr>
<td>database 8, 8, 8, 9, 10, 11, 12</td>
</tr>
<tr>
<td>H</td>
</tr>
<tr>
<td>hard drive 7, 7, 7, 8, 10, 11, 12</td>
</tr>
<tr>
<td>I</td>
</tr>
<tr>
<td>install 7, 8, 9</td>
</tr>
<tr>
<td>M</td>
</tr>
<tr>
<td>maintain 11, 11</td>
</tr>
<tr>
<td>hdd</td>
</tr>
<tr>
<td>drive 11</td>
</tr>
</tbody>
</table>

You need to place the elements that have the following class on the same line:

- **indexformatted-value**
  - This is the text of the index term.

- **indexrefid**
  - This element contains a list of links.

A fixed width is used for the formatted value and the links container (almost half of the available width). To achieve the index hierarchical layout, set progressive padding to the formatted value text.

In your customization CSS (on page 1292), add the following CSS rule:

```
*{class="indexformatted-value"},
```
/* Hide the sequences of links that actually do not contain links. */
*[class = "index/groups"] *[class = "index/entry"] > *[class="index/refid"]{
    display:none;
}
*[class = "index/groups"] *[class = "index/entry"] > *[class="index/refid"]:has(*[class="index/link"]){
    display:inline-block;
}

/* Move the nesting of indexterms from margin to padding */
*[class = "index/groups"] *[class = "index/entry"] { 
    margin-left: 0;
}
*[class = "index/groups"]
*[class = "index/entry"]
*[class="index/formatted-value"]{
    padding-left: 0.2em;
}
*[class = "index/groups"]
*[class = "index/entry"]
*[class = "index/entry"]
*[class="index/formatted-value"]{
    padding-left: 0.4em;
}
*[class = "index/groups"]
*[class = "index/entry"]
*[class = "index/entry"]
*[class = "index/entry"]
*[class="index/formatted-value"]{
    padding-left: 0.6em;
To avoid bleeding of the index term label, you may need to mark it as being hyphenated:

```css
*{class~="index/formatted-value"} {
    hyphens:auto;
}
```

To activate hyphenation, see: How to Enable Hyphenation for Entire Map (on page 1380).

Footnotes

Footnotes are pieces of information placed at the bottom of the page. A footnote has a number that is left in the content (the footnote call) and the same value placed before the footnote text (the footnote marker).

Footnotes - Built-in CSS

Footnote properties are defined in [PLUGIN_DIR]css/print/p-foot-notes.css.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers and use some colors, add the following rules to your customization CSS (on page 1292):

```css
*{class ~="topic/fn":footnote-call {
    font-weight: bold;
    color:red;
}

*{class ~="topic/fn":footnote-marker {
    font-weight: bold;
    color:red;
}
```

Related Information:

How to Add a Separator Above the Footnotes

The `@footnote` part of a `@page` declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a `leader`. The leader uses a letter or a line style to fill the entire width of the page.

```xml
@page {
    margin: 0.5in;
    ....
@footnote {
    content: leader(solid);
    color: silver;
}
}
```

To create a dotted line, you can use the dot character: `leader('.')`. Other commonly used characters are: `"-"` (dash) and `"_"` (underscore).

How to Reset the Footnotes Counter

There are cases where you want to reset the footnote counter.

For example, if you need to reset it at the beginning of each chapter, add the following rules to your customization CSS (on page 1292):

```xml
*[class =~ "bookmap/chapter"],
*[class =~ "topic/topic"] [is-chapter] {
    counter-reset: footnote 1;
}
```

Or you can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:

```xml
<p outputclass="reset-footnotes"/>
```

Page Breaks

The page breaks can be controlled in multiple ways:

1. By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
3. In your DITA topic, set the `@outputclass` attribute on the topic root (or any element) to contain one of the `page-break-before`, `page-break-after`, or `page-break-avoid` values. If you want to control the page
breaking from the DITA map, use the `@outputclass` attribute on the `<topicref>`, with any of the values mentioned above.

Related Information:
- Double Side Pagination (on page 1360)
- Oxygen PDF Chemistry: Controlling Page Breaks

Page Breaks - Built-in CSS

Page break properties are used in: [PLUGIN_DIR]css/print/p-page-breaks.css.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization CSS (on page 1292):

```css
* [class ~="topic/table"] { 
  page-break-inside:avoid;
}
* [class ~="topic/ol"] { 
  page-break-inside:avoid;
}
* [class ~="topic/ul"] { 
  page-break-inside:avoid;
}
```

**Note:** Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```css
* [class ~="task/steps"] { 
  page-break-inside:auto;
}
```

**Note:** Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break **before all** the second-level topics (for example, sections in chapters that are usually kept flowing one after another without page breaks), add the following in your customization CSS (on page 1292):

```css
* [class ~="map/map"] > * [class ~="topic/topic"] > * [class ~="topic/topic"] { 
  page-break-before:always;
}
```
If you want to force a page break for a specific topic, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` attribute set to one of these values:

- **page-break-before**
  
  Use this for a page break before the marked element.

- **page-break-after**

  Use this for a page break after the marked element.

- **page-break-avoid**

  Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, use:

```xml
<topic outputclass="page-break-before" ...
```

**Note:** You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```xml
<ol outputclass="page-break-avoid" ...
```

### How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your customization CSS (on page 1292).

Style the separating blank page:

```css
@page topic-separating-page{
    @top-left {
        content: "";
    }
    @top-right {
        content: "";
    }
    @top-center {
        content: "This page is blank";
    }
}
```

Associate this page to the `:after` pseudo element of the topic:

```css
* [class~="topic/topic"] [outputclass="add-separator-page"] :after {
    content: " ";
```
In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```xml
<topic outputclass="add-separator-page"> ... </topic>
```

The `:after` pseudo element will be created next to the topic content and will be placed on the `topic-separating-page`.

Use the page margin box selectors to override the default content from the headers/footers.

**Note:** You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

### How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a following page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization CSS (on page 1292):

```css
:root {
    widows: 4;
    orphans: 4;
}
```

### How to Avoid Page Breaks Between Top-Level Topics (Chapters)

If you plan to publish a simple map with just one level of topics (such as a list of topics), then the automated page breaks between these topics might not be desired.

In this case, you can use the following CSS snippet to disable the page breaks between chapters:

```css
*[class = "topic/topic"][is-chapter] {
    -oxy-page-group:auto;
}
```

- Oxygen PDF Chemistry User Guide: Chapter Page Placement and Styling

### Hyphenation

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

The transformation plugin uses the capabilities of the PDF Chemistry processor to perform hyphenation.
Hyphenation Dictionaries

Oxygen XML Editor Eclipse plugin provides built-in hyphenation patterns for the following languages:

<table>
<thead>
<tr>
<th>Code</th>
<th>Language</th>
</tr>
</thead>
<tbody>
<tr>
<td>da</td>
<td>Danish</td>
</tr>
<tr>
<td>de</td>
<td>German</td>
</tr>
<tr>
<td>de_CH</td>
<td>German (Switzerland)</td>
</tr>
<tr>
<td>en</td>
<td>English</td>
</tr>
<tr>
<td>en-GB</td>
<td>English (Great Britain)</td>
</tr>
<tr>
<td>es</td>
<td>Spanish</td>
</tr>
<tr>
<td>fr</td>
<td>French</td>
</tr>
<tr>
<td>it</td>
<td>Italian</td>
</tr>
<tr>
<td>nb</td>
<td>Norwegian Bokmål</td>
</tr>
<tr>
<td>nl</td>
<td>Dutch</td>
</tr>
<tr>
<td>ro</td>
<td>Romanian</td>
</tr>
<tr>
<td>ru</td>
<td>Russian</td>
</tr>
<tr>
<td>sv</td>
<td>Swedish</td>
</tr>
<tr>
<td>th</td>
<td>Thai</td>
</tr>
<tr>
<td>pt</td>
<td>Portuguese</td>
</tr>
<tr>
<td>da</td>
<td>Danish</td>
</tr>
</tbody>
</table>

The built-in hyphenation pattern license terms are listed in the XML files in the `[CHEMISTRY_INSTALL_DIR]/config/hyph` folder. Most of them comply with the LaTeX distribution policy.

Installing New Hyphenation Dictionaries

Oxygen XML Editor Eclipse plugin uses the TeX hyphenation dictionaries converted to XML by the OFFO project: https://sourceforge.net/projects/offo/.

For a Standalone Chemistry Installation

The hyphenation dictionaries are located in: `[CHEMISTRY_INSTALL_DIR]/config/hyph`. The .xml files allow you to read the licensing terms. The .hyp files are the compiled dictionaries that Oxygen XML Editor Eclipse plugin actually uses.

One simple way to add more dictionaries:
1. Download and extract the offo-hyphenation-compiled.zip file. This file is a bundle of many dictionary files.
2. Copy the fop-hyph.jar file to the [CHEMISTRY_INSTALL_DIR]/lib directory.
3. If you just need a single dictionary, place the .hyp file in the [CHEMISTRY_INSTALL_DIR]/config/hyph directory.

For Chemistry Embedded into an Oxygen XML Editor Installation

To add dictionaries:

1. Download and extract the offo-hyphenation-compiled.zip file.
2. Copy the fop-hyph.jar file to the [OXYGEN_INSTALL_DIR]/lib directory.
3. If you just need a single dictionary, place the .hyp file in the [OXYGEN_INSTALL_DIR]/config/hyph directory. Create that directories if it is missing.

For Chemistry Embedded into a DITA Oxygen Publishing Engine

The hyphenation dictionaries are located in: [OPE_INSTALL_DIR]/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry/config/hyph.

To add dictionaries:

1. Download and extract the offo-hyphenation-compiled.zip file. This file is a bundle of many dictionary files.
2. Copy the fop-hyph.jar file to the [CHEMISTRY_INSTALL_DIR]/lib directory.
3. If you just need a single dictionary, place the .hyp file in the [OPE_INSTALL_DIR]/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry/config/hyph directory.

How to Alter a Hyphenation Dictionary

The source of the hyphenation dictionaries are stored as XML files in the [CHEMISTRY_INSTALL_DIR]/config/hyph directory.

Each file is named with the language code and has the following structure:

```xml
<hyphenation-info>
  <hyphen-min before="2" after="3"/>
  <exceptions>
    o-mni-bus
    ...
  </exceptions>
  <patterns>
    préémi3nent.
    proémi3nent.
  </patterns>
</hyphenation-info>
```
To change the behavior of the hyphenation, you can modify either the patterns or the exceptions sections:

**exceptions**

Contents the list of words that are not processed using the patterns, each on a single line. Each of the words should indicate the hyphenation points using the hyphen ("-"), character. If a word does not contain this character, it will not be hyphenated.

For example, o-mni-bus will match the omnibus word and will indicate two possible hyphenation points.

Note: Compound words (like "e-mail") cannot be controlled by exception words.

**patterns**

Contains the list of patterns, each on a single line. A pattern is a word fragment, not a word. The numbers from the patterns indicate how desirable a hyphen is at that position.

For example, tran3s2act indicates that the possible hyphenation points are "tran-s-act" and the preferable point is the first one, having the higher score of "3".

After you add the exceptions and the patterns, you will have to rebuild the binary dictionaries (on page 1380).

### How to Rebuild the Binary Hyphenation Dictionaries

Every time you change the dictionary source XML files, you have to rebuild the binary dictionaries:

1. Locate the folder that contains the dictionary sources: \[CHEMISTRY_INSTALL_DIR\]/config/hyph.
2. Start a command-line terminal and change the directory to that folder.
3. Start the hyph.bat (on Windows) or hyph.sh (on Linux or Mac).

A report with the rebuilt dictionaries should be listed in the terminal.

### How to Enable Hyphenation for Entire Map

To enable hyphenation for your entire map:

1. Make sure you set an @xml:lang attribute on the root of your map, or set the default.language parameter in the transformation.
2. In your customization CSS (on page 1292), add:

```css
:root {  
    hyphens: auto;  
}
```
3. To except certain elements from being hyphenated, use `hyphens: none`. The following example excludes the `<keyword>` elements from being hyphenated:

```css
*[class =~ "topic/keyword"] {
    hyphens: none;
}
```

### How to Enable/Disable Hyphenation for Tables

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map or your table elements.
2. The built-in CSS already has the following rule defined that activates hyphenation:

```css
*[class =~ "topic/table"] {
    hyphens: auto;
}
```

**Note:** To disable table hyphenation, add the following in your customization CSS (on page 1292):

```css
*[class =~ "topic/table"] {
    hyphens: none;
}
```

3. To prevent certain elements from being hyphenated, use `hyphens: none`. The following example excludes the `<keyword>` elements from being hyphenated:

```css
*[class =~ "topic/keyword"] {
    hyphens: none;
}
```

### How to Disable Hyphenation for a Word

To disable hyphenation for a specific word, there are several possible approaches:

- If the word is a compound (like "T-shirt") and you want to keep it on the same line, you have two options:
  
  **Manual Approach**
  
  Wrap the word in an inline element with the `@outputclass` attribute set. In the CSS, change its style to `white-space:nowrap`. For example:

  ```xml
  .. <ph outputclass="no-hyphenation">T-shirt</ph>...
  ```

  ```css
  *[outputclass =~ "no-hyphenation"] {
      white-space: nowrap;
  }
  ```

  **Automatic Approach**
A better alternative to this is to write an XSLT extension that matches the text nodes and performs automatic markup (to see an example, go to How to Wrap Words in Markup (on page 1287) in the XSLT Extensions for PDF Transformations (on page 1284) section). Then match the `compound-word` class the same as in the previous example:

```
*{outputclass =~ "compound-word"} {
  white-space: nowrap;
}
```

**Another Alternative**

In all the compound words from your documentation, replace the hyphen ("-" Worcestershire) with a non-breaking hyphen character \texttt{U+2011} (or XML notation \texttt{&#2011;}).

Then change the `autocorrect settings (on page 98)` to automatically replace the compound word with its equivalent. For example: "T-shirt" would be replaced with "T[\u2011]shirt".

- If the word is not a compound, you have two options:
  - Use one of the approaches listed above.
  - Alter the hyphenation dictionaries as explained in: How to Alter a Hyphenation Dictionary (on page 1379).

**Accessibility**

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

Related Information:
- Oxygen PDF Chemistry: Accessibility

**Accessibility - Built-in CSS**

Accessibility properties are defined in \texttt{[PLUGIN_DIR]css/print/p-accessibility.css}.

**How to Create Fully Accessible Documents**

To make your documents fully accessible (PDF/UA1), do the following:

1. In your customization CSS (on page 1292), specify fonts for all elements and for all page margin boxes. There should be no text that falls back to the basic provided fonts (Times, Courier, etc.). For instance, you can use:

```
:root { font-family: Arial }
@page {
  @top-left {font-family: Arial }
  ...
```
2. Specify an @alt attribute with a description on any image, or better, use the <alt> DITA element.
3. Change the Chemistry invocation from the build.xml file, adding the argument -pdf-ua. There are two targets to change: chemistry and chemistry.embedded.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

To use them in the customization CSS (on page 1292):

- You can place the font files in the same folder as your CSS and use a @font-face definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: Oxygen PDF Chemistry User Manual: Fonts.

How to Avoid Characters Being Rendered as #

When the processor renders text with a font that does not include certain characters, those characters are replaced with the # symbol.

To prevent this, make sure you use the proper font.

As an example, suppose the right arrow character is used in a definition list like this:

```
<dlentry>
  <dt>&#8594;</dt>
  <dd><ph>This is the right arrow.</ph></dd>
</dlentry>
```

If the font does not include this character, the output will look something like this:

```
# This is the right arrow.
```

To fix this, use a fallback font. For example, if you use Times New Roman for the entire publication, you could add Symbol as the fallback font. In your customization CSS (on page 1292), add:

```
*[class ~= "topic/dlentry"] {
    font-family: "Times New Roman", Symbol;
}
```

Tip: On Windows, one simple way to determine the font needed to display the text is to copy the text fragment that has rendering problems from the DITA source document and paste it into Microsoft WordPad or Word. It will automatically select a font capable of rendering the text. Simply click on the text to see the name
of the font from the "Font" ribbon toolbar. Then you can use it as a fallback font in the CSS. Make sure there are no licensing restrictions on that particular font.

**How to Set Fonts in Titles and Content**

Suppose that in your customization CSS *(on page 1292)*, you have defined your font (for example, *Roboto*) using a Google web font:

```css
@import url('https://fonts.googleapis.com/css?family=Roboto');
```

You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your customization CSS *(on page 1292)*, add an `!important` rule that associates a font to all the elements from the document:

```css
* {
  font-family: "Roboto" !important;
}
```

**Note:** If you want to use the `:root` selector instead of the `*` sector, without the `!important` qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Next, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: *Debugging the CSS (on page 1293)*.

For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above `*` selector, you need to use more specific CSS selectors:

```css
*[class~="front-page/front-page-title"],
*[class~="topic/title"] {
  font-family: Arial !important;
}

*[class~="pr-d/codeph"],
*[class~="topic/pre"] {
  font-family: monospace !important;
}
```

**Related Information:**

- How to Change the Font of the Headers and Footers *(on page 1305)*
How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected until one that includes all the glyphs is found. A common font sequence for Asian languages is as follows:

```
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: How to Set Fonts in Titles and Content (on page 1384).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the -oxy-simulate-style:yes CSS property in the font face definition as explained in: Using Simulated/Synthetic Styles in Oxygen Chemistry

How to Add Asian Fonts in Linux

For Asian languages on Linux distributions, you need to set a custom font inside your customization CSS (on page 1292). The following example uses the Noto CJK font.

⚠️ Note: As a prerequisite, the NotoSansCJKsc-hinted.zip font was downloaded from Noto CJK and unzipped in a resources folder.

The font declaration and the font usage must be declared in the customization CSS (on page 1292) file:

```css
/* Font Declaration */
@font-face {
    font-family: "Noto Sans CJK";
    font-style: normal;
    font-weight: 100;
    src: url(resources/NotoSansCJKsc-Thin.otf);
}
@font-face {
    font-family: "Noto Sans CJK";
    font-style: normal;
    font-weight: 300;
    src: url(resources/NotoSansCJKsc-Light.otf);
}
@font-face {
    font-family: "Noto Sans CJK";
    font-style: normal;
    font-weight: 400;
    src: url(resources/NotoSansCJKsc-Regular.otf);
}
```
Localization

The **DITA Map PDF - based on HTML5 & CSS** transformation type supports a large number of languages for customizing localization. In this type of transformation, the intermediary merged DITA map is transformed to HTML5 using the DITA-OT built-in support, so the customization of the internationalization (the labels for chapters, parts, figures, tables, notes, etc.) can be achieved by following the DITA-OT recommendations: [Customizing Generated Text](https://www.dita-ot.org/3.2/topics/globalization-languages.html).

It is recommended that you do this customization on a DITA-OT distribution deployed outside of the Oxygen installation. Otherwise, you will lose the customization when upgrading Oxygen. You can contact the Oxygen support team to ask for the Oxygen Publishing Engine package.

Supported Languages (HTML5 and CSS)

There are over 20 supported languages. For the full list of supported languages (and their codes), see [https://www.dita-ot.org/3.2/topics/globalization-languages.html](https://www.dita-ot.org/3.2/topics/globalization-languages.html).

How to Select a Language (HTML5 and CSS)

There are two ways to switch the labels to a specific language:

- Alter the DITA maps and/or topics to have the `@xml:lang` attribute set on the root element with one of the supported values (i.e. "fr", "de", "zh", "ru").
- If changing the files is not an option, you can alter the value of the `default.language` transformation parameter to the desired language code.
How to Add Support for a New Language

If the list of supported languages does not include the language you need, you can create a custom dictionary. The DITA-OT documentation offers a good insight on how to do it: https://www.dita-ot.org/3.2/topics/plugin-addgeneratedtext.html

In addition to that, you need to alter CSS files. Some of the labels come from CSS files located in the [PLUGIN_DIR]/css/print/i18n/ directory.

You should use one of the files as a template, copy its rules to your customization CSS (on page 1292), and then translate the labels. Make sure you also change the :lang selector to match your language code.

Comments and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the show.changes.and.comments transformation parameter to yes.

Figure 413. Chemistry Annotations in Acrobat Reader

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the Comments section when opening the output file in Acrobat Reader.

Note: Comments with the Mark as Done flag selected appear with a checkmark in the Comments section and with a Completed label (John Doe Completed).

To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the show.changes.and.comments.as.pdf.sticky.notes transformation parameter set to no.

The comments and changes are included in the merged map file (on page 1293) either as XML elements (<oxy-insert>, <oxy-delete>, <oxy-comment>, <oxy-attributes>) in the case of the XML merged map, or as HTML elements with similar classes (oxy-insert, oxy-delete, oxy-comment, oxy-attributes) in the case of the HTML merged map. Sub-elements contain meta-information about each change.

Tip: These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.

Note: The inserted text, deleted text, and deleted markup are included in the sticky notes.
Comments and Tracked Changes - XML Fragment

This section contains information about how each type of tracked change is structured in the merged map XML file (on page 1293).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside the `range` (`<oxy-range-start>` to `<oxy-range-end>`), the inserted text is highlighted by an `<oxy-insert-hl>` element, and the details are stored in the `<oxy-insert>` element.

```xml
<oxy:oxy-range-start id="sc_1" hr_id="1"/>

<oxy:oxy-insert href="#sc_1" hr_id="1">
  <oxy:oxy-author>dan</oxy:oxy-author>
  <oxy:oxy-content>insert</oxy:oxy-content>
  <oxy:oxy-date>2018/03/15</oxy:oxy-date>
  <oxy:oxy-hour>09:38:29</oxy:oxy-hour>
  <oxy:oxy-tz>+02:00</oxy:oxy-tz>
</oxy:oxy-insert>

<oxy:oxy-insert-hl>This is an insert!!</oxy:oxy-insert-hl>

<oxy:oxy-range-end hr_id="1"/>
```

Comments

Similar to insertions, comments are defined in a `range` (`<oxy-range-start>` to `<oxy-range-end>`), the comment details is in the `<oxy-comment>` element, and the highlighted content is wrapped in the `<oxy-comment-hl>` element.

```xml
<oxy:oxy-range-start id="sc_1" hr_id="1"/>

<oxy:oxy-comment href="#sc_1" hr_id="1">
  <oxy:oxy-author>dan</oxy:oxy-author>
  <oxy:oxy-comment-text>This is a comment.</oxy:oxy-comment-text>
  <oxy:oxy-date>2018/03/15</oxy:oxy-date>
  <oxy:oxy-hour>09:56:59</oxy:oxy-hour>
  <oxy:oxy-tz>+02:00</oxy:oxy-tz>
</oxy:oxy-comment>
```
Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The <oxy-attributes> element contains details about multiple attribute changes, each stored in the <oxy-attributed-change> element.

Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in the <oxy-delete-hl> element.
Colored Highlights
To show some text as highlighted with a background color:

```xml
<oxy:oxy-color-hl color="rgba(140,255,140,50)">Some colored text.</oxy:oxy-color-hl>
```

Comments and Tracked Changes - HTML Fragment
This section contains information about how each type of tracked change is structured in the merged map HTML file (on page 1293).

Insertions
For an insertion type of tracked change, the structure that defines the insertion details is inside a range (oxy-range-start to oxy-range-end), the inserted text is highlighted by a <span> element with the class oxy-insert-hl, and the details are stored in a <span> element with the oxy-insert class.

```xml
<span class="oxy-range-start" id="sc_1" hr_id="1"></span>

<span class="oxy-insert" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-content">insert</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:38:29</span>
  <span class="oxy-tz">+02:00</span>
</span>

<span class="oxy-insert-hl">This is an insert!!</span>

</span>
```

Comments
Similar to insertions, comments are defined in a range (oxy-range-start to oxy-range-end), the comment details in an element with the class oxy-comment, and the highlighted content is wrapped in the oxy-comment-hl element.

```xml
<span class="oxy-range-start" id="sc_1" hr_id="1"></span>

<span class="oxy-comment" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
</span>
```
Note: Comments that are marked as done have a `flag="done"` attribute:

```html
<span class="oxy-comment" href="#sc_6" hr_id="6" flag="done">
    The commented text.
</span>
```

### Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class `oxy-attributes` contains details about multiple attribute changes, each stored in an element with the class `oxy-attribute-change`.

```html
<element>
    <span class="oxy-range-start" id="sc_3" hr_id="3"/>
    <span class="oxy-range-end" hr_id="3"/>
    <span class="oxy-attributes" href="#sc_3" hr_id="3">
        <span class="oxy-attribute-change" type="inserted" name="platform">
            <span class="oxy-author">dan</span>
            <span class="oxy-current-value">windows</span>
            <span class="oxy-date">2018/03/15</span>
            <span class="oxy-hour">10:05:04</span>
            <span class="oxy-tz">+02:00</span>
        </span>
        ....
        <span class="oxy-attribute-change" type="removed" name="audience">
            ....
        </span>
    </span>
</element>
```

### Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class `oxy-delete-hl`.

```html
....
```
There is a structure that offers details about the deletion change, using the element with the class oxy-delete. This is linked to the above deletion range by the same ID value:

```html
<span class="oxy-delete" href="#sc_2" hr_id="2">
  <span class="oxy-author">dan</span>
  <span class="oxy-content"><img href="../img/ex.gif"></span>
  <span class="oxy-date">2018/03/14</span>
  <span class="oxy-hour">11:38:06</span>
  <span class="oxy-tz">+02:00</span>
</span>
```

### Colored Highlights

To show some text as highlighted with a background color:

```html
<span class="oxy-color-hl" color="rgba(140,255,140,50)">Some colored text.</span>
```

### Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in: [PLUGIN_DIR]/css/print/p-side-notes.css.

### How to Style Changed or Commented Text

To style the highlighted text from the document content, use the oxy-comment-hl element (or oxy-delete-hl, oxy-insert-hl, respectively, by local name or class name):

```css
oxy-comment-hl, .oxy-comment-hl {
  color:magenta;
}
```

**Note:** The class name selector is useful when using the DITA Map PDF - based on HTML5 & CSS or DITA PDF - based on HTML5 & CSS transformation scenarios.

If you want to change the small labels that define the affected start and end ranges (they are a number formatted like: "[n] .. [/n]" where n is the number of the change), you can use the following selectors:

```css
oxy-range-start:before, .oxy-range-start:before {
  display:inline;
  content:'[' attr(hr_id) ']';
  color:red;
}
```
Use `display:none` if you want to hide them.

If you want to change the background color of the comment footnote (assuming you set the `show.changes.and.comments.as.pdf.sticky.notes` transformation to `no`), add the following snippet in your customization CSS (on page 1292):

```css
oxy-comment,
.oxy-comment {
    background-color: inherit;
    border: 2pt solid yellow;
}
```

Similarly, you can style the other footnotes for `<oxy-attributes>`, `<oxy-delete>`, and `<oxy-insert>` elements.

**How to Hide Tracked Change Footnotes**

This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

In some cases, when your document contains a lot of tracked changes, you may need to hide the footnotes associated with the insertions, deletions, or attribute changes. Using the following example, the deletions and insertions are hidden, but the comments remain visible. In your customization CSS (on page 1292), add:

```css
oxy-attributes,
oxy-delete,
oxy-insert{
    float:none;
    display:none;
}
```

**Draft Watermarks**

A *watermark* is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. *Draft watermarks* are used to indicate that a document is under construction or has not yet been approved.

**How to Add a Draft Watermark on All Pages**

To add a draft watermark to all of your publication pages, you can use the following page selector in your customization CSS (on page 1292):
If you have already set a background image for other pages (for example, the front-page or table-of-contents), the above selector won’t change them, as they are more specific.

The best practice is to use a different draft.css CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish as draft, use the draft.css in your transformation scenario, otherwise directly reference the customization CSS (on page 1292).

- Images and Figures (on page 1402)

---

**How to Add a Draft Watermark Depending on Metadata**

Suppose you want to apply a Draft watermark until your DITA bookmap is approved and the map is approved when an `<approved>` element has been added to the metadata section (for example, in the bookmeta/bookchangehistory element).

```xml
<bookmeta>
    <author>John</author>
    <critdates>
        <created date="1/1/2015"/>
        <revised modified="3/4/2016"/>
        <revised modified="3/5/2016"/>
    </critdates>
    <bookchangehistory>
        <approved/>
    </bookchangehistory>
    ...
</bookmeta>
```

Use oxy_xpath every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the Oxygen XPath Builder view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):

```css
@page {
    background-image: url(oxy_xpath('if (//bookmeta/bookchangehistory/approved) then "" else "../../images/draft-watermark.png"'));
    background-position:center;
    background-repeat:no-repeat;
}
```
or use an element selector that restricts the watermark image only to the page area covered by that element:

```css
:root, body{
  ... /* same as properties above */
}
```

The `body` selector is used here in case you want to apply the DITA Map PDF - based on HTML5 & CSS transformation type. You can use another element selector to target a specific part of your publication (for example, marking only the tables as drafts).

- Metadata (on page 1320)
- How to Debug XPath Expressions (on page 1297)

Flagging Content

In DITA, you can mark certain content to flag it or draw attention to it. This is done by defining a flag in a DITAVAL file.

You can attach the DITAVAL file to the DITA map using the `<ditavalref>` element in the map, or by specifying it in the `args.filter` transformation parameter.

In the following example, all the elements that have the attribute `@product` set to `YourProd` is flagged to have a purple background:

```xml
<val>
  ...
  <prop action="flag" att="product" val="YourProd" bgcolor="purple"/>
  ...
</val>
```

Related Information:
- Change Bars
- DITAVAL Elements

How to Flag Content Using Change Bars

As an example, to add a change bar (revision mark) for particular content, you can use the following in the DITAVAL file:

```xml
<val>
  <revprop action="flag"
    changebar="color:blue;style:solid;width:2pt;offset:1.25mm;placement:start" val="new"/>
</val>
```
This would result in any content that is marked with `@rev="new"` having a blue change bar.

**How to Flag Content Using Images**

You can mark the elements that match a specific profiling condition using images (one for the start, one for the end). The image references are relative to the DITAVAL file.

```xml
<prop action="flag"
  att="product"  val="MyProd"
  backcolor="blue"
  color="yellow" >

<startflag imageref="startflag.jpg">
  <alt-text>This is the start of my product info</alt-text>
</startflag>

<endflag imageref="endflag.jpg">
  <alt-text>This is the end of my product info</alt-text>
</endflag>
</prop>
```

**Styling the Content**

If you need to change the styles of the elements from the topic contents, you should create a customization CSS (on page 1292) and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS (on page 1293).

**Reusing the Styling for WebHelp and PDF Output**

If you are using the `pdf-css-html5` transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive output.

This is an output example from the WebHelp transformation:

```
<h1 class="title topic/title title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
  <p class="shortdesc">When caring ...</p>
  <p class="p">When caring for your flower garden you want ...</p>
</div>
```

And the same example from the PDF transformation (note the additional emphasized class values):

```
<h1 class="- topic/title title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="- topic/body body">
  <p class="- topic/shortdesc shortdesc">When caring ...</p>
</div>
```
When caring for your flower garden you want ...  

It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```
.shortdesc {
    font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

### Titles

Titles can be styled by matching the `topic/title` class attribute.

```css
*[class~="topic/title"] {
    color:navy;
}
```

### How to Avoid Wrapping the Title Text Without Indentation

By default, the chapter/section number is on the same line as the title text. If the title is too long, the text wraps to the next line without any indentation.

```
4.5.5 This is a long title
text that wraps.
```

If you want the wrapped text to include indentation, you need to set the value of the `args.css.param.title.layout` transformation parameter to `table`. This results in the chapter/section number being placed in one cell while the rest of the title content is in another cell with wrapped text and it is displayed with an indent:

```
4.5.5 This is a long title
text that wraps.
```

### Equations

This processor supports MathML equations.

### How to Change the Font of MathML Equations

Suppose that you need to change the font of MathML equations from the documentation, and also add some padding. The MathML fragments are wrapped in elements that have the class `equation-d/equation-block` or `equation-d/equation-inline`, so you can match them with:

```css
*{class="equation-d/equation-block"},
*{class="equation-d/equation-inline"} {
```
Note: Some of the fonts may not be supported. In that case, a default serif font is used.

Lists

You can style the list item markers or other properties.

Note: The lists are treated differently than ordinary block elements in the sense that their margins are not collapsed with the margins of the neighboring blocks or lists. This is also visible for nested lists.

How to Style the List Markers

For the media print, the default CSS rules for the list items use the :marker pseudo-class.

```css
@media print {
  *[class~="topic/li"]::marker {
    text-align: center;
    font-weight: bold;
  }
  *[class~="topic/li"] {
    margin-left: 0.25in;
  }
}
```

To eliminate the bold font weight for the items form ordered lists then add the following rules to your customization CSS (on page 1292):

```css
*[class="topic/ol"] > *[class="topic/li"]:marker {
  font-weight: normal;
}
```

For the unordered lists:

```css
*[class="topic/ul"] > *[class="topic/li"]:marker {
  font-weight: normal;
}
```

How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.
Use the `list-style-type` CSS Property.

The Chemistry engine supports the following types: decimal, decimal-leading-zero, lower-roman, upper-roman, lower-latin, upper-latin, lower-alpha, upper-alpha.

```css
*[class =~ "topic/ol"] {  
    list-style-type: lower-roman;  
}
```

Change the Content of the `:marker` CSS Pseudo Element.

The following example emulates the Cyrillic numbering for the list items for an ordered list that has the `@outputclass` attribute set to cyrillic:

```css
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:marker {  
    width:3em;  
}
```

```css
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(1):marker{  
    content:"а"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(2):marker{  
    content:"б"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(3):marker{  
    content:"в"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(4):marker{  
    content:"г"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(5):marker{  
    content:"д"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(6):marker{  
    content:"е"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(7):marker{  
    content:"ё"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(8):marker{  
    content:"й"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(9):marker{  
    content:"ё"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(10):marker{  
    content:"к"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(11):marker{  
    content:"л"  
}
*[class =~ "topic/ol"] [outputclass =~ "cyrillic"] > *[class =~ "topic/li"]:nth-of-type(12):marker{  
    content:"м"  
}
```

**Important:** This example will work only for lists up to 28 items. You will have to extend it for longer lists!

- Oxygen PDF Chemistry User Guide: Lists

Links

Links allow the users to navigate through the documentation.
How to Remove 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, add the following in your customization CSS (on page 1292):

```css
*[^class ~="topic/xref"][^href]:after,
*[^class ~="topic/link"][^href]:after {
  content: none !important;
}
```

Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```css
[^class ~="topic/entry"][^class ~="topic/xref"][^href]:after{
  content: none !important;
}
```

How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your customization CSS (on page 1292), add this snippet:

```css
*[^class ~="topic/xref"][^href]:after,
*[^class ~="topic/link"][^href]:after {
  font-weight: bold;
  text-decoration: underline;
}
```

How to Hide Descriptions in Related Links Sections

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the merged map (on page 1293) like this:

```xml
<related-links class="- topic/related-links ">
  <linkpool class="- topic/linkpool ">
    <link class="- topic/link "
      role="friend" scope="local" type="topic">
      <linktext class="- topic/linktext ">Salvia</linktext>
      <desc class="- topic/desc ">The salvia plant</desc>
    </link>
  </linkpool>
  ...
</related-links>
```

If you need to hide these descriptions, add the following code in your customization CSS (on page 1292):
Images and Figures

Images are an important part of a publication.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images - Built-in CSS

Image properties are defined in [PLUGIN_DIR]css/print/p-figures-images.css.

```css
*[class =~ "topic/image"] { 
    prince-image-resolution: 120dpi; 
    -ah-image-resolution: 120dpi; 
    image-resolution: 120dpi; 
    /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */ 
    max-width: 6.5in; 
}
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your customization CSS (on page 1292), add the following snippet:

```css
*[class =~ "topic/image"] { 
    ... 
    /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */ 
    max-width: 6.5in; 
}
```

How to Change Image Resolution

This is a good technique to change the size of all raster images from your documentation. This will not work for vector images, such as PDF or SVG. If the images (PNG, for example) contain the image resolution in their metadata, this will be taken into account. For all other images, the default resolution is 120dpi.
**Note:** Instead of using `@width` and `@height`, it is recommended that you use images that fit the page dimensions. Then you could fine-tune the images in the output using the `image-resolution` property (see below). This will help to prevent image rendering issues (for example, a multiple format output or a replaced image in the source file).

If the default resolution is not good (suppose you need a higher pixel density of 300dpi), you can change it by adding the following in your customization CSS (on page 1292):

```css
*[class ~="topic/image"] {  
  prince-image-resolution: 300dpi;
  -ah-image-resolution: 300dpi;
  image-resolution: 300dpi;
}
```

**How to Place Big Images on Rotated Pages**

Very wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (on page 1292), add:

```css
*[class="topic/image"][outputclass='land'] {  
  page: landscape-page;
}
```

Setting the attribute `@outputclass = 'land'` on the table element will force the table on a new landscape page.

Another solution is to set an `@outputclass` attribute on the image, then create a rule that matches it, and associate a landscape page for it.

**How to Place a Text and Image Side by Side**

If you need to align text and an image side by side, you can use the following technique:

1. Organize your text and image under a `<div>` element like this:

   ```html
   ...
   <div outputclass="side-by-side">
     <p>This will be in the left side, the next figure in the right. </p>
     <fig>
     <image href="cactus.jpeg"/>
     </fig>
   </div>
   ...
   ```

   **Note:** You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS (on page 1292), add:
The image should fill the entire width of the parent `<fig>` element:

```
*[outputclass ~="side-by-side"] > *[class ~="topic/fig"] > *[class ~="topic/image"] { 
  width: 100%;
}
```

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```
*[outputclass ~="side-by-side"] > *[class ~="topic/p"] { 
  vertical-align:top;
}

*[outputclass ~="side-by-side"] > *[class ~="topic/fig"] { 
  vertical-align:top;
  font-size:0pt;
}
```

**Note:** The `font-size:0pt` is needed to remove the font ascent and descent around the image rectangle.

## How to Control the Image Size in Complex Static Content

It is common to have text and images mixed together in a :before or :after pseudo element. For example, for notes you may have both artwork and text:

```
*[class ~="topic/note"]:before { 
  content: url('note.png') "Some text";
}
```

If you want to change the size of the image, you have two options:

- **Use the `image-resolution` CSS property:**

  ```
  *[class ~="topic/note"] { 
    image-resolution:300dpi;
  }
  ```
• Separate the image from the text and apply the width and height CSS properties only on the image, using the width and height properties. You could use multiple :before pseudo-elements for that, considering that the farthest content presented before the actual content of an element is matched by the :before with the highest number in the brackets:

```css
*[class ~="topic/note"]::before(2) {
    content: url('note.png') ;
    width:0.5in;
}
*[class ~="topic/note"]::before(1) {
    content: "Some text";
}
```

### How to Center Images

DITA defines a @placement attribute for the `<image>` elements. The implicit value is inline. Suppose that you need to center the images that have the placement set to break (for example, they are not on the same line with other content and the images from the `<fig>` element).

In your customization CSS (*on page 1292*), add:

```css
*[class ~="topic/fig"] { 
    text-align:center;
}
/* Other images, with break placement. */
*[class ~="topic/image"] [placement="break"]{
    display:block;
    text-align:center;
}
/*
Scaled images are getting a computed width attribute, so we can use the auto margins.
Auto margins function only if the block they apply to has a width.
*/
*[class ~="topic/image"] [placement="break"][width] { 
    margin-left:auto;
    margin-right:auto;
    border: 2pt solid red;
}
```
How to Change/Reset the Figure Numbering

Note: This topic is applicable for the DITA Map PDF - based on HTML5 & CSS DITA PDF - based on HTML5 & CSS transformation types.

There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:

```
Figure NN. Lore Ipsum Title
```

NN is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure `<figcaption>` (this is an HTML element generated by the XSL transformation), and create another label using a `.fig--title-label` selector on the `<figcaption>`.

```
*[class =~ "topic/topic"] [is-chapter] {
    counter-reset: figcount;
}

.fig--title-label{
    display:none;
}
```

```
* [class =~ "topic/fig"] > .figcap:before{
    /* Add more styling or change the content if needed */
    content: "Figure " counter(figcount) ". ";
    counter-increment: figcount;
}
```

How to Fix Missing Images

If your images are not accessible, you may receive an error message in the transformation console like this:

```
Image not found. URI:file:/path/to/my/image
```

This is usually because they are in a folder that is not in the folder subtree of the transformed map or topic.

To solve this, you can set the following transformation parameter: `fix.external.refs.com.oxygenxml=true`.

Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.
Tables - Built-in CSS

There is a combination of CSS files that address tables:

- \[PLUGIN_DIR\]/css/core/-table-html-cals.css
- \[PLUGIN_DIR\]/css/print/p-tables.css

How to Deal With Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `@orient = 'land'` on the table element will force the table on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```
* [class~="topic/table"] > *[class~="topic/tgroup"]{cols='5'},
* [class~="topic/table"] > *[class~="topic/tgroup"]{cols='6'},
* [class~="topic/table"] > *[class~="topic/tgroup"]{cols='7'},
* [class~="topic/table"] > *[class~="topic/tgroup"]{cols='8'} {
  page: landscape-page;
  max-width: 100%;
  page-break-before: avoid;
}
```

**Note:** The `landscape-page` page layout is defined in the \[PLUGIN_DIR\]css/print/p-pages-and-headers.css.

If you want to rotate the entire topic that contains the big table, use:

```
* [class~="topic/topic"]:has(*:not([class~="topic/topic"])) > *[class~="topic/table"] >
* [class~="topic/tgroup"]{cols='5'},
* [class~="topic/topic"]:has(*:not([class~="topic/topic"])) > *[class~="topic/table"] >
* [class~="topic/tgroup"]{cols='6'},
* [class~="topic/topic"]:has(*:not([class~="topic/topic"])) > *[class~="topic/table"] >
* [class~="topic/tgroup"]{cols='7'},
* [class~="topic/topic"]:has(*:not([class~="topic/topic"])) > *[class~="topic/table"] >
* [class~="topic/tgroup"]{cols='8'},
```
How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells be confined to a small horizontal space. Sometimes this causes long words to bleed outside the cell boundaries.

By default, the built-in CSS automatically activates the hyphenation for the text inside tables as long as your topics have the language specified.

In case the text is still bleeding outside the boundaries, you can also use the `overflow-wrap` property to force the word to break:

```css
*[class = "topic/table"] { 
  overflow-wrap: break-word;
}
```

Related Information:
- [Hyphenation (on page 1377)]
- [How to Enable/Disable Hyphenation for Tables (on page 1381)]

How to Enable the Automatic Table Layout

The DITA specification indicates that tables should have a fixed layout. However, you can get a more optimal arrangement of the cells using the automatic layout. In your customization CSS (on page 1292), add:

```css
*[class="topic/tgroup"] { 
  table-layout:auto !important;
}
```
If you want to control which table you want this layout, you can set the `@outputclass` attribute on the `<table>` element:

```xml
<table outputclass='auto_tbl'> ... </table>
```

Then, in the CSS, use a rule that matches the `@outputclass`:

```css
*[class~="topic/table"]*[outputclass='auto_tbl'] > *[class~="topic/tgroup"] { table-layout:auto !important; }
```

**Important:** Make sure the tables have no column width specified.

### How to Rotate Content from a Table Cell

There are cases where you want to style the first column as a kind of table header, with vertical text.

There is an important thing to remember: you can rotate an element from a table cell, but not the cell itself. So, your DITA table cell should contain a `<div>` or a `<p>` element that will be rotated. The cell has to be marked somehow so that it can be matched from the CSS. One way is to set an `@outputclass` attribute on it, another will be to mark the table and then match the first entries from it.

```xml
<row>
  ...
  <entry outputclass="rotated">
    <p>Rotated</p>
  </entry>
  ...
</row>
```

In your customization CSS *(on page 1292)*, use the following rule that matches the child of the entry:

```css
*[outputclass =~ "rotated"] > * { display: block;
    transform: rotate(-90deg) !important;
    text-align: left !important;
    padding:0;
    margin:0;
    white-space: nowrap;
    width:150px;
    height:80px;
}
```
The padding and margins are set to zero to clear any space that may come from other rules. The width is required - it will become the height of the cell. If this is not specified, the vertical rotated text will bleed out of the cell. The height is optional.

**How to Add Horizontal Lines to a Choice Table**

To add horizontal lines that separate the options within a `<choicetable>`, you can use borders set on each of the rows. The following CSS styles the top header and the first column with some background colors. In a choice table, the first column represents the choice labels.

```css
* [class~="task/choptionhd"],
* [class~="task/choptionhd"],
* [class~="task/chdeschd"],
* [class~="task/choption"] {
    background-color: #EEEEEE;
    text-align: left;
}

* [class~="task/choicetable"] {
    border: 2pt solid #EEEEEE;
}

* [class~="task/choicetable"] * [class~="task/chrow"],
* [class~="task/choicetable"] * [class~="task/chhead"] {
    border-bottom: 2pt solid #EEEEEE;
}

* [class~="task/choicetable"] * [class~="topic/stentry"] {
    border-bottom: none;
    border-right: none;
}
```

**Note:** Using the frame attribute on the choice table will make these selectors apply partially. Please make sure you are designing your customization CSS taking into account all possible values for the frame attribute.

**How to Remove the Table NN Label**

For the **DITA Map PDF - based on HTML5 & CSS** transformation scenario, the label for a table's title is wrapped in a span element with the class: `table--title-label`.

```html
<table ...
...
<caption class="- topic/title title tablecap">
    <span class="table--title-label">Table
    <span class="table--title-label-number">1. </span></span></caption>
```
To hide it, set its display to none:

```css
.table--title-label {
    display:none;
}
```

For the direct transformation, use:

```css
 *[class =~ "topic/table"] > *[class =~ "topic/title"]:before {
    content: none;
}
```

## Code Blocks

Code blocks are used to render section of programming code.

### How to Enable Code Syntax Highlighting

This topic refers only to the DITA Map PDF - based on HTML5 & CSS transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-css
- language-ini
- language-java
- language-javascript
- language-json
- language-lua
- language-perl
- language-php
- language-python
- language-ruby
- language-sql
- language-xml
- language-xquery

For example, for a java snippet:
Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `<span>` and `<strong>` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS (on page 1292):

```css
.hl-keyword {
  color: red !important;
}
.hl-comment {
  color: blue !important;
}
```

How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your customization CSS (on page 1292):

```css
*{class~="pr-d/codeblock"} {
  white-space: pre;
}
```
For the DITA Map PDF - based on HTML5 & CSS transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: XSLT Extensions for PDF Transformations (on page 1284).

How to Deal with Unwanted Returns in Code Blocks

There are cases where the source file contains long lines of code that need to continue onto the next line in the rendered PDF (to wrap visually).

When the user copies the block from the PDF reader, they get two separated lines. This means that the command fails when users copy it from the PDF to the command-line terminal (because it comes in as two commands).

For example, the command:

```
$gist = ls -l * | count -n | some more
```

May be rendered in the PDF on two lines:

```
$gist = ls -l * | count -n
| some more
```

And this is invalid when used in the terminal.

There is no CSS workaround for this, but to manually format the command line, add a line continuation character like this:

```
$gist = ls -l * | count -n \n| some more
```

Note: For Linux/Mac OSX, the continuation character is the backslash \. For Windows, this is the shift character ^.

The command-line processor will now recognize that the first line is continuing on to the next one.

Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (tip, caution, danger, restriction, important, warning).

For information on how to add and manage mixed content before the note icons and labels, see How to Control the Image Size in Complex Static Content (on page 1404).

How to Change Note Icons

The recommended icon format is SVG.

To change the default icons for notes that do not have a @type attribute, add the following rule to your customization CSS (on page 1292):

```
div.note > span.note__title{
``
For a note with a `@type` attribute set to `warning`, `caution`, or `trouble`, add the following corresponding CSS rule:

```css
div.warning > span.note__title{
    background-image: url("../img/warning.svg") !important;
}
div.caution > span.note__title{
    background-image: url("../img/caution.svg") !important;
}
div.trouble > span.note__title{
    background-image: url("../img/troubleshooting.svg") !important;
}
```

### Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (on page 1292):

```css
a:has(dfn[@class ~="abbreviated-form"]) {
    color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'black' else 'red'");
    text-decoration: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then 'none' else 'underline'");
}
```

This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.

### Trademarks

Trademarks are used to specify legally registered words and they are often used in technical documentation. To specify a trademark, your DITA content could use a structure similar to this:

```xml
<tm tmtype="tm">My Product Name</tm>
```

Depending on the value of the `@tmtype` attribute, a different symbol is appended to the text: (®, ™, or #).

The structure of the merged HTML document the CSS will apply to is:

```html
<span class="- topic/tm" tmtype="tm">My Product Name</span>
```

### How to Style the Trademark Element Text

To change the style of the entire trademark text, you can match the `topic/tm` class like this:
How to Style the Trademark Symbol

To change the aspect of the trademark symbol, you can use the `topic/tm` class. Usually, common fonts already render these symbols smaller and with superscript by default. The following example does it from the CSS:

```
* [class =~ "topic/tm"] {  
  font-weight: bold;
}
```

Styling Through Custom Parameters

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while the value of the parameter will be become the attribute value. The namespace of these synthetic attributes is: `http://www.oxygenxml.com/extensions/publishing/dita/css/params`.

When using the DITA Map PDF - based on HTML5 & CSS or the DITA PDF - based on HTML5 & CSS transformations, the generated attribute will be in no namespace.

**Notes:**

- Make sure the name of your custom parameter does not conflict with an attribute name that may already exist on the root element.
- Use only Latin alphanumeric characters for parameter names.
- You can set multiple styling parameters at the same time.

How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, preface, notices).

The custom parameter is:

```
args.css.param.only-chapters-in-toc="yes"
```

The CSS that hides the `topicrefs` at level 2 or more:

```
:root[only-chapters-in-toc='yes'] * [class =~ "toc/toc"]
  > * [class =~ "map/topicref"] > * [class =~ "map/topicref"] {  
    display: none;
}
```
The `:root[a|only-chapters-in-toc='yes']` selector makes the rule activate only when the attribute is set.

How to Change the Page Size Using a Parameter
In the following example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario as:

```xml
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used as follows:

```css
@page {
    size: oxy_xpath('/@*[local-name()="page-size"]');
}
```

How to Change the Front Page Background Using a Parameter
Suppose you want to customize the front page of your publication depending on an "internal-use" marker. You should define the parameter in the transformation scenario as:

```xml
args.css.param.internal-use="yes"
```

Then in the CSS, the attribute value is extracted and used as follows:

```css
:root[internal-use='yes'] *[class~='front-page/front-page'] {
    page: front-page-internal-use;
}
```

```css
@page front-page-internal-use {
    background-color: yellow; /* or use an SVG as background-image */
}
```

Controlling the Publication Content
Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a preface, frontmatter, or backmatter with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA bookmap.

A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:
Then you may define a frontmatter. For this, you can link the topics that need to appear before the main content. You can also define the location where the table of contents will be placed. In the example below, it appears between the `abstract.dita` and `foreword.dita` topics:

```xml
<frontmatter>
  <topicref href="topics/abstract.dita"/>
  <booklists>
    <toc/>
  </booklists>
  <topicref href="topics/foreword.dita"/>
</frontmatter>
```

**Note:** To remove the TOC from the publication, just omit the `<toc>` element from the `<booklists>` element.

Next, the topics are grouped into chapters:

```xml
...<chapter href="topics/installation.dita" />...
```

At the end, you could define the structure of the backmatter. Just like for the frontmatter, you can include some topics and some generated content (such as the index). In the example below, the glossary is defined to come after the index, followed by a list of figures and list of tables. At the very end, there is a topic with some thank you notes.

```xml
<backmatter>
  <topicref href="topics/conclusion.dita"/>
  <booklists>
    <indexlist/>
    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes"/>
      <topicref href="topics/anti_lock_braking_system.dita" keys="abs" print="yes"/>
    </glossarylist>
    <figurelist/>
    <tablelist/>
  </booklists>
</backmatter>
```
As you can see, the bookmap offers much better control over the final content of the publication. It also offers more options in controlling the metadata that will go into the PDF (see the Metadata (on page 1320) topic).

**How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map**

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter `hide.frontpage.toc.index.glossary`. See: Transformation Parameters (on page 1269).

**Related Information:**
- How to Remove Entries from the TOC (on page 1352)
- How to Hide the TOC (on page 1352)

**How to Make Chapters Look Like Individual Publications**

⚠️ **Note:** This topic is only applicable for the DITA Map PDF - based on HTML5 & CSS transformation scenario.

Sometimes you want to make each chapter independent (i.e. it can be read separately, as a separate part of your publication). For this, you need the page counter, figure, and table counters to restart at each chapter. You can control this by using the `args.css.param.numbering` (on page 1338) command-line parameter.

In addition to numbering, you can force the creation of a chapter TOC (on page 1353).

**Troubleshooting**

This section contains information about fixing various publishing problems.

**The XPath function format-date() does not respect the specified locale**

The XPath expressions are evaluated using the Saxon HE processor. This processor does not support other languages than English. ([https://sourceforge.net/p/saxon/mailman/message/26849522/](https://sourceforge.net/p/saxon/mailman/message/26849522/))

Formatting a date using other language code:

```xml
<title:before {
    content: oxy_xpath('format-date(current-date(), "[Mn] \[Y\]", "ru", (), ())');
}
```

results in an output like: [Language: en]september 2019, the image of the date being formatted in English.

You can either switch to a more language neutral format that avoids the months names:

```xml
<title:before {
    content: oxy_xpath('format-date( current-date(), "[M] \[Y\]", "en", (), ())');
}
```
or you can use a more complex XPath expression, like:

```xml
<title:before{
  
  content: oxy_xpath("let $cm:= format-date(current-date(), '[MNn]') \ 
     return concat( \ 
       if ($cm= 'January') then  'JAN' else \ 
       if ($cm= 'February') then  'FEB' else \ 
       if ($cm= 'March') then  'MAR' else \ 
       if ($cm= 'April') then  'APR' else \ 
       if ($cm= 'May') then  'MAY' else \ 
       if ($cm= 'June') then  'JUNE' else \ 
       if ($cm= 'July') then  'JUL' else \ 
       if ($cm= 'August') then  'AUG' else \ 
       if ($cm= 'September') then  'SEPT' else \ 
       if ($cm= 'October') then  'OCT' else \ 
       if ($cm= 'November') then  'NOV' else '' \ 
       , \ 
       ', \ 
       format-date(current-date(), '[Y0001]') \ 
     )");
}
```

Make sure the entire expression is rendered blue in the CSS editor. Replace the capitalized month names with the translation in the desired language.
Error Parsing CSS File - Caused by a Networking Problem

Problem
My custom styles are not applied and in the transformation results console, I get an error containing one of the following: I/O exception, Unknown host, Error parsing.

Cause
One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

Note: If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

Remedy

1. Check your proxy settings (ask the system administrator for help).

2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

Note: If the problem is caused by a remote font, see Using Local Fonts.

XSL FO-based DITA to PDF Customization

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps (on page 2134) to PDF output. Oxygen XML Editor Eclipse plugin includes a built-in DITA Map PDF - based on XSL-FO transformation scenario (on page 992) that converts DITA maps to PDF using an xsl:fo processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the customization.dir parameter).
- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the DITA Open Toolkit Documentation.

Tip: Some sample plugins are available on GitHub that could help you to get started with creating a plugin:
- Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual
- Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title
Using a Customization Directory

One way to customize the PDF output generated by the DITA Map PDF - based on XSL-FO transformation scenario (on page 992) is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the customization.dir parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:

1. Copy all the entire DITA-OT-DIR\plugins\org.dita.pdf2\Customization directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see Embedding a Company Logo (on page 1421) for a specific example of how you can modify contents of the directory to embed a logo in the output.

   Tip: For other specific examples, see DITA-OT Documentation - PDF Customization Plugin.
3. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 992), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:

- Automatic PDF plugin customization generator by Jarno Elovirta.
- DITA-OT Documentation - PDF Customization Plugin

Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book.

1. Create a customization directory (on page 1421) (if you haven't already done so).
2. Create a cfg\common\artwork directory structure in your customization directory and copy your logo to that directory (for example, [C:\Customization\cfg\common\artwork\logo.png].

   Important: Make sure that your logo image is named: logo.png.
3. Rename Customization\catalog.xml.orig to: Customization\catalog.xml.
4. Open the catalog.xml in Oxygen XML Editor Eclipse plugin and uncomment this line:

   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"-->

It now looks like this:

   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>

5. Rename the file Customization\fo\xsl\custom.xsl.orig to: C:\Customization\fo\xsl\custom.xsl
6. Open the `custom.xsl` file in Oxygen XML Editor Eclipse plugin and create the template called `createFrontCoverContents` for DITA-OT 3.4.

**Tip:** You can copy the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal. This new template in the `custom.xsl` file will override the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

**Example:**

For example, the `custom.xsl` could look like this:

```xml
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="2.0">

<xsl:template name="createFrontCoverContents">
<!-- set the title -->
<fo:block xsl:use-attribute-sets="__frontmatter__title">
    <xsl:choose>
        <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
            <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
        </xsl:when>
        <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]">
            <xsl:apply-templates select="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]"/>
        </xsl:when>
        <xsl:otherwise>
            <xsl:value-of select="//*[contains(@class,' topic/topic ')][1]/*[contains(@class,' topic/title ')]"/>
        </xsl:otherwise>
    </xsl:when>
</fo:block>

<!-- set the subtitle -->
<xsl:apply-templates select="$map//*[contains(@class,' bookmap/bookmeta ')]"/>
<fo:block xsl:use-attribute-sets="__frontmatter__owner">
    <xsl:apply-templates select="$map//*[contains(@class,' bookmap/booktitlealt ')]"/>
</fo:block>
</xsl:template>
</xsl:stylesheet>
```
7. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 992), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

**Tip:** For other specific examples, see DITA-OT 3.x Documentation - Customizing PDF Output.

Related Information:
- Using a Customization Directory (on page 1421)

## Customizing the Header and Footer in PDF Output

The XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml`. These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.

1. Create a customization directory (on page 1421) (if you haven't already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

**Tip:** For more information and examples, see the Oxygen PDF Customization Plugin project on GitHub.

3. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 992), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.
Adding a Watermark to PDF Output

To add a watermark to the PDF output of a DITA Map PDF - based XSL-FO transformation scenario (on page 992), follow this procedure:

1. Create a customization directory (on page 1421) (if you haven't already done so).
2. Create a `cfg\common\artwork` directory structure in your customization directory and copy your watermark image to that directory (for example, `C:\Customization\cfg\common\artwork\watermark.png`).
3. Rename the `Customization\catalog.xml.orig` file to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor Eclipse plugin and **uncomment** this line:

   ```xml
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```

   The uncommented line should look like this:

   ```xml
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```

5. Rename the file: `Customization\fo\xsl\custom.xsl.orig` to: `Customization\fo\xsl\custom.xsl`.
6. Open the `Customization\fo\xsl\custom.xsl` file in Oxygen XML Editor Eclipse plugin to overwrite two XSLT templates:

   - The first template is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl`. Override by copying the original template content in the `custom.xsl` and specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:

     ```xml
     <fo:static-content flow-name="odd-body-header">
     <fo:block-container absolute-position="absolute"
       top="-2cm" left="-3cm" width="21cm" height="29.7cm"
       background-image="{concat($artworkPrefix,
         'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
       <fo:block/>
     </fo:block-container>
     </fo:block>
     </fo:block-container>
     <fo:block xsl:use-attribute-sets="_body_odd_header">
     <xsl:call-template name="insertVariable">
       <xsl:with-param name="theVariableID" select="'Body odd header'"/>
       <xsl:with-param name="theParameters">
         <prodname>
           <xsl:value-of select="$productName"/>
         </prodname>
       </xsl:with-param>
     </xsl:call-template>
     <xsl:call-template name="insertVariable">
       <xsl:with-param name="theVariableID" select="'Body odd header'"/>
       <xsl:with-param name="theParameters">
         <prodname>
           <xsl:value-of select="$productName"/>
         </prodname>
       </xsl:with-param>
     </xsl:call-template>
     </fo:block>
     </fo:static-content>
     ```

   - The second template is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl`. Override by copying the original template content in the `custom.xsl` and specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:
The second template to override is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. Override it by copying the original template content in the `custom.xsl` and adding the `block-container` element that references the watermark image file:

```xml
<xsl:template name="createFrontMatter_1.0">
  <fo:page-sequence master-reference="front-matter"
      xsl:use-attribute-sets="__force_page_count">
    <xsl:call-template name="insertFrontMatterStaticContents"/>
    <fo:flow flow-name="xsl-region-body">
      <fo:block-container absolute-position="absolute"
        top="-2cm" left="-3cm" width="21cm" height="29.7cm"
        background-image="{concat($artworkPrefix,"Configuration/OpenTopic/cfg/common/artwork/watermark.png")}">
        <fo:block/>
      </fo:block-container>
      <fo:block xsl:use-attribute-sets="__frontmatter">
        <!-- set the title -->
      </fo:block>
      <fo:block xsl:use-attribute-sets="__frontmatter__title">
        <xsl:choose>
          <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
            <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
          </xsl:when>
          <xsl:when test="$map/*[contains(@class,' bookmap/mainbooktitle ')][1]">
            <xsl:apply-templates select="$map/*[contains(@class,' bookmap/mainbooktitle ')][1]"/>
          </xsl:when>
        </xsl:choose>
      </fo:block>
    </fo:flow>
  </fo:page-sequence>
</xsl:template>
```
7. Edit the DITA Map PDF - based on XSL-FO transformation scenario (on page 992), go to the Parameters tab, and set the customization.dir parameter to point to the location of your customization directory.

Related Information:
- Adding a Watermark in DITA Map to XHTML Output (on page 2073)

**Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author**

You can embed *Edit* links in the DITA Map PDF output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an *Edit* link in the DITA Map PDF output, follow these steps:
1. Edit a DITA Map PDF - based on XSL-FO transformation scenario (on page 992) and open the Parameters tab.

2. Set values for the following parameters:
   - `editlink.remote.ditamap.url` - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - `editlink.web.author.url` - The URL of the Oxygen XML Web Author installation, for example https://www.oxygenxml.com/oxygen-xml-web-author/

3. Run the transformation scenario.

Result: In the PDF output, all topics will have an Edit link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

### Force Page Breaks Between Two Block Elements in PDF Output

Suppose that in your DITA content you have two block elements (on page 2132), such as two paragraphs:

```xml
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit plugin (on page 2137) that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

   ```xml
   <p>First para</p>
   <pi name='pagebreak'/>
   <p>Second para</p>
   ```

2. Locate the DITA Open Toolkit distribution and in the `plugins` directory create a new plugin folder (for example, `DITA-OT-DIR/plugins/pdf-page-break`).

3. In this new folder, create a new `plugin.xml` file with the following content:

   ```xml
   <plugin id="com.yourpackage.pagebreak">
     <feature extension="package.support.name" value="Force Page Break Plugin"/>
     <feature extension="package.support.email" value="support@youremail.com"/>
     <feature extension="package.version" value="1.0.0"/>
     <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
   </plugin>
   ```

   The most important feature in the `plugin` is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named `pageBreak.xsl` with the following content:

   ```xml
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                   xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
     <xsl:template match="processing-instruction('pagebreak')">
       <fo:block break-after="page"/>
     </xsl:template>
   </xsl:stylesheet>
   ```
5. Install your plugin in the DITA Open Toolkit. (on page 2108)

The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

Show Comments and Tracked Changes in PDF Output

To include comments and tracked changes (stored within your DITA topics) in the PDF output, follow these steps:

1. Edit a DITA Map PDF - based on XSL-FO transformation scenario.
2. In the Parameters tab, set the value of the show.changes.and.comments parameter to yes. If you also want to display change bars for inserted or deleted content in the PDF, set the show.changebars parameter to yes.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
   - **ct.insert.color** - Specifies the color for insertion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'blue'.
   - **ct.delete.color** - Specifies the color for deletion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'red'.
   - **ct.comment.bg.color** - Specifies the background color for comment type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'yellow'.
4. Click OK and then the Apply Associated button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a DITA map (on page 2134) is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in Add a Font to the Built-in FO Processor - Advanced Version (on page 1060).

DITA-OT PDF Font Mapping

The DITA-OT contains a file DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:
The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the *font-mappings.xml*.

If it finds a mapping like this:

```
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the *monospace* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
  <physical-font char-set="default">
    <font-face>Courier New, Courier</font-face>
  </physical-font>
  ............
</logical-font>
```

**Important:**

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to *Helvetica*.

Related Information:

---

**Adding Libraries to the Built-in FO Processor (DITA-OT)**

Starting with Oxygen XML Editor Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA-OT FO processor. For older version of Oxygen XML Editor Eclipse plugin, use the following procedures to enable such support.

**Adding Hyphenation Support for DITA-OT Transformation Scenarios**

1. Download the pre-compiled *JAR (on page 2135)* from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the *fop-hyph.jar* library.

**Adding Support for PDF Images**

1. Download the *fop-pdf-images JAR* libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the libraries.
Adding Support for CGM Images

1. Go to the JCGM page and download the jcgm-image-0.1.1.jar and jcgm-core-0.2.0.jar libraries.
2. Edit the DITA-OT transformation scenario and switch to the Advanced tab.
3. Click the Libraries button and add the path to the libraries.

Debugging DITA PDF Transformations

To debug a DITA PDF transformation scenario, follow these steps:

1. Open the Preferences dialog box (on page 47), go to XML > XML Catalog, click Add, and select the file located at DITA-OT-DIR\plugins\org.dita.pdf2\cfg\catalog.xml.
2. Open the map in the DITA Maps Manager (on page 1877) and create a DITA Map PDF - based on XSL-FO transformation scenario.
3. Edit the scenario, go to the Parameters tab and change the value of the clean.temp parameter to no.
4. Run the transformation scenario.
5. Open the stage1.xml file located in the temporary directory and format and indent (on page 284) it.
6. Create a transformation scenario for this XML file by associating the topic2fo_shell_fop.xsl stylesheet located at DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets topic2fo_shell_xep.xsl or topic2fo_shell_axf.xsl located in the same folder.
   
   Note: For validation purposes, you need to add the main debugged stylesheet (usually topic2fo_shell_fop.xsl) to the Master Files folder (on page 231) in the Navigator view.
7. In the transformer drop-down menu, select the Saxon EE XSLT processor (the same processor used when the DITA-OT transformation is executed).
8. Click the Parameters button and set the locale parameter with the value en_GB and the customizationDir.url parameter to point either to your customization directory or to the default DITA-OT customization directory. Its value should have a URL syntax like this: file://c:/path/to/DITA-OT-DIR/plugins/org.dita.pdf2/cfg.
9. If your XSLT stylesheet uses Java extensions, you need to reference the extra JAR libraries by clicking the Extensions button and add the libraries in the resulting dialog box. For example, if you have enabled the show.changes.and.comments parameter, you need to add the following JAR library for the parameter to have an effect: DITA-OT\plugins\com.oxygenxml.common\lib\oxygen-dita-publishing-xslt-extensions.jar.
10. Apply the transformation to continue the debugging process.
Related Information:

- Debugging XSLT Stylesheets and XQuery Documents (on page 1524)
- How to Enable Debugging for FO Processor Transformations (on page 1062)

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

   You should start from a copy of the file [DocBook XSL directory]/fo/titlepage.templates.xml and customize it. The instructions for the spec file can be found here.

   An example of spec file:

   ```xml
   <t:titlepage-content t:side="recto">
     <mediaobject/>
     <title
       t:named-template="book.verso.title"
       font-size="$hsize2;"
       font-weight="bold"
       font-family="{$title.font.family}"/>
     <corpauthor/>
     ...
   </t:titlepage-content>
   ```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

   Apply [DocBook XSL directory]/template/titlepage.xsl to the title spec file. The result is an XSLT stylesheet (for example, mytitlepages.xsl).

3. Import mytitlepages.xsl in a DocBook customization layer.

   The customization layer is the stylesheet that will be applied to the XML document. The mytitlepages.xsl should be imported with an element like this:

   ```xml
   <xsl:import href="dir-name/mytitlepages.xsl"/>
   ```

4. Insert a logo image in the XML document.

   The path to the logo image must be inserted in the book/info/mediaobject structure of the XML document.

5. Apply the customization layer to the XML document.

   A quick way is to duplicate the transformation scenario DocBook PDF that is included with Oxygen XML Editor Eclipse plugin and set the customization layer in the XSL URL property of the scenario (on page 1004).
Related Information:

- Video demonstration for creating a DocBook customization layer in Oxygen XML Editor Eclipse plugin.
12. Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

**Note:** If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

**Examples:**

- `child::*` - Selects all children of the root node.
- `./name` - Selects all elements having the name "name", descendants of the current node.
- `/catalog/cd[price>10.80]` - Selects all the `<cd>` elements that have a price element with a value larger than 10.80.

To find out more about XPath, see [http://www.w3.org/TR/xpath](http://www.w3.org/TR/xpath).

**Related Information:**
- Content Completion in XPath Expressions (on page 571)

**XPath Builder View**

The **XPath/XQuery Builder** view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.1, you can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor Eclipse plugin executes the expressions over the XML document in the associated scenario.

**Note:** If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

- **XPath version chooser drop-down menu**
A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note: The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note: Oxygen XML Editor Eclipse plugin uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Editor Eclipse plugin returns a compilation error.

Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the Results view (on page 281).

Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor Eclipse plugin automatically groups favorites in folders named after the method of execution.

History drop-down menu

Keeps a list of the last 15 executed XPath expressions. Use the ✪ Clear history action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

- Update on cursor move
  
  When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

- Evaluate as you type
  
  When you select this option, the XPath expression you are composing is evaluated in real time.

  Note: This option and the automatic validation are disabled when the scope is other than Current file.
Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Editor Eclipse plugin allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Enclosing project** - All the files of the project that encloses the current edited file.
- **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (Navigator (on page 221), Project Explorer or Package Explorer).
- **All opened files** - All files that are opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected DITA map that is open in the DITA Maps Manager view (on page 1877).
- **Opened archive** - Files that are opened in the Archive Browser view (on page 1440).
- **Working sets** - The selected working sets (on page 2139).

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called working sets (on page 2139).
- **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope.
When you hover your cursor over the version icon, a tooltip is displayed to let you know what engine Oxygen XML Editor Eclipse plugin currently uses.

While you edit an XPath or XQuery expression, Oxygen XML Editor Eclipse plugin assists you with the following features:

- **Content Completion Assistant (on page 2133)** - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- **Syntax Highlighting** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the Preferences dialog box (on page 47) and go to Editor > Syntax Highlight (on page 129).

- **Automatic validation of the expression as you type.**

  **Note:** When you type invalid syntax, a red serrated line underlines the invalid fragments.

- **Function signature and documentation balloon**, when the cursor is located inside a function.

**Related Information:**

- XPath Expression Results View (on page 1436)
XPath Expression Results View

When you run an XPath expression, Oxygen XML Editor Eclipse plugin displays the results of its execution in the **XPath Results** view.

This view contains the following columns:

- **Description** - The result that Oxygen XML Editor Eclipse plugin displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. If no information regarding location is available, Oxygen XML Editor Eclipse plugin displays **Not available** in the **Location** column. Oxygen XML Editor Eclipse plugin displays the results in a valid XPath expression format.

Example:

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter //chapter in the XPath expression field and press Enter. This action returns all the chapter nodes of the DocBook book in the **Results View**. Click a
record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Editor Eclipse plugin adds a result in the **Results View** for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

**Figure 415. XPath Results Highlighted in Editor Panel with Character Precision**

 XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through **XML Catalogs** ([page 2139](#)). These catalogs are configured in the **XML Catalog preferences** ([page 149](#)) pages and the **XML Parser preferences** ([page 151](#)).

**Example:**

As an example, consider the evaluation of the `collection(URIofCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an **XML catalog**, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is `ro.sync.xml.parser.CatalogEnabledXMLReader`. Specify it as it follows:

```xml
let $docs := collection(iri-to-uri(
  "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;
  parser=ro.sync.xml.parser.CatalogEnabledXMLReader")
)
```
 XPath Prefix Mapping

To define default mappings between prefixes and namespace URIs go to the XPath preferences page (on page 161) and enter the mappings in the Default prefix-namespace mappings table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

Important: If you define a default namespace, Oxygen XML Editor Eclipse plugin binds this namespace to the first free prefix from the list: default, default1, default2, and so on. For example, if you define the default namespace xmlns="something" and the prefix default is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix default. To find all the <level> elements when you define a default namespace in the root element, use this expression: //default:level in the XPath toolbar.
13. Working with Archives

Oxygen XML Editor Eclipse plugin includes a useful Archive Browser view (on page 1440) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- JAR archives (on page 2135)
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- IDML files (on page 2135)

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the Browse for archived file action to browse and select files from a particular archive.

For more information about working with an EPUB archive in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

Browsing Archives

To view the contents and structure of an archive, use one of the following methods:

- Open an archive from the Navigator view (on page 221). This will open the archive in the main editing pane. The archive will be unmounted when the editor is closed.
- Use the Eclipse File System (EFS) by right-clicking the archive in the Navigator view and choosing Expand Zip Archive. This will expand the archive in the Navigator view. All the standard Navigator actions are available on the mounted archive. To close the archive, you can use the Collapse ZIP Archive action and any file opened from the expanded archive will be closed when the archive in unmounted.

Tip: If a file is not recognized by Oxygen XML Editor Eclipse plugin as a supported archive type, you can add it from the Archive preferences page (on page 48).
Archive Contextual Menu Actions

The following additional actions are available from the contextual menu for archives:

- **Open**
  
  Opens a resource from the archive in the editor.

- **Extract**
  
  Extracts a resource from the archive in a specified folder.

- **New folder**
  
  Creates a folder as child of the selected folder in the browsed archive.

- **New file**
  
  Creates a file as child of the selected folder in the browsed archive.

- **Add files**
  
  Adds existing files as children of the selected folder in the browsed archive.

  **Note:** On OS X, the **Add file** action is also available and it allows you to add one file at a time.

- **Rename**
  
  Renames a resource in the archive.

- **Cut**
  
  Cuts the selected archive resource.

- **Copy**
  
  Copies the selected archive resource.

- **Paste**
  
  Pastes a file or folder into the archive.

- **Delete**
Removes a file or folder from archive.

**Copy location**

Copies the URL location of the selected resource.

**Refresh**

Refreshes the selected resource.

**Properties**

Shows the properties of the selected resource.

For more information, watch our video demonstration about working with an EPUB in the Archive Browser view:

[https://www.youtube.com/embed/OIGTNQwOCi8](https://www.youtube.com/embed/OIGTNQwOCi8)

## Working with Archive Files

Oxygen XML Editor Eclipse plugin includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the **Navigator** view or the main editing pane, their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.
When an archive is expanded, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes (on page 1444) back to the archive. You can also use the Open in System Application action to open the archive in the default system application that is associated with that type of file.

**EPUB-Specific Validation**

When working with EPUB archives, Eclipse includes a Validate action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Editor Eclipse plugin uses the open-source EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

For more information about working with an EPUB archive in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

**Related Information:**

- The Archive Browser View (on page 1440)
- EPUB Document Type (Framework) (on page 974)
Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to File > New > New from Templates.

2. Choose your particular type of archive template. For example, select one of the ODF, OOXXML, or EPUB templates.

3. Click Next and choose the name and location of the file.

4. Click Finish.

A skeleton archive is saved on disk and open in Eclipse.

Tip: Use toolbar and contextual menu actions to edit, add, and remove resources from the archive.

For EPUB archives, you can use the Validate action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive and then edit them in the main editor pane. To open a file, simply double-click it or select Open from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose Never ask me again, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Archive preferences page (on page 48).

Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in Eclipse.

2. Open the document.xml file contained in the archive.

3. Run one of the following built-in transformation scenarios:
   a. DOCX DITA to migrate to DITA.
   b. DOCX TEI P5 to migrate to TEI.

4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

Tip: Oxygen XML Editor Eclipse plugin also includes a built-in transformation scenario called ODT TEI P5 for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.
Databases and SharePoint

Oxygen XML Editor Eclipse plugin provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Editor Eclipse plugin. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Editor Eclipse plugin offers the means for managing the interaction with some of the most commonly used databases (both Relational and Native XML databases). Through this interaction, Oxygen XML Editor Eclipse plugin helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Editor Eclipse plugin include:

- IBM DB2 (on page 1450)
- Microsoft SQL Server (on page 1454)
- Oracle Database (on page 1458)
- PostgreSQL (on page 1463)
- Berkeley DB XML (on page 1467)
- eXist (on page 1473)
- MarkLogic (on page 1477)
- MySQL (on page 1486)
- Generic JDBC (on page 1488)
- JDBC-ODBC (on page 1489)
- BaseX (on page 1490)
- WebDAV (on page 1495)
- Microsoft SharePoint (on page 1508)

Related Information:

- Integration with Microsoft SharePoint (on page 1508)

Data Source Explorer View

The Data Source Explorer view displays your database connections. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.
You can connect to a database simply by expanding the connection node (click the connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Editor Eclipse plugin supports multiple simultaneous database connections and the connection tree in the Data Source Explorer view provides an easy method for browsing them.

![Data Source Explorer View](image)

The objects (nodes) that are displayed in the Data Source Explorer view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the Navigator view (on page 221), a file browsing application, or another database.

### Toolbar Actions

The following actions are available in the toolbar of this view:

- **Filters**
  
  Opens the Data Sources / Table Filters preferences page (on page 55), allowing you to decide which table types are displayed in the Data Source Explorer view.

- **Configure Database Sources**
  
  Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

### Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the Data Source Explorer view. The actions depend on the type of database, the type of node, or the hierarchical level of the node where the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.
Table Explorer View

Relational databases tables in the Data Source Explorer view (on page 1445) can be displayed and edited in the Table Explorer view by selecting the Edit action from the contextual menu of a Table node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Editor Eclipse plugin attempts to update the database with the new cell content.

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: 🔒.
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the Table Explorer view (using the Limit the number of cells option in the Data Sources Preferences page (on page 55)). If a table that has more cells than the value set in the options is displayed in the Table Explorer view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, an information dialog box appears, notifying you that the value you have inserted cannot be converted to the SQL type of that field. For example, if you have a column that contains LONG (numerical) values, and a character or string is
inserted into one of its cells, you would get the error message that a string value cannot be converted to the requested SQL type (NUMBER).

- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key propID column to 8, results in a duplicate entry error since that value has already been used in the first record:

Figure 420. Duplicate Entry for Primary Key

Table Explorer Contextual Menu Actions

Common editing actions (Cut, Copy, Paste, Select All, Undo, Redo) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the Table Explorer view, also includes the following actions:

Set NULL

Sets the content of the cell to null. This action is not available for columns that cannot have a value of null.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

Delete row

Deletes the selected row.

Copy

Copies the content of the cell.
Paste

Paste copied content into the selected cell.

Table Explorer Toolbar Actions

The toolbar of the Table Explorer view also includes the following actions:

- **Export to XML**
  
  Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from database (on page 1517) chapter).

- **Refresh**
  
  Performs a refresh for the sub-tree of the selected node.

- **Insert row**
  
  Inserts an empty row in the table.

- **Duplicate row**
  
  Makes a copy of the selected row and adds it in the Table Explorer view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

- **Commit row**
  
  Commits the selected row.

- **Delete row**
  
  Deletes the selected row.

Database Connection Support

Oxygen XML Editor Eclipse plugin offers support for a variety of Relational and Native XML database connections. The database drivers and connections for various types of database are configured in the Data Sources preferences page (on page 51) and once configured, the database connections can be viewed and managed in the Data Source Explorer view (on page 1445). Oxygen XML Editor Eclipse plugin also includes a Database perspective (on page 193) that helps you to manage databases.

The database support in Oxygen XML Editor Eclipse plugin offers a variety of capabilities, including:

- Browsing the structure of databases in the Data Source Explorer view (on page 1445).
- Viewing relational tables in the Table Explorer view (on page 1447).
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.
Relational Database Support
Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Editor Eclipse plugin offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Editor Eclipse plugin also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, MariaDB).

Native XML Database Support
Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Editor Eclipse plugin offers support for the most commonly used native XML databases, including:

- Berkeley DB XML
- eXist
- MarkLogic
- Oracle XML DB
- Base X

Related Information:
- WebDAV Connections (on page 1495)
- Integration with Microsoft SharePoint (on page 1508)

IBM DB2 Database Connections
Oxygen XML Editor Eclipse plugin includes support for IBM DB2 database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of an IBM DB2 database in the Data Source Explorer view (on page 1445), open tables in the Table Explorer view (on page 1447), and perform various operations on the resources in the repository.
Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file. Unzip the zip file and use the db2jcc.jar and db2jcc_license_cu.jar files in Oxygen XML Editor Eclipse plugin for configuring a DB2 data source (on page 1451).
2. Configure IBM DB2 Data Source drivers (on page 1451).
3. Configure an IBM DB2 Server Connection (on page 1452).
4. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

How to Configure IBM DB2 Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the IBM website and in the DB2 Clients and Development Tools category select the DB2 Driver for JDBC and SQLJ download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. Open the Preferences dialog box (on page 47) and go to Data Sources.
4. Click the + New button in the Data Sources panel.
The dialog box for configuring a data source is opened.

Figure 422. Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.

6. Select DB2 in the driver Type drop-down menu.

7. Click the Add Files button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

   The IBM DB2 driver files are:
   - db2jcc.jar
   - db2jcc_license_cisuz.jar
   - db2jcc_license_cu.jar

8. Select the most appropriate Driver class.

9. Click the OK button to finish the data source configuration.

10. Continue on to configure your IBM DB2 connection (on page 1452).

How to Configure an IBM DB2 Connection

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the **New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

![Connection Configuration Dialog Box](image)

**Figure 423. Connection Configuration Dialog Box**

3. Enter a unique name for the connection.

4. Select an *IBM DB2* data source in the **Data Source** drop-down menu.

5. Enter the connection details.
   a. Enter the URL to the installed IBM DB2 engine.
   b. Enter the user name to access the IBM DB2 engine.
   c. Enter the password to access the IBM DB2 engine.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** *on page 1445* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** *on page 2137*.

### IBM DB2 Contextual Menu Actions

**General Contextual Menu Actions**

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** *on page 1445*, depending on the node where it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.
Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the Table Explorer view (on page 1447).

Export to XML (available on Table nodes)

Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (on page 1517) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1445), the various nodes in IBM DB2 connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

Schema Level Nodes

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Editor Eclipse plugin.

Microsoft SQL Server Database Connections

Oxygen XML Editor Eclipse plugin includes support for Microsoft SQL Server database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a SQL Server database in the Data Source Explorer view (on page 1445), open tables in the Table Explorer view (on page 1447), and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

2. Configure MS SQL Server Data Source drivers (on page 1455).

3. Configure a MS SQL Server Connection (on page 1456).

4. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

How to Configure Microsoft SQL Server Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

2. Open the Preferences dialog box (on page 47) and go to Data Sources.

3. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

   ![Data Source Drivers Configuration Dialog Box](image)

4. Enter a unique name for the data source.

5. Select SQLServer in the driver Type drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded. The SQL Server driver file is called `sqljdbc.jar`.

7. Select the most appropriate **Driver class**.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure your Microsoft SQL Server connection *(on page 1456)*.

**How to Configure a Microsoft SQL Server Connection**

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. **Open the Preferences dialog box** *(on page 47)* and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

3. Enter a unique name for the connection.

4. Select the **SQL Server** data source in the **Data Source** drop-down menu.

5. Enter the connection details.

   a. Enter the URL of the SQL Server server.

      If you want to connect to the server using Windows integrated authentication, you must add `;integratedSecurity=true` to the end of the URL. The URL will look like this:
jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;

**Note:** For integrated authentication, leave the **User** and **Password** fields empty.

b. Enter the user name for the connection to the SQL Server.

c. Enter the password for the connection to the SQL Server.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** (on page 1445) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2137).

**Microsoft SQL Server Contextual Menu Actions**

**General Contextual Menu Actions**

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (on page 1445), depending on the node where it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.

- **Disconnect (available on **Connection nodes)**
  
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on **Connection nodes)**
  
  Opens the **Data Sources preferences page** (on page 51) where you can configure both data sources and connections.

- **Edit (available on **Table nodes)**
  
  Opens the selected table in the **Table Explorer view** (on page 1447).

- **Export to XML (available on **Table nodes)**
  
  Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the **Import from Database** (on page 1517) chapter).

**Database-Specific Contextual Menu Actions**

In addition to the general contextual menu actions in the **Data Source Explorer view** (on page 1445), the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

- **XML Schema Repository Level Nodes**
  
  **Register**
Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the Add and Remove buttons.

**Schema Level Nodes**

**Add**

Adds a new schema to the XML Schema files.

**Unregister**

Removes the selected schema from the XML Schema Repository.

**View**

Opens the selected schema in Oxygen XML Editor Eclipse plugin.

**Oracle Database Connections**

The Oracle database is a common relational type of database system. Oxygen XML Editor Eclipse plugin comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Editor Eclipse plugin allows you to browse Oracle repositories in the Data Source Explorer view (on page 1445), open tables in the Table Explorer view (on page 1447), and perform various operations on the resources in the repository.

**Figure 426. Oracle Database Connection**

![Data Source Explorer](image)

**Related Information:**
- Using XQuery with Oracle XML DB

**Configuring an Oracle 11g Database Connection**

To configure the support for a Oracle 11g database, follow this procedure:

2. Configure Oracle 11g Data Source drivers (on page 1459).
3. Configure an Oracle 11g Connection (on page 1460).
4. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

How to Configure Oracle 11g Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

2. Open the Preferences dialog box (on page 47) and go to Data Sources.

3. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.

Figure 427. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.

5. Select Oracle in the driver Type drop-down menu.

6. Click the Add Files button and select the Oracle driver file that you downloaded.

   The Oracle driver file is called ojdbc5.jar.
7. Select the most appropriate **Driver class**.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure your Oracle connection (*on page 1460)*.

**How to Configure an Oracle 11g Connection**

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the **Preferences** dialog box (*on page 47*) and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   ![Figure 428. Connection Configuration Dialog Box](image)

3. Enter a unique name for the connection.

4. Select the **Oracle 11g** data source in the **Data Source** drop-down menu.

5. Enter the connection details.
   a. Enter the URL of the Oracle server.
   b. Enter the user name for the connection to the Oracle server.
   c. Enter the password for the connection to the Oracle server.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1445), depending on the node where it is invoked:

- Refresh
  Performs a refresh on the selected node.

- Disconnect (available on Connection nodes)
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- Configure Database Sources (available on Connection nodes)
  Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

- Edit (available on Table nodes)
  Opens the selected table in the Table Explorer view (on page 1447).

- Export to XML (available on Table nodes)
  Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (on page 1517) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1445), the various nodes in Oracle database connections include the following additional contextual menu actions:

- XML Schema Repository Level Nodes

  Register
  Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. Local scope means that the schema is visible only to the user who registers it. Global scope means that the schema is public.

  Note: Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the
registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- CREATE ANY TABLE
- CREATE ANY INDEX
- SELECT ANY TABLE
- UPDATE ANY TABLE
- INSERT ANY TABLE
- DELETE ANY TABLE
- DROP ANY TABLE
- ALTER ANY TABLE
- DROP ANY INDEX

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

**XML Repository Level Nodes**

- Add container
  Adds a new child container to the current one.

- Add resource
  Adds a new resource to the folder.

**Container Level Nodes**

- Add container
  Adds a new child container to the current one.

- Add resource
  Adds a new resource to the folder.

- Delete
  Deletes the current container.

- Properties
  Shows various properties of the current container.

**Resource Level Nodes**

- Open
  Opens the selected resource in the editor.

- Open in System Application
When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Rename**

Renames the current resource

**Move**

Moves the current resource to a new container (also available through drag and drop).

**Delete**

Deletes the current container.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Properties**

Shows various properties of the current container.

**Compare**

Compares two selected resources.

**PostgreSQL Database Connections**

Oxygen XML Editor Eclipse plugin includes support for PostgreSQL database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a PostgreSQL database in the Data Source Explorer view (on page 1445), open tables in the Table Explorer view (on page 1447), and perform various operations on the resources in the repository.
Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Configure PostgreSQL Data Source drivers (on page 1464).
3. Configure a PostgreSQL Connection (on page 1466).
4. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

How to Configure PostgreSQL 8.3 Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Open the Preferences dialog box (on page 47) and go to Data Sources.
3. Click the + New button in the Data Sources panel.
   The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.

5. Select PostgreSQL in the driver Type drop-down list.

6. Click the Add Files button and select the PostgreSQL driver file that you downloaded.
The PostgreSQL driver file is called `postgresql-8.3-603.jdbc3.jar`.

7. Select the most appropriate **Driver class**.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to configure your PostgreSQL connection (*on page 1466*).

**How to Configure a PostgreSQL 8.3 Connection**

To configure a connection to a PostgreSQL 8.3 server, follow these steps:

1. **Open the Preferences dialog box (on page 47) and go to Data Sources**.

2. **Click the + New button in the Connections panel**.

   The dialog box for configuring a database connection is displayed.

3. **Enter a unique name for the connection**.

4. **Select the PostgreSQL 8.3 data source in the Data Source drop-down menu**.

5. **Enter the connection details**.

   a. **Enter the URL of the PostgreSQL 8.3 server**.
   b. **Enter the user name for the connection to the PostgreSQL 8.3 server**.
   c. **Enter the password for the connection to the PostgreSQL 8.3 server**.

6. **Click the OK button to finish the connection configuration**.
7. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the Data Source Explorer view (on page 1445), depending on the node where it is invoked:

- **Refresh**
  
  Performs a refresh on the selected node.

- **Disconnect (available on Connection nodes)**
  
  Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

- **Configure Database Sources (available on Connection nodes)**
  
  Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

- **Edit (available on Table nodes)**
  
  Opens the selected table in the Table Explorer view (on page 1447).

- **Export to XML (available on Table nodes)**
  
  Opens the Export Criteria dialog box (a thorough description of this dialog box can be found in the Import from Database (on page 1517) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the Data Source Explorer view (on page 1445), the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

- **Resource Level Nodes**

  **Compare**

  Compares two selected resources.

Berkeley DB XML Database Connections

Oxygen XML Editor Eclipse plugin includes support for Berkeley DB XML database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a Berkeley DB XML database in the Data Source Explorer view (on page 1445) and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB
and inherits its features and attributes, along with native XML support. A detailed description can be found at: http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html.

Figure 433. Berkeley DB XML Connection

Configuring a Berkeley DB XML Database Connection

Follow this procedure to configure the support for a Berkeley DB XML database:

2. Configure a Berkeley DB XML Connection (on page 1469).
3. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

How to Configure Berkeley DB XML Data Source Drivers

For this procedure, you need to already have a Berkeley DB XML database installed on your system.

Oxygen XML Editor Eclipse plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Berkeley DBXML from the driver Type drop-down menu.
5. Click the Add Files button to add the Berkeley DB driver files.

The driver files for the Berkeley DB database (and their locations) are as follows:

• db.jar (check for it in [DBXML_DIR]/lib or [DBXML_DIR]/jar)
How to Configure a Berkeley DB XML Connection

Oxygen XML Editor Eclipse plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured Berkeley data source from the Data Source drop-down menu.
5. Enter the connection details.
   a. Set the path to the Berkeley DB XML database directory in the Environment home directory field. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
   b. Select the Verbosity level: DEBUG, INFO, WARNING, or ERROR.
   c. Optionally, you can select the Join existing environment checkbox. If selected, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

Berkeley DB XML Contextual Menu Actions

While browsing Berkeley DB XML connections in the Data Source Explorer view (on page 1445), the various nodes include the following contextual menu actions:

Connection Level Nodes

- Configure Database Sources
  
  Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

Disconnect
Stops the connection.

**New Collection**

Opens a **Container configuration** dialog box that allows you to add a new container in the repository.

**Figure 434. Container Configuration Dialog Box**

This dialog box allows you to configure the following:

- **Name** - The name of the new container.
- **Container type** - At creation time, every container must have a type defined for it. This container type identifies how XML documents are stored in the container. As such, the container type can only be determined at container creation time. You cannot change it when subsequent container opens. You can select one of the following types:
  - **Node container** - XML documents are stored as individual nodes in the container. Each record in the underlying database contains a single leaf node, its attributes and attribute values (if any), and its text nodes (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the individual nodes stored in the underlying databases. This is the default selection and is the preferred container type.
  - **Whole document container** - The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.
- **Allow validation** - If selected, documents will be validated when they are loaded into the container. The default behavior is to not validate documents.
- **Index nodes** - If selected, indices for the container will return nodes rather than documents. The default is to index at the document level. This property has no meaning if the container type is **Whole document container**.

**Refresh**

Performs a refresh on the selected node.
Properties
Shows various properties of the current container.

Container Level Nodes

Import Files
Allows you to add a new file on the connection, in the current folder.

Export
Allows you to export the folder on the remote connection to a local folder.

Cut
Removes the current selection and places it in the clipboard.

Paste
Pastes the copied selection.

Rename
Renames the current resource.

Delete
Deletes the current container.

Edit indices
Opens a Container Indices dialog box that allows you to configure indices properties for the selected Berkeley container.

Figure 435. Container Indices Dialog Box

This dialog box allows you to configure the following properties:
• **Granularity** - A measure of the level of details of your data in the database. You can select one of the following:
  - **Document level** - Good option for retrieving large documents.
  - **Node level** - Good option for retrieving nodes from within documents.

• **Node** - The name of the node.

• **Namespace** - The index namespace.

• **Index type**:
  - **Uniqueness** - Indicates whether or not the indexed value must be unique within the container.
  - **Path type** - Drop-down menu that allows you to select from the following:
    - **node** - Indicates that you want to index a single node in the path.
    - **edge** - Indicates that you want to index the portion of the path where two nodes meet.
  - **Node type** - Drop-down menu that allows you to select from the following:
    - **element** - An element node in the document content.
    - **attribute** - An attribute node in the document content.
    - **metadata** - A node found only in the metadata content of a document.
  - **Key type** - Drop-down menu that allows you to select from the following:
    - **equality** - Improves the performances of tests that look for nodes with a specific value.
    - **presence** - Improves the performances of tests that look for the existence of a node regardless of its value.
    - **substring** - Improves the performance of tests that look for a node whose value contains a given sub-string.
  - **Syntax** - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is `string`.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated
with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor Eclipse plugin XQuery Debugger. The same restrictions and peculiarities (on page 1484) apply for the Berkeley debugger as for the MarkLogic debugger.

eXist Database Connections

Oxygen XML Editor Eclipse plugin includes support for eXist database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a eXist database in the Data Source Explorer view (on page 1445) and perform various operations on the resources in the repository.
Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated Create eXist-db XML connection wizard.
- Use the Data Sources preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an eXist database using the dedicated Create eXist-db XML connection wizard, follow these steps:

1. Open the Preferences dialog box (on page 47), go to Data Sources and click the Create eXist-db XML connection link.
2. Enter your connection details in the connection wizard and click OK.

   **Important:** To create an eXist connection using this wizard, Oxygen XML Editor Eclipse plugin expects the exist/webstart/exist.jnlp path to be accessible at the provided Host and Port.
3. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

How to Configure an eXist Connection Manually

**Attention:** For this manual procedure, you need to already have an eXist database server installed.

**Tip:** There is an easier way to configure an eXist database connection using a built-in wizard. For more information, see How to Configure an eXist Connection Using the Built-in Wizard (on page 1474).
Step 1: Configure eXist Data Source Drivers
Oxygen XML Editor Eclipse plugin supports eXist database server versions up to and including version 5.0. To configure a data source for an eXist database, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select eXist from the driver Type drop-down menu.
5. Click the Add Files button to add the eXist driver files. The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Editor Eclipse plugin.
   - The exist.jar file located in the base directory.
   - All JAR files in the lib/core/ directory.
6. Click the OK button to finish the data source configuration.

Step 2: Configure an eXist Connection
To configure a connection to an eXist database, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the Data Source drop-down menu.
5. Enter the connection details:
   a. Set the URI to the installed eXist engine in the XML DB URI field.
   b. Set the user name in the User field.
   c. Set the password in the Password field.
   d. Enter the start collection in the Collection field.
      eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

For more information about running XQuery against an eXist XML database, watch our video demonstration:
https://www.youtube.com/embed/Yoc5h1zSddA

eXist Contextual Menu Actions
While browsing eXist database connections in the Data Source Explorer view (on page 1445), the various nodes include the following contextual menu actions:

Connection Level Nodes
Configure Database Sources

Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

Disconnect

Stops the connection.

Refresh

Performs a refresh on the selected node.

Container Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Collection

Creates a new collection on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated
with that type of resource. You can then edit the resource, save it, and when you
switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse
plugin will detect that there was a change and will ask if you want to upload the
edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource
that can then be used for various actions, such as opening or transforming the
resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

MarkLogic Database Connections

Oxygen XML Editor Eclipse plugin Enterprise edition includes support for MarkLogic database connections.
Once you configure a MarkLogic connection (on page 1479), you can use the Data Source Explorer view (on
page 1445) to display all the application servers that are configured on the MarkLogic server. You can expand
each application server and view all of its configured modules, and the Data Source Explorer view (on page
1445) allows you to open and edit these modules.

Note: To browse modules located in a database, directory properties must be associated with them.
These directory properties are generated automatically if the directory creation property of the database is set
to automatic. If this property is set to manual or manual-enforced, add the directory properties of the modules
manually, using the XQuery function \texttt{xdmp:directory-create()}. For example, for two documents with the \texttt{/code/modules/main.xqy} and \texttt{/code/modules/imports/import.xqy} IDs, run the following query:

\begin{verbatim}
{xsdmp:directory-create('/code/modules/'), xsdmp:directory-create('/code/modules/imports/')}
\end{verbatim}

For more information about directory properties, go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.

**MarkLogic and XQuery**

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow to you to spot possible issues without the need of actually executing the XQuery script.

When debugging XQuery files with MarkLogic (on page 1481), you can use the \textit{Data Source Explorer view} (on page 1445) to open the files from the application server that is involved in the debugging process. By using the \textit{Data Source Explorer view} (on page 1445), any imported modules are better identified by the MarkLogic server. You can also use step actions and breakpoints (on page 1483) in the modules to help identify problems.

**Modules Container**

For each Application server (for example: Bill (HTTP port:8060)), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this \textit{Modules} container.

\textit{Note}: You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

**Requests Container**

Each MarkLogic application server includes a \textit{Requests} container. In this container, Oxygen XML Editor Eclipse plugin displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire \textit{Requests} container at the end of your session, right-click it and use the \textit{Cancel all requests} action (on page 1485).

\begin{figure}
\centering
\includegraphics[width=0.5\textwidth]{Figure437.png}
\caption{MarkLogic Connection in Data Source Explorer}
\end{figure}

### Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Editor Eclipse plugin Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from [MarkLogic Community site](http://www.marklogic.com/community).
2. Configure MarkLogic Data Source drivers (on page 1479).
3. Configure a MarkLogic Connection (on page 1479).
4. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

**Related Information:**
- [MarkLogic Development in Oxygen XML Editor Eclipse plugin](on page 1480)

### How to Configure MarkLogic Data Source Drivers

Available in the Enterprise edition only.

**Note:** Oxygen XML Editor Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

2. Unzip the downloaded archive.
3. Open the Preferences dialog box (on page 47) and go to Data Sources.
4. Click the + New button in the Data Sources panel.
5. Enter a unique name for the data source.
6. Select MarkLogic from the driver Type drop-down list.
7. Click the Add Files button and select the MarkLogic driver file from the lib folder of the archive that you downloaded and unzipped. The driver file name is `marklogic-xcc-{server_version}.jar`, where `{server_version}` is the MarkLogic server version.
8. Click the OK button to finish the data source configuration.
9. Continue on to configure your MarkLogic Connection (on page 1479).

### How to Configure a MarkLogic Connection

Available in the Enterprise edition only.

**Note:** Oxygen XML Editor Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the Data Source drop-down menu.
5. Enter the connection details.

   a. The host name or IP address of the installed MarkLogic engine in the XDBC Host field. Oxygen XML Editor Eclipse plugin uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is digest, so make sure to change it to basic.

   b. Set the port number of the MarkLogic engine in the Port field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the Use it to execute queries action (on page 1485) from Data Source Explorer.

   c. Set the user name to access the MarkLogic engine in the User field.

   d. Set the password to access the MarkLogic engine in the Password field.

   e. Optionally, in the WebDAV URL field, set the URL used for browsing the MarkLogic database in the Data Source Explorer view (on page 1445). The Database field specifies the database that will have the XQuery expressions executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

MarkLogic Development in Oxygen XML Editor Eclipse plugin

The Oxygen XML Editor Eclipse plugin support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an XQuery builder (on page 691) that helps to improve productivity.

Working with XQuery Files

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the Outline view (on page 689) collects and displays all the functions from all imported modules. The Content Completion Assistant (on page 2133) also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.
When developing queries for MarkLogic, it is best to open the resources from the Data Source Explorer view (on page 1445). When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

**XQuery Debugging**

Oxygen XML Editor Eclipse plugin allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Editor Eclipse plugin connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

**Working with Modules**

MarkLogic has a concept of two types of XQuery modules, library and main modules. A library module is used to define functions. Library modules cannot be evaluated directly. They are imported, either from other library modules or from main modules. A main module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see XQuery Library Modules and Main Modules.

When working with library modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Editor Eclipse plugin will request the server to validate the modules.

To validate library modules stored on a MarkLogic server, follow these steps:

1. Configure a MarkLogic database connection (on page 1479).
2. Expand the MarkLogic connection in the Data Source Explorer view (on page 1445) and open the library modules. The main module must also be opened from the Data Source Explorer view (on page 1445).
3. Configure a validation scenario (on page 488) for each library module. Specify the main module in the URL of the file to validate field.

**Result:** Validation is done on the server that contains the main module. The main module and all other library modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the Content Completion Assistant (on page 2133) and the Outline view (on page 689) should now present the functions from all the modules.

**Related Information:**
- Debugging with MarkLogic (on page 1481)
- Configuring a MarkLogic Database Connection (on page 1479)
Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a MarkLogic data source (on page 1479) and a MarkLogic connection (on page 1479).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor Eclipse plugin accesses. On the server side, debugging must be activated in the XDBC server and in the Task Server section of the server control console (the switch debug allow). If the debugging is not activated, the MarkLogic server reports a DBG-TASKDEBUGALLOW error.

Note: An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor Eclipse plugin uses to process XQuery expressions by selecting the Use it to execute queries action (on page 1485) from the contextual menu in the Data Source Explorer view (on page 1445).
3. Open the XQuery file and start the debugging process.
   • If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the Data Source Explorer view (on page 1445) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   • The MarkLogic XQuery debugger integrates seamlessly into the XQuery Debugger perspective (on page 192). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario (on page 1541) directly.
   • Otherwise, switch to the XQuery Debugger perspective (on page 2137), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar (on page 1526).

For general information about how a debugging session is started and controlled, see the Working with the Debugger (on page 1541) section.

Note: Before starting a debugging session, it is recommended that you link the MarkLogic connection with an Eclipse project. To do this, go to the Data Source Explorer view (on page 1445) and select Link to project in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add breakpoints (on page 1544) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse Navigator view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and breakpoints (on page 1543) to help identify problems. When you add a breakpoint (on page 1544) on a line where the debugger never stops, Oxygen XML Editor Eclipse plugin displays a warning message. These warnings are displayed for breakpoints you add either in the main XQuery (which you can open locally or from the server) or for breakpoints you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic (on page 1483).
Remote Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor Eclipse plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor Eclipse plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:** When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

[https://www.youtube.com/embed/eQ4ThDZq1bk](https://www.youtube.com/embed/eQ4ThDZq1bk)

**Related Information:**

- MarkLogic Development in Oxygen XML Editor Eclipse plugin *(on page 1480)*
- Configuring a MarkLogic Database Connection *(on page 1479)*

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place breakpoints *(on page 1543)* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.

To place breakpoints in the modules, use the following procedure:

1. In the Data Source Explorer view *(on page 1445)*, open all the modules from the Modules container of the XDBC application server *(on page 1480)* that performs the debugging.
2. Set breakpoints *(on page 1544)* in the module as needed.
3. Continue debugging *(on page 1541)* the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

- Check the Breakpoints view *(on page 1530)* and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.
Related Information:

- MarkLogic Database Connections (on page 1477)
- MarkLogic Development in Oxygen XML Editor Eclipse plugin (on page 1480)

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The Value column of the Variables view contains the expression from the variable declaration. It can be evaluated by copying the expression with the Copy value action from the contextual menu of the Variables view (on page 1539) and pasting it in the XWatch view (on page 1532).
- There is no support for output to source mapping (on page 1542).
- There is no support for showing the trace (on page 1536).
- You can only set breakpoints (on page 1530) in imported modules in one of the following cases:
  - When you open the module from the context of the application server involved in the debugging, using the Data Source Explorer view (on page 1445).
  - When the debugger automatically opens the modules in the Editor.
- No breakpoints (on page 1543) are set in modules from the same server that are not involved in the current debugging session.
- No support for profiling (on page 1544) when an XQuery transformation is executed in the debugger.

MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the Data Source Explorer view (on page 1445), the various nodes include the following contextual menu actions:

Connection Level Nodes

- **Configure Database Sources**
  
  Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

Disconnect

Stops the connection.

Link to Project

Links the connection to a project. This is helpful for MarkLogic debugging sessions (on page 1481).

Refresh
Performs a refresh on the selected node.

**Container Level Nodes**

**Enable Debug Mode**

Switches the server to a debugging mode. For more information, see MarkLogic debugging sessions *(on page 1481)*.

**Use it to Execute Queries**

The server will be used to process XQuery expressions against it.

**Refresh**

Performs a refresh on the selected node.

**Module or Folder Level Nodes**

**Export**

Allows you to export the folder on the remote connection to a local folder.

**Refresh**

Performs a refresh on the selected node.

**Requests Level Nodes**

**Refresh**

Performs a refresh on the selected node.

**Cancel all requests**

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire Requests container at the end of your sessions.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Copy location**
Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Refresh**

Performs a refresh on the selected node.

**Compare**

Compares two selected resources.

**Related Information:**
- Configuring a MarkLogic Database Connection *(on page 1479)*
- MarkLogic Development in Oxygen XML Editor Eclipse plugin *(on page 1480)*
- Debugging with MarkLogic *(on page 1481)*

**MySQL Database Connections**

Oxygen XML Editor Eclipse plugin includes support for MySQL database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a SQL Server database in the Data Source Explorer view *(on page 1445)*, open tables in the Table Explorer view *(on page 1447)*, and perform various operations on the resources in the repository.

**Configuring a MySQL Database Connection**

To configure the support for a MySQL database, follow this procedure:

1. Configure MySQL Data Source drivers *(on page 1486)*.
2. Configure a MySQL Connection. *(on page 1487)*
3. To view your connection, go to the Data Source Explorer view *(on page 1445)* (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective *(on page 2137)*.

**How to Configure MySQL Data Source Drivers**

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

To configure this data source, follow these steps:

1. Go to [https://www.oxygenxml.com/database_drivers.html](https://www.oxygenxml.com/database_drivers.html) and download the appropriate MySQL driver.
2. Open the Preferences dialog box *(on page 47)* and go to Data Sources.
3. Click the + New button in the Data Sources panel.

   The dialog box for configuring a data source is opened.
4. Enter a unique name for the data source.

5. Select Generic JDBC in the driver Type drop-down list.

6. Click the Add Files button and select the MySQL driver file that you downloaded.
   The driver file for the MySQL server is called mysql-com.jar.

7. Select the most appropriate Driver class.

8. Click the OK button to finish the data source configuration.

9. Continue on to configure your MySQL connection (on page 1487).

How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.

2. Click the + New button in the Connections panel.
   The dialog box for configuring a database connection is displayed.
3. Enter a unique name for the connection.

4. Select the MySQL data source in the Data Source drop-down list.

5. Enter the connection details.
   a. Enter the URL of the MySQL server.
   b. Enter the user name for the connection to the MySQL server.
   c. Enter the password for the connection to the MySQL server.

6. Click the OK button to finish the connection configuration.

7. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

**Generic JDBC Database Connections**

Oxygen XML Editor Eclipse plugin includes support for Generic JDBC database connections.

**Configuring a Generic JDBC Database Connection**

To configure the support for a generic JDBC database, follow this procedure:

1. Configure Generic JDBC Data Source drivers (on page 1489).
2. Configure a Generic JDBC Connection (on page 1489).
3. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Editor Eclipse plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor Eclipse plugin along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Data Sources panel.
3. Enter a unique name for the data source.
4. Select Generic JDBC in the driver Type drop-down list.
5. Add the driver file(s) using the Add Files button.
6. Select the most appropriate Driver class.
7. Click the OK button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection (on page 1489).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select the Generic JDBC data source in the Data Source drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the generic JDBC database, with the following format: jdbc: <subprotocol>:\<subname>.
   b. Enter the user name for the connection to the generic JDBC database.
   c. Enter the password for the connection to the generic JDBC database.
6. Click the OK button to finish the connection configuration.
7. To view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

JDBC-ODBC Database Connections

Oxygen XML Editor Eclipse plugin includes support for JDBC-ODBC database connections.
How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Editor Eclipse plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor Eclipse plugin along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the **Preferences** dialog box (on page 47) and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

3. Enter a unique name for the connection.

4. Select **JDBC-ODBC Bridge** in the **Data Source** drop-down list.

5. Enter the connection details.
   a. Enter the URL of the ODBC source.
   b. Enter the user name of the ODBC source.
   c. Enter the password of the ODBC source.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer view** (on page 1445) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2137).
BaseX Database Connections

Oxygen XML Editor Eclipse plugin includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a BaseX database in the Data Source Explorer view (on page 1445) and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named .basex and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.
2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: http://localhost:8984/webdav/TEST/etc/factbook.xml.
3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Editor Eclipse plugin as described in How to Configure a WebDAV Connection (on page 1495). The WebDAV URL should resemble this: http://{hostname}:{port}/webdav/. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
   - WebDAV URL: http://localhost:8984/webdav
   - User: admin
   - Password: admin
4. Once the WebDAV connection is created, to view your connection, go to the Data Source Explorer view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the Window > Show View menu) or switch to the Database perspective (on page 2137).

BaseX Contextual Menu Actions

While browsing BaseX connections in the Data Source Explorer view (on page 1445), the various nodes include the following contextual menu actions:

Connection Level Nodes

- Configure Database Sources
  
  Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

- Disconnect

  Stops the connection.

- New Folder
Creates a new folder on the connection.

**Import Files**

Allows you to add a new file on the connection, in the current folder.

**Refresh**

Performs a refresh on the selected node.

**Folder Level Nodes**

**New File**

Creates a new file on the connection, in the current folder.

**New Folder**

Creates a new folder on the connection.

**Import Folders**

Imports folders on the server.

**Import Files**

Allows you to add a new file on the connection, in the current folder.

**Export**

Allows you to export the folder on the remote connection to a local folder.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Paste**

Pastes the copied selection.

**Rename**

 Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**
When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

- **Cut**
  Removes the current selection and places it in the clipboard.

- **Copy**
  Copies the current selection into the clipboard.

- **Copy location**
  Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

- **Rename**
  Renames the current resource

- **Delete**
  Deletes the current container.

- **Refresh**
  Performs a refresh on the selected node.

- **Properties**
  Shows various properties of the current container.

- **Compare**
  Compares two selected resources.

### Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

**Important:** The XQJ connector is only capable of running XQuery 1.0 scripts, therefore XQuery 3.0 and 3.1 scripts are not supported.

### BaseX XQJ Data Source

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source (on page 1494). The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `basek-xqj-1.2.3.jar` (the version names of the JAR file may differ). These libraries can
be downloaded from [xqj.net/basex/basex-xqj-1.2.3.zip](xqj.net/basex/basex-xqj-1.2.3.zip). As an alternative, you can also find the libraries in the BaseX installation directory, in the `lib` sub-directory.

**BaseX XQJ Connection**

The next step is to create an XQJ connection *(on page 1495).*

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port:** 1984
- **serverName:** localhost
- **user:** admin
- **password:** admin

**XQuery Execution**

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Editor Eclipse plugin and create an XQuery Transformation *(on page 1068).* In the Transformer drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

**How to Configure an XQJ Data Source**

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to `PATH` - on Windows, to `LD_LIBRARY_PATH` - on Linux, or to `DYLD_LIBRARY_PATH` - on OS X. Restart Oxygen XML Editor Eclipse plugin after configuring the environment variables.

2. Open the Preferences dialog box *(on page 47)* and go to Data Sources.

3. Click the + New button in the Data Sources panel.

4. Enter a unique name for the data source.

5. Select XQuery API for Java (XQJ) in the Type combo box.

6. Click the Add button to add XQJ API-specific files.
   
   You can manage the driver files using the Add, Remove, Detect, and Stop buttons.
   
   Oxygen XML Editor Eclipse plugin detects any implementation of `javax.xml.xquery.XQDataSource` and presents it in Driver class field.

7. Select the most suited driver in the Driver class combo box.

8. Click the OK button to finish the data source configuration.
9. Continue on to configure the XQJ connection (on page 1495).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources (on page 1494) in the Data Source combo box.
5. Fill-in the connection details:
   - The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the OK button to finish the connection configuration.

WebDAV Connections

Oxygen XML Editor Eclipse plugin includes support for WebDAV server connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a WebDAV connection in the Data Source Explorer view (on page 1445) and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

By default, Oxygen XML Editor Eclipse plugin contains built-in data source drivers for WebDAV connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the Data Source Explorer view (on page 1445).

To configure a WebDAV connection, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. Click the + New button in the Connections panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the Data Source drop-down menu.
5. Enter the connection details:
   a. Set the URL to the WebDAV repository in the field WebDAV URL.
   b. Set the user name that is used to access the WebDAV repository in the User field.
   c. Set the password that is used to access the WebDAV repository in the Password field.
6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer** view (on page 1445) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2137). For more information about the WebDAV support in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

   https://www.youtube.com/embed/vDXO36CqbyM

### WebDAV Contextual Menu Actions

While browsing WebDAV connections in the **Data Source Explorer** view (on page 1445), the various nodes include the following contextual menu actions:

#### Connection Level Nodes

- **Configure Database Sources**  
  Opens the **Data Sources preferences page** (on page 51) where you can configure both data sources and connections.

- **Disconnect**  
  Stops the connection.

- **New Folder**  
  Creates a new folder on the connection.

- **Import Files**  
  Allows you to add a new file on the connection, in the current folder.

- **Refresh**  
  Performs a refresh on the selected node.

#### Folder Level Nodes

- **New File**  
  Creates a new file on the connection, in the current folder.

- **New Folder**  
  Creates a new folder on the connection.

- **Import Folders**  
  Imports folders on the server.

- **Import Files**  
  Allows you to add a new file on the connection, in the current folder.

- **Export**
Allows you to export the folder on the remote connection to a local folder.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Paste**

Pastes the copied selection.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Resource Level Nodes**

**Open**

Opens the selected resource in the editor.

**Open in System Application**

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Rename**

Renames the current resource
Delete
Delete the current container.

Refresh
Performs a refresh on the selected node.

Properties
Shows various properties of the current container.

Compare
Compares two selected resources.

SQL Execution Support
The database support in Oxygen XML Editor Eclipse plugin includes support for writing SQL statements, syntax highlighting, folding (on page 2134), and dragging and dropping from the Data Source Explorer view (on page 1445). It also includes transformation scenarios for executing the statements, and the results are displayed in the Table Explorer view (on page 1447).

Drag and Drop from Data Source Explorer View
Dragging operations from the Data Source Explorer view (on page 1445) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the Database Connection Support (on page 1449) section).

2. Browse to the table you will use in your statement.

3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.
4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- **SELECT `field1`, `field2`, ..., FROM `catalog` . `table`** (for example: `SELECT `DEPT`, `DEPTNAME`, `LOCATION` FROM `camera`.`cameraDesc` )
- **UPDATE `catalog` . `table` SET `field1` = , `field2` = , ...** (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` = , `DEPTNAME` = , `LOCATION` = )
- **INSERT INTO `catalog` . `table` ( `field1`, `field2`, ..., VALUES ( , )** (for example: `INSERT INTO `camera`.`cameraDesc` ( `DEPT`, `DEPTNAME`, `LOCATION`) VALUES ( , , )`)
- **DELETE FROM `catalog` . `table`** (for example: `DELETE FROM `camera`.`cameraDesc` )

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- **SELECT `field` FROM `catalog` . `table`** (for example: `SELECT `DEPT` FROM `camera`.`cameraDesc` )
- **UPDATE `catalog` . `table` SET `field` =** (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` = )
- **INSERT INTO `catalog` . `table` ( `field1` VALUES ()** (for example: `INSERT INTO `camera`.`cameraDesc` ( `DEPT`) VALUES ()`)
- **DELETE FROM `catalog` . `table`** (for example: `DELETE FROM `camera`.`cameraDesc` WHERE `DEPT` = )
SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a transformation scenario (on page 980) using the Configure Transformation Scenario(s) action from the toolbar or the XML menu.
   A SQL transformation scenario needs a database connection. You can configure a connection using the Preferences button from the SQL transformation dialog box.
   The dialog box contains the list of existing scenarios that apply to SQL documents.

2. Set parameter values for SQL placeholders using the Parameters button from the SQL transformation dialog box.
   For example, in `SELECT * FROM 'test'.'department' where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.
   When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

   ✗ Restriction: When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the Parameters button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.

3. Execute the SQL scenario by clicking the OK or Apply associated button.
   The result of a SQL transformation is displayed in a view (on page 281) at the bottom of the Oxygen XML Editor Eclipse plugin window.

4. View more complex return values of the SQL transformation in a separate editor panel.
   A more complex value returned by the SQL query (for example, an XMLTYPE or CLOB value) cannot be displayed entirely in the result table.
   a. Right-click the cell containing the complex value.
   b. Select the action Copy cell from the contextual menu.
      The action copies the value in the clipboard.
   c. Paste the value into an appropriate editor.
      For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Editor Eclipse plugin.
XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Editor Eclipse plugin offer XQuery support:

- **Native XML Databases**:
  - Berkeley DB XML
  - eXist
  - MarkLogic (validation support available starting with version 5)

- **Relational Databases**:
  - IBM DB2
  - Microsoft SQL Server (validation support not available)
  - Oracle (validation support not available)

**Related Information:**
- Editing XQuery Documents *(on page 686)*

**Build Queries with Drag and Drop from the Data Source Explorer View**

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer view (on page 1445)** and dropping them into the editor panel.

1. Configure the data source drivers *(on page 1449)* for the particular relational database in the Data Sources preferences page *(on page 51)*.
2. Configure the connection *(on page 1449)* for the particular relational database in the Data Sources preferences page *(on page 51)*.
3. Browse the connection in the Data Source Explorer view *(on page 1445)*, expanded to the table or column that you want to insert in the query.
4. Drag the table or column name to the XQuery editor panel.
5. Drop the table or column name where the XPath expression is needed.

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

**XQuery Validation When Connected to a Database**

With Oxygen XML Editor Eclipse plugin, you can validate your XQuery documents when connected to a database. When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor Eclipse plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.
XQuery Transformation for Databases

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

1. Configure the data source drivers and the connection (on page 1449) for the particular database.

2. Configure an XQuery transformation scenario.
   a. Click the
      Configure Transformation Scenario toolbar button or go to menu Document > Transformation > Configure Transformation Scenario.
      The Configure Transformation Scenario dialog box (on page 1078) is opened.
   b. Click the New button toward the bottom of the dialog box.
   c. Select XML Transformation with XQUERY (on page 1019).
      The New Scenario dialog box for configuring an XQuery scenario is opened.
d. Insert the scenario name in the dialog box for editing the scenario.

e. Choose the database connection in the Transformer drop-down list.

f. Configure any other parameters as needed.
   For an XQuery transformation, the output tab has an option called Sequence that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the Size limit on Sequence view option (on page 162) in the XQuery preferences page. If you choose Perform FO Processing in the FO Processor tab, the Sequence option is ignored.

g. Click the OK button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist and Berkeley DB XML, the Content Completion Assistant (on page 2133) lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query.

Note: An XQuery transformation is executed against a Berkeley DB XML server as a transaction using the query transaction support of the server.

3. Run the transformation scenario.
   To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Editor Eclipse plugin window (for example, an XMLTYPE or CLOB value), do the following:
   • Right-click that table cell.
   • Select the Copy cell action from the contextual menu to copy the value into the clipboard.
   • Paste the value wherever you need it (for example, in an open XQuery editor panel of Oxygen XML Editor Eclipse plugin).

Related Information:
   • XML Transformation with XQuery (on page 1019)
   • XQuery XQJ Transformation (on page 1503)

XQuery XQJ Transformation

XQuery API for Java (XQJ) refers to the common Java API for the XQuery 1.0 specification. The XQJ API enables you to execute XQuery against an XML data source.

Important: The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

Oxygen XML Editor Eclipse plugin supports any transformer that offers an XQJ API implementation and it be used for validating XQuery or transforming XML documents.
To configure the support for XQJ, do the following:

1. **Configure an XQJ Data Source (on page 1494).**
2. **Configure an XQJ Connection (on page 1495).**
3. To view your connection, go to the **Data Source Explorer view (on page 1445)** (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2137).**

**How to Configure an XQJ Data Source**

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is **Zorba.**

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on OS X. Restart Oxygen XML Editor Eclipse plugin after configuring the environment variables.

2. **Open the Preferences dialog box (on page 47) and go to Data Sources.**

3. Click the **New** button in the **Data Sources** panel.

4. Enter a unique name for the data source.

5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.

6. Click the **Add** button to add XQJ API-specific files.
   
   You can manage the driver files using the **Add, Remove, Detect, and Stop** buttons.
   
   Oxygen XML Editor Eclipse plugin detects any implementation of `javax.xml.xquery.XQDataSource` and presents it in **Driver class** field.

7. Select the most suited driver in the **Driver class** combo box.

8. Click the **OK** button to finish the data source configuration.

9. Continue on to **configure the XQJ connection (on page 1495).**

**How to Configure an XQJ Connection**

The steps for configuring an XQJ connection are the following:

1. **Open the Preferences dialog box (on page 47) and go to Data Sources.**

2. Click the **New** button in the **Connections** panel.

3. Enter a unique name for the connection.

4. Select one of the previously configured **XQJ data sources (on page 1494)** in the **Data Source** combo box.
5. Fill-in the connection details.
   The properties presented in the connection details table are automatically detected depending on the
   selected data source.

6. Click the **OK** button to finish the connection configuration.

### XQuery Database Debugging

Oxygen XML Editor Eclipse plugin includes a debugging interface that helps you to detect and solve problems
with XQuery transformations that are executed against MarkLogic and Berkeley DB XML databases.

For more information about the debugging support in Oxygen XML Editor Eclipse plugin, see [Debugging XSLT Stylesheets and XQuery Documents](on page 1524).

### Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin includes support for debugging XQuery transformations that are executed
against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a [MarkLogic data source](on page 1479) and a [MarkLogic connection](on page 1479).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor Eclipse
   plugin accesses. On the server side, debugging must be activated in the XDBC server and in the **Task Server**
   section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic
   server reports a **DBG-TASKDEBUGALLOW** error.

   **Note:** An XDBC application server must be running to connect to the MarkLogic server and this
   XDBC server will be used to process XQuery expressions against the server. You can change the XDBC
   application server that Oxygen XML Editor Eclipse plugin uses to process XQuery expressions by
   selecting the **Use it to execute queries** action ([on page 1485]) from the contextual menu in the **Data Source Explorer** view ([on page 1445]).

3. Open the XQuery file and start the debugging process.
   - If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the
     **Data Source Explorer** view ([on page 1445]) and open the file from the application server that is
     involved in the debugging process. This improves the resolving of any imported modules.
   - The MarkLogic XQuery debugger integrates seamlessly into the **XQuery Debugger perspective**
     ([on page 192]). If you have a MarkLogic validation scenario configured for the XQuery file, you can
     choose to debug the scenario ([on page 1541]) directly.
   - Otherwise, switch to the **XQuery Debugger perspective** ([on page 2137]), open the XQuery file in the
     editor, and select the MarkLogic connection in the XQuery engine selector from the **debug control toolbar**
     ([on page 1526]).

   For general information about how a debugging session is started and controlled, see the **Working with the Debugger** ([on page 1541]) section.
Note: Before starting a debugging session, it is recommended that you link the MarkLogic connection with an Eclipse project. To do this, go to the Data Source Explorer view (on page 1445) and select Link to project in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add breakpoints (on page 1544) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse Navigator view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and breakpoints (on page 1543) to help identify problems. When you add a breakpoint (on page 1544) on a line where the debugger never stops, Oxygen XML Editor Eclipse plugin displays a warning message. These warnings are displayed for breakpoints you add either in the main XQuery (which you can open locally or from the server) or for breakpoints you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic (on page 1483).

Remote Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor Eclipse plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor Eclipse plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

Important: When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

https://www.youtube.com/embed/eQ4ThDZq1bk

- MarkLogic Development in Oxygen XML Editor Eclipse plugin (on page 1480)
- Configuring a MarkLogic Database Connection (on page 1479)

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place breakpoints (on page 1543) in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the breakpoints in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.
To place breakpoints in the modules, use the following procedure:

1. In the Data Source Explorer view (on page 1445), open all the modules from the Modules container of the XDBC application server (on page 1480) that performs the debugging.
2. Set breakpoints (on page 1544) in the module as needed.
3. Continue debugging (on page 1541) the query.

If you get a warning that the breakpoints failed to initialize, try the following solutions:

• Check the Breakpoints view (on page 1530) and make sure there are no older breakpoints (set on resources that are not part of the current debugging context).
• Make sure you open the modules from the context of the application server that does the debugging and place breakpoints there.

Related Information:
- MarkLogic Database Connections (on page 1477)
- MarkLogic Development in Oxygen XML Editor Eclipse plugin (on page 1480)

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

• Debugging support is only available for MarkLogic server versions 4.0 or newer.
• For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
• All declared variables are presented as strings. The Value column of the Variables view contains the expression from the variable declaration. It can be evaluated by copying the expression with the Copy value action from the contextual menu of the Variables view (on page 1539) and pasting it in the XWatch view (on page 1532).
• There is no support for output to source mapping (on page 1542).
• There is no support for showing the trace (on page 1536).
• You can only set breakpoints (on page 1530) in imported modules in one of the following cases:
  ◦ When you open the module from the context of the application server involved in the debugging, using the Data Source Explorer view (on page 1445).
  ◦ When the debugger automatically opens the modules in the Editor.
• No breakpoints (on page 1543) are set in modules from the same server that are not involved in the current debugging session.
• No support for profiling (on page 1544) when an XQuery transformation is executed in the debugger.
Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor Eclipse plugin XQuery Debugger. The same restrictions and peculiarities (on page 1484) apply for the Berkeley debugger as for the MarkLogic debugger.

Integration with Microsoft SharePoint

Oxygen XML Editor Eclipse plugin provides support for browsing and managing SharePoint connections in the Data Source Explorer view (on page 1445). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

⚠️ Note: You can access documents stored on SharePoint Online for Office 365 sites that use either Cloud identity (default) or Federated identity (ADFS) as the authentication method.

🚫 Restriction: The SharePoint connection is only available in the Enterprise edition of Oxygen XML Editor Eclipse plugin.

Related Information:

- Working with Databases (on page 1445)
How to Configure a SharePoint Connection

By default, Oxygen XML Editor Eclipse plugin contains built-in data source drivers for SharePoint. Use this data source to create a connection to a SharePoint server that will be available in the Data Source Explorer view (on page 1445).

To configure a SharePoint connection, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Data Sources.
2. In the Connections panel click the New button.
3. Enter a unique name for the connection.
4. Select SharePoint in the Data Source combo box.
5. Fill-in the connection details:
   a. Set the URL to the SharePoint repository in the field SharePoint URL.
   b. Set the server domain in the Domain field. If you are using a SharePoint 365 account, leave this field empty.
   c. Set the user name to access the SharePoint repository in the User field.
   d. Set the password to access the SharePoint repository in the Password field.

SharePoint Contextual Menu Actions

While browsing SharePoint connections in the Data Source Explorer view (on page 1445), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the Data Sources preferences page (on page 51) where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.
New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the Data Source Explorer view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.
**Copy**

Copies the current selection into the clipboard.

**Copy location**

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

**Check Out**

Checks out the selected document on the server.

**Check In**

Checks in the selected document on the server. This action opens the **Check In** dialog box. In this dialog box, the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to comment on a file that you check in.

**Discard Check Out**

Discards the previous checkout operation, making the file available for editing to other users.

**Rename**

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

**Compare**

Compares two selected resources.
15. Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Editor Eclipse plugin offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features (on page 980).

Figure 444. Import Wizards of the Oxygen XML Editor Eclipse plugin Plugin

Import from Text Files

Oxygen XML Editor Eclipse plugin includes the possibility of importing text files (txt or csv file extensions) as XML documents.

To import a text file into an XML file, follow these steps:

1. Go to File > Import > Oxygen XML Editor Eclipse plugin > Text File and click Next. A Select text file dialog box is displayed.

2. Select the URL of the text file (txt or csv file extensions).
3. Select the encoding of the text file.

4. Click the **Next** button.
   The **Import from text file** dialog box is displayed.

   **Figure 445. Import from Text File Dialog Box**

5. Configure the settings for the conversion.
   a. Select the **Field delimiter** for the import settings. You can choose between the following: *Comma*, *Semicolon*, *Tab*, *Space*, or *Pipe*.
   b. The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (**<** symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (**=A** symbol). Clicking a second time causes the column data to be ignored (**X** symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   c. **First row contains field names** - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
d. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following options in the drop-down menu: **ELEMENT**, **ATTRIBUTE**, or **SKIPPED**.

e. **Import Settings** - Clicking this button opens the **Import preferences page (on page 141)** that allows you to configure more import options.

f. The **XML Import Preview** panel contains an example of what the generated XML document looks like.

g. **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Finish** to generate the XML document.

---

**Import from MS Excel Files**

Oxygen XML Editor Eclipse plugin provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Editor Eclipse plugin **Smart Paste mechanism (on page 330)** by simply copying data from Excel and pasting it into a document in **Author** mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in **Grid** mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Editor Eclipse plugin also offers a configurable import wizard that works with any type of XML document.

**Smart Paste Method in Author Mode**

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in **Author** mode.

The Oxygen XML Editor Eclipse plugin **Smart Paste mechanism (on page 330)** will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

**Grid Mode Method**

The **Grid** mode in Oxygen XML Editor Eclipse plugin displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to **Grid** mode in Oxygen XML Editor Eclipse plugin.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select Insert row or Insert column, depending on the structure of the copied cells.

5. Paste the copied cells from the clipboard into the newly inserted cells in Grid mode.

6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Editor Eclipse plugin might ignore that cell.

Import Wizard Method

By default, this method supports importing Excel 97/2000/XP/2003 formats out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See Import Data from MS Excel 2007 or Newer (on page 1517) for instructions on adding more libraries.

To use the Import wizard to import an Excel file into an XML file, follow these steps:

1. Go to File > Import > Oxygen XML Editor Eclipse plugin > MS Excel file.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the Available Sheets section of this dialog box.
3. Click the Next button to proceed to the next stage of the wizard.

Figure 446. Import Wizard

4. Configure the settings for the conversion. This stage of the wizard offers the following options:
Import settings section

Presents the input data in a tabular form. By default, all data items are converted to element content ( symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( symbol). Clicking a second time causes the column data to be ignored ( symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

First row contains field names

If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

Customize

This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: ELEMENT, ATTRIBUTE, or SKIPPED.

Import Settings

Clicking this button opens the Import preferences page (on page 141) that allows you to configure more import options.

Import formatted data (as displayed in Excel)

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

XML Import Preview panel

Contains an example of what the generated XML document will look like.

Save in file

If selected, the new XML document is saved in the specified path.

5. Click Finish to generate the XML document.

For more information about exchanging data between Oxygen XML Editor Eclipse plugin and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

Related Information:

- Exporting XML Content to Excel (on page 309)
Import Data from MS Excel 2007 or Newer

To import spreadsheet data from Excel 2007 or newer (.xlsx), Oxygen XML Editor Eclipse plugin needs additional libraries from the release 3.10 of the Apache POI project.

Manually Add the Libraries

To manually add the libraries, follow these steps:

   The specific ZIP file that you need is: poi-bin-3.10-FINAL-20140208.zip.

3. Copy the following .jar files into the plugin.xml file of the Oxygen XML Editor Eclipse plugin Eclipse plugin (if you installed the plugin via the Eclipse update site, you will find it in the eclipse/plugins/com.oxygenxml... folder, and if you installed it via the dropins ZIP distribution, it is located in the eclipse/dropins/plugins/com.oxygenxml... folder):
   • dom4j-1.6.1.jar
   • poi-ooxml-3.10-FINAL-20140208.jar
   • poi-ooxml-schemas-3.10-FINAL-20140208.jar
   • xmlbeans-2.3.0.jar

   **Note:** The .jar files can be found in either the root folder where you unpacked the archive, or in the ooxml-lib subfolder.

Result: You can now use the Import wizard (on page 1515) to import data from Excel 2007 or newer.

Related Information:

- Exporting XML Content to Excel (on page 309)

Import Database Data as an XML Document

To import the data from a relational database table as an XML document, follow these steps:

1. Go to File > Import > Oxygen / Database Data and click Next to start the Import wizard.
   This opens a Select database table dialog box that lists all the defined database connections:
2. Select the connection to the database that contains the appropriate data. Only connections configured in relational data sources can be used to import data.

3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button. The **Preferences/Data Sources** option page is opened.

4. Click **Connect**.

5. In the list of sources, expand a schema and choose the required table.

6. Click the **Next** button. The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.
7. Configure the settings for the conversion.

   a. **SQL Preview** - If this button is pressed, the Import settings pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content ( symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values ( symbol). Clicking a second time causes the column data to be ignored ( symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

   b. **Customize** - This button opens a Presentation Names dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: **ELEMENT**, **ATTRIBUTE**, or **SKIPPED**.

   c. **Import Settings** - Clicking this button opens the Import preferences page (on page 141) that allows you to configure more import options.
d. The **XML Import Preview** panel contains an example of what the generated XML document looks like.

e. **Save in file** - If selected, the new XML document is saved in the specified path.

f. **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.

8. Click **Finish** to generate the XML document.

---

**Import from HTML Files**

Oxygen XML Editor Eclipse plugin offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in **Author** mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Editor Eclipse plugin also offers a configurable import wizard that works with any type of XML document.

**Smart Paste Method**

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in **Author** mode.

The Oxygen XML Editor Eclipse plugin **Smart Paste mechanism (on page 330)** will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

**Import Wizard Method**

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File > Import > Oxygen XML Editor Eclipse plugin > HTML File**. The **Import HTML** wizard is displayed.
2. Select a parent folder and file name for the resulting XHTML document.
3. Enter the URL of the HTML document.
4. Select the type of the resulting XHTML document:
   - XHTML5
   - XHTML 1.0 Transitional
   - XHTML 1.0 Strict
5. Click the **Finish** button.

**Result:** The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.
Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Editor Eclipse plugin also provides special support for a convert protocol that can be used to chain predefined processors to dynamically import content from various sources.

A dynamic conversion URL chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (excel) on a target identified by the identifier (urn:files:sample.xls) and converts the Excel™ resource to XML. The second applied processor (xslt) applies an XSLT stylesheet identified using the identifier (urn:processors:excel2d.xsl) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an XML catalog that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the `/` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the XML Catalog (on page 2139) support in the application. In the example above, the urn:files:sample.xls target resource is resolved via the XML catalog.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a DITA map (on page 2134) with a `<topicref>` such as:

```
<topicref href="convert:/.../processor=excel!/resources/sample.xls"/>
```

the resources/sample.xls path will be resolved relative to the DITA map location.

This type of URL can be opened in the application by using the Open URL action from the File menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a DITA map.

A GitHub project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Editor Eclipse plugin. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the XML catalog mapping.

The following predefined conversion processors are included:
• **xslt** Processor - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xslt;ss=urn:processors:convert.xsl;pl=v1!/urn:files:sample.xml
  ```

• **xquery** Processor - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xquery;ss=urn:processors:convert.xquery;pl=v1!/urn:files:sample.xml
  ```

• **excel** Processor - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

  ```
  convert:/processor=excel;sn=test!/urn:files:sample.xls
  ```

• **java** Processor - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of JAR (on page 2135) libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

  ```
  public void convert(String systemID, String originalSourceSystemID, InputStream is, OutputStream os, LinkedHashMap<String, String> properties) throws IOException
  ```

  ```
  convert:/processor=java;jars=libs;ccn=test.JavaToXML!/urn:files:java/WSEditorBase.java
  ```

• **js** Processor - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

  ```
  convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
  ```

• **json** Processor - Converts a JSON input to XML. It has no parameters.

  ```
  convert:/processor=json!/urn:files:personal.json
  ```

• **xhtml** Processor - Converts HTML content to well-formed XHTML. It has no parameters.

  ```
  convert:/processor=xhtml!/urn:files:test.html
  ```

• **wrap** Processor - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

  ```
  convert:/processor=wrap!/urn:files:test.csv
  ```
- cache Processor - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (File > CReload (F5)) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;...!/urn:files:test.csv
```

Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow round-tripping content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the h2d.xsl stylesheet and converts DITA to HTML when the content is saved in the application using the d2h.xsl stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```

Important: If you are publishing a DITA map that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter fix.external.refs.com.oxygenxml to true. This will instruct Oxygen XML Editor Eclipse plugin to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the Libraries button in the Advanced tab of the transformation scenario.

Related Information:

- https://github.com/oxygenxml/dita-glass
16. Debugging XSLT Stylesheets and XQuery Documents

Oxygen XML Editor Eclipse plugin includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

XSLT Debugger Perspective
The XSLT Debugger perspective (on page 2137) allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this perspective, select Window > Open Perspective > Other > Oxygen XSLT Debugger.

XQuery Debugger Perspective
The XQuery Debugger perspective (on page 2137) allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this perspective, select Window > Open Perspective > Other > Oxygen XQuery Debugger.

XSLT/XQuery Debugging Overview
The XSLT Debugger and XQuery Debugger perspectives (on page 2137) allows you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 9.9.1.5 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 9.9.1.5 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
- Output to source mapping between every line of output and the instruction element / source context that generated it.
- Breakpoints (on page 1543) on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.
- Available templates and hits count.
• Variables view.
• Dynamic output generation.

For even more information, watch our video demonstration:

https://www.youtube.com/embed/m9d8c4V-LJw

**Debugger Layout**

The XML and XSL files are displayed in **Text mode (on page 254)**. The other modes (**Author mode (on page 197), Grid mode (on page 196)**) are available only in the **Editor perspective (on page 189)**.

The **XSLT/XQuery Debugger perspective (on page 2137)** contains the following components:

• **Source Document View (XML)** - Displays and allows the editing of XML files (documents).
• **XSLT/XQuery Document View (XSLT/XQuery)** - Displays and allows the editing of XSL files (stylesheets) or XQuery documents.
• **Output View** - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed (using the ➔ Run button on the Control toolbar (on page 1528)). Several actions are available in the contextual menu for this view, including Find/Replace, Copy, and Format and Indent. There are two types of output views: a text-based Output view (with XML syntax highlights) and HTML view.
• **Control Toolbar (on page 1526)** - Contains a variety of actions to help you configure and control the debugging process.
• **Information Views (on page 1529)** - The information views at the bottom of the editor display various types of information to help you understand the transformation process.

**Tip:** The Output view and the various other information views are dockable (on page 2133) so that you can configure the workspace according to your preferences.
XML documents and XSL stylesheets or XQuery documents that were opened in the Editor perspective (on page 2137) are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system that you are used to in the Editor perspective. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the Editor perspective.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

Related Information:

- Steps in a Typical Debugging Process (on page 1541)
- Identify the XSLT / XQuery Expression that Generated Particular Output (on page 1542)
- Supported Processors for XSLT / XQuery Debugging (on page 1549)
- Performance Profiling of XSLT Stylesheets and XQuery Documents (on page 1544)

Control Toolbar

The Control toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.
XML source selector

The current selection represents the source document used as input by the transformation engine. The selection list contains all open files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value \texttt{NONE}, because usually XQuery documents do not require an input source.

XSL / XQuery selector

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all open files (XSLT / XQuery files being emphasized).

Link with editor

When selected, the XML and XSLT/XQuery selectors display the names of the files open in the central editor panels. This button is toggled off by default.

Output selector

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the \textit{Insert Editor Variables (on page 176)} button, or the \textit{Browse} button.

Configure parameters

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

Edit extensions

Allows you to add and remove the Java classes and \textit{JARS (on page 2135)} used as XSLT extensions.

Turn on/off profiling

Enables / Disables current transformation profiling.

Enable XHTML output

Enables the rendering of the output in the \textit{HTML output view (on page 1525)} during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the \textit{Text output} area to a file and use an external browser for viewing.

When starting a debug session from the \textit{Editor perspective (on page 2137)} by using the \textit{Debug Scenario} action, the state of this toolbar button reflects the state of the \textit{Show as XHTML} output option from the scenario.

Turn on/off output to source mapping
Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

**Debugger preferences**
Quick link to Debugger preferences page (on page 160).

**XSLT / XQuery engine selector**
Lists the processors available for debugging XSLT and XQuery transformations (on page 1549).

**XSLT / XQuery engine advanced options**
If Saxon HE/PE/EE is selected, you can click this button to open the Advanced Saxon Transformation Options page (on page 1007).

**Step into F7**
Starts the debugging process and runs until the next instruction is encountered.

**Step over F8 (Alt + F8 on OS X)**
Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

**Step out Shift + F7 (Command + F8 on OS X)**
Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

**Run Shift + F5**
Starts the debugging process. The execution of the process is paused when a breakpoint (on page 1530) is encountered or the transformation ends.

**Run to cursor Ctrl + F5**
Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid breakpoint (on page 1543) is reached or the execution ends.

**Run to end Alt + F5**
Runs the transformation until the end, without taking into account enabled breakpoints (on page 1543), if any.

**Pause Shift + F6**
Request to pause the current transformation as soon as possible.

**Stop F6**
Request to stop the current transformation without completing its execution.

**Show current execution nodes**
Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:
• Entering (→) or leaving (←) an XML execution node.

• Entering (→) or leaving (←) an XSL execution node.

• Entering (→) or leaving (←) an XPath execution node.

Note: When you set a MarkLogic server as a processor, the Show current execution nodes button is named Refresh current session context from server. Click this button to refresh the information in all the views.

Note: For some of the XSLT processors (Saxon-HE/PE/EE) the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: Step into, Step over or Step Out.

Related Information:

- Advanced Saxon HE/PE/EE XQuery Transformation Options (on page 1022)

Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified.

The information types include the following:

Left side information views

- Breakpoints view (on page 1530)
- XWatch view (on page 1532)
- Context view (on page 1531)
- Messages view (on page 1533) (XSLT only)
- Variables view (on page 1539)
- Invocation Tree view (on page 1546)

Right side information views

- Stack view (on page 1533)
- Output Mapping Stack view (on page 1534)
- Trace view (on page 1536)
- Templates view (on page 1537) (XSLT only)
- Nodes/Values Set view (on page 1538)
- Hotspots view (on page 1547)
Tip: The information views are dockable (on page 2133) so that you can configure the workspace according to your preferences.

Breakpoints View

The Breakpoints view lists all breakpoints (on page 1543) that are set on open documents. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu. Breakpoints can be inserted (on page 1544) in the XML source document or the XSLT/XQuery document in debugging sessions.

Once you insert a breakpoint, it is automatically added to the list in the Breakpoints view and you can edit its associated condition. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as true.

Figure 451. Breakpoints View

The Breakpoints view contains the following columns:

- **Enabled** - If selected, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the breakpoint is set.
- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the breakpoint line in the document.

Note: The breakpoints list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

- **Go to**
  
  Moves the cursor to the source of the breakpoint.

- **Run to Breakpoint**
  
  Runs the debugger up to the point of this particular breakpoint and ignores the others (regardless of whether they were previously enabled or disabled).

- **Enable**
Enables the *breakpoint*.

**Disable**

Disables the *breakpoint*. A disabled *breakpoint* will not be evaluated by the Debugger.

**Add**

Allows you to add a new *breakpoint* and *breakpoint condition*.

**Edit**

Allows you to edit an existing *breakpoint*.

**Remove**

Deletes the selected *breakpoint*.

**Enable all**

Enables all *breakpoints*.

**Disable all**

Disables all *breakpoints*.

**Remove all**

Removes all *breakpoints*.

**Related Information:**

- *Using Breakpoints* (on page 1543)

**Context View**

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating `.` (dot) XPath expression in *XWatch* view (on page 1532). The value of the context node is presented as a tree in the *Context* view. If the view is not displayed, it can be opened by selecting it from the *Window > Show View* menu.

**Figure 452. Context node view**
The context nodes are presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

**XPath Watch (XWatch) View**

The **XWatch** view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the **Expression** column, Oxygen XML Editor Eclipse plugin supports you with syntax highlight and content completion assistance (*on page 571*).

![Figure 453. XPath Watch View](image)

**Table 40. XWatch columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression</td>
<td>XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).</td>
</tr>
<tr>
<td>Value</td>
<td>Result of XPath expression evaluation. Value has a type (see the possible values (<em>on page 1539</em>) in the Variables View (<em>on page 1539</em>)) section. For Node Set results, the number of nodes in the set is shown in parenthesis.</td>
</tr>
</tbody>
</table>

**Important:** Notes about working with the **XWatch** view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the **Expression** column and start typing.
- To delete an expression, click its **Expression** column and delete its content.
- If the expression result type is a **Node Set**, click its **Value** column and its value is displayed in the **Nodes/Values Set** view (*on page 1538*).
Messages View

Using an `xsl:message` instruction is one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The Messages view is available only for XSLT debugging sessions and shows all `xsl:message` calls executed by the XSLT processor during transformation. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

![Message View](image)

**Figure 454. Messages View**

<table>
<thead>
<tr>
<th>Message</th>
<th>Terminate</th>
<th>Resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message 1</td>
<td>no</td>
<td>personal.xsl [line 8]</td>
</tr>
<tr>
<td>Message 2</td>
<td>no</td>
<td>personal.xsl [line 12]</td>
</tr>
<tr>
<td>Message 3</td>
<td>no</td>
<td>personal.xsl [line 29]</td>
</tr>
</tbody>
</table>

**Table 41. Messages columns**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>Message content.</td>
</tr>
<tr>
<td>Terminate</td>
<td>Signals whether or not the processor terminates the transformation once it encounters the message (yes/no respectively).</td>
</tr>
<tr>
<td>Resource</td>
<td>Resource file where <code>xsl:message</code> instruction is defined and the message line number.</td>
</tr>
</tbody>
</table>

The following actions are available in the contextual menu:

**Go to**

Highlight the XSL fragment that generated the message.

**Copy**

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

**Clear all**

Removes all messages from the view.

**Important:**

- Clicking a record from the table highlights the `xsl:message` declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.
Stack View

The Stack view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

During the transformation, two stacks are managed. One for source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Editor Eclipse plugin shows both node types in one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

![Stack View](image)

The contextual menu contains one action: Go to, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

<table>
<thead>
<tr>
<th>Table 42. Stack Columns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Column</strong></td>
</tr>
<tr>
<td>#</td>
</tr>
<tr>
<td>XML/XSLT/XQuery Node</td>
</tr>
<tr>
<td>Attributes</td>
</tr>
<tr>
<td>Resource</td>
</tr>
</tbody>
</table>

**Important:** Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.
Output Mapping Stack View

The Output Mapping Stack view displays context data (on page 1542) and presents the XSLT templates/XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 456. Output Mapping Stack view

The Go to action of the contextual menu takes you to the line that contains the XSLT element displayed in the Output Mapping Stack view.

Table 43. Output Mapping Stack Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.</td>
</tr>
<tr>
<td>XSL/XQuery Node</td>
<td>The name of an XSLT template/XQuery element that participated in the generation of the selected output area.</td>
</tr>
<tr>
<td>Attributes</td>
<td>The attributes of the XSLT template/XQuery node.</td>
</tr>
<tr>
<td>Resource</td>
<td>The name of the file containing the XSLT template/XQuery element.</td>
</tr>
</tbody>
</table>

Important: Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in XSLT rules.

Related Information:

- Identify the XSLT / XQuery Expression that Generated Particular Output (on page 1542)
• Stack View (on page 1533)
• Trace View (on page 1536)
• Templates View (on page 1537)

Trace View

Usually, the XSLT/XQuery processors signal the following events during transformation:

- Entering a source (XML) node.
- Leaving a source (XML) node.
- Entering an XSLT/XQuery node.
- Leaving an XSLT/XQuery node.

The Trace view catches all of these events, so you can see how the process evolved. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document (using the Export to XML action in the contextual menu). Thus, you have the possibility of comparing the trace results from multiple debug sessions.

Figure 457. Trace History View

The contextual menu contains the following actions:

Go to

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

Export to XML

Saves the entire trace list in XML format.

Table 44. Trace History Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth</td>
<td>Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.</td>
</tr>
</tbody>
</table>
## XML/XSLT/XQuery Node

Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as \#document. Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).

### Attributes

Attributes of the node (a list of id="value" pairs).

### Resource

Resource file where the node is located.

### Important: Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

### Templates View

The `xsl:template` is the basic element for stylesheets transformation. The Templates view is only available during XSLT debugging sessions and shows all `xsl:template` instructions used by the transformation. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Being able to see the number of hits for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

**Figure 458. Templates view**

![Templates view](image)

The contextual menu contains one action: Go to, which moves the selection in the editor panel to the line that contains the XSLT template displayed on the selected line from the view.

### Table 45. Templates columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Match</td>
<td>The <code>match</code> attribute of the <code>xsl:template</code>.</td>
</tr>
<tr>
<td>Hits</td>
<td>The number of hits for the <code>xsl:template</code>. Shows how many times the XSLT processor used this particular template.</td>
</tr>
</tbody>
</table>
### Table of Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority</td>
<td>The template priority as established by XSLT processor.</td>
</tr>
<tr>
<td>Mode</td>
<td>The <em>mode</em> attribute of the <em>xsl:template</em>.</td>
</tr>
<tr>
<td>Name</td>
<td>The <em>name</em> attribute of the <em>xsl:template</em>.</td>
</tr>
<tr>
<td>Resource</td>
<td>The resource file where the template is located.</td>
</tr>
</tbody>
</table>

**Important:** Remarks:

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

### Nodes/Values Set View

The **Nodes/Values Set** view is always used in relation with the [Variables view](#) and [XWatch view](#). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. It shows an XSLT node set value in a tree form. This view is updated as a response to the following events:

- You click a variable that has a node set value in the [Variables](#) or [XWatch view](#).
- You click a tree fragment in the [Variables](#) or [XWatch view](#).
- You click an XPath expression evaluated to a node set in the [Variables](#) or [XWatch view](#).

**Figure 459. Node Set view**
The nodes / values set is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

**Important**: Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (…) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

**Variables View**

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Editor Eclipse plugin uses the following icons to differentiate variables and parameters:

- **v** - Global variable.
- **{v}** - Local variable.
- **P** - Global parameter.
- **{p}** - Local parameter.

The following value types are available:

- Boolean
- String
- Date - XSLT 2.0 / 3.0 only.
- Number
- Set
- Object
- Fragment - Tree fragment.
- Any
- Undefined - The value was not yet set, or it is not accessible.

**Note:**

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

- If the variable is not used, the **Value** field displays "The variable is declared but never used".
- If the variable value cannot be evaluated, the **Value** field displays "The variable value is unavailable".

- Document
- Element
• Attribute
• ProcessingInstruction
• Comment
• Text
• Namespace
• Evaluating - Value under evaluation.
• Not Known - Unknown types.

Figure 460. Variables View

Table 46. Variables Columns

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of variable / parameter.</td>
</tr>
<tr>
<td>Value Type</td>
<td>Type of variable/parameter.</td>
</tr>
<tr>
<td>Value</td>
<td>Current value of variable / parameter.</td>
</tr>
</tbody>
</table>

The value of a variable (the **Value** column) can be copied to the clipboard for pasting it to other editor areas with the **Copy value** action from the contextual menu. This is useful if you have long and complex values that cannot be easily remembered just by looking at them once.

**Important:** Remarks:

• Local variables and parameters are the first entries presented in the table.
• Clicking a record highlights the variable definition line.
• Variable values could differ depending on the transformation engine used or stylesheet version set.
• If the value of the variable is a node set or a tree fragment, clicking it causes the **Node Set view (on page 1538)** to be shown with the corresponding set of values.
• Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

**Multiple Output Documents in XSLT 2.0 and XSLT 3.0**

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed dynamically while the transformation is
running in an output view. There is one tab for each `xsl:result-document` instruction in the Result Documents view so that the output is not mixed while still being presented in multiple views.

**Steps in a Typical Debugging Process**

Depending on your situation and needs, the debugging process might be more complex, but the following procedure is an example of a typical debugging process:

1. Open the source XML document and the XSLT/XQuery document.

2. If you are in the Editor perspective (on page 2137), switch to the XSLT Debugger or XQuery Debugger perspective (on page 2137) with one of the following actions:
   - Select Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger.
   - Select the Debug scenario action on the toolbar. This action initializes the Debugger perspective (on page 2137) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.

3. Select the source XML document in the XML source selector of the Control toolbar (on page 1527). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to NONE.

4. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar (on page 1527).

5. Set XSLT/XQuery parameters using the Configure parameters button on the Control toolbar (on page 1527).

6. Set one or more breakpoints (on page 1543).

7. Step through the stylesheet using the following buttons available on the Control toolbar (on page 1528):
   - ⏯ Step into
   - ⏯ Step over
   - ⏯ Step out
   - ➤ Run
   - ⏎ Run to cursor
   - ⏎ Run to end
   - ⏯ Pause
   - ⏯ Stop

8. Examine the data in the information views to find the bug in the transformation process.
   For more information about fixing bugs in the transformation, see: *Identify the XSLT / XQuery Expression that Generated Particular Output* (on page 1542).
Identify the XSLT / XQuery Expression that Generated Particular Output

To quickly spot the XSLT templates or XQuery expressions with problems, it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, Step in) can be used for this purpose. Using Step in, you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click particular text in the Output view and the editor will select the XML source context and the XSLT template/XQuery element that generated that text. Also, inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

This is an example of a typical procedure for identifying an expression that generated particular output:

1. Switch to the XSLT Debugger or XQuery Debugger perspective (on page 2137) with one of the following actions:
   - Select Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger.
   - Select the Debug scenario action on the toolbar. This action initializes the Debugger perspective (on page 2137) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.

2. Select the source XML document in the XML source selector of the Control toolbar (on page 1527). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to NONE.

3. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar (on page 1527).

4. Select the appropriate engine in the XSLT/XQuery engine selector of the Control toolbar (on page 1528).

5. Set XSLT/XQuery parameters using the Configure parameters button on the Control toolbar (on page 1527).

6. Apply the XSLT stylesheet or XQuery transformation using the Run to end button that is available on the Control toolbar (on page 1528).

7. Inspect the mapping by clicking a section of the output in the Output view.
This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/ XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations, inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the Output Mapping Stack view (on page 1534).

Related Information:

- Output Mapping Stack View (on page 1534)
- Trace View (on page 1536)
- Templates View (on page 1537)

Using Breakpoints

The Oxygen XML Editor Eclipse plugin XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure breakpoints are persistent between work sessions, they are saved at project level. You can set a maximum of 100 breakpoints per project.
Inserting Breakpoints

To insert a breakpoint, follow these steps:

1. Click the line where you want to insert the breakpoint in the XML source document or the XSLT/XQuery document. Breakpoints are automatically created on the ending line of a start tag, even if you click a different line.
2. Right-click the vertical stripe on the left side of the editor panel and select Add breakpoint.

Result:

Once you insert a breakpoint, it is automatically added to the list in the Breakpoints view and you can edit its associated condition. A breakpoint can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A breakpoint with an associated condition only stops the execution of the Debugger if the breakpoint condition is evaluated as true.

Figure 462. Example: Breakpoints

| 4 | <title></title> |
| 5 | </body> |
| 7 | <p></p> |
| 8 | <table frame="all" rowsep="1" |
| 8 | <title>test</title> |
| 9 | <group cols="2"> |

Tip: You can configure the color and how breakpoints are shown from the Eclipse Annotations preferences page (Window ('Eclipse' on Mac OSX) > Preferences > General > Editors > Text Editors > Annotations).

Removing Breakpoints

To remove a breakpoint, Right-click the breakpoint icon ( ● ) in the vertical stripe on the left side of the editor panel and select Remove breakpoint.

Related Information:

- Breakpoints View (on page 1530)

Performance Profiling of XSLT Stylesheets and XQuery Documents

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processor that can be used for debugging and it is available from the debugging perspective (on page 2137).
Enabling the Profiler

Enabling and disabling the profiler is controlled by the Profiler button from the debugger Control toolbar (on page 1527). The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you need to set it before starting the transformation. For information about a common debugging procedure, see Steps in a Typical Debugging Process (on page 1541).

Profiling Information Views

Immediately after enabling the profiler, two new information views are added to the current debugger information views (on page 1529):

- Invocation tree view (on page 1546) on left side
- Hotspots view (on page 1547) on right side

Profiling data is available only after the transformation ends successfully.

On the left side (Invocation tree view (on page 1546)), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

On the right side (Hotspots view (on page 1547)), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions, the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

Source Backmapping

In either the Invocation tree (on page 1546) or Hotspots view (on page 1547), you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item causes Oxygen XML Editor Eclipse plugin to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

Figure 463. Source Backmapping

Saving and Customizing Profiling Data

The profiling data can be saved (exported) into XML and HTML format. In either the Invocation tree (on page 1546) or Hotspots view (on page 1547), right-click anywhere in the view and select Export to XML or
Export to HTML. The HTML report can be customized based upon the profiling raw data. When you select Export to HTML, Oxygen XML Editor Eclipse plugin will save it as XML and apply an XSLT stylesheet to render the report as XML. You can customize these stylesheets to suit your needs. By default, they are located in: 

\{OXYGEN_INSTALL_DIR\}/frameworks/profiler/.

Other Profiling Notes

- If you want to change the XSLT/XQuery profiler settings (on page 160), use the contextual menu and choose the corresponding View settings entry.
- Profiling exhaustive transformations may run into an OutOfMemory error due to the large amount of information being collected. If this is the case, you can close unused projects when running the profiling or use high values for Java VM options -Xms and -Xmx. If this does not help you can shorten your source XML file and try again.
- For more information about the XSLT/XQuery Profiler, watch our video demonstration:

https://www.youtube.com/embed/4ftHschjLqA

Invocation Tree View

The Invocation Tree view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 464. Invocation Tree View

The entries in the invocation tree include a few possible icons that indicate the following:

- ◀ - Points to a call whose inherent time is insignificant compared to its total time.
- ✓ - Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the XSLT/XQuery profiler settings (on page 160):

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.

- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

The Invocation Tree view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: 

\[OXYGEN\_INSTALL\_DIR\]/frameworks/profiler/. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

View settings

Opens the XSLT/XQuery Profiler preferences page (on page 160) that allows you to configure various profiling settings.

Hotspots View

The Hotspots view displays a list of all instruction calls that lie above the threshold defined in the XSLT/ XQuery profiler settings (on page 160). If the view is not displayed, it can be opened by selecting it from the Window > Show View menu.

Figure 465. Hotspots View

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:
• **Instruction** - The name of the instruction.

• **Percentage** - The percentage number for this hotspot entry with respect to the total time.

• **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot. All calls into this instruction are summed up regardless of the particular call sequence.

• **Calls** - The invocation count of the hotspot entry.

If you click the ▲ handle on the left side of a hotspot, a tree of back-traces will be shown.

Every entry in the backtrace tree has textual information attached to it that depends on the XSLT/XQuery profiler settings (on page 160):

• A percentage number that is calculated with respect to either the total time or the called instruction.

• A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.

• An invocation count that shows how often the hotspot has been invoked on this call-path.

 broaden> **Note:** This is not the number of invocations of this instruction.

• An instruction name that also contains its attributes.

The **Hotspots** view also includes the following contextual menu actions:

**Export to HTML**

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: 

`{OXYGEN_INSTALL_DIR}/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

**Export to XML**

Use this option to save the profiling data as an XML file in a specified location.

**View settings**

Opens the XSLT/XQuery Profiler preferences page (on page 160) that allows you to configure various profiling settings.

### Debugging XSLT that Call Java Extensions

It is possible to debug an XSLT that calls Java extensions. This is achieved through a transformation scenario where the Java extensions are specified, and the debugging can be done based upon the same scenario.

To debug XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation scenario (on page 1045) for your XSLT document (select Configure Transformation Scenario(s) action from the toolbar, then click New, and select XSLT transformation).
2. In the New scenario dialog box, click the Extensions button (in the XSLT tab), specify the Java extensions (JAR libraries) that are needed, and click OK.
3. Once you are finished configuring the transformation scenario, click OK, then select Save and close.
4. Use the Debug scenario action on the toolbar and the debugging will be based upon the same transformation scenario you just configured and saved.

Tip: You could achieve this during a typical debugging process (on page 1541) by specifying the Java extensions using the Edit extensions button on the debugger control toolbar (on page 1527).

Related Information:
• Validating XSLT Stylesheets that Call Java Extensions (on page 567)

Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set breakpoints (on page 1543) in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.
   a. Set at least 256 MB as heap memory for the Java virtual machine (recommended 1024 MB) by setting the -Xmx parameter in the debug configuration (for example, `-Xmx1024m`).
   b. Make sure the [OXYGEN_INSTALL_DIR]/lib/oxygen.jar file and your Java extension classes are on the Java classpath.
      The Java extension classes should be the same classes that were set as an extension (on page 1527) of the XSLT/XQuery transformation in the debugging perspective (on page 2137).
   c. Set the class ro.sync.exml.Oxygen as the main Java class of the configuration.
      The main Java class ro.sync.exml.Oxygen is located in the oxygen.jar file.

2. Start the debug configuration.
   Now you can set breakpoints and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

Supported Processors for XSLT / XQuery Debugging

The following built-in XSLT processors are integrated in the debugger and can be selected in the Control Toolbar (on page 1526):

• Saxon 9.9.1.5 HE (Home Edition) - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
• Saxon 9.9.1.5 PE (Professional Edition) - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,
• **Saxon 9.9.1.5 EE (Enterprise Edition)** - a schema aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 / 3.0 basic ones, XSLT 2.0 / 3.0 schema aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,

• **Saxon 6.5.5** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,

• **Xalan 2.7.2** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.
17. Framework and Author Mode Customization

This section contains information and tutorials about customizing the authoring experience through custom frameworks and customizing the Author editing mode through CSS styling or API extensions.

Creating and Configuring Custom Frameworks

Oxygen XML Editor Eclipse plugin includes built-in, configured frameworks (on page 2135) for DocBook, DITA, TEI, XHTML, and JATS, but you can also create your own customization to handle other types of documents. A common use case is wanting to customize the interface to accommodate the needs of your authoring team.

Fully configuring a framework usually involves customizing CSS stylesheets, XML schemas, GUI components (menu actions, toolbars, inline components, content completion proposals, and more), configuring other more general settings, then bundling the framework to share with your team. The CSS and GUI components are used to customize the interface, while other general settings can be configured to accommodate custom document templates, XML catalogs, transformation scenarios, and more.

Advanced Framework Customization

Oxygen XML Editor Eclipse plugin supports individual document types and classes of document types through frameworks (on page 2135). A framework associates a document type or a class of documents with CSS stylesheets, validation schemas, catalog files, new files templates, transformation scenarios, content completion proposals, custom actions, and more.

This section includes information about numerous possibilities for creating and customizing a framework, and how to share your customization with others.

Tip: A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Creating/Extending a Custom Framework

The easiest way to create a custom framework (on page 2135) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it. You can then easily share the custom framework (on page 1594) with your team.

To create a custom framework by extending an existing one, follow these steps:
1. In a location where you have full write access, create a folder structure similar to this:
   custom_frameworks/dita-extension.
2. Open the Preferences dialog box (on page 47) and go to Document Type Association > Locations (on page 61). Add the path to your custom_frameworks folder in the Additional frameworks directories list and click OK or Apply to save your changes.
3. Go to the Document Type Association preferences page (on page 60) and select an existing framework configuration (for example, DITA) and use the Extend button to create an extension for it.
   
   **Step Result:** This opens the Document Type Configuration dialog box (on page 62) where you can define the set of rules and settings for your custom framework.
4. Give the extension an appropriate name, select External for the Storage option, click the browsing button ( ) to specify the location of the custom directory you created in step 1.
5. Continue to configure the extension using the tabs on the bottom half of the dialog box. For details about each of those tabs, see the child topics in the Document Type Configuration dialog box (on page 62) section. For even more information about customizing the extended framework, see the various topics and tutorials in the Creating and Configuring Custom Frameworks (on page 1551) section. Make sure that you save any resources you reference in your framework configuration (CSS files, new document templates, schemas used for validation, catalogs, etc.) in your custom framework directory you created in step 1.
6. Click OK to close the configuration dialog box and then OK or Apply to save your changes.
   
   **Results:** You now have a fully functional framework that can be shared with others (on page 1594).

<table>
<thead>
<tr>
<th>Related Information:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Sharing a Custom Framework (on page 1594)</td>
</tr>
</tbody>
</table>

**Customizing the Editing Experience for a Framework**

You can customize the editing experience in Author mode for you and any other user who shares the same framework. This includes the ability to configure actions, menus, toolbars, icons, structure insertion shortcuts, and content completion proposals specifically for a particular framework (on page 2135) (document type). Advanced users who are familiar with API development can also create custom Author mode operations (on page 1724) for a particular framework.

**Customizing Actions for a Framework**

To add or configure actions for a framework (on page 2135) (document type), follow this procedure:

1. Open the Preferences dialog box (on page 47), go to Document Types Association, and select the framework.
2. Click Edit and in the Document Type configuration dialog box (on page 62) go to the Author tab, then go to the Actions subtab.
3. To create a new action, click the + New button. To edit an existing action, select the action and click the Edit button.
Result: In either case, this opens the **Action configuration dialog box (on page 68)** where you can configure numerous aspects of the action.

**Example: Configure the Insert Section Action for a Framework**

This topic describes the procedure for defining the **Insert Section** action for a custom [framework (on page 2135)](https://example.com). It is assumed that the icon files, ![Section16.gif](https://example.com/Section16.gif) for the menu item and ![Section20.gif](https://example.com/Section20.gif) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in your custom *framework directory* ([OXYGEN_INSTALL_DIR]/frameworks/[CUSTOM_FRAMEWORK_DIR]).

**Figure 466. Action Dialog Box**

1. Set the **ID** field to `insert_section`. This is a unique action identifier.

2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.

3. Set the **Menu access key** to `i`. On Windows, the menu items can be accessed using **Alt+letter** keys combination, when the menu is visible. The **letter** is visually represented by underlining the first letter from the menu item name having the same value.

4. Add a **Description**.

5. Set the **Large icon (20x20)** field to `$\{frameworks\}/sdf/Section20.gif`. A good practice is to store the image files inside the *framework directory* and use **editor variable (on page 176)** `$\{framework\}` to make the image relative to the *framework location*. 
If the images are bundled in a JAR (on page 2135) archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

If the image file `Section20.gif` is located in the images directory inside the JAR archive, you can reference it by using `/images/Section20.gif`. The JAR file must be added into the Classpath list.

6. Set the Small icon (16x16) field to `${frameworks}/sdf/Section16.gif`.

7. Click the text field next to Shortcut key and set it to `Ctrl+Shift+S` (Meta+Shift+S on Mac OS). This will be the key combination to trigger the action using the keyboard only.
   The shortcut is enabled only by adding the action to the main menu of Author mode (on page 1555), which contains all the actions that the author will have in a menu for the current document type.

8. At this time the action has no functionality added to it. Next you must define how this action operates.
   An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The XPath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example, suppose you want the action to add a section only if the current element is either a `<book>`, `<article>`, or another `<section>`.
   a. Set the XPath expression field to:
   ```xml
   local-name()='section' or local-name()='book' or local-name()='article'
   ```
   b. Set the invoke operation field to `InsertFragmentOperation` built-in operation, designed to insert an XML fragment at cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the Author Default Operations (on page 1702) section. This set can be expanded with your own Java operation implementations.
   c. Configure the arguments section as follows:
   ```xml
   <section xmlns="http://www.oxygenxml.com/sample/documentation">
     <title/>
   </section>
   ```
   `insertLocation` - leave it empty. This means the location will be at the cursor position.
   `insertPosition` - select "Inside".

**Example: Configure the Insert Table Action for a Framework**

This topic describes the procedure for defining the `Insert Table` action for a custom framework (on page 2135). Suppose that you want to create an action that inserts a table with three rows and three columns into a
document and the first row is the table header. As with the insert section action (on page 1553), you will use the InsertFragmentOperation built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom framework directory ({OXYGEN_INSTALL_DIR}\frameworks\[CUSTOM_FRAMEWORK_DIR]}).

1. Set ID field to insert_table.
2. Set Name field to Insert table.
3. Set Menu access key field to t.
4. Set Description field to Adds a table element.
5. Set Toolbar icon to ${framework} / toolbarIcon.png.
6. Set Menu icon to ${framework} / menuIcon.png.
7. Set Shortcut key to Ctrl + Shift + T (Command + Shift + T on OS X).
8. Set up the action's functionality:
   a. Set XPath expression field to true().
      true() is equivalent with leaving this field empty.
   b. Set Invoke operation to use InsertFragmentOperation built-in operation that inserts an XML fragment to the cursor position.
   c. Configure operation's arguments as follows:

      fragment - set it to:

      ```xml
      <table xmlns="http://www.oxygenxml.com/sample/documentation">
        <header><td/> <td/> <td/></header>
        <tr><td/> <td/> <td/></tr>
        <tr><td/> <td/> <td/></tr>
      </table>
      ```

      insertLocation - to add tables at the end of the section use the following code:

      ```xml
      ancestor::section/*[last()]
      ```

      insertPosition - Select After.

**Customizing the Menu for a Framework**

Defined actions can be grouped into customized menus in the Oxygen XML Editor Eclipse plugin menu bar.

1. Open the Document Type configuration dialog box (on page 62), select your custom framework (on page 2135), and go to the Author tab.
2. Go to the Menu subtab. In the left side you have the list of actions and some special entries:
   • Submenu - Creates a submenu. You can nest an unlimited number of menus.
   • Separator - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then click the Edit button.

4. Select the Submenu label in the left panel section and the appropriate label in the right panel section, then click the Add as child button. Change the submenu name to Table, using the Edit button.

5. Select the Insert section action in the left panel section and the Table label in the right panel section, then click the Add as sibling button.

6. Now select the Insert table action in the left panel section and the Table in the right panel section. Click the Add as child button.

Figure 467. Configuring the Menu

When opening a test document for a custom framework in Author mode, the menu you created is displayed in between the Tools and the Document menus. The upper part of the menu contains generic Author mode actions (common to all document types) and the two actions created previously (with Insert table under the Table submenu).

Figure 468. Author Mode Menu

Customizing the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the Author editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the Document Type configuration dialog box (on page 62) for the particular framework (on page 2135) and go to the Author tab. Next, go to the Contextual Menu subtab.
2. Follow the same steps as explained in the Configuring the Main Menu (on page 1555), except changing the menu name because the contextual menu does not have a name.

*Note:* You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and framework-specific ones) are grouped together under the same submenu.

**Figure 469. Configuring the Contextual Menu**

To test it, open the test file, and open the contextual menu. In the lower part there is shown the **Table** submenu and the **Insert section** action.

**Customizing the Toolbar for a Framework**

This procedure describes how to add defined actions to a toolbar for a custom framework (on page 2135). You can also create additional custom toolbars with existing or custom actions.

1. Open the **Document Type** configuration dialog box (on page 62) for your custom framework and select the **Author** tab.
2. Go to the **Toolbar** subtab.

**Figure 470. Configuring the Toolbar**
The panel is divided in two sections. The left side contains a list of actions, while the right side contains an action tree, displaying the list of actions added in the toolbar. The special entry called Separator allows you to visually separate the actions in the toolbar.

3. To add an action, select it in the left panel and select the particular toolbar label where you want it added in the right panel section, then click the Add as child or Add as sibling button.

Result: When opening a document for the particular framework in Author mode, the toolbar with the new buttons will be displayed in the toolbar area.

Tip: If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the Author mode, right-click the main toolbar, select Configure Toolbars, and make sure the appropriate toolbar (such as the Author Custom Actions toolbar) is selected.

Note: A maximum of 16 toolbars can be added. If you add more, all extra toolbars will be automatically converted to sub-toolbars for the last added toolbar.

Customizing the Content Completion for a Framework

You can customize the content of the following Author controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- Content Completion Assistant (on page 2133) window
- Elements view (on page 349)
- Insert Element menus (from the Outline view (on page 273) or breadcrumb (on page 320) contextual menus)

You can use the content completion customization support in a custom framework (on page 2135) by following this procedure:

1. Open the Document type configuration dialog box (on page 62) for your custom framework and select the Author tab. Next, go to the Content Completion tab.
The top side of the **Content Completion** section contains the list with all the actions defined within the custom *framework* and the list of actions that you decided to include in the *Content Completion Assistant* list of proposals. The bottom side contains the list with all the items that you decided to remove from the *Content Completion Assistant* list of proposals.

2. If you want to add a custom action to the list of current *Content Completion* proposals, select the action item from the *Available actions* list and click the ![Add as child](image) or ![Add as sibling](image) button to include it in the *Current actions* list. An *Insert Action* dialog box appears, giving you the possibility to select where to provide the selected action.

3. If you want to exclude a certain item from the *Content Completion* proposals, you can use the ![Add](image) button from the *Filter - Remove content completion items* list. The *Remove item* dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The *Item name* combo box accepts wildcards.
Customizing Text-to-Markup Automatic Conversions

Some built-in frameworks include a configuration file that defines shortcut patterns that can be used in Author mode to automatically insert a certain XML structure. More specifically, the XML structure (fragment) automatically replaces a specific prefix pattern. For example, if you are editing a DITA document using the built-in DITA framework, entering a hyphen (--) followed by a space at the beginning of a paragraph would automatically replace them with an unordered list element (<ul> ) with a child list item element (<li> ). This is made possible by the AutoCorrect mechanism in Oxygen XML Editor Eclipse plugin.

It is possible to customize the particular configuration file (structureAutocorrect.xml) to define your own markup insertion shortcut patterns by following these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (on page 47) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 66) add a link to that resources folder (if it does not already exist).
3. Create a new structureAutocorrect.xml file or edit an existing one (this file already exists in the resources folder of particular document types and you can use an existing file as a starting point for your customization).
4. Make the appropriate changes to your structureAutocorrect.xml file. The file should look like this:

```
<structure-autocorrect>
  <!-- Unordered lists -->
  <prefix-replacement prefix="-"> 
    <ul><li/></ul>
  </prefix-replacement>
  <!-- Ordered lists -->
  <prefix-replacement prefix="1.">
    <ol><li/></ol>
  </prefix-replacement>
  <!-- Code block -->
  <prefix-replacement prefix="```">
  </prefix-replacement>
</structure-autocorrect>
```
Using this example, when a user enters one of the defined prefixes at the start of an element that allows the corresponding fragment, Oxygen XML Editor Eclipse plugin will automatically replace the prefix with its corresponding fragment. For example, entering a hyphen (-) at the beginning of a paragraph followed by a space would automatically replace them with an unordered list element ( `<ul>` ) with a child list item element ( `<li>` ). Any subsequently added content would be placed inside the first node/element that does not have a child node/element (in this example, the cursor would be placed in the first `<li>` element).

5. Save the file in the resources folder for the particular document type, using the fixed name: `structureAutocorrect.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/structureAutocorrect.xml`).

6. Restart the application and open a document for your particular framework to test your customization.

   **Note:** Once the file is created, changes that you make to it are processed by Oxygen XML Editor Eclipse plugin when you press the **Reload** toolbar button.

### Adding Retina/HiDPI Icons in a Framework

Higher resolution icons can also be included in customized frameworks for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the Document Type Configuration dialog box (on page 62) (from the Action dialog box (on page 68)) or from an API (ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer (on page 1761)).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myIcon@2x.png`).

Developers should not specify the path of the alternate icons (`@2x` or `@3x`) in the Action dialog box (on page 68) or the XMLNodeRendererCustomizer API (on page 1761). When using a Retina or HiDPI display, Oxygen XML Editor Eclipse plugin automatically searches the folder of the normal icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the normal icon is scaled and used instead.

**Related Information:**
- Retina/HiDPI Images in Author Mode (on page 428)

### Customizing Smart Paste Support

The Smart Paste feature (on page 330) preserves certain style and structure information when copying content from some of the most common applications and pasting into frameworks (document types) that support Smart Paste (on page 331) in Oxygen XML Editor Eclipse plugin. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.
The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (framework (on page 2135)). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

**How to Customize the Smart Paste Mapping**

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular framework contains a folder named resources in the following path structure:
   ```
   /frameworks/[Document Type]/resources
   ```
2. Create an XSLT file named `xhtml2content.xsl` and save it in the resources folder for the particular framework.
   
   For example: `/frameworks/[Document Type]/resources/xhtml2content.xsl`
3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the Supported Parameters for the Custom Smart Paste XSLT (on page 1563) section below.

   **Tip:** The built-in DITA framework includes an `xhtml2ditaDriver.xsl` file (in `{OXYGEN_INSTALL_DIR}/frameworks/dita/resources`) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire contents of the built-in `dita/resources` folder and customize the stylesheets according to your needs.
4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Editor Eclipse plugin.

**Result:** When you paste content from external applications (such as a web browser or and Office document) to a document that is open in Author mode, and that matches the particular framework, the styling from the `xhtml2content.xsl` stylesheet will be applied on the clipboard contents.

**Customized Smart Paste Stylesheet Sample:**

```xml
<xsl:stylesheet version="1.0"
 xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
 xmlns:xhtml="http://www.w3.org/1999/xhtml"
 xmlns="urn:hl7-org:v3"
 exclude-result-prefixes="xsl xhtml">

  <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

  <xsl:template match="xhtml:b | xhtml:strong">
    <content styleCode="bold">
      <xsl:apply-templates select="@* | node()
    </content>
  </xsl:template>
</xsl:stylesheet>
```
Supported Parameters for the Custom Smart Paste XSLT

The following parameters can be used in your XSLT stylesheet for customizing the Smart Paste mechanism:

**inTableContext**

The custom XSLT stylesheet receives this parameter with a value of `true` if the end user is pasting content inside a table.

**folderOfPasteTargetXml**

A URL pointing to the folder where the current edited XML document is located. This is used to save images relative to the current XML document.

**context.path.names**

A sequence of element names showing the current context in the XML document where the paste occurred.

**context.path.uris**

A sequence of namespaces, one for each context path name.

**context.path.separator**

The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called `externalPasteOptions.xml` in the resources folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:

```xml
<!-- Options that control external paste (automatic conversions when pasting HTML and URL flavors from the clipboard). -->
<pasteOptions>
  <!-- True to check if the entire sequence of words which get pasted are converted to the target vocabulary. If the check fails, the content will be inserted as a simple sequence of words without any formatting. -->
  <checkEntireContentIsFullyPreserved>true</checkEntireContentIsFullyPreserved>
</pasteOptions>
```
Customizing the Content Completion Assistant

Oxygen XML Editor Eclipse plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the Content Completion Assistant. Oxygen XML Editor Eclipse plugin also includes support that allows you to customize the Content Completion Assistant to suit your specific needs.

There are two ways to customize the Content Completion Assistant in Oxygen XML Editor Eclipse plugin:

- You can add, modify, or remove actions that are proposed for each particular document type (framework) by using the Content Completion subtab in the Document Type Association configuration dialog box. To access this subtab, open the Preferences dialog box, go to Document Type Association, use the New, Edit, Duplicate, or Extend button (on page 60), click on the Author tab, and then the Content Completion subtab.
- You can use a cc_config.xml configuration file that is specific to each document type (framework) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (<li>) accepts more than 60 child elements. Oxygen XML Editor Eclipse plugin includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (<li>) to only accept paragraph elements (<p>). In this case, the Content Completion Assistant should not offer any element other than a paragraph (<p>) when a list item (<li>) is inserted into a document. It would also be helpful if the required child element (<p>) was automatically inserted whenever a list item (<li>) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be quite complicated in some cases. Fortunately, Oxygen XML Editor Eclipse plugin offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.
Setting up the Content Completion Configuration File
To customize the configuration file for the Content Completion Assistant (on page 2133), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the Preferences dialog box (on page 47) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 66) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the resources folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the `cc_config.xml` file from the base framework and modify it. You also need to make sure that the file in your extension is listed in the Classpath tab (on page 66) before the one from the base framework.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

Tip: In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Configuring Elements or Attributes that are Proposed for Each Element
For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (`cc_config.xml`) uses `<elementProposals>` elements. This element allows you to customize or filter the child elements and attributes for an element.

Warning: Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

Elements:
To control the elements that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

- **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the `<title>` elements in the document, while
"chapter/title" matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]` - Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]` - Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]` - Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]` - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

**Example:** The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

* `[@a and @b or @c and @d]`
* `[@a and (@b or @c) and @d]`

The following are just examples of how simplified XPath expressions might look like:

- `elementName`
- `//elementName`
- `/elementName1/elementName2/elementName3`
- `//xs:localName`

**Note:** Using a namespace prefix requires that you declare it on the `<elementProposals>` element.

For example: `<elementProposals xmlns:db5="http://docbook.org/ns/docbook" path="db5:listitem" insertElements="db5:para" />`

- `//xs:documentation[@lang="en"]`

**Note:** If the `@path` attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleElements (on page 1567)` or `rejectElements (on page 1567)` to specify or restrict particular elements for a framework (on page 2135).

For example, suppose that in your DITA documents, you want to restrict your users from using `<image>` and `<fig>` elements because you do not want images to be included in your output. The configuration file should look like this:

```
<elementProposals rejectElements="image fig" />
```

Since the `@path` attribute is missing, the specified element will be filtered out from the proposals for the entire framework.

- `insertElements` - A space-separated sequence of child element names. Each time the element specified in the `@path` attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, `insertElements="b i"` will insert exactly one `<b>` element, followed by an `<i>` element. An empty value ("") means that no child elements should be inserted.
Note: If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- **possibleElements** - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute. For example, `"b i codeph ph"` means that the Content Completion Assistant will contain these four elements when invoked on the element specified in the `@path` attribute. The following other possible values are also supported:
  - **NONE** - There will be no proposals in the content completion list.
  - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - **INSERTED** - The proposals will be the same list of elements that are defined in the `@insertElements` attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals possibleElements="b i codeph ph"/>
```

- **rejectElements** - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

This setting also influences copy/paste and insertion behaviors. For example, if you reject the insertions of images in paragraphs and you try to paste an image inside a paragraph, by default the application will take your choice into account and try to insert the image in a place where it is allowed.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```xml
<elementProposals rejectElements="image fig imagemap foreign"/>
```

**Attributes:**

To control the attributes that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

- **path** - A path within the document that matches the element that will have its attribute proposals changed. For example, `"title"` matches all the `<title>` elements in the document, while `"chapter/title"` matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences (on page 122).

Note:

If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use `possibleAttributes (on page 1568)` or `rejectAttributes (on page 1568)` to specify or restrict attributes for an entire framework.
For example, suppose that you only want to allow a limited set of attributes in a customized framework. The configuration file should look like this:

```xml
<elementProposals possibleAttributes=""
    id domains href scope format type conref
    props keyref class"/>
```

Since the `@path` attribute is missing, this applies to the entire framework and only the specified attributes will be proposed.

- **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

```xml
<elementProposals path="ol/li" insertAttributes="product platform"/>
```

- **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

```xml
<elementProposals path="ol/li">
    <insertAttribute name="platform" value="test"/>
</elementProposals>
```

- **possibleAttributes** - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals possibleAttributes="scope format type"/>
```

- **rejectAttributes** - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the Content Completion Assistant will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```xml
<elementProposals rejectAttributes="importance platform product"/>
```

**Other Important Notes About the Configuration File**

- **Important:**
  - By default, the element names that do not have a namespace prefix are considered from *no-namespace*. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the `@elementPath` and `@model` attributes.
  - This configuration file only affects the content completion assistance. It has no effect on validation or operations invoked from other areas in the interface (such as the toolbar or menus).
  - To test the effects of your changes, you should restart the application, although in some cases, you can simply use the **Refresh (F5)** action to test your customizations.
• When an XML element from the document is matched against a list of configured elementProposals, the first one in sequence takes precedence. Therefore, make sure you place the more specific elementProposals (those with a longer path) first in your configuration file.

• Regular expression patterns can be used in the following attributes: @possibleElements, @rejectElements, @possibleAttributes, and @rejectAttributes. For example, code*, *block, con*ref, _.

• Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex elementProposals patterns are defined, you should avoid infinite recursions.

Examples: Configuring the Element Proposals

• Example 1: Automatically Insert Elements

Suppose that you want to automatically insert a paragraph element ( \textless p \textgreater ) whenever a DITA ordered list item element ( \textless ol/li \textgreater ) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```xml
<elementProposals path="ol/li" insertElements="p"
  possibleElements="_INSERTED_"/>
```

Tip: This particular example modifies an action that inserts a list in a DITA document. There are several ways to invoke this action in the interface. For example, there is a toolbar button and an action in the DITA menu that inserts a list. However, since the configuration file only affects the Content Completion Assistant, this modification will have no effect on the behavior of the toolbar or menu action. Those actions would need to be configured separately if you want the result to be the same as the content completion proposal. For more information, see Customizing the Editing Experience for a Framework (on page 1552).

• Example 2: Insert Complex Element Structure

For a more complex example, suppose that you want to insert a complex structure whenever a DITA \textless prolog \textgreater element is inserted.

For instance, if you need to insert the following structure inside \textless prolog \textgreater elements:

```xml
<prolog>
  <author></author>
  <metadata>
    <keywords>
      <keyword></keyword>
      <keyword></keyword>
    </keywords>
  </metadata>
</prolog>
```

The configuration file should include the following:

```xml
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
```
• **Example 3: Limit Possible Elements**

Suppose that you also want to limit the proposals for the `<keywords>` element to only allow the user to insert `<audience>` or `<keyword>` elements. The configuration file should include the following:

```xml
<elementProposals path="prolog/metadata/keywords"
insertElements="keyword, keyword"/>
```

Example 3: Limit Possible Elements

Suppose that you want to simply restrict your users from inserting `<image>` elements inside DITA list item elements (<li>), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="li" rejectElements="image"/>
```

Examples: Configuring the Attributes Proposals

• **Example 1: Automatically Insert Attributes**

Suppose that you want to insert an @id attribute (with an empty value) whenever a DITA list item element (<li>) is inserted. The configuration file should include the following:

```xml
<elementProposals path="li" insertAttributes="id"/>
```

• **Example 2: Limit Possible Attributes**

Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (<li>) is inserted. The configuration file should look like this:

```xml
<elementProposals path="li" insertAttributes="id"
possibleAttributes="id product platform audience"/>
```

Suppose that you want to simply restrict your users from inserting @conref attributes inside DITA topics (<topic> element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

```xml
<elementProposals path="topic" rejectAttributes="conref"/>
```

Related Information:

- Configuring the Proposals for Attribute and Element Values *(on page 1570)*
- Customizing the Rendering of Elements *(on page 1574)*

**Configuring the Proposals for Attribute and Element Values**

Oxygen XML Editor Eclipse plugin includes support for configuring the proposed values that appear in the *Content Completion Assistant* *(on page 2133)*. To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the *Content Completion Assistant*. 
For an example of a specific use-case, suppose that you want the Content Completion Assistant to propose several possible values for the language code when you use an @xml:lang attribute.

**Setting up the Content Completion Configuration File**

To customize the configuration file for the Content Completion Assistant (on page 2133), follow these steps:

1. Create a new resources folder (if it does not already exist) in the frameworks directory for the particular document type (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources).
2. Open the Preferences dialog box (on page 47) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 66) add a link to that resources folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (cc_config.xml) already exists for the particular document type (in the resources folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the cc_config.xml file from the base framework and modify it. You also need to make sure that the file in your extension is listed in the Classpath tab (on page 66) before the one from the base framework.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the resources folder for the particular document type, using the fixed name: cc_config.xml (for example, OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml).
6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

**Tip:** In some cases, you can simply use the C Refresh (F5) action to test your customizations, without having to restart the application.

**Configuring Proposed Values**

For the purposes of adding or replacing the values that are proposed, the configuration file (cc_config.xml) includes a series of match instructions that will match an element or attribute name. You also have the possibility of using an @editable attribute on the <match> element to specify the editable state of the attribute values, as reflected in the Attributes view (on page 344) and the In-place Attributes Editor (on page 346). The possible values for the @editable attribute are:

- **true** - The attribute values can be edited by choosing from a combo box or manually providing a value.
- **false** - The attribute values cannot be edited.
- **onlyAllowedItems** - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.
A new value is specified inside one or more `<item>` elements, which are grouped inside an `<items>` element. The behavior of the `<items>` element is specified with the help of the `@action` attribute, which can have any of the following values:

- **append** - Adds new values to appear in the proposals list (default value).
- **addIfEmpty** - Adds new values to the proposals list only if no other values are contributed by the schema.
- **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source.

**Other Important Notes About the Configuration File**

*Important:*

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application.

**Example: Specifying Values Directly**

If you want to specify the values directly, the configuration file should look like this:

```xml
<!-- Replaces the values for an element with the local name "lg", from the given namespace -->
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>

<!-- Adds two values for an attribute with the local name "type", from any namespace -->
<match attributeName="type" editable="onlyAllowedItems">
  <items>
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>
```

**Example: Calling an External XSLT Script**

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```xml
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.
Tip: You can use `<xsl:message>` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the Content Completion Assistant is invoked.

Note: A comprehensive XSLT sample is included in the Content Completion Configuration document template (in the Framework Templates > Oxygen Extensions section of the New from templates wizard (on page 206)).

Configuring Proposed Values in the Context Where the Content Completion was Invoked

Web Author Customization Note: This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element where the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, `color`) and other values for another property (for example, `shape`). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```xml
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value=""/>
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value=""/>
</sampleArticle>
```

The content completion configuration file:

```xml
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <match elementName="property" attributeName="value">
    <xslt href="get_values.xsl" useCache="false" action="replace"/>
  </match>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```xml
<xsl:stylesheet
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:saxon="http://saxon.sf.net/"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:param name="documentSystemID" as="xs:string"></xsl:param>
  <xsl:param name="contextElementXPathExpression" as="xs:string"></xsl:param>
```
The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context where the content completion was invoked.

Related Information:
- Configuring the Proposals for Elements and Attributes (on page 1564)
- Customizing the Rendering of Elements (on page 1574)

Customizing the Rendering of Elements

In addition to the support for configuring the proposals that appear in the Content Completion Assistant (on page 2133), Oxygen XML Editor Eclipse plugin also includes support for customizing how the elements are rendered. You can do this by using the `XMLNodeRendererCustomizer` API extension (on page 1761), but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`<p>`) to be rendered as “Paragraph” instead of “p” in the various components in Author mode (such as in the Outline view (on page 273), Elements view (on page 349), Attributes view (on page 344), and the breadcrumb navigation bar). To achieve this, you can use the `<elementRenderings>` element in the configuration file.

Setting up the Content Completion Configuration File

To customize the configuration file for the Content Completion Assistant (on page 2133), follow these steps:
1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).

2. Open the Preferences dialog box (on page 47) and go to Document Type Association. Select the particular document type, click the Edit button, and in the Classpath tab (on page 66) add a link to that `resources` folder (if it does not already exist).

3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the Content Completion Configuration document template that is included in Oxygen XML Editor Eclipse plugin (File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
   c. If you extend a framework, you need to copy the content of the `cc_config.xml` file from the base framework and modify it. You also need to make sure that the file in your extension is listed in the Classpath tab (on page 66) before the one from the base framework.

4. Make the appropriate changes to your custom configuration file.

5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).

6. Restart the application and open an XML document. In the Content Completion Assistant you should see your customizations.

   Tip: In some cases, you can simply use the Refresh (F5) action to test your customizations, without having to restart the application.

Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the `<render>` element inside a `<elementRenderings>` element to specify how element names, their annotations, and their icons are rendered.

The `<elementRenderings>` element supports the `@platform` attribute, which can have one of the following values:

- **webapp**
  
  The element renderings are only applied to Oxygen XML Web Author.

- **standalone**
  
  The element renderings are only applied to standalone distributions of Oxygen.

- **eclipse**
  
  The element renderings are only applied to Eclipse plugin distributions of Oxygen.

Note: If the `@platform` attribute is missing, the element renderings are applied to all types of distributions.
You can use the following attributes for the `<render>` element:

- **element**
  Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from noNamespace.

- **as**
  Provides the name (label) that will be displayed for the element in various components in Author mode (the Content Completion Assistant, the breadcrumb navigation bar, the Full Tags display mode (on page 314), and the Outline (on page 273), Elements (on page 349), and Attributes (on page 344) views). This attribute is optional. If it is missing, the name of the element is used.

If you want to translate this label into another language, use the `${i18n(key_name)}` editor variable (on page 181). The following code snippet shows how the DITA paragraph elements (`<p>`) can be translated:

```xml
<elementRenderings>
  <render element="p" as="${i18n(cc_p)}"/>
</elementRenderings>
```

**Note:** The `cc_p` id is a key that identifies the translations available for the paragraph element.

- **iconPath**
  Optional attribute that specifies the icon for the element. This is shown in the Content Completion Assistant and the Outline view (on page 273) in Author mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of "myImg.png" will cause Oxygen XML Editor Eclipse plugin to load "frameworks/${framework}/resources/myImg.png"). If you want to access a built-in resource, the value can begin with a forward slash "/", and the image file will be searched for in the Oxygen XML Editor Eclipse plugin classpath resources (for example,="/images/OrderedList16.png" will load an icon from the built-in Oxygen XML Editor Eclipse plugin JAR file resources).

- **xml:lang (Deprecated)**
  It is recommended to use the `${i18n(key_name)}` editor variable (on page 181) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple `<render>` elements for the same `@element` attribute (element name) and the `@xml:lang` attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

  **Note:** The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (`<p>`) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if...
the language is English (or any other language). Your configuration file should look something like this:

```xml
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the `<render>` element also accepts the following element to change the tooltip annotations for an element (in both Author mode and Text mode):

```xml
annotation
  <annotation>${i18n(cc_p)}</annotation>
</render>
```

This element can be used within the `<render>` element to customize the tooltip annotations that are displayed for the element in various components in Author mode (such as tooltips shown in the Content Completion Assistant documentation window, the breadcrumb navigation bar, the Full Tags display mode (on page 314), and the Outline (on page 273), Elements (on page 349), Attributes (on page 344) views), as well as the tooltips that are displayed when you hover over elements in Text mode. You can use HTML content to style the annotations (see the example below (on page 1578)).

**Note:** If this element is missing, the styling for the annotations for that element is collected from the associated schema (on page 336).

**Tip:** The annotations can also be translated in the configuration file. For example:

```xml
<elementRenderings>
  <render element="p" as="${i18n(cc_p)}">
    <annotation>${i18n(cc_p)}</annotation>
  </render>
</elementRenderings>
```

Other Important Notes About the Configuration File for Rendering Elements

**Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the Refresh (F5) action to test your customizations.
- If the framework (on page 2135) has an associated style guide, then the annotations defined in the configuration file will take precedence over those defined in the style guide. To check to see if your framework uses a style guide, look for the following folder: `$(oxygenInstallDir)/frameworks/${framework}/styleguide/`. If that folder exists, it is recommended that you make your annotation changes directly in the style guide, rather than in the configuration file.
• If an *XMLNodeRendererCustomizer* API extension (on page 1761) has been implemented for the framework and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the *XMLNodeRendererCustomizer* implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.

• The rendering customizations defined in the configuration file also apply to aspects of the Oxygen XML Web Author interface.

**Example: Changing the Rendering of an Element**

Suppose that you want to render the name of the DITA `<title>` element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in Author mode. The configuration file should look like this:

```xml
<elementRenderings>
  <render element="title" as="Title" iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A `<i>heading`</i>` or `<b>label</b>` for the main parts of a topic</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```

• Configuring the Proposals for Attribute and Element Values (on page 1570)

• Configuring the Proposals for Elements and Attributes (on page 1564)

• Customizing XML Node Rendering (on page 1761)

• Schema Annotations in Author Mode (on page 336)

• Customizing Annotations in the Content Completion Assistant (on page 1578)

**Customizing Annotations in the Content Completion Assistant**

Oxygen XML Editor Eclipse plugin gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the *Content Completion*
Assistant (on page 2133) for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the Elements view (on page 349). If you hover over attributes in the Attributes view (on page 344) you also see information about each attribute, gathered from the same schema.

If you have a framework configuration (on page 62) set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the Content Completion Assistant, follow these steps:

1. Create a new folder in the configuration directory for the document type.

   **Example:** OXYGEN_INSTALL_DIR/frameworks/dita/styleguide

2. Use the New document wizard to create a file using the Content Completion Styleguide document template (in the Framework Templates > Oxygen Extensions section).

3. Save the file in the folder created in step 1, using the fixed name: contentCompletionElementsMap.xml.

4. Open the Preferences dialog box (on page 47), go to Document Type Association, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Editor Eclipse plugin will locate your mapping file by doing one of the following:
   - In the Classpath tab add a link to the newly created folder.
   - In the Catalogs tab add a new catalog file (on page 512). The selected file needs to contain the following:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN" "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <uri name="http://www.oxygenxml.com/\{processed_dt_name\}/styleguide/contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
</catalog>
```

   where `{processed_dt_name}` is the name of the document type in lower case and with spaces replaced by underscores.

   **Note:** If Oxygen XML Editor Eclipse plugin finds a mapping file in both locations, the one in the Catalogs tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

   **Example:** You can look at how the DITA mapping file is configured: OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml

   The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.
In the *Content Completion Assistant (on page 2133)*, you should see the additional annotations for each element.

**Translating Annotations**

Annotations in the Content Completion Assistant can be displayed in various languages. Based on the language set for the interface, Oxygen XML Editor Eclipse plugin looks for several filename formats to determine the information to load for the content completion annotations. These files that begin with the name `contentCompletionElementsMap`, are located in the `styleguide` folder for each built-in framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide`).

For example, for English, the files are loaded in the following order (from specific to more general):

- `contentCompletionElementsMap_en_US.xml` or `contentCompletionElementMap_en_UK.xml`, and so on
- `contentCompletionElementsMap_en.xml`
- `contentCompletionElementsMap.xml`

If you want the annotations to be displayed in another language, you need to create similar files for the particular language. For example, to show annotations in German, create a file with one of the following names (and store it in the `styleguide` folder for your framework):

- `contentCompletionElementsMap_de_DE.xml`
- `contentCompletionElementsMap_de.xml`

**Related Information:**

- *Customizing the Rendering of Elements (on page 1574)*

**Creating New Document Templates for a Custom Framework**

You can create your own custom document templates and attach them to a custom framework (on page 2135). You can then share the custom framework (on page 1594) so that all users will have access to the templates in the `New from templates` wizard (on page 206).

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file and customize it to become a starting point for creating new files of this type.

   **Tip:** You can use editor variables (on page 176) in the template file content and they will be expanded when the files are opened. Also, see Customizing Document Templates (on page 208) for other template customization tips (for example, you could add placeholders or hints (on page 210) to assist authors).

2. Save the new template in a directory (for example, called `templates`) within your custom framework directory.
Attention: The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, My Custom Template1.xml will appear in the new file wizard as My Custom Template1). You can also configure the displayed name in a properties file by following the procedure found in the Configure the Displayed Names for Document Templates (on page 210) section.

3. Open the Document Type configuration dialog box (on page 62) for that specific framework, go to the Templates tab (on page 81), and click the + button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, ${frameworkDir}/templates). Binding to an absolute file (e.g., C:\some_dir\templates) makes the association difficult to share between users.

4. Click OK for all of the dialog boxes to save your changes.

5. To test the template, open the new document wizard (New toolbar button or File > New > New from Templates) and you should see your custom template in the folder for your custom framework (in the Framework templates section).

Related Information:
• Customizing Document Templates (on page 208)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an XML Catalog (on page 2139) may be used to map the web location to a local file system entry. The following procedure presents an example of using an XML catalog in a custom framework (on page 2135) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

Example:

Create a new XML file called catalog.xml and save it in your custom framework directory (\OXYGEN_INSTALL_DIR\frameworks\[CUSTOM_FRAMEWORK_DIR]). The content of the file should look like this:

```xml
<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd" uri="/schema/abs.xsd" />
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd" uri="/schema/abs.xsd" />
</catalog>
```

2. Add catalog files to your custom framework using the Catalogs tab (on page 82) from the Document Type configuration dialog box (on page 62).
To test the catalog settings, restart Oxygen XML Editor Eclipse plugin and try to validate a new sample document for your custom framework. There should be no errors.

**Example:**

The schema that validates the document refers the other file `abs.xsd` through an **import** element:

```xml
<xs:import namespace=
"http://www.oxygenxml.com/sample/documentation/abstracts"
schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The **@schemaLocation** attribute references the `abs.xsd` file:

```xml
<xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to `http://www.oxygenxml.com/SDF/abs.xsd` must be resolved to the `abs.xsd` file located in the **schema** directory (note that the **schema** directory needs to be in the same folder as the XML Catalog). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

**Configuring Transformation Scenarios for a Framework**

When distributing a **framework** *(on page 2135)* to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the **framework** configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your **framework**.

1. Create an **xsl** folder inside your custom **framework** directory (`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

   The folder structure for the documentation **framework** should be:

   ```
   oxygen
   frameworks
   [CUSTOM_FRAMEWORK_DIR]
   schema
css
templates
xsl
   ```

2. Create an **xsl** file and save it in the **xsl** folder. To help you get started, you can use the sample `sdf.xsl` file found in the **sample framework customization package**.
3. Open the Preferences dialog box (on page 47) and go to Document Type Associations. Select the particular framework, click the Edit button to open Document Type Configuration dialog box (on page 62), and choose the Transformation tab. Click the + New button and choose the appropriate type of transformation (for example, XML transformation with XSLT).

In the New scenario dialog box, fill in the following fields:

- Fill in the Name field with the name of your transformation scenario.
- Set the XSL URL field to path of your custom stylesheet (for example, \${framework}/xsl/ mycustom.xsl).

![Figure 474. Configuring a New XSLT Transformation Scenario](image)

4. Change to the Output tab. Configure the fields as follows:

- Set the Save as field to \${cfd}/${cfn}.html. This means the transformation output file will have the name of the XML file and the html extension and will be stored in the same folder.
- Select the Open in Browser/System Application option.

**Note**: To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

- Select the Saved file option.

5. Click the OK button to save the new scenario.

Now the scenario is listed in the Transformation tab:
To test the transformation scenario that you just created, you can use the sample `sdf.xml` file found in the sample framework customization package. Click the Apply Transformation Scenario(s) button to display the Transform with dialog box. The scenario list contains the scenario you defined earlier. Select the SDF to HTML scenario that you just defined and click the Apply associated button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

### Configuring Validation Scenarios for a Framework

You can distribute a framework (on page 2135) with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

**Note:** If a master file is associated with the current file, the validation scenarios defined in the master file, along with any Schematron schema defined in the default scenarios for that particular framework, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular framework. For more information on master files, see Master Files Support (on page 229) or Working with Modular XML Files in the Master Files Context (on page 515).

To associate a validation scenario with a specific framework, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Document Type Association.
2. Select the document type and click the Edit button to open the Document Type Configuration dialog box (on page 62), then choose the Validation tab. This tab displays a list of document types. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the Default box for that specific document type.
3. To edit an existing scenario, select the scenario and click the Edit button. To add a new scenario, click the New button.

In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.
This scenario configuration dialog box allows you to configure the following information and options:

**Name**

The name of the validation scenario.

**URL of the file to validate**

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable (on page 176) or a custom editor variable (on page 183).

**File type**

The type of the document that is validated in the current validation unit. Oxygen XML Editor Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

**Validation engine**

The validation engine to use for the validation process.
You can select one of the engines available in Oxygen XML Editor Eclipse plugin for validation of the particular document type.

**Default engine** means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page (on page 165), XQuery preferences page (on page 162), XML Schema preferences page (on page 154)).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the DITA Maps Manager Validate and Check for Completeness action (on page 1918), but for a local file rather than an entire DITA map (on page 2134)).

The **Table Layout Validation** engine looks for table layout problems (for more information, see Report table layout problems (on page 1922)).

**Automatic validation**

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 476). If the **Automatic validation** feature is disabled in the Document Checking preferences page (on page 93), then this option is ignored, as the preference setting has a higher priority.

**Schema**

This option becomes active when you set the **File type** to XML Document and allows you to specify the schema used for the validation unit.

**Specify Schema**

Opens the Specify Schema dialog box that allows you to set a schema to be used for validating XML documents.

**Figure 478. Specify Schema Dialog Box**

The Specify Schema dialog box contains the following options:

**Use detected schema**

Uses the schema detected for the particular document (on page 503).
Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the \* Insert Editor Variables (on page 176) button, or the browsing actions in the \* Browse drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions** - Opens a dialog box that allows you to specify Java extension JARs (on page 2135) to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

**Move Up**

Moves the selected scenario up one spot in the list.

**Move Down**

Moves the selected scenario down one spot in the list.

**Add**

Adds a new validation unit to the list.

**Remove**

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the validation phase.

5. Click **Ok**.

The newly created validation scenario is now included in the list of scenarios in the Validation tab (on page 83). You can use the Default checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.
Customizing Author Mode Using CSS Files Associated with a Framework

The easiest way to customize the main CSS stylesheet of a framework is to create a new stylesheet, save it as an alternate CSS file that will be applied as an additional layer to the main CSS, and then select it from the Styles drop-down menu in Author mode.

For example, suppose that you want to customize the main CSS for DITA documents. To do this, follow these steps:

1. First, create a new CSS stylesheet and save it in the /frameworks/dita/css/edit folder (where the default main stylesheet named style-basic.css is located).

2. Edit the DITA framework and go to the CSS subtab:
   a. Open the Preferences dialog box and go to Document Type Association.
   b. Select the DITA document type and click the Edit button.

   Tip: If you do not have write permissions to modify the document type, use the Extend button to create an extension of the framework.

   a. Go to the CSS subtab of the Author tab.

3. Add the new stylesheet as an alternate CSS stylesheet:
   a. Click the Add button to open a dialog box that allows you to specify the URI and Title for your newly created stylesheet.
   b. Select the Alternate option to define it as an alternate stylesheet that will be applied as an additional layer to the main CSS.
4. Click OK in all the dialog boxes to validate the changes.

5. Select your newly created CSS stylesheet from the Styles drop-down menu on the toolbar in Author mode. You can now edit DITA documents based on the new CSS stylesheet. You can also edit the new CSS stylesheet itself and see its effects on rendering DITA documents in the Author mode by using the Refresh action that is available on the Author toolbar and in the DITA menu.

Related Information:
- Configuring and Managing Multiple CSS Styles for a Framework (on page 1589)
- Customizing Author Mode Through CSS (on page 1611)

Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Editor Eclipse plugin provides a Styles drop-down menu on the toolbar that allows you to select one main (non-alternate) CSS style (on page 2136) and multiple alternate CSS styles (on page 2132). This makes it easy to change the look of the document as it appears in Author mode and the output without having to continually edit the CSS stylesheets.

An example of a common use case is when content authors want to use custom styling within a document. You can select a main CSS stylesheet that styles the whole document and then apply alternate styles, as layers, to specific parts of the document.

Managing the CSS Styles
The main (on page 2136) and alternate (on page 2132) styles that are listed in the Styles drop-down menu can be controlled in the Document Type configuration dialog box (on page 62). To access it, follow these steps:

1. Open the Preferences dialog box (on page 47).
2. Go to Document Type Association.
3. Select the appropriate document type and click the Edit button.

Important: If you do not have access rights to the folder where the framework (on page 2135) files are stored, you can either elevate read/write permissions on that framework folder or you can extend the framework and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework (on page 1594).
The CSS styles (CSS files) associated with the particular document type are listed in the CSS subtab (on page 67) of the Author tab.

**Figure 481. Main and Alternate CSS Styles in the Document Type Configuration Dialog Box**

You can Add, Edit, or Delete styles from this dialog box to manage the main (on page 2136) and alternate (on page 2132) styles associated to the particular document type. You can also change the order of the styles by using the Move Up and Move Down buttons. This will also change the order that they appear in the Styles drop-down menu. The alternate styles are combined with the main CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the rules that are defined in the last alternate style in this list will take precedence, since it is the last one to be combined (applied as a layer).

The URI column shows the path of each CSS file. The names listed in the Styles drop-down menu match the values in the Title column. The value in the Alternate column determines whether it is a main or alternate CSS. If the value is no it is a main CSS. If the value is yes it is an alternate CSS and the style can be combined with a main CSS or other alternate styles when using the Styles drop-down menu.

**Note:** To group alternate styles into categories (submenus), use a vertical bar character (|) in the Title column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the Styles drop-down menu, while the text after the final vertical bar will be rendered as the name of the style inside the submenu.

**Example:** Suppose that you want to add two alternate stylesheets in separate submenus, with the Title column set to My Styles|User Assistance|Hints and My Styles|User Actions|Inline Actions, respectively.
Oxygen XML Editor Eclipse plugin will add a **My Styles** submenu with two submenus (**User Assistance** that contains the **Hints** style, and **User Actions** that contains the **Inline Actions** style) in the **Styles** drop-down menu.

The **Enable multiple selection of alternate CSSs** checkbox (on page 68) at the bottom of the pane must be selected for the **alternate CSS styles** (on page 2132) to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the **alternate** styles are treated like **main CSS styles** (on page 2136) and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to **ignore** or **merge** them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

**Using the Styles Drop-down Menu**

You can use the **Styles** drop-down menu to select a **main css style** (on page 2136) that applies to the whole document and then select one or more **alternate css styles** (on page 2132) that behave like layers and are merged sequentially with the **main style**. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in **Author** mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Editor Eclipse plugin will remember them when subsequent documents are opened.

**Main CSS Style**

The **main styles** are listed in the top section and each of their corresponding CSS files are primarily used to render basic things such as the font and background of the document. You can only select one main style at a time.

**Alternate CSS Styles**

The **alternate styles** are listed in the bottom section and their corresponding CSS files are used to render numerous different types of things in the document as they are merged with the selected **main styles**. You can select as many alternate styles as you wish. If you are unsure about how each of the styles with change
the look of your documents based solely upon their name, there is no harm in selecting them to see the difference. You can simply deselect them to revert to the previous look.

**Note:** If you deselect the Enable multiple selection of alternate CSSs option (on page 68) in the CSS subtab of the Document Type configuration dialog box (on page 62), the alternate styles are treated like main CSS styles and you can only select one at a time.

**EXAMPLE: CSS Styles in DITA**

Oxygen XML Editor Eclipse plugin comes with a set of built-in CSS layer stylesheets for DITA documents (as well as some that are specifically for DITA maps (on page 2134)). In the subsequent figure, a DITA document has the Century style selected for the main CSS style and the alternate styles Full width, Show table column specification, Hints, and Inline actions are combined for additive styling to specific parts of the document.

**Tip:** The Hints style displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure. The Inline actions style displays possible elements that are allowed to be inserted at various locations throughout DITA documents.

**Figure 482. Styles Drop-down Menu in a DITA Document**

Localizing Frameworks

Oxygen XML Editor Eclipse plugin supports framework localization (translating framework actions, buttons, and menu entries to various languages). This lets you develop and distribute a framework to users that speak other languages without changing the distributed framework.

To localize the content of a framework, create a translation.xml file that contains all the translation (key, value) mappings. The translation.xml has the following format:

```xml
<translation>
  <languageList>
    <language description="English" lang="en_US"/>
    <language description="German" lang="de_DE"/>
    <language description="French" lang="fr_FR"/>
  </languageList>
  <key value="list">
    <comment>List menu item name.</comment>
    <val lang="en_US">List</val>
    <val lang="de_DE">Liste</val>
    <val lang="fr_FR">Liste</val>
  </key>
  ......................
</translation>
```

Oxygen XML Editor Eclipse plugin matches the GUI language with the language set in the translation.xml file. If this language is not found, the first available language declared in the <languageList> tag for the corresponding framework is used.

Add the directory where this file is located to the Classpath list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the Preferences dialog box (on page 47) and go to Document Type Association. Use the New or Edit button to open the Document type configuration dialog box (on page 62), go to Author > Actions, and rename the bold action to ${i18n(translation_key)}. Actions with a name format other than ${i18n(translation_key)} are not localized. Translation_key corresponds to the key from the translation.xml file.

Now open the translation.xml file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:
To use a description from the translation.xml file in the Java code used by your custom framework, use the new ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle() API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```css
title:before{
    content:"${i18n(title.key)} : ";
}
```

**Note:** You can enter any language you want in the <languagelist> tag and any number of keys.

The translation.xml file for the DocBook framework is located here: [OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml. In the Classpath list corresponding to the DocBook document type the following entry was added: ${framework}/i18n/.

To see how the DocBook actions are defined to use these keys for their name and description, open the Preferences dialog box (on page 47) and go to Document Type Association > Author > Actions. If you look in the Java class ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog available in the oxygen-sample-framework module of the Oxygen SDK Maven archetype, you can see how the new ro.sync.ecss.extensions.api.AuthorResourceBundle API is used to retrieve localized descriptions for various keys.

### Sharing a Custom Framework

You can create a custom framework by extending a built-in document type (on page 1551) (such as DITA or DocBook) using the Document Type Association preferences page (on page 60), make modifications to it, and then share the extension with your team.

### Sharing the Extended Framework

There are several ways that you can share the extended custom framework (on page 1551) with others:

- Distribute the extended framework along with a project by following these steps:
  1. In a location where you have full write access, create a folder for your project.
  2. Go to the Navigator view (on page 221) and create a project. Save it in the folder you created in step 1.
  3. Create a custom framework by extending an existing one (on page 1551), if you haven't already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your
custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).

4. Go to Options > Preferences > Document Type Association > Locations (on page 61).

5. In the Additional frameworks directories list, add an entry using the \$pd\ editor variable (on page 181) like this: \$pd\/custom\_frameworks.

6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their Navigator view (on page 221), the new framework becomes available in the list of document types.

• Distribute the directory of the extended framework (on page 1551) to the other members of your team. They will simply copy that directory to their /frameworks directory. The new framework will be available in their list of document types when Oxygen XML Editor Eclipse plugin starts.

To test the extended framework, the other members of your team can check the list of document types in the Document Type Association preferences page (on page 60) to see if the framework is present and if it appears before the built-in frameworks (meaning that it has higher priority).

Framework Customization Tutorial

This section contains topics meant to provide a general tutorial for customizing a framework (on page 2135). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

Tip: A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: https://www.oxygenxml.com/php/get_oxygen_sample_framework.php. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Framework Customization Overview

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

XML Grammar

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor Eclipse plugin needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor Eclipse plugin detects the schema, see Associating a Schema to XML Documents (on page 503).

Consider a use-case where several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, test_report.xsd defines a report with results of a testing session. The report consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0" maxOccurs="unbounded">
              <xs:element name="important" type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="entry">
          <xs:complexType>
            <xs:sequence>
              <xs:element name="test_name" type="xs:string"/>
              <xs:element name="passed" type="xs:boolean"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
</xs:schema>
CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in Author mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a `table-row` style. Similarly, the `row` elements must contain elements with a `table-cell` style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

**report**

The root of a report document. It should be rendered as a box that contains all other elements. To achieve this, the display type is set to `block`. Additionally, some margins are set for it. The CSS rule that matches this element is:

```css
report {
    display: block;
    margin: 1em;
}
```

**title**

The title of the report. Usually titles have a large font. The `block` display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```css
title {
    display: block;
    font-size: 2em;
}
```
Contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the block display. Also, the background color is changed to make it standout.

```
description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}
```

**line**

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be block style.

```
line {
    display:block;
}
```

**important**

Defines important text from the description. Since it can be mixed with text, its display property must be set to inline. Also, the text is emphasized with bold to make it easier to spot.

```
important {
    display:inline;
    font-weight:bold;
}
```

**results**

Displays the list of test_names and the results for each one. To make it easier to read, it is displayed as a table, with a green border and margins.

```
results{
    display:table;
    margin:2em;
    border:1px solid green;
}
```

**entry**

The results are displayed as a table so the entry is a row in the table. Thus, the display is table-row.

```
entry {
    display:table-row;
}
```

test_name, passed
The name of the individual test, and its result. They are cells in the results table with the display set to `table-cell`. Padding and a border are added to emphasize the table grid.

```css
test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}
passed{
    font-weight:bold;
}
```

The full content of the CSS file `test_report.css` is:

```css
report {
    display:block;
    margin:1em;
}
description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}
line {
    display:block;
}
important {
    display:inline;
    font-weight:bold;
}
title {
    display:block;
    font-size:2em;
}
results{
    display:table;
```
Oxygen XML Editor Eclipse Plugin 22.0 | 17 - Framework and Author Mode Customization | 1600

Figure 483. Report Rendered in Author Mode

![Automated test report](image)

Note: You can edit attributes in-place in the Author mode using form-based controls (on page 327).

**XML Instance Template**

Based on the XML Schema and CSS file Oxygen XML Editor Eclipse plugin can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:
The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
        xsi:noNamespaceSchemaLocation="http://www.mysite.com/reports/test_report.xsd">
    <title>Test report title</title>
    <description>
        ......
    </description>
</report>
```

If you want to share the files with other team members, you could create an archive containing the `test_report.xml`, `test_report.css`, and `test_report.xsd` and send it to the other users.
Basic Tutorial: Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type (framework (on page 2135)). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action. For more advanced and other types of customizations, see the Advanced Framework Customization (on page 1551) section.

Step 1: Organize Framework Files

First, create a new folder for your customized framework (on page 2135). This folder will be used to store all files related to the documentation framework. The folder structure will look something like this:

```
oxygen
  frameworks
    sdf
      schema
    css
```

The frameworks directory is the container where all the Oxygen XML Editor Eclipse plugin framework customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a framework means delivering a framework directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor Eclipse plugin installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your framework distribution, copy it in the frameworks directory of the newly installed application and start Oxygen XML Editor Eclipse plugin by running the provided start-up script files.

You should copy the created schema files abs.xsd and sdf.xsd, sdf.xsd being the master schema, to the schema directory and the CSS file sdf.css to the css directory.

Step 2: Extend an Existing Framework

The easiest way to create a custom framework (on page 2135) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the Preferences dialog box (on page 47) and go to Document Type Association > Locations (on page 61). Add the path to your custom framework directory in the Additional frameworks directories list and click OK or Apply to save your changes.

2. Go to the Document Type Association preferences page (on page 60) and select an existing framework configuration (for example, DocBook) and use the Extend button to create an extension for it.

   **Step Result:** This opens the Document Type Configuration dialog box (on page 62) where you can define the set of rules and settings for your custom framework.
3. Give the extension an appropriate name, select **External** for the **Storage** option, click the browsing button ( ) to specify the location of your custom framework directory.

4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.

**Results:** You now have a fully functional framework that you can continue to customize.

### Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook framework (on page 2135), suppose the documents are either *articles* or *books*, and composed of *sections*. The *sections* may contain `<title>`, `<para>`, `<figure>`, `<table>`, and other `<section>` elements. To complete the picture, each section includes a `<def>` element from another namespace.

The first schema file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://www.oxygenxml.com/sample/documentation"
  xmlns:doc="http://www.oxygenxml.com/sample/documentation"
  xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
  elementFormDefault="qualified">

  <xs:import namespace="http://www.oxygenxml.com/sample/documentation/abstracts"
    schemaLocation="abs.xsd"/>

  <xs:element name="book" type="doc:sectionType"/>
  <xs:element name="article" type="doc:sectionType"/>
  <xs:element name="section" type="doc:sectionType"/>

  <xs:complexType name="sectionType">
    <xs:sequence>
      <xs:element name="title" type="xs:string"/>
      <xs:element ref="abs:def" minOccurs="0"/>
      <xs:choice>
        <xs:sequence>
          <xs:element ref="doc:section" maxOccurs="unbounded"/>
        </xs:sequence>
        <xs:sequence>
        </xs:sequence>
      </xs:choice>
    </xs:sequence>
  </xs:complexType>
</xs:schema>
```

The namespace of the documents will be **http://www.oxygenxml.com/sample/documentation**. The namespace of the `<def>` element is **http://www.oxygenxml.com/sample/documentation/abstracts**.

Next, the structure of the sections is defined. They all start with a `<title>`, then have the optional `<def>` element then either a sequence of other sections, or a mixture of paragraphs, images, and tables.
The paragraph contains text and other custom styling markup, such as bold (\textbf{}) and italic (\textit{}) elements.

The \textit{} element has an attribute with a reference to the file containing image data.

The \textbf{} element contains a header row and then a sequence of rows (\texttt{\textit{tr}} elements) each of them containing the cells. Each cell has the same content as the paragraphs.
The `<def>` element is defined as a text only element in the imported schema `abs.xsd`:

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"

targetNamespace="http://www.oxygenxml.com/sample/documentation/abstracts"
>
<xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

### Step 4: Associate the Schema to the Framework

In the bottom section of the **Document Type** configuration dialog box (on page 62), there are a series of tabs. The **Schema** tab refers to the schema that is used for validation of the documents that match the defined association rules.

**Important:** If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this **Schema** tab will not be used for validation or content completion.

**Schema Type**

Select from the combo box the value **XML Schema**.

**Schema URI**

Enter the value of the schema location (for example, `${frameworks}/sdf/schema/sdf.xsd`). Use the `${frameworks}` editor variable (on page 181) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor Eclipse plugin installations.
Important: The $frameworks variable is expanded at the time of validation into the absolute location of the directory containing the framework (on page 2135).

Step 5: Create a Custom CSS

If you read the Framework Customization Overview (on page 1595) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the Author mode layout engine) to associate specific properties with that element.

Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: book, article, section, title, figure, table, image. These elements are marked as having block style for display. Elements that are placed one after the other in a flowing sequence are: b, i. These will have inline display.

```css
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
    display:block;
}

/* Horizontal flow */
b,i {
    display:inline;
}
```

Important: Having block display children in an inline display parent results in Oxygen XML Editor Eclipse plugin changing the style of the parent to block display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The * operator matches any element, it can be used to match titles having progressive depths in the document.

```css
title{
    font-size: 2.4em;
    font-weight: bold;
}
* * title{
```
It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The :before and :after pseudo elements will be used, plus the CSS counters.

First declare a counter named `sect` for each `book` or `article`. The counter is set to zero at the beginning of each such element:

```css
book,
article{
    counter-reset: sect;
}
```

The `sect` counter is incremented with each section, that is a direct child of a `book` or an `article` element.

```css
book > section,
article > section{
    counter-increment: sect;
}
```

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the `sect` counter and a dot.

```css
book > section > title:before,
article > section > title:before{
    content: "Section " counter(sect) ". ";
}
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```css
section{
    margin-left: 1em;
    margin-top: 1em;
}
```
In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

Styling Inline Elements

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```javascript
b {
    font-weight: bold;
}

i {
    font-style: italic;
}
```

Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor Eclipse plugin supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor Eclipse plugin.

```javascript
image{
    display: block;
    content: attr(href, url);
    margin-left: 2em;
}
```
The `image` element has the required `@href` attribute of type `xs:anyURI`. The `@href` attribute contains an image location so the rendered content is obtained by using the function:

```
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor Eclipse plugin identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Editor Eclipse plugin handles both absolute and relative specified URLs. If the image has an absolute URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is relative specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity `graphic` that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the Author mode:

```
imagedata[entityref]{
  content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `@width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```
imagedata[width]{
  width: attr(width, length);
}
```
Step 6: Associate the Custom CSS to the Framework

Once you have customized your framework through CSS styling rules, you then need to associate the custom CSS file.

Step 7: Testing the Framework Customization

To test the new framework (on page 2135) customization, create an XML instance that conforms with the association rules that you specified in your framework customization. You will not specify an XML Schema location directly in the document, using an xsi:schemaLocation attribute. Instead, Oxygen XML Editor Eclipse plugin will detect its associated document type and use the specified schema.

```xml
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
  <title>My Technical Book</title>
  <section>
    <title>XML</title>
    <abs:def>Extensible Markup Language</abs:def>
    <para>In this section of the book I will explain different XML applications.</para>
  </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the title to title2. Validate again. This time there should be an error.

Invalid content was found starting with element 'title2'. One of 'xmlns"http://www.oxygenxml.com/sample/documentation":title' is expected.
Undo the tag name change, go to **Author** mode, and Oxygen XML Editor Eclipse plugin should load the CSS from the *document type association* (on page 2134) and create a layout similar to this:

![Figure 486. Example: Testing a Framework Customization](image)

### Customizing Author Mode Through CSS

The visual **Author** editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The **Author** editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Also, Oxygen XML Editor Eclipse plugin has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who customize **Author** mode through custom frameworks (on page 1551).

### Associating a CSS with an XML Document

**Associating a Stylesheet with an XML Document**

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the **version 2.1 of the CSS specification** from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported.

There are several methods for associating a stylesheet (CSS) with an XML document:

- **Insert the xml-stylesheet processing instruction** with the `@type` attribute at the beginning of the XML document. The easiest way to do this is by using the [Associate XSLT/CSS Stylesheet](#) action that is available on the toolbar or in the **XML** menu.

  CSS example:

  ```xml
  <?xml-stylesheet type="text/css" href="test.css"?>
  ```

- **Add a new CSS file** to a **framework** (on page 2135) (document type). To do so, [open the Preferences dialog box](#) and go to **Document Type Association**. Edit the appropriate **framework**, open the **Author** tab, then the **CSS** subtab. Click the [New](#) button to add a new CSS file.

  **Note:** The built-in frameworks are read-only, so you need to [Extend](#) or [Duplicate](#) them to configure them as custom frameworks.
If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

**Figure 487. Document with no CSS association default rendering**

For information about associating a CSS to a framework (document type), see Customizing Author Mode Using CSS Files Associated with a Framework (on page 1587).

**Handling CSS Imports**

When a CSS document contains imports to other CSS documents, the references are also passed through the XML Catalog (on page 2139) URI mappings to determine an indirect CSS referenced location.

**Example: CSS Import**

For example, if you can have a CSS import, such as:

```html
@import "http://host/path/to/location/custom.css";
```

and then add your own XML Catalog (on page 2139) file that maps the location to a custom CSS in the XML Catalog preferences page (on page 149):

```xml
<uri name="http://host/path/to/location/custom.css"
    uri="path/to/custom.css"/>
```

**Adding a Custom Default CSS for Every XML Document**

To add a custom CSS that is applied to every XML document, add a mapping in your XML Catalog (on page 2139) file that looks like this:

```xml
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
    uri="path/to/custom.css"/>
```
This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual **Author** editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

**Editor Variables in CSS Imports**

You can use various editor variables (*on page 176*) in CSS imports. When editing an XML document with an associated CSS in **Author** mode, the editor variables will be expanded and resolved.

**Example: Editor Variable in a CSS Import**

For example, the following editor variable:

```css
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA framework (*on page 2135*) folder where the `custom.css` is placed. In the Document Type Association preferences page (*on page 60*), you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the `framework()` function.

**Note:** If you use editor variables like `${cfdu}` (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.

**Displaying Processing Instructions from Other XML Editors**

By default, external processing instructions are hidden (for example, processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be associated with the current document using a CSS (*on page 1611*) like this:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
oxy|processing-instruction[Pub],
oxy|processing-instruction[PubTbl],
oxy|processing-instruction[xm-replace_text],
oxy|processing-instruction[xm-deletion_mark],
oxy|processing-instruction[xm-insertion_mark_start],
oxy|processing-instruction[xm-insertion_mark_end]
{
    display:block !important;
}
```

**Specifying Media Types in the CSS**

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Editor Eclipse plugin **Author** mode and ignored in other media types. This can be accomplished by using the `oxygen` media type.

**Example: oxygen Media Type**
This example results in the text being bold if the document is opened in a web browser that does not recognize `@media oxygen`, while the text is bold and underlined when opened in Oxygen XML Editor Eclipse plugin Author mode.

You can also use the `oxygen` media type to specify CSS selectors to be applied in certain operating systems or platforms by using the `os` and `platform` properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor Eclipse plugin in Windows, and another set of style rules for Mac OS. The supported properties are as follows:

- **os** - The possible values are: win, linux, or mac.
- **platform** - The possible values are: standalone, eclipse, or webapp.

**Example: os and platform Properties**

```css
@media oxygen AND (os:"win") AND (platform:"standalone") {  
  p{
    content:"PPP";
  }
}
```

**Related Information:**
- [@media Rule (on page 1615)](#)

**CSS At-Rules**

Oxygen XML Editor Eclipse plugin supports some of the standard at-rules specified by CSS Level 2.1 and 3. The `@media` rule also include support for some style rules that are specific to Oxygen XML Editor Eclipse plugin.

**@font-face At-Rule**

Oxygen XML Editor Eclipse plugin allows you to use custom fonts in the Author mode by specifying them in the CSS using the `@font-face` media type. Only the `src` and `font-family` CSS properties can be used for this media type.
Example: \texttt{@font-face} Rule

\texttt{@font-face{}
  \hspace{1em} font-family: "Baroque Script";
  /* The location of the loaded TTF font must be relative to the CSS*/
  \hspace{1em} src:url("BaroqueScript.ttf");
}

The specified \texttt{font-family} must match the name of the font declared in the \texttt{.ttf} file.

@\texttt{media} Rule

The \texttt{@media} rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Editor Eclipse plugin supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- \texttt{screen} - The styles marked with this media type are used only for rendering a document on screen.
- \texttt{print} - The styles marked with this media type are used only for printing a document.
- \texttt{all} - The styles marked with this media type are used for rendering a document in all supported types of media.
- \texttt{oxygen} - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode. For more information, see Specifying Media Types in the CSS (on page 1613).
- \texttt{oxygen-dark-theme} - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode when a dark theme is used (for example, \texttt{Graphite}).
- \texttt{oxygen-high-contrast-black} - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode on a Windows High Contrast Theme with a black background.
- \texttt{oxygen-high-contrast-white} - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin Author mode on a Windows High Contrast Theme with a white background.

Example: \texttt{@media} Rule

\texttt{@media oxygen{}
  \hspace{1em} b{
    text-decoration:underline;
  }
}\texttt{}}
\texttt{@media oxygen-high-contrast-white{}
  \hspace{1em} b{
    font-weight:bold;
}\texttt{}}
Supported Properties

Oxygen XML Editor Eclipse plugin also supports a few properties to set specific style rules that depend upon the size of the visible area in Author mode. These supported properties are as follows:

- **min-width** - The styles selected in this property are applied if the visible area in Author mode is equal to or greater than the specified value.
- **max-width** - The styles selected in this property are applied if the visible area in Author mode is less than or equal to the specified value.

**Example: min-width and max-width Properties**

```css
@media (min-width:500px) {
    p{
        content: 'XXX';
    }
}
@media (max-width:700px) {
    p:after{
        content: 'yyy';
    }
}
```

- [Specifying Media Types in the CSS](on page 1613)

Standard W3C CSS Supported Features

Oxygen XML Editor Eclipse plugin supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

Supported CSS Selectors

The following table lists the CSS selectors that are supported in Oxygen XML Editor Eclipse plugin:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Universal selector</td>
<td>CSS Level 2</td>
<td>Matches any element</td>
</tr>
<tr>
<td>E</td>
<td>Type selector</td>
<td>CSS Level 2</td>
<td>Matches any element (i.e. an element with the local name E)</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------</td>
<td>-----------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>E F</td>
<td>Descendant selector</td>
<td>CSS Level 2</td>
<td>Matches any ( F ) element that is a descendant of an ( E ) element.</td>
</tr>
<tr>
<td>E &gt; F</td>
<td>Child selectors</td>
<td>CSS Level 2</td>
<td>Matches any ( F ) element that is a child of an element ( E ).</td>
</tr>
<tr>
<td>E:lang(c)</td>
<td>Language pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element of type ( E ) if it is in (human) language ( c ) (the document language specifies how language is determined).</td>
</tr>
<tr>
<td>E + F</td>
<td>Adjacent selector</td>
<td>CSS Level 2</td>
<td>Matches any ( F ) element immediately preceded by a sibling element ( E ).</td>
</tr>
<tr>
<td>E ~ F</td>
<td>General sibling selector</td>
<td>CSS Level 3</td>
<td>Matches any ( F ) element preceded by a sibling element ( E ).</td>
</tr>
<tr>
<td>E[foo]</td>
<td>Attribute selector</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element with the ( &quot;foo&quot; ) attribute set (whatever the value).</td>
</tr>
<tr>
<td>E[foo=&quot;warning&quot;]</td>
<td>Attribute selector with value</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element whose ( &quot;foo&quot; ) attribute value is exactly equal to ( &quot;warning&quot; ).</td>
</tr>
<tr>
<td>E[foo~=&quot;warning&quot;]</td>
<td>Attribute selector containing value</td>
<td>CSS Level 2</td>
<td>Matches any ( E ) element whose ( &quot;foo&quot; ) attribute value is a list of space-separated values, one of which is exactly equal to ( &quot;warning&quot; ).</td>
</tr>
<tr>
<td>E[lang</td>
<td>=&quot;en&quot;]</td>
<td>Attribute selector containing hyphen separated values</td>
<td>CSS Level 2</td>
</tr>
<tr>
<td>E:before and E:after</td>
<td>Pseudo elements</td>
<td>CSS Level 2</td>
<td>The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.</td>
</tr>
<tr>
<td>E:first-child</td>
<td>The first-child pseudo-class</td>
<td>CSS Level 2</td>
<td>Matches element ( E ) when ( E ) is the first child of its parent.</td>
</tr>
<tr>
<td>E:not(s)</td>
<td>Negation pseudo-class</td>
<td>CSS Level 2</td>
<td>An ( E ) element that does not match simple selector ( s ).</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>------</td>
<td>-----------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>E:has</td>
<td>Relational pseudo-class</td>
<td>CSS Level 4</td>
<td>The :has() relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see :has Relational Pseudo-Class (on page 1622).</td>
</tr>
<tr>
<td>E:hover</td>
<td>The hover pseudo-class</td>
<td>CSS Level 2</td>
<td>The :hover pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.</td>
</tr>
<tr>
<td>E:focus</td>
<td>The focus pseudo-class</td>
<td>CSS Level 2</td>
<td>The :focus pseudo-class applies while an element has the focus (accepts keyboard input).</td>
</tr>
<tr>
<td>E:focus-within</td>
<td>The generalized input focus pseudo-class</td>
<td>CSS Level 4</td>
<td>The :focus-within pseudo-class applies to elements that will have the :focus pseudo-class applied. Additionally, the ancestors of an element that matches :focus-within also match.</td>
</tr>
<tr>
<td>E:marker</td>
<td>The marker pseudo-class</td>
<td>CSS Level 4</td>
<td>The ::marker pseudo-element represents the automatically generated marker box of a list item.</td>
</tr>
<tr>
<td>E#myid</td>
<td>The ID selector</td>
<td>CSS Level 2</td>
<td>Matches any E element with ID equal to &quot;myid&quot;.</td>
</tr>
<tr>
<td>E[att^=&quot;val&quot;]</td>
<td>Substring matching attribute selector</td>
<td>CSS Level 3</td>
<td>An E element whose att attribute value begins exactly with the string val.</td>
</tr>
</tbody>
</table>

**Important:** Limitation: In Oxygen XML Editor Eclipse plugin the match is performed only taking into account the attributes with the exact name: "id".
<table>
<thead>
<tr>
<th>Expression</th>
<th>Name</th>
<th>CSS Level</th>
<th>Description / Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>E[att$=&quot;val&quot;]</td>
<td>Substring matching attribute</td>
<td>CSS Level 3</td>
<td>An E element whose <code>att</code> attribute value ends exactly with the string <code>val</code>.</td>
</tr>
<tr>
<td></td>
<td>selector</td>
<td></td>
<td></td>
</tr>
<tr>
<td>E[att*=&quot;val&quot;]</td>
<td>Substring matching attribute</td>
<td>CSS Level 3</td>
<td>An E element whose <code>att</code> attribute value contains the substring <code>val</code>.</td>
</tr>
<tr>
<td></td>
<td>selector</td>
<td></td>
<td></td>
</tr>
<tr>
<td>E:root</td>
<td>Root pseudo-class</td>
<td>CSS Level 3</td>
<td>Matches the root element of the document. In HTML, the root element is always the HTML element.</td>
</tr>
<tr>
<td>E:empty</td>
<td>Empty pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element that has no text or child elements.</td>
</tr>
<tr>
<td>E:nth-child(n)</td>
<td>The nth-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent.</td>
</tr>
<tr>
<td>E:nth-last-child(n)</td>
<td>The nth-last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth child of its parent, counting from the last one.</td>
</tr>
<tr>
<td>E:nth-of-type(n)</td>
<td>The nth-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type.</td>
</tr>
<tr>
<td>E:nth-last-of-type(n)</td>
<td>The nth-last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, the nth sibling of its type, counting from the last one.</td>
</tr>
<tr>
<td>E:last-child</td>
<td>The last-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last child of its parent.</td>
</tr>
<tr>
<td>E:first-of-type</td>
<td>The first-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, first sibling of its type.</td>
</tr>
<tr>
<td>E:last-of-type</td>
<td>The last-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, last sibling of its type.</td>
</tr>
<tr>
<td>E:only-child</td>
<td>The only-child pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, only child of its parent.</td>
</tr>
<tr>
<td>E:only-of-type</td>
<td>The only-of-type pseudo-class</td>
<td>CSS Level 3</td>
<td>An E element, only sibling of its type.</td>
</tr>
<tr>
<td>ns</td>
<td>E</td>
<td>Element namespace selector</td>
<td>CSS Level 3</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>@namespace ns &quot;http://some_namespace_uri&quot;;</td>
</tr>
<tr>
<td>Expression</td>
<td>Name</td>
<td>CSS Level</td>
<td>Description / Example</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------</td>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>E!&gt;F</td>
<td>The subject selector</td>
<td>CSS Level 4</td>
<td>An element that has the local name E and has a child F. See Subject Selector (on page 1621).</td>
</tr>
</tbody>
</table>

### Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor Eclipse plugin uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```xml
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```
b {font-weight:bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

**Example: Defining prefixed and default namespaces**

Given the namespace declarations:

```xml
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

Then:

```
sync|A
```

Represents the name A in the `http://sync.example.org` namespace.

```
*B
```

Represents the name B in ANY namespace, including NO NAMESPACE.

```
C
```

Represents the name C in ANY namespace, including NO NAMESPACE.

**Example: Defining prefixed namespaces combined with pseudo-elements**

To match the `<def>` element its namespace declares, bind it to the `abs` prefix and then write a CSS rule:
Oxygen XML Editor Eclipse plugin supports the subject selector described in CSS Level 4 (currently a working draft at W3C [http://www.w3.org/TR/selectors4/]). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.

**Example:**

```
table! > caption {
    border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```
table > caption {
    border: 1px solid red;
}
```

This draws a border around the caption.

**Taking Processing Instructions into Account in CSS Subject Selectors**

You can test for the existence of specific processing instructions (\texttt{PI}) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
    color:red;
}
```
This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```xml
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

### Descendant Selectors Limitation

**Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```css
a:has(b c)
```

and:

```css
a:has(b>c)
```

**Related Information:**

- :has Relational Pseudo-Class *(on page 1622)*

### :has Relational Pseudo-Class

Oxygen XML Editor Eclipse plugin supports the CSS Level 4 subject selector (currently a working draft at W3C [http://www.w3.org/TR/selectors4/](http://www.w3.org/TR/selectors4/)), as described in Subject Selector *(on page 1621)*. Oxygen XML Editor Eclipse plugin also supports the :has relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see [https://drafts.csswg.orgselectors-4/#relational](https://drafts.csswg.orgselectors-4/#relational).

You can create conditions that take into account the structure of the matching element.

**Example:** `has` Pseudo Class

```css
table:has( tbody > thead){
  border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `<thead>` element in the `<tbody>` element.

### Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (`PI`) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```
This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

### Descendant Selectors Limitation

**Important:** The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a:has(b c)
```

and:

```
a:has(b>c)
```

### Supported CSS Properties

Oxygen XML Editor Eclipse plugin validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in Author mode, as well as some of the values of the *visual* category that are listed below under the Ignored Values column. For the Oxygen XML Editor Eclipse plugin-specific (extension) CSS properties, see CSS Extensions (on page 1633).

<table>
<thead>
<tr>
<th>Name</th>
<th>Rendered Values</th>
<th>Ignored Values</th>
</tr>
</thead>
<tbody>

| | ed for *inline*, *block-level*, and replaced elements (such as images, tables, table cells) | |
| 'word-spacing' | NONE | |
| 'z-index' | NONE | |

**<length>** - Refers to distance measurements and is expressed in units such as mm, cm, in, em, rem, ex, pc, pt, px. For more information, see the W3 CSS Level 3 length type specifications.

**Related Information:**
- CSS Extensions *(on page 1633)*

### Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of 0 corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a real number between 0 and 1, or a percent.

**Example: RGBA Color**

```
personnel:before {
    display:block;
    padding: 1em;
    font-size: 1.8em;
    content: "Employees";
    font-weight: bold;
    color:#EEEEEE;
    background-color: rgba(50, 50, 50, 0.6);
}
```

### attr() Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content only for the pseudo-elements. For instance, the :before pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```
title:before{
    content: "[Audience Level: " attr(audience) "]";
}
```

If the `<title>` element from the XML document is:

```
<title audience="Expert">Changing the Timing Belt</title>
```
Then the title will be displayed as:

[Audience Level: Expert] Changing the Timing Belt

In Oxygen XML Editor Eclipse plugin, the use of \texttt{attr()} function is available not only for the \texttt{content} property, but also for any other property. This is similar to the CSS Level 3 working draft: http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional. The arguments of the function are:

\begin{verbatim}
attr ( attribute_name , attribute_type , default_value )
\end{verbatim}

\texttt{attribute_name}

The attribute name. This argument is required.

\texttt{attribute_type}

The attribute type. This argument is optional. If it is missing, argument's type is considered \texttt{string}. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor Eclipse plugin accepts one of the following types:

\texttt{color}

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor Eclipse plugin supports colors specified either by name (red, blue, green, etc.) or as an RGB hexadecimal value \texttt{#FFFFEE}.

\texttt{url}

The value is a URL pointing to a media object. Oxygen XML Editor Eclipse plugin supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

\texttt{integer}

The value must be interpreted as an integer.

\texttt{number}

The value must be interpreted as a float number.

\texttt{length}

The value must be interpreted as an integer.

\texttt{percentage}

The value must be interpreted relative to another value (length, size) expressed in percents.

\texttt{em}

The value must be interpreted as a size. 1 em is equal to the \texttt{font-size} of the relevant font.

\texttt{ex}
The value must be interpreted as a size. 1 ex is equal to the height of the x character of the relevant font.

**px**

The value must be interpreted as a size expressed in pixels relative to the viewing device.

**mm**

The value must be interpreted as a size expressed in millimeters.

**cm**

The value must be interpreted as a size expressed in centimeters.

**in**

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

**pt**

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

**pc**

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

**default_value**

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

**Example: attr Function**

Consider the following XML instance:

```
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">Green paragraph with small font and margin.</para>
</sample>
```

The `<para>` elements have `@bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```
background-color: attr(bg_color, color);
```

The `font_size` represents the font size in `em` units. You can use this value to change the style of the element:

```
font-size: attr(font_size, em);
```

The complete CSS rule is:
The document is rendered as:

CSS Level 3 target-counter() and target-counters() Functions

The CSS Level 3 functions `target-counter` and `target-counters` can be used as values for the `content` property to retrieve counter values and display information obtained from a target at the end of a link.

**target-counter Function**

This function retrieves the value of the innermost counter with a given name.

```
target-counter ( <url> , <custom-ident> [ , <counter-style> ] ? )
```

- **url**
  
  The URL of the target. This argument is required.

- **custom-ident**
  
  The name of the counter. This argument is required.

- **counter-style**
  
  This argument can be used to format the result. This argument is optional.

**Example:**
HTML:

```html
<nav>
  <ol>
    <li class="frontmatter"><a href="#pref_01">Preface</a></li>
    <li class="frontmatter"><a href="#intr_01">Introduction</a></li>
    <li class="bodymatter"><a href="#chap_01">Chapter One</a></li>
  </ol>
</nav>
```

CSS:

```css
.frontmatter a::after { content: leader(\.'\') target-counter(attr(href url), page, lower-roman) }
.bodymatter a::after { content: leader(\.'\') target-counter(attr(href url), page, decimal) }
```

Result:

```
Preface..............vii
Introduction.........xi
Chapter One.........1
```

target-counters Function

This function fetches the value of all counters of a given name from the end of a link, and formats them by inserting a given string between the value of each nested counter.

```
target-counter ( <url> , <custom-ident> , <string> [, <counter-style> ] ? )
```

url

The URL of the target. This argument is required.

custom-ident

The name of the counter. This argument is required.

string

The string to be inserted between the value of each nested counter. This argument is required.

counter-style

This argument can be used to format the result. This argument is optional.

Related Information:

- [https://www.w3.org/TR/css-gcpm-3/#target-counter](https://www.w3.org/TR/css-gcpm-3/#target-counter)
- [https://www.w3.org/TR/css-gcpm-3/#target-counters](https://www.w3.org/TR/css-gcpm-3/#target-counters)
calc() Function

The `calc()` function allows mathematical expressions with addition (+), subtraction (-), multiplication (*), division (/) to be used as component values. Percentages are solved relative to the dimensions of the containing parent block. It can be used when length values are accepted:

```css
elem {
  width: calc(100% - 1em);
}
```

For more information, see: [https://drafts.csswg.org/css-values-3/#calc-notation](https://drafts.csswg.org/css-values-3/#calc-notation)

CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor Eclipse plugin CSS extensions are useful.

Examples of how they can be used:

- Property for marking *foldable elements* (on page 2134) in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
- Constructing a URL from a relative path location.
- String processing functions.

Built-in CSS Selectors

When Oxygen XML Editor Eclipse plugin renders content in the Author mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

List of CSS Selector Contributed by Oxygen XML Editor Eclipse plugin

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
@namespace xi "http://www.w3.org/2001/XInclude";

*[dir='lro'] { direction:ltr; unicode-bidi:bidi-override; }

@media oxygen-high-contrast-black, oxygen-dark-theme{
/*
 * In DIFF these place holder PIs are not handled so we treat them as normal PIs with a bit of styling.
 */

oxy|processing-instruction[oxy-placeholder] {
    visibility: -oxy-collapse-text;
    -oxy-display-tags:none;
}

oxy|processing-instruction[oxy-placeholder]:before {
    background-color: rgba(192, 192, 192, 0.2) !important;
    color: rgba(0, 0, 0, 0.6) !important;
    font-weight: bold;
    /* When there isn't an associated CSS the NO_CSS rules hide the PIs. @see AuthorViewport.CSS_ERROR_END */
    display: -oxy-morph;
    content: attr(content) !important;
}

@media oxygen-high-contrast-black, oxygen-dark-theme{
    oxy|processing-instruction[oxy-placeholder]:before {
        background-color: rgba(0, 0, 0, 0.15) !important;
        color: rgb(156, 156, 156) !important;
    }
    /* -----------------------------------------------
    * built-in oXygen elements
    */
    oxy|comment {
        color: #a2a2a2 !important;
        background-color: transparent !important;
    }
}
Example:

To show all entities in the Author mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```css
oxy|entity {
    background-color: inherit !important;
}
```

Additional CSS Selectors

Oxygen XML Editor Eclipse plugin provides support for selecting additional types of nodes. These custom selectors apply to: document, doctype, processing-instruction, comment, CDATA sections, entities, and reference sections. Processing-instructions are not displayed by default. To display them, open the Preferences dialog box (on page 47), go to Editor > Author, and select Show processing instructions.

Note: The custom selectors are presented in the default CSS for Author mode and all of their properties are marked with the !important flag. For this reason, you have to set the !important flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the Author mode extensions namespace at the beginning of the stylesheet documents:

```css
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- **oxy|document** - The oxy|document selector matches the entire document:

  ```css
  oxy|document {
      display:block !important;
  }
  ```

- **oxy|doctype** - The following example changes the rendering of doctype sections:

  ```css
  oxy|doctype {
      display:block !important;
      color:blue !important;
      background-color:transparent !important;
  }
  ```
• **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

```css
oxy|processing-instruction {
    display:block !important;
    color:purple !important;
    background-color:transparent !important;
}
```

A processing instruction usually has a target and one or more pseudo attributes:

```xml
<?target_name data="b"?>
```

You can match a processing instruction with a particular target from the CSS using the following construct:

```css
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```css
oxy|processing-instruction[target_name][data="b"]
```

• **oxy|comment** - The XML comments displayed in Author mode can be changed using the `oxy|comment` selector:

```css
oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
}
```

• **oxy|cdata** - The `oxy|cdata` selector matches **CDATA** sections:

```css
oxy|cdata{
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
}
```

• **oxy|entity** - The `oxy|entity` selector matches the entity content:

```css
oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
    background-color:transparent !important;
}
```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```css
oxy|entity[name='amp'],
oxy|entity[name='lt'],
```
oxy|entity[name='gt'],
oxy|entity[name='quot'],
oxy|entity[name='apos'],
oxy|entity[name='#']{
  -oxy-display-tags: none;
}

• **oxy|reference** - The references to entities, XInclude, and DITA @conref and @conkeyref attributes are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that references them.

You can use the **reference** property to customize the way these references are rendered in **Author** mode:

```css
oxy|reference {
  border: 1px solid gray !important;
}
```

In the **Author** mode, content is highlighted when text contains comments (on page 354) and changes (if Track Changes (on page 354) was active when the content was modified).

If this content is referenced, the **Author** mode does not display the highlighted areas in the new context. If you want to mark the existence of the comments and changes, you can use the **oxy|reference[comments]**, **oxy|reference[changeTracking]**, and **oxy|reference[changeTracking][comments]** selectors.

**Note:** Two artificial attributes (comments and changeTracking) are set on the reference node, containing information about the number of comments and tracked changes in the content.

• The following example represents the customization of the reference fragments that contain comments:

```css
oxy|reference[comments]:before {
  content: "Comments: " attr(comments) !important;
}
```

• To match reference fragments based on the fact that they contain tracked changes inside, use the **oxy|reference[changeTracking]** selector:

```css
oxy|reference[changeTracking]:before {
  content: "Change tracking: " attr(changeTracking) !important;
}
```

• Here is an example of how you can set a custom color for the reference containing both tracked changes and comments:

```css
oxy|reference[changeTracking][comments]:before {
  content: "Change tracking: " attr(changeTracking) " and comments: " attr(comments) !important;
}
```
Additional CSS Properties

Oxygen XML Editor Eclipse plugin provides various additional CSS properties to extend the standard CSS properties.

Append Content Properties: -oxy-append-content / -oxy-prepend-content

Used to append specified content.

-oxy-append-content Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the content property, where only the value from the rule with the greatest specificity is taken into account, the -oxy-append-content property adds content to that generated by the lesser specificity rules into a new compound content.

Example:

```xml
element:before{
    content: "Hello";
}
element:before{
    -oxy-append-content: "World!";
}
```
The content shown before the element will be Hello World.

-oxy-prepend-content Property

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the content property, where only the value from the rule with the greatest specificity is taken into account, the -oxy-prepend-content prepends content to that generated by the lesser specificity rules into a new compound content.

Example:

```css
element:before{
  content: "Hello!";
}
element:before{
  -oxy-prepend-content: "said: ";
}
element:before{
  -oxy-prepend-content: "I ";
}
```

The content shown before the element will be I said: Hello.

Collapse Text: -oxy-collapse-text Property Value

Used to collapse the content of an element.

Oxygen XML Editor Eclipse plugin allows you to set the value of the visibility property to -oxy-collapse-text, meaning that the content of that element is not rendered. If an element is marked as -oxy-collapse-text you are not able to position the cursor inside it and edit it. The purpose of -oxy-collapse-text is to make the text value of an element editable only through a form control.

Example: visibility Property

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the Author visual editing mode:

```css
title{
  content: oxy_textfield(edit, '#text', columns, 40);
  visibility: -oxy-collapse-text;
}
```

Cyrillic Counters: -oxy-lower-cyrillic Property Values

Used to style lists with Cyrillic counters.
Oxygen XML Editor Eclipse plugin allows you to set the value of the `list-style-type` property to Cyrillic counters. For example, `-oxy-lower-cyrillic-ru`, `-oxy-lower-cyrillic-uk`, `-oxy-upper-cyrillic-ru` or `-oxy-upper-cyrillic-uk`, meaning that you can have Russian and Ukrainian counters.

**Example: Cyrillic Counters**

Counting list items with Cyrillic symbols:

```css
li{
  display:list-item;
  list-style-type:-oxy-lower-cyrillic-ru;
}
```

**Display Tag Markers: -oxy-display-tags Property**

Used to specify whether or not tag markers are displayed.

Oxygen XML Editor Eclipse plugin allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with `:before` and `:after` pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named `-oxy-display-tags`, with the following possible values:

- **none** - Tags markers will not be presented regardless of the current display mode (on page 314).
- **default** - The tag markers will be created depending on the current display mode (on page 314).
- **inherit** - The value of the property is inherited from an ancestor element.

```css
-oxy-display-tags
  Value: none | default | inherit
  Initial: default
  Applies to: all nodes(comments, elements, CDATA, etc.)
  Inherited: false
  Media: all
```

**Example: -oxy-display-tags Property**

In this example, the `para` element from DocBook uses a `:before` and `:after` element and its tag markers will not be visible.

```css
para:before{
  content: "{";
}
para:after{
  content: "}";
}
```
Editable: -oxy-editable Property

Used to inhibit the content of a particular element.

If you want to inhibit editing a certain element's content, you can set the -oxy-editable CSS property (deprecated property editable is also supported) to false.

Folding Elements: -oxy-foldable Property

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Editor Eclipse plugin allows you to declare some elements to be foldable (on page 2134). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor Eclipse plugin marks the foldable content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the Folding submenu of the contextual menu:

- **Toggle Fold**
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))**
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  Unfolds all elements in the current document.

To define the element whose content can be folded by the user, you must use the property: -oxy-foldable: true; . To define the elements that are folded by default, use the -oxy-folded: true property.

**Note:** The -oxy-folded property works in conjunction with the -oxy-foldable property. Thus, the folded property is ignored if the -oxy-foldable property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The property -oxy-not-foldable-child is used to identify the child element that is kept visible. It accepts as value an element name or a list of comma-separated element names. The first
child element from the XML document that appears in the list of element names will be identified as the not foldable child and displayed. If the element is marked as foldable (`-oxy-foldable:true;`) but it doesn't have the property `-oxy-not-foldable-child` or none of the specified non-foldable children exists, then the element is still foldable. In this case the element kept visible when folded will be the before pseudo-element.

Note: Deprecated properties `foldable`, `not-foldable-child`, and `folded` are also supported.

**Example: Folding DocBook Elements**

All the elements below can have a `<title>` child element and are considered to be logical sections. You mark them as being foldable leaving the `<title>` element visible.

```xml
<set>,
  <book>,
    <part>,
      <reference>,
        <chapter>,
          <preface>,
            <article>,
              <sect1>,
              <sect2>,
              <sect3>,
              <sect4>,
              <section>,
              <appendix>,
              <figure>,
              <example>,
            </article>,
          </preface>,
        </chapter>,
        <reference>,
        <chapter>,
        <preface>,
        <article>,
        </article> table {
            -oxy-foldable:true;
            -oxy-not-foldable-child: title;
        }
```

**Links: -oxy-link Property**

Used to specify that a particular element should be considered a link.

Oxygen XML Editor Eclipse plugin allows you to declare some elements to be links. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the `link` property on the :before or :after pseudo element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to `attr(href)`.

**Example: DocBook Link Elements**

The following elements are defined to be links on the :before pseudo element and their values are defined by the value of an attribute.
Morph Elements: -oxy-morph Property Value

Used to specify that an element should be displayed inline.

Oxygen XML Editor Eclipse plugin allows you to specify that an element has an -oxy-morph display type (deprecated morph property is also supported), meaning that the element is inline (on page 2135) if all its children are inline.

**Example: -oxy-morph Property Value**

Suppose you have a wrapper XML element that allows users to set a number of attributes on all sub-elements. This element should have an inline (on page 2135) or block (on page 2132) behavior, depending on the behavior of its child elements:

```xml
wrapper{
    display:-oxy-morph;
}
```

Placeholders for Empty Elements: -oxy-placeholder-content Property

Used to configure placeholders for empty elements.

Oxygen XML Editor Eclipse plugin displays the element name as pseudo-content for empty elements if the Show placeholders for empty elements option (on page 95) is selected in the Author preferences page and there is no before or after content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (-oxy-placeholder-content and -oxy-show-placeholder).

- **-oxy-placeholder-content CSS Property**

To control the displayed pseudo-content for empty elements, you can use the -oxy-placeholder-content CSS property.

The following example would change the `<keyword>` element to be displayed as `<key>`:

```css
...
Note: This CSS property accepts the \$\{i18n(key)\} (on page 181) localization editor variable, as in the following example:

- oxy-placeholder-content:\$\{i18n(id)\};

**-oxy-show-placeholder** CSS Property

The **-oxy-show-placeholder** property allows you to decide whether or not the placeholder will be shown. The possible values are:

- **always** - Always display placeholders.
- **default** - Always display placeholders if before or after content is not set in the CSS.
- **inherit** - The placeholders are displayed according to the Show placeholders for empty elements option (on page 95) (if before and after content is not declared).
- **no** - Never display placeholders.

Note: Deprecated properties **show-placeholder** and **placeholder-content** are also supported.

Related Information:
- Using Placeholders in Document Templates (on page 208)

**Style Elements: -oxy-style Property**

Used to configure the style of particular elements.

Oxygen XML Editor Eclipse plugin allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

**Example: -oxy-style Property**

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```css
*{
  -oxy-style:attr(style);
}
```

Suppose you want to display the `<title>` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```xml
<title style="color:red;">My Memoirs</title>
```

Tip: The `@style` attribute is supported by default in HTML5 documents.
**Tags Color: -oxy-tags-color Property**

Used to configure the background or foreground colors of tags.

By default, Oxygen XML Editor Eclipse plugin does not display element tags. You can use the **Partial Tags** button from the **Author** toolbar to control the amount of displayed markup (on page 314).

To configure the default background and foreground colors of the tags, open the **Preferences** dialog box (on page 47), go to **Editor > Edit modes > Author**, and set the desired colors in the **Tags background color** (on page 96) and **Tags foreground color** (on page 96) options.

If you want to be more specific and configure the colors using a CSS, the **-oxy-tags-background-color** and **-oxy-tags-color** properties allow you to control the background and foreground colors for any particular XML element.

**Example:**

```xml
para {
  -oxy-tags-color:white;
  -oxy-tags-background-color:green;
}
title {
  -oxy-tags-color:yellow;
  -oxy-tags-background-color:black;
}
```

**Custom CSS Functions**

Oxygen XML Editor Eclipse plugin provides a wide range of custom CSS extension functions that can be used to customize the visual **Author** editing mode.

**Arithmetic Functions**

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the *java.lang.Math* class (http://download.oracle.com/javase/6/docs/api/java/lang/Math.html).

In addition, the following functions are available:

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oxy_add (param1, ..., paramN, 'returnType')</code></td>
<td>Adds the values of all parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
<tr>
<td><code>oxy_subtract (param1, param2, ..., paramN, 'returnType')</code></td>
<td>Subtracts the values of parameters <code>param2</code> to <code>paramN</code> from <code>param1</code>.</td>
</tr>
<tr>
<td><code>oxy_multiply (param1, ..., paramN, 'returnType')</code></td>
<td>Multiplies the values of parameters from <code>param1</code> to <code>paramN</code>.</td>
</tr>
</tbody>
</table>
### Syntax and Details

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>oxy_divide (param1, param2, 'returnType')</code></td>
<td>Performs the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
<tr>
<td><code>oxy_modulo (param1, param2, 'returnType')</code></td>
<td>Returns the reminder of the division of <code>param1</code> to <code>param2</code>.</td>
</tr>
</tbody>
</table>

**Note:** The `returnType` can be ‘integer’, ‘number’, or any of the supported CSS measuring types.

**Example:** *oxy_multiply Function*

If you have an image with `width` and `height` specified on it, this will compute the number of pixels on it:

```css
image:before{
  content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

### Actions: `oxy_action()` Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the `oxy_button()` function *(on page 1674)* that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type *(framework configuration)* but the `oxy_action()` function allows you to define it directly in the CSS instead of the framework configuration.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** *(optional)* - A short description with details about the result of the action.
- **icon** *(optional)* - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin *(oxygen.jar)* by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an *editor variable* *(on page 176)*.
- **operation** - The name of the Java class implementing the *ro.sync.ecss.extensions.api.AuthorOperation* interface. There is also a variety of *predefined operations* *(on page 1702)* that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor Eclipse plugin operations from *ro.sync.ecss.extensions.commons.operations* package. If the class is not found in this package, then it will be loaded using the specified name.

- **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- **ID** *(optional)* - The ID of the action from the *framework*. If this is specified, all others parameters are disregarded.
Example: **oxy_action** function inside an **oxy_button form control (on page 1674)**:

```xml
oxy_button(
  action, oxy_action{
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'),
  showIcon, true)
```

Example: **oxy_action** Function

You can also create a button form control directly from an **oxy_action** function:

```xml
oxy_action(
  name, 'Insert',
  description, 'Insert an element after the current one',
  operation, 'InsertFragmentOperation',
  arg-fragment, '<element>${caret}</element>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After')
```

**Tip:** A code template is available to make it easy to add the **oxy_action** function with the **Content Completion Assistant (on page 2133)** by pressing **Ctrl + Space (Command + Space on OS X)** and select the **oxy_action** code template.

**Related Information:**
- Button Form Control (on page 1674)

**Action Lists: oxy_action_list() Function**

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The **oxy_action_list()** function is used from the **oxy_buttonGroup() function (on page 1676)** that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (framework configuration) but the **oxy_action_list()** function allows you to define the actions directly in the CSS instead of the framework configuration.

The arguments received by the **oxy_action_list()** function are a list of actions (executed sequentially) that are defined with the **oxy_action() function (on page 1651)**. The following properties are supported in the **oxy_action()** function:
• **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.

• **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.

• **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (oxygen.jar) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an editor variable (on page 176).

• **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of predefined operations (on page 1702) that can be used.

**Note:** If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor Eclipse plugin operations from ro.sync.ecss.extensions.commons.operations package. If the class is not found in this package, then it will be loaded using the specified name.

- **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).

• **ID** - (optional) - The ID of the action from the framework. If this is specified, all others parameters are disregarded.

**Example: oxy_action_list Function**

```css
p:after {
  content: oxy_buttonGroup(
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list{
      oxy_action{
        name, 'Insert a new paragraph',
        description, 'Insert an element after the current one',
        operation, 'InsertFragmentOperation',
        arg-fragment, '<p></p>',
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
      },
      oxy_action{
        name, 'Delete',
        description, 'Deletes the current element',
        operation, 'DeleteElementOperation'
      }
    }
  }
}
```
Tip: A code template is available to make it easy to add the `oxy_action_list` function with the `Content Completion Assistant (on page 2133)` by pressing `Ctrl + Space (Command + Space on OS X)` and select the `oxy_action_list` code template.

Related Information:
- Actions: `oxy_action() Function (on page 1651)`
- Button Group Form Control (on page 1676)

### Attributes Concatenation: `oxy_attributes()` Function

This function concatenates the attributes for an element and returns the serialization.

**Syntax:**

```cpp
oxy_attributes()
```

**Example: `oxy_attributes` Function**

```xml
element{
    content:oxy_attributes();
}
```

For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x=""/>`, the CSS function will display:

```
att1="x" xmlns:a="2" x=""
```

### Base URL: `oxy_base-uri()` Function

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the XML Base specification for more details.

**Example: `oxy_base-uri` Function**

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in Author mode):

```xml
image[href]{
    content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), 
        '.jpeg', 'Thumbnail.jpeg'));
}
```

### Capitalization: `oxy_capitalize()` Function

This function capitalizes the first letter of the text received as argument.

**Syntax:**
oxy_capitalize (text)

text

The text in which the first letter will be capitalized.

**Example: oxy_capitalize Function**

```
*:before{
    content: oxy_capitalize(oxy_name()) *: *
}
```

This would insert the capitalized qualified name as static text content before the element.

### Compound Actions: oxy_compound_action() Function

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function (on page 1674) or the `oxy_buttonGroup()` form control function (on page 1676).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function (on page 1651).

You can use three optional properties (`name`, `description`, `icon`) in the `oxy_compound_action()` function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first `oxy_action` function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the `oxy_getActionName` function.
- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the `oxy_getActionDescription` function.
- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (oxygen.jar) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed as an editor variable (on page 176). If you want to reuse the icon of an action already defined in your framework, you can use the `oxy_getActionIcon` function.

The `oxy_getActionName`, `oxy_getActionDescription`, and `oxy_getActionIcon` functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.
- **fallback** (optional) - A fallback value in case the ID value provided in the `framework.defined.action.id` parameter is not found.

**Example: oxy_compound_action Function**
oxy_button(
    action,
    oxy_compound_action(
        name, oxy_getActionName('framework.id', 'Fallback'),
        description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
        icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
        oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
            icon, url('insert.png'),
            arg-fragment, '<p audience=""></p>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
        ),
        oxy_action(
            name, 'Activate edit mode',
            description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',
            operation, 'SetPseudoClassOperation',
            arg-name, 'edit-mode-on',
            arg-elementLocation, '.'
        )
    ),
    showIcon, true)

Tip: A code template is available to make it easy to add the oxy_compound_action function with the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_action_list code template.

Related Information:
- Actions: oxy_action() Function (on page 1651)
- Button Form Control (on page 1674)

Concatenation: oxy_concat() Function
This function concatenates the received string arguments.

Syntax:

oxy_concat ( str_1 , str_2 )

str_1 ... str_n
The string arguments to be concatenated.

**Example: oxy_concat Function**

If an XML element has an attribute called **padding-left**:

```xml
<p padding-left="20">...
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```xml
*{padding-left}{{padding-left:oxy_concat(attr(padding-left), "px"));}
```

**Get Text: oxy_getSomeText(text, length) Function**

This function allows you to truncate a long string and to set a maximum number of displayed characters.

Syntax:

```javascript
oxy_getSomeText ( text, length, endsWithPoints )
```

- **text**
  
  Displays the actual text.

- **length**
  
  Sets the maximum number of characters that are displayed.

- **endsWithPoints**
  
  Specifies if the truncated text ends with ellipsis.

**Example: oxy_getSomeText Function**

If an attribute value is very large, you can trim its content before it is displayed as static content:

```css
*{longdesc}:before{
  content: oxy_getSomeText(attr(longdesc), 200);
}
```

**Indexing: oxy_indexof() Function**

This function is used to define searches.

The `oxy_indexof()` function has two signatures:

**Syntax 1:**

```javascript
oxy_indexof ( text, toFind )
```

Returns the index within `text` string of the first occurrence of the `toFind` substring.

*text*
Text to search in.

**toFind**

The searched substring.

**Syntax 2:**

```
oxy_indexof ( text , toFind , fromOffset )
```

Returns the index within `text` string of the first occurrence of the `toFind` substring. The search starts from `fromOffset` index.

**text**

Text to search in.

**toFind**

The searched substring.

**fromOffset**

The index to start the search from.

**Example: oxy_indexof Function**

```
oxy_indexof('abcd', 'bc') returns 1.
oxy_indexof('abcdbc', 'bc', 2) returns 4.
```

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```
image[longdesc] {
  content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

**Label: oxy_label() Function**

This function can be used in conjunction with the CSS **content** property to change the style of generated text.

The arguments of the function are **property name - property value** pairs. The following properties are supported:

- **text** - This property specifies the built-in form control you are using.
- **width** - Specifies the width of the content area using relative (**em**, **ex**), absolute (**in**, **cm**, **mm**, **pt**, **pc**, **px**), and percentage (followed by the % character) length units. The **width** property takes precedence over the **columns** property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the **color** property is **inherit**, the form control has the same color as the element that was used to insert it.
- **background-color** - Specifies the background color of the form control. If the value of the **background-color** property is **inherit**, the form control has the same color as the element that was used to insert it.
• **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
  ◦ **font-weight, font-size, font-style, font**
  ◦ **text-align, text-decoration**
  ◦ **width**
  ◦ **color, background-color**
  ◦ **link** - For more information about this property, see the link property section (on page 1647).

```xml
element{
    content: oxy_label(text, "Label Text", styles,
    "font-size:2em;color:red;link:attr(href);");
}
```

Instead of using the values of the **styles** property individually, you can define them in a CSS file as in the following example:

```css
* {
    width: 40%;
    text-align:center;
}
```

Then refer that file with an @import directive, as follows:

```xml
elem {
    content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")
}
```

⚠️ **CAUTION:** Extensive use of the **styles** property may lead to performance issues.

If the text from an **oxy_label()** function contains new lines, for example **oxy_label(text, 'LINE1\A LINE2', width, 100px)**, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

💡 **Note:** The text is split after \A, which represents a new line character.

You can use the **oxy_label()** function together with a built-in form control (on page 1668) function to create a form control based layouts.

**Example: oxy_label Function**

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```xml
person:before {
    content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
    \A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the **Name** label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the **oxy_label()** to style each label differently.

```xml
person:before {
```
content: oxy_label(text, "Name:", styles, "font-weight:bold;width:200px")
    oxy_textfield(edit, '@name', columns, 20) "\A"
 oxy_label(text, "Address:", styles, "width:200px")
 oxy_textfield(edit, '@address', columns, 20)
}

**Tip:** A code template is available to make it easy to add the oxy_label function with the **Content Completion Assistant (on page 2133)** by pressing **Ctrl + Space (Command + Space on OS X)** and select the oxy_label code template.

### Last Occurrence: oxy_lastindexOf() Function

This function is used to define last occurrence searches.

The oxy_lastindexOf() function has two signatures:

**Syntax 1:**

```javascript
oxy_lastindexOf ( text , toFind )
```

Returns the index within text string of the rightmost occurrence of the toFind substring.

- **text**
  
  Text to search in.

- **toFind**
  
  The searched substring.

**Syntax 2:**

```javascript
oxy_lastindexOf ( text , toFind , fromOffset )
```

The search starts from fromOffset index. Returns the index within text string of the last occurrence of the toFind substring, searching backwards starting from the fromOffset index.

- **text**
  
  Text to search in.

- **toFind**
  
  The searched substring.

- **fromOffset**
  
  The index to start the search backwards from.

**Example: oxy_lastindexOf Function**

```javascript
oxy_lastindexOf('abcdbc', 'bc') returns 4.
oxy_lastindexOf('abcdbccdbc', 'bc', 2) returns 1.
```
If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```xml
image[longdesc]{
    content: oxy_substring(attr(longdesc), 0, oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

### Link Text: oxy_link-text() Function

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other frameworks (on page 2135), go to Configuring an Extensions Bundle (on page 1725).

#### DITA Support

For DITA, the `oxy_link-text()` function resolves the `<xref>` element and the elements that have a `@keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `<topicref>` element that has the `@navtitle` and `@locktitle` attributes set, the function returns the value of the `@navtitle` attribute.

#### DocBook Support

For DocBook, the `oxy_link-text()` function resolves the `<xref>` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

**Example: oxy_link-text() Function**

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `@xreflabel` attribute.

```xml
<para><code id="para.id" xreflabel="The reference label">my code</code></para>
<para><xref linkend="para.id"/></para>

xref {
    content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `@href` is not valid), you can use an optional argument to display fallback text.

```xml
*[class="map/topicref"]:before{
    content: oxy_link-text("Cannot find the topic reference");
    link:attr(href);
}
```
Local Name: oxy_local-name() Function
This function evaluates the local name of the current node.
It does not have any arguments.

Example: oxy_local-name Function
To insert the local name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_local-name() " : ";
}
```

Lowercase: oxy_lowercase() Function
This function transforms the text received as argument to lower case.

Syntax:

```java
oxy_lowercase( text )
```

| text |
The text to be lower cased.

Example: oxy_lowercase Function
To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_lowercase(oxy_name()) " : ";
}
```

Name: oxy_name() Function
This function evaluates the qualified name of the current node.
It does not have any arguments.

Example: oxy_name Function
To insert a qualified name as static text content before the element, use this CSS selector:

```css
*:before{
    content: oxy_name() " : ";
}
```

Parent URL: oxy_parent-url() Function
This function evaluates the parent URL of a URL received as string.

Syntax:
oxy_parent-url ( URL )

URL

The URL as string.

Replace: oxy_replace() Function

This function is used to replace a string of text.

The oxy_replace() function has two signatures:

Syntax 1:

oxy_replace ( text, target, replacement )

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

- text
  The text in which the replace will occur.

- target
  The target string to be replaced.

- replacement
  The string replacement.

Example: Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual Author editing mode:

```xml
image[href] {
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href), 
    '.jpeg', 'Thumbnail.jpeg'));
}
```

Syntax 2:

oxy_replace ( text, target, replacement, isRegExp )

This function replaces each substring of the text that matches the target string with the specified replacement string.

- text
  The text in which the replace will occur.

- target
  The target string to be replaced.

- replacement
  The string replacement.
isRegExp

If `true` the target and replacement arguments are considered regular expressions, if `false` they are considered literal strings.

**Example:** Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```xml
image[title]{
  content:oxy_replace(attr(title), "\s+", ",", true)
}
```

### Substring of Text: `oxy_substring()` Function

This function is used to return a string of text.

The `oxy_substring()` function has two signatures:

#### Syntax 1:

```xml
oxy_substring (text, startOffset)
```

Returns a new string that is a substring of the original `text` string. It begins with the character at the specified index and extends to the end of `text` string.

- **text**
  - The original string.
- **startOffset**
  - The beginning index, inclusive.

#### Syntax 2:

```xml
substring (text, startOffset, endOffset)
```

Returns a new string that is a substring of the original `text` string. The substring begins at the specified `startOffset` and extends to the character at index `endOffset - 1`.

- **text**
  - The original string.
- **startOffset**
  - The beginning index, inclusive.
- **endOffset**
  - The ending index, exclusive.

**Example: oxy_substring Function**

- `oxy_substring('abcd', 1)` returns the string `bcd`.
- `oxy_substring('abcd', 4)` returns an empty string.
oxy_substring('abcd', 1, 3) returns the string 'bc'.

If you only want to display part of an attribute value, for instance the part that comes before an Appendix string:

```xml
image[longdesc] {
  content: oxy_substring(attr(longdesc), 0, oxy_indexof(attr(longdesc), "Appendix"));
}
```

Unescape URL Value: oxy_unescapeURLValue(string) Function

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

**Example: oxy_unescapeURLValue Function**

```xml
oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html") returns the following value:
```

```xml
http://www.example.com/a simple example.html
```

Unparsed Entity URI: oxy_unparsed-entity-uri() Function

This function returns the URI value of an unparsed entity name.

**Syntax:**

```xml
oxy_unparsed-entity-uri ( unparsedEntityName )
```

unparsedEntityName

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

**Example: oxy_unparsed-entity-uri Function**

CSS for displaying the image in Author for an `imagedata` with `entityref` to an unparsed entity:

```xml
imagedata[entityref] {
  content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

Uppercase: oxy_uppercase() Function

This function transforms the text received as argument to upper case.

**Syntax:**

```xml
oxy_uppercase ( text )
```

text

The text to be capitalized.
**Example: oxy_uppercase Function**

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```css
*:before{
  content: oxy_uppercase(oxy_name()) "": ";
}
```

**URL: oxy_url() Function**

This function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Editor Eclipse plugin uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (on page 176) (built-in or custom).

**Syntax:**

```javascript
oxy_url(base_location, loc_1, loc_2)
```

- **base_location**
  String representing the base location. If not absolute, will be solved relative to the CSS file URL.

- **loc_1 ... loc_n (optional)**
  Strings representing relative location path components.

**Examples: oxy_url Function**

The following function receives String objects as input parameters:

```javascript
```

and returns:

The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```javascript
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    ".jpeg", 'Thumbnail.jpeg'));
}
```

The following function uses an editor variable (on page 176) as the first parameter to point to the Oxygen XML Editor Eclipse plugin installation location:
XPath: oxy_xpath() Function

This function is used to evaluate XPath expressions.

Syntax:

```
oxy_xpath ( XPathExpression [, processChangeMarkers , value ] [, evaluate , value ]
)
```

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced `<xi:include>` section or inside artificially referenced content (for example, DITA `<@conref>` or `<@topicref>` references).

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (`delete` changes are removed and `insert` changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
  - `dynamic` - Evaluates the XPath each time there are changes in the document.
  - `dynamic-once` - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
  - `static` - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

**Note:** When XPath expressions are evaluated, the entities and `<xi:include>` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```
<article>
```
where `section1.xml` contains the following content:

```
<section>
  <p>Referenced content</p>
</section>
```

The XPath expression will be executed over the actual content in the `section1.xml` file.

**Example: oxy_xpath Function**

The following example counts the number of words from a paragraph (including tracked changes (on page 2139)) and displays the result in front of it:

```
para:before{
  content:
  concat("|Number of words:",
    oxy_xpath(
      "count(tokenize(normalize-space(string-join(text(), ' ')), ' '))",
      processChangeMarkers,
      true),
      " | ");
}
```

**Note:** The `oxy_xpath()` function supports editor variables (on page 176), as in the following example:

```
* {
  content:
  oxy_concat("Result: ",
    oxy_xpath('count(collection("$cfdu/\?select=*.xml\")'))
  );
}
```

**Form Controls**

Oxygen XML Editor Eclipse plugin provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render Author mode. For customization purposes, Oxygen XML Editor Eclipse plugin also supports custom form controls in Java (on page 1696).

**How to Add a Built-in Form Control in Author Mode**

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a date picker form control (on page 1683), its dedicated function is `oxy_datePicker`.

3. Associate the CSS file with the XML document in one of the following ways:
   - If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and associate the CSS with the framework (on page 1587). This approach is recommended if you intend on sharing the customization with others.
   - If you do not have a framework, you can associate the CSS to the XML document through a Processing Instruction (on page 1611).

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Audio File Player Form Control

The `oxy_audio` built-in form control is used for providing a mechanism to play audio clips.

The `oxy_audio` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3'), width, 400px)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

Example: `oxy_audio` Form Control

```javascript
object {
    content:
    oxy_audio(
        href, 'resources/audio.mp3',
        width, 200px),
}
```

Tip: To insert a sample of the `oxy_audio` form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the `oxy_audio` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM
Browser Form Control

The `oxy_browser` built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the Author mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Editor Eclipse plugin workspace.

The `oxy_browser` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg'), width, 50%, height, 50%)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_browser Form Control**

```
object {
    content:
    oxy_browser{
        href, 'http://example.page',
        width, 600px,
        height, 400px,
    }
}
```

**Tip:** To insert a sample of the `oxy_browser` form control in a CSS file, invoke the **Content Completion Assistant** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_browser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

**Interacting with the Oxygen XML Editor Eclipse plugin Workspace**

The `oxy_browser` form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the `oxy_browser` form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript
and the Oxygen XML Editor Eclipse plugin Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

**Important:** This will only work if the loaded HTML is located inside a framework or plugin directory *(on page 61)*, such as: `[OXYGEN_INSTALL_DIR]/frameworks/` or `[OXYGEN_INSTALL_DIR]/plugins/`.

The following global variables can be used:

- **authorAccess** - This object is an instance of `ro.sync.ecss.extensions.api.AuthorAccess`.
- **contextElement** - An instance of `ro.sync.ecss.extensions.api.node.AuthorNode`. The form control is added over this node.
- **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```javascript
var newAttrValue = apiHelper.newInstance(
   "ro.sync.ecss.extensions.api.node.AttrValue",
   ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
   "counter", newAttrValue, contextElement);
...
```

You can also specify the constructor signature:

```javascript
var newAttrValue = apiHelper.newInstance(
   "ro.sync.ecss.extensions.api.node.AttrValue",
   (java.lang.String, java.lang.String, boolean)",
   ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
   "counter", newAttrValue, contextElement);
...
```

For more information, open the `form-controls.xml` file in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` directory and go to section 11.1 - Interacting with the Oxygen Workspace.

**Warning:** On Mac OS X, you need to use asynchronous calls to the API, due to the following JDK bug: [https://bugs.openjdk.java.net/browse/JDK-8087465](https://bugs.openjdk.java.net/browse/JDK-8087465). By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: `sync()` and `async()`.

```javascript
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
    // On Mac, methods that change the document must be executed asynchronously.
    ctrl.async();
    ctrl.setAttribute("counter", newAttrValue, contextElement);
}...
```
Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

```javascript
function bridgeReady () {
    // We declare a member function for each method of the
    // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
    var handler = {
        attributeChanged : function(event) {
            var node = event.getOwnerAuthorNode();
            var attrName = event.getAttributeName();

            if (node.equals(contextElement) && attrName === "counter") {
                init();
            }
        },
        contentDeleted : function(event) {},
        contentInserted : function(event) {}
    };

    // We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that will
    // delegate its methods to the JS object's functions.
    // We assign the listener to a global variable so that we can remove it later on,
    // on the dispose() method.
    authorDocumentListener = apiHelper.createProxyListener("ro.sync.ecss.extensions.api.AuthorListener", handler);

    var ctrl = authorAccess.getDocumentController();

    // Add the proxy listener.
    ctrl.addAuthorListener(authorDocumentListener);
}
```

2. Since a listener was added on the document, it is important to remove it once the form control is not used anymore. When a form control is discarded, the `dispose()` JavaScript function is invoked, so if you have
any cleanup to do, make sure you define a function with this name and remove any previously created listeners in it.

```javascript
/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
    // Dispose all added listeners.
    var ctrl = authorAccess.getDocumentController();
    ctrl.removeAuthorListener(authorDocumentListener);
}
```

**Debugging JavaScript Used for Custom Form Controls**

If you encounter unexpected results when using the method described above (on page 1670), you can debug the script by using the following guidelines:

- Calls to `alert("message.to.present")` or `console.log("message.to.present")` will be presented in the Results panel (on page 281).
- You can install the **Firebug extension** by executing the following script:

```javascript
function installFB() {
    if (!document.getElementById('FirebugLite')) {
        E = document['createElement'] + 'NS' && document.documentElement.namespaceURI;
        E = E ? document['createElement'] + 'NS'(E, 'script')
             : document['createElement']('script');
        E['setAttribute']('id', 'FirebugLite');
        E['setAttribute']('src',
            'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened');
        E['setAttribute']('FirebugLite', '');
        (document['getElementsByTagName']('head')[0]
         || document['getElementsByTagName']('body')[0]).appendChild(E);
        E = new Image;
        E['setAttribute']('src', 'https://getfirebug.com/' + '#startOpened');
    }
}
```

**Note:** To force the Browser Form Control to reload after making changes to the JavaScript file, you need to use the **Reload page** action from the form control's contextual menu.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzMSLM
Button Form Control

The oxy_button built-in form control is used for graphical user interface objects that invoke a custom Author mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The oxy_button form control supports the following properties:

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

- **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be true or false (default value).

- **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.

```xml
<element content="oxy_button(actionID, 'remove.attribute', showText, true);">
</element>
```

- **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be true or false.

```xml
<element content="oxy_button(actionID, 'remove.attribute', showIcon, true);">
</element>
```

- **enableInReadOnlyContext** - To enable button form controls (on page 1674) or groups of buttons form controls (on page 1676) this property needs to be set to true. This property can be used to specify areas as read-only (by setting the -oxy-editable property to false). This is useful when you want to use an action that does not modify the context.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_button(hoverPseudoclassName, 'showBorder')
```
• **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

• **actionID** - The ID of the action, specified in the *document type association (on page 68)*, that is invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is invoked.

• **action** - Defines an action directly, rather than using the `actionID` parameter to reference an action from the *document type association (on page 68)*. This property is defined using the *oxy_action function (on page 1651)*.

**Tip:** You can also create a button form control directly from an *oxy_action function (on page 1652).*

```xml
oxy_button(action, oxy_action{
  name, 'Insert',
  description, 'Insert an element after the current one',
  icon, url('insert.png'),
  operation, 'InsertFragmentOperation',
  arg-fragment, '<element>${caret}</element>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After'
})
```

**Tip:** To execute multiple actions sequentially, you can use the *oxy_compound_action function (on page 1655).*

**Example: oxy_button Form Control**

```xml
button:before {
  content: "Label:"
  oxy_button{
    /* This action is declared in the document type
       associated with the XML document. */
    actionID, "insert.popupWithMultipleSelection";
  }
}
```

**Tip:** To insert a sample of the *oxy_button* form control in a CSS file, invoke the *Content Completion Assistant (on page 2133)* by pressing `Ctrl + Space (Command + Space on OS X)` and select the `. oxy_button`
code template. Also, an \texttt{oxy_button_in_place_action} code template is available that inserts an \texttt{oxy_button} function that includes an \texttt{action} parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: \texttt{[OXYGEN_INSTALL_DIR]/samples/form-controls}.

For more information about form controls, watch our video demonstration:

\url{https://www.youtube.com/embed/-WY3wzkMSLM}

Related Information:

- Custom CSS Functions \textit{(on page 1650)}
- Actions: \texttt{oxy_action()} Function \textit{(on page 1651)}

**Button Group Form Control**

The \texttt{oxy_buttonGroup} built-in form control is used for a graphical user interface group of buttons that invokes one of several custom \texttt{Author} mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The \texttt{oxy_buttonGroup} form control supports the following properties:

- \texttt{label} - Specifies the label to be displayed on the button. This label can be translated using the \texttt{$(i18n())} editor variable \textit{(on page 181)}.
- \texttt{icon} - The path to the icon to be displayed on the button.
- \texttt{visible} - Specifies whether or not the form control is visible. The possible values of this property are \texttt{true} (default value) and \texttt{false}.
- \texttt{tooltip} - Specifies a tooltip to be displayed when you hover over the form control.
- \texttt{transparent} - Makes the button transparent without any borders or background colors. The values of this property can be \texttt{true} or \texttt{false}.
- \texttt{fontInherit} - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be \texttt{true} or \texttt{false} (default value). To make the form control inherit its font from its parent element, set the \texttt{fontInherit} property to \texttt{true}.
- \texttt{enableInReadOnlyContext} - To enable button form controls \textit{(on page 1674)} or groups of buttons form controls \textit{(on page 1676)} this property needs to be set to \texttt{true}. This property can be used to specify areas as \texttt{read-only} (by setting the \texttt{-oxy-editable} property to \texttt{false}). This is useful when you want to use an action that does not modify the context.
- \texttt{hoverPseudoclassName} - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
```
**border:** 1px solid red;

- **actionIDs** - The IDs of the actions that will be presented in the group of buttons.
- **actionID** - The ID of the action, specified in the *document type association (on page 68)*, that is invoked when you click the button.

**Note:** The element that contains the form control represents the context where the action is invoked.

- **actions** - Defines a sequential list of actions directly, rather than using the actionID parameter to reference actions from the *document type association (on page 68)*. This property is defined using the *oxy_action_list function (on page 1652).*

```
oxy_buttonGroup{
  label, 'A group of actions',
  icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
  actions,
  oxy_action_list{
    oxy_action{
      name, 'Insert',
      description, 'Insert an element after the current one',
      operation, 'InsertFragmentOperation',
      arg-fragment, '<element></element>',
      arg-insertLocation, '.',
      arg-insertPosition, 'After'
    },
    oxy_action{
      name, 'Delete',
      description, 'Deletes the current element',
      operation, 'DeleteElementOperation'
    }
  }
}
```

**Tip:** To execute multiple actions sequentially, you can use the *oxy_compound_action function (on page 1655)* in the *oxy_action_list function (on page 1652).*

```
p:before {
  content:
  oxy_buttonGroup{
    label, 'A group of actions',
    icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
    actions,
    oxy_action_list{
      oxy_compound_action{
        name, oxy_getActionName('framework.id', 'Fallback'),
```
description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',

icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),

oxy_action{
  name, 'Insert',
  description, 'Insert an element after the current one',

  operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
  icon, url('insert.png'),
  arg-fragment, '<p audience=''></p>',
  arg-insertLocation, '.',
  arg-insertPosition, 'After'
},

oxy_action{
  name, 'Activate edit mode',
  description, 'Sets a pseudo class that will activate a CSS rule that will present a text field form control for the @audience attribute',

  operation, 'SetPseudoClassOperation',
  arg-name, 'edit-mode-on',
  arg-elementLocation , '.'
}

}

oxy_action{
  name, 'Delete',
  description, 'Deletes the current element',

  operation, 'DeleteElementOperation'
}

}

• actionContext - Specifies the context that the action associated with the form control is executed. Its possible values are element (default value) and caret. If you select the element value, the context is the element that holds the form control. If you select the caret value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the element value is selected automatically.

• actionStyle - Specifies what to display for an action in the form control. The values of this property can be text (default value), icon, or both.

**Example: oxy_buttonGroup Form Control**

buttongroup:before {
  content:
  oxy_label(text, "Button Group:", width, 150px, text-align, left)
oxy_buttonGroup(
    label, 'A group of actions',
    /* The action IDs are declared in the document type
       associated with the XML document. */
    actionIDs,
    "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
    actionStyle, "both"));
}

Tip: To insert a sample of the oxy_buttonGroup form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_buttonGroup code template. Also, an oxy_buttonGroup_in_place_action code template is available that inserts an oxy_buttonGroup function that includes an oxy_action_list function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Compound Actions: oxy_compound_action() Function (on page 1655)
- Label: oxy_label() Function (on page 1658)

Checkbox Form Control

The oxy_checkbox built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The oxy_checkbox form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2137) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.
Note: You can set the value of the visibility property to -oxy-collapse-text (on page 1644) to render the text only in the form control that the oxy_editor function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

- **tooltips** - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 180).

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\, 2\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.

- **labels** - This property must have the same number of items as the values property. Each item provides a literal description of the items listed in the values property. These labels can be translated using the ${i18n()} editor variable (on page 181). If this property is not specified, the values property is used as the label.

- **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example: Single oxy_checkbox Form Control**

```css
checkBox[attribute]:before {
    content: "A check box editor that edits a two valued attribute (On/Off)"
    The values are specified in the CSS:
    oxy_checkbox{
        edit, '@attribute',
```
values, "On",
uncheckedValues, "Off",
labels, "On/Off");
}

Example: Multiple oxygenCheckbox Form Controls

```
multipleCheckBox[attribute]:before {
  content: "Multiple checkboxes editor that edits an attribute value.
    Depending whether the check-box is selected,
    a different value is committed:
  
  oxygen_checkbox{
    edit, "@attribute",
    values, "true, yes, on",
    uncheckedValues, "false, no, off",
    resultSeparator, ",",
    labels, "Present, Working, Started";
  }
}
```

Tip: To insert a sample of the oxygenCheckbox form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxyCheckbox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

- Collapse Text: -oxy-collapse-text Property Value (on page 1644)

Combo Box Form Control

The oxygenCombobox built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The oxygenCombobox form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
@attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2137) and the CSS must have a namespace declaration for the prefix.

#text - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the visibility property to -oxy-collapse-text (on page 1644) to render the text only in the form control that the oxy_editor function specifies.

• columns - Controls the width of the form control. The unit size is the width of the w character.

• width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

• visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

• editable - This property accepts the true and false values. In addition to a drop-down menu, the true value also generates an editable text field box that allows you to insert other values than the proposed ones. The false value generates a drop-down menu that only accepts the proposed values.

• tooltips - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 180).

• values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, (values, '1\\, 2\\, 3, 4, edit, false) will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

• fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

• labels - This property must have the same number of items as the values property. Each item provides a literal description of the items listed in the values property. These labels can be translated using the ${i18n()} editor variable (on page 181).

Note: This property is only available for read-only combo boxes (the editable property is set to false).

• color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

• hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

p:before {
    content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
• **canRemoveValue** - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.

• **onChange** - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function (on page 1651) or referenced from the framework (on page 2135) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

**Example: oxy_combobox Form Control**

```css
comboBox:before {
    content: "A combo box that edits an attribute value.

    The possible values are provided from CSS:

    oxy_combobox{
        edit, "@attribute",
        editable, false,
        values, "value1, value2, value3",
        labels, "Value no1, Value no2, Value no3",
        onChange, oxy_action{
            name, 'Insert',
            operation, 'XQueryUpdateOperation',
            arg-script, 'insert node <product>{xs:string(@attribute)}</product>
                as last into .'}
    }
}
```

**Tip:** To insert a sample of the oxy_combobox form control in a CSS file, invoke the **Content Completion Assistant (on page 2133)** by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_combobox code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Date Picker Form Control

The oxy_datePicker built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The oxy_datePicker form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2137) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the visibility property to oxy-collapse-text (on page 1644) to render the text only in the form control that the oxy_editor function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

- **format** - This property specifies the format of the inserted date. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

- **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the datePicker form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to false.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_datePicker Form Control**
Oxygen XML Editor Eclipse Plugin 22.0 | 17 - Framework and Author Mode Customization | 1685

date {
    content:
        oxy_label(text, "Date time attribute with format defined in CSS: ", width, 300px)
        oxy_datePicker(
            columns, 16,
            edit, "$attribute",
            format, "yyyy-MM-dd";
    }

Tip: To insert a sample of the oxy_datePicker form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_datePicker code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:
- Custom CSS Functions (on page 1650)
- Label: oxy_label() Function (on page 1658)

HTML Content Form Control

The oxy_htmlContent built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The oxy_htmlContent form control supports the following properties:

- href - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- id - The unique identifier of an item. This is a <div> element that has a unique @id and is a child of the <body> element. The <div> element is the container of the HTML content to be rendered by the form control.
- content - An alternative to the @href and @id pair of elements. It provides the HTML content that will be displayed in the form control.
- width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).
• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
```

You can customize the style of the content using CSS that is either referenced by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

**Example: oxy_htmlContent Form Control**

In the following example, the form control collects the content from the `p_description <div>` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `@intro_id` attribute value.

```css
p#intro_id:before {
  content: oxy_htmlContent(
    href, "descriptions.html",
    id, "p_description",
    width, 400px);
}
```

An alternative example, using the `content` property:

```css
p#intro_id:before {
  content: oxy_htmlContent(
    content, "<div style='font-weight:bold;'>My content</div>",
    width, 400px);
}
```

**Note:** Anchor HTML elements are displayed but the links are inactive.

**Tip:** To insert a sample of the `oxy_htmlContent` form control in a CSS file, invoke the **Content Completion Assistant (on page 2133)** by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_htmlContent` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: `OXYGEN_INSTALL_DIR/samples/form-controls`.
For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:
- Custom CSS Functions (on page 1650)

**Pop-up Form Control**

The oxy_popup built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The oxy_popup form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2137) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the visibility property to oxy-collapse-text (on page 1644) to render the text only in the form control that the oxy_editor function specifies.

- **rows** - This property specifies the number of rows that the form control presents.

  **Note:** If the value of the rows property is not specified, the default value of 12 is used.

- **color** - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

  **Note:** This property is used for rendering in the Author mode.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

- **tooltips** - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 180).

  **Example:**

```xml
link:before{
    content: oxy_popup(
        edit, '@href',
        values, "Spring, Summer, Autumn, Winter",
        tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac, Chrysanthemum${comma}Salvia, Gerbera",
        selectionMode, single);
}
```
• **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

**Note:** Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\, 2\, 3, 4, edit, false)` will display a form control that has 1, 2, 3 for the first value and 4 for the second value.

• **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the space character is used.

**Note:** The value of the `resultSeparator` property cannot exceed one character.

• **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.

• **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the `values` property is used instead.

• **columns** - Controls the width of the form control. The unit size is the width of the w character. This property is used for the visual representation of the form control.

• **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

• **rendererSort** - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are `ascending` and `descending`.

• **editorSort** - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are `ascending` and `descending`.

• **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.

• **sort** - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the `editorSort` and `rendererSort` properties have a higher priority. The possible values of this property are `ascending` and `descending`.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example:** *oxy_popup Form Control*
popupWithMultipleSelection:before {
  content: "This editor edits an attribute value. The possible values are specified inside the CSS:"
  oxy_popup(
    edit, "@attribute",
    values, "value1, value2, value3, value4, value5",
    labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
    resultSeparator, "|",
    columns, 10,
    selectionMode, "multiple",
    color, "blue",
    fontInherit, true);
  font-size: 30px;
}

Tip: To insert a sample of the oxy_popup form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the .oxy_popup code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

Text Area Form Control

The oxy_textArea built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The oxy_textArea form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - @attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2137) and the CSS must have a namespace declaration for the prefix.
  - #text - Specifies that the presented/edited value is the simple text value of an element.
Note: You can set the value of the visibility property to -oxy-collapse-text (on page 1644) to render the text only in the form control that the oxy_editor function specifies.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT
  <ph>phase</ph>
  <apiname><text>API</text></apiname>
</codeblock>
```

and your CSS includes the following snippet:

```css
codeblock:before{
  content:
  oxy_textArea(
    edit, '#content',
    contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

Note: When the value of the edit property is #content, the text area form control will also offer content completion proposals.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```xml
<codeblock outputclass="language-xml">START_TEXT
  <ph>phase</ph>
  <apiname><text>API</text></apiname>
</codeblock>
```

and your CSS includes the following snippet:

```css
codeblock:before{
  content:
  oxy_textArea(
    edit, '#content',
    contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

Note: When the value of the edit property is #content, the text area form control will also offer content completion proposals.

- **columns** - Controls the width of the form control. The unit size is the width of the w character.
• **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The **width** property takes precedence over the **columns** property (if the two are used together).

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be **true** or **false** (default value). To make the form control inherit its font from its parent element, set the **fontInherit** property to **true**.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are **true** (default value) and **false**.

• **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.

• **contentType** - Specifies the type of content that the form control will format with syntax highlighting. The following values are supported: text/css; text/shell; text/cc; text/xquery; text/xml; text/python; text/xsd; text/c; text/xpath; text/javascript; text/xsl; text/wsdl; text/html; text/xproc; text/properties; text/sql; text/rng; text/sch; text/json; text/perl; text/php; text/java; text/batch; text/rnc; text/dtd; text/nvdl; text/plain.

• **indentOnTab** - Specifies the behavior of the **Tab** key. If the value of this property is set to **true** (default value), the **Tab** key inserts characters. If it is set to **false**, **Tab** is used for navigation, jumping to the next editable position in the document.

• **white-space** - CSS property that influences the value that you edit, as well as the form control size:
  - **pre** - The whitespaces and new lines of the value are preserved and edited. If the **rows** and **columns** properties are not specified, the form control calculates its size on its own so that all the text is visible.
  - **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.

  ![Note:](image) The **rows** and **columns** properties must be specified. If these are not specified, the form control considers the value to be **pre**.

  - **normal** - The white spaces and new lines are normalized.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

**Example: oxy_textArea Form Control**

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```
textArea {
  visibility: -oxy-collapse-text;
}
```
white-space: pre;

textarea[language="CSS"]:before {
    content: oxy_textArea(
        edit, '#text',
        contentType, 'text/css');
}

textarea[language="XML"]:before {
    content: oxy_textArea(
        edit, '#text',
        contentType, 'text/xml',
        rows, 10,
        columns, 30);
}

Tip: To insert a sample of the oxy_textArea form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_textArea code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

For more information about form controls, watch our video demonstration:

Text Field Form Control

The oxy_textfield built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The oxy_textfield form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
@attribute_name - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2137) and the CSS must have a namespace declaration for the prefix.

#text - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the visibility property to -oxy-collapse-text (on page 1644) to render the text only in the form control that the oxy_editor function specifies.

columns - Controls the width of the form control. The unit size is the width of the w character.

width - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units. The width property takes precedence over the columns property (if the two are used together).

fontInherit - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be true or false (default value). To make the form control inherit its font from its parent element, set the fontInherit property to true.

visible - Specifies whether or not the form control is visible. The possible values of this property are true (default value) and false.

values - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

tooltips - Associates tooltips to each value in the values property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ${comma} variable (on page 180).

tooltip - Specifies a tooltip to be displayed when you hover over the form control.

color - Specifies the foreground color of the form control. If the value of the color property is inherit, the form control has the same color as the element that was used to insert it.

hasMultipleValues - Specifies if the text field allows multiple values separated by spaces or just a single value.

Note: If the value is false, the Content Completion Assistant (on page 2133) considers the entire text as the prefix for its proposals. If the value is true (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: value a, value b, and other values. If the hasMultipleValues property is set to true and the user enters "value " (notice the space character after 'value') in the text field, the Content Completion Assistant will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the hasMultipleValues property was set to false, the Content Completion Assistant would only suggest value a and value b because the space is considered part of the prefix.

hoverPseudoclassName - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```css
p:before {
  content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
```
Example: oxy_textfield Form Control

```css
element {
    content: "Label: ",
    oxy_textfield{
        edit, "@my_attr",
        values, "value1, value2",
        color, "red",
        columns, 40};
}
```

Tip: To insert a sample of the oxy_textfield form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_textfield code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: [OXYGEN_INSTALL_DIR]/samples/form-controls.

URL Chooser Form Control

The oxy_urlChooser built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the current open editor.

The oxy_urlChooser editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a QName (on page 2137) and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

  **Note:** You can set the value of the visibility property to -oxy-collapse-text (on page 1644) to render the text only in the form control that the oxy_editor function specifies.
• **columns** - Controls the width of the form control. The unit size is the width of the \texttt{w} character.

• **width** - Specifies the width of the content area using relative (\texttt{em}, \texttt{ex}), absolute (\texttt{in}, \texttt{cm}, \texttt{mm}, \texttt{pt}, \texttt{pc}, \texttt{px}), and percentage (followed by the \texttt{%} character) length units. The \texttt{width} property takes precedence over the \texttt{columns} property (if the two are used together).

• **color** - Specifies the foreground color of the form control. If the value of the \texttt{color} property is \texttt{inherit}, the form control has the same color as the element that was used to insert it.

• **visible** - Specifies whether or not the form control is visible. The possible values of this property are \texttt{true} (default value) and \texttt{false}.

• **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be \texttt{true} or \texttt{false} (default value). To make the form control inherit its font from its parent element, set the \texttt{fontInherit} property to \texttt{true}.

• **fileFilter** - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as \texttt{"jpg,png,gif"} is mapped to three filters that will display all \texttt{jpg}, \texttt{png}, and \texttt{gif} files respectively.

• **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```xml
p:before {
    content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

**Example:** \texttt{oxy_urlChooser Form Control}

```xml
urlChooser[file]:before {
    content: "A URL chooser editor that allows browsing for a URL.
    The selected URL is made relative to the currently edited file:"
    oxy_urlChooser(
        edit, "@file",
        columns 25);
}
```

\textbf{Tip:} To insert a sample of the \texttt{oxy_urlChooser} form control in a CSS file, invoke the \texttt{Content Completion Assistant (on page 2133)} by pressing \texttt{Ctrl + Space (Command + Space on OS X)} and select the \texttt{.}

\texttt{oxy_urlChooser} code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: \texttt{[OXYGEN_INSTALL_DIR]/samples/form-controls}.

[https://www.youtube.com/embed/-WY3wzkMSLM](https://www.youtube.com/embed/-WY3wzkMSLM)
Video Player Form Control

The oxy_video built-in form control is used for providing a mechanism to play videos.

The oxy_video form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```css
  oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4')), width, 400px, height, 300px)
  ```

- **width** - Specifies the width of the content area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

- **height** - Specifies the height of the form control area using relative (em, ex), absolute (in, cm, mm, pt, pc, px), and percentage (followed by the % character) length units.

**Example: oxy_video Form Control**

```css
object {
  content:
  oxy_video(
    href, 'resources/video.mp4',
    width, 400px,
    height, 300px),
}
```

**Tip:** To insert a sample of the oxy_video form control in a CSS file, invoke the Content Completion Assistant (on page 2133) by pressing Ctrl + Space (Command + Space on OS X) and select the oxy_video code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: `[OXYGEN_INSTALL_DIR]/samples/form-controls`.

For more information about form controls, watch our video demonstration:

[https://www.youtube.com/embed/-WY3wzkMSLM](https://www.youtube.com/embed/-WY3wzkMSLM)
Implementing Custom Form Controls

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of `ro.sync.ecss.extensions.api.editor.InplaceRenderer`. The renderer has to be a SWING implementation and can be used both in the standalone and Eclipse distributions.

- **swingEditorClassName** - You can use this property for the standalone (Swing-based) distribution to specify the name of the class used for editing. It is a Swing implementation of `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a SWT implementation of the `ro.sync.ecss.extensions.api.editor.InplaceEditor`.

  **Note:** If the custom form control is intended to work in the Oxygen XML Editor Eclipse plugin standalone distribution, the declaration of `swtEditorClassName` is not required. The renderer (the class that draws the value) has different properties from the editor (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the `classpath` property is an enumeration of URLs separated by comma.

- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor Eclipse plugin will perform the commit logic by itself. You can use the custom value to perform the commit logic yourself.

- **ecHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas).

  The value of this property is a class name that must implement the `ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor` method. The JAR (on page 2135) that contains this implementation can either be added in the Classpath tab in the Document Type Configuration dialog box (on page 66) for your particular framework (on page 2135) or specified with the `classpath` property (on page 1697).

Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```java
public class ComboBoxEditor extends AbstractInplaceEditor {

  /**
   * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
   */
```

```java
@override
public void stopEditing() {
    Runnable customCommit = new Runnable() {
        @Override
        public void run() {
            AuthorDocumentController documentController = context.getAuthorAccess().getDocumentController();
            documentController.insertXMLFragment("<custom/>", offset);
        }
    };
    EditingEvent event = new EditingEvent(customCommit, true);
    fireEditingStopped(event);
}
```

The custom form controls can use any of the predefined properties of the built-in form controls (on page 1668), as well as specified custom properties.

**Example: CSS**

The following is an example of how to specify a custom form control in the CSS:

```css
myElement {
    content: oxy_editor(
        renderClassName, "com.custom.editors.CustomRenderer",
        swingEditorClassName, "com.custom.editors.SwingCustomEditor",
        swtEditorClassName, "com.custom.editors.SwtCustomEditor",
        edit, "@my_attr",
        customProperty1, "customValue1",
        customProperty2, "customValue2"
    )
}
```

**How to Implement Custom Form Controls**

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Editor Eclipse plugin SDK at: https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java JAR (on page 2135) library.
4. Copy the JAR library to the `OXYGEN_INSTALL_DIR/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Editor Eclipse plugin, open the Preferences dialog box (on page 47), go to Document Type Association, edit the appropriate framework, and add the JAR library in the Classpath tab.
6. Specify the custom form control in your CSS, as described above.
Tip: To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory: 

\[OXYGEN_INSTALL_DIR\]/samples/form-controls.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

**Editing Processing Instructions Using a Form Control**

Oxygen XML Editor Eclipse plugin allows you to edit *processing instructions*, *comments*, and *CDATA* by using CSS extensions.

Note: You can edit both the content and the attribute value from a *processing instruction*.

**Example: Editing an Attribute from a Processing Instruction**

**PI content:**

```xml
<?pi_target attr="val"?>
```

**CSS:**

```css
@namespace oxy "http://www.oxygenxml.com/extensions/author"

oxy|processing-instruction:before {
    display:inline;
    content:
        "EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
}
oxy|processing-instruction{
    visibility:-oxy-collapse-text;
}
```

**Related Information:**

- Text Field Form Control *(on page 1692)*
- Collapse Text: -oxy-collapse-text Property Value *(on page 1644)*
- Displaying Processing Instructions from Other XML Editors *(on page 1613)*

**Custom CSS Pseudo-classes**

You can set your custom CSS pseudo-classes on the nodes from the *AuthorDocument* model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified). You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.
In Oxygen XML Editor Eclipse plugin they are used to hide/show the `colspec` elements from CALS tables. To take a look at the implementation, see:

1. `{OXYGEN_INSTALL_DIR}/frameworks/docbook/css/cals_table.css` (Search for `-oxy-visible-colspecs`)
2. The definition of action `table.toggle.colspec` from the DocBook framework (on page 2135) makes use of the pre-defined `TogglePseudoClassOperation` Author mode operation.

Here are some examples:

**Example: Controlling the visibility of a section using a pseudo-class**

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```css
section {
  display:none;
}

section:access-control-user {
  display:block;
}
```

By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

**Example: Coloring the elements at the current cursor location**

You could create an `AuthorCaretListener` that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```css
*:caret-visited {
  color:red;
}
```

The API that you can use from the `CaretListener`:

```java
ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String,
ro.sync.ecss.extensions.api.node.AuthorElement)

ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String,
ro.sync.ecss.extensions.api.node.AuthorElement)
```

**Predefined Pseudo-Class Author Mode Operations**

Pre-defined Author mode operations can be used directly in your framework to work with custom pseudo-classes:

1. `TogglePseudoClassOperation`
2. `SetPseudoClassOperation`
3. **RemovePseudoClassOperation**

### Using the :before(n) and :after(n) CSS Pseudo Elements

Although not standard, this extension may be useful if you want to style sections by adding multiple levels of static content. To add static content to an element, you would normally use a :before or :after pseudo element.

This example adds static text before the title ("Chapter 1", "Chapter 2", etc.):

```css
h1:before {
  content: "Chapter " counter(chapter) ".";
  color: blue;
}
```

All of this is styled with the same color (blue in this example). Using standard CSS, it is impossible to style specific aspects of it (for example, just the chapter number with a larger font and with red). However, you can do it using multiple :before(n) or :after(n) pseudo elements:

```css
h1:before(3) {
  content: "Chapter ";
  color: blue;
}

h1:before(2) {
  content: counter(chapter);
  color: red;
  font-size: large;
}

h1:before(1) {
  content: ".";
  color: blue;
}
```

**Notes:**

- The bigger the level, the more distant the pseudo element is.
- Level 1 corresponds to normal :before or :after pseudo elements.

### Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the Author mode includes a **CSS Inspector view (on page 353)** to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that...
matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

**Figure 489. CSS Inspector View**

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

**Related Information:**

- **CSS Inspector View (on page 353)**

**Author Mode Operations**

This topic lists the default operations for the **Author** mode.

**ChangeAttributeOperation**

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom **Author** mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

- **name**
  - The attribute local name.

- **namespace**
  - The attribute namespace.

- **elementLocation**
  - The XPath location that identifies the element.

- **value**
  - The new value for the attribute. If empty or null the attribute will be removed.

- **editAttribute**
  - If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

- **removelfEmpty**
The possible values are `true` and `false`. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

**ChangeAttributesOperation**

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom **Author** mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

- `elementLocations`
  The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

- `attributeNames`
  The names of the attributes to add, modify, or remove. The values can be local names or Clark notations.

- `values`
  The new attributes values, each on a new line. An empty value will remove the attribute if `removeIfEmpty` is set to `true`.

- `removeIfEmpty`
  The possible values are `true` (default) and `false`. **True** means that the attribute will be removed if an empty value is provided.

**ChangePseudoClassesOperation**

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

- `setLocations`
  An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes set. If it is not defined, then the element at the cursor position will be used.

- `setPseudoClassNames`
  A space-separated list of pseudo-class names that will be set on the matched nodes.

- `removeLocations`
  An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes removed. If it is not defined, then the element at the cursor position will be used.

- `removePseudoClassNames`
  A space-separated list of pseudo-class names that will be removed from the matched nodes.

- `includeAllNodes`
  The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.
DeleteElementOperation

Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

DeleteElementsOperation

Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

ExecuteCommandLineOperation

This operation allows you to start a process executing a given command line. It has the following arguments:

- **name**
  The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

- **workingDirectory**
  The path to the directory where the command line is executed. The default value is `"."` (current directory).

- **cmdLine**
  The command line to be executed (accepts editor variables (on page 1717)).

- **showConsole**
  If set to `true`, the console panel will be displayed in Oxygen XML Editor Eclipse plugin. The default value is `false`.

ExecuteMultipleActionsOperation

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding framework, or one of the common actions for all frameworks supplied by Oxygen XML Editor Eclipse plugin.

- **actionIDs**
  The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

ExecuteMultipleWebappCompatibleActionsOperation

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

ExecuteTransformationScenariosOperation

This operation allows running one or more transformation scenarios defined in the current document type association (on page 2134). It is useful to add to the toolbar buttons that trigger publishing to various output formats. The argument of the operation is:

- **scenarioNames**
The list of scenario names that will be executed, separated by new lines.

**InsertEquationOperation**

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

- **fragment**
  
  The XML fragment containing the MathML content that should be inserted.

**InsertFragmentOperation**

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation (on page 1721).

**InsertOrReplaceFragmentOperation**

Similar to InsertFragmentOperation (on page 1705), except it removes the selected content before inserting the fragment. Also, the `insertPosition` parameter has another possible value: Replace. If this value is used, the operation deletes the node selected by the XPath expression denoted by the `insertLocation` parameter. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation (on page 1721).

**InsertOrReplaceTextOperation**

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

- **text**
  
  The text section to insert.

**InsertXIncludeOperation**

Insert an XInclude element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

**JSOperation**

Allows you to call the Java API from custom JavaScript content. For some sample JSOperation implementations, see https://github.com/oxygenxml/javascript-sample-operations.

**Note:** For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API.

This operation accepts the following parameter:

- **script**
  
  The JavaScript content to execute. It must have a function called `doOperation()`, which can use the predefined `authorAccess` variable. The `authorAccess` variable has access to the entire `ro.sync.ecss.extensions.api.AuthorAccess` Java API.
The following example is a script that retrieves the current value of the `type` attribute on the current element, allows the end user to edit its new value and sets the new value in the document:

```javascript
function doOperation(){
    //The current node is either entirely selected...
    currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
    if(currentNode == null){
        //or the cursor is placed in it
        caretOffset = authorAccess.getEditorAccess().getCaretOffset();
        currentNode = authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    }

    //Get current value of the @type attribute
    currentTypeValue = "";
    currentTypeValueAttr = currentNode.getAttribute("type");
    if(currentTypeValueAttr != null){
        currentTypeValue = currentTypeValueAttr.getValue();
    }

    //Ask user for new value for attribute.
    newTypeValue = javax.swing.JOptionPane.showInputDialog("Input @type value", currentTypeValue);
    if(newTypeValue != null){
        //Create and set the new attribute value for the @type attribute.
        attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue(newTypeValue);
        authorAccess.getDocumentController().setAttribute("type", attrValue, currentNode);
    }
}
```

Tip: You can call functions defined inside a script called `commons.js` from your custom script content so that you can use that external script file as a library of functions. Note that this `commons.js` file must be placed in the root of the `framework` directory (for example, `{OXYGEN_INSTALL_DIR}/frameworks/dita/commons.js`) because that is the only location where Oxygen XML Editor Eclipse plugin will look for it.

**MoveCaretOperation**

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

**xpathLocation**

An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.
position

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- **Before** - Places the cursor at the beginning of the selection.
- **Inside, at the beginning** - Places the cursor at the beginning of the selection.
- **After** - Places the cursor at the end of the selection.
- **Inside, at the end** - Places the cursor at the end of the selection.

selection

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: None, Element, and Content.

MoveElementOperation

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

**sourceLocation**

XPath expression that identifies the content to be moved.

**deleteLocation**

XPath expression that identifies the node to be removed. This parameter is optional. If missing, the sourceLocation parameter will also identify the node to be deleted.

**surroundFragment**

A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

**targetLocation**

XPath expression that identifies the location where the node must be moved to.

**insertPosition**

Argument that indicates the insert position.

**moveOnlySourceContentNodes**

When true, only the content of the source element is moved.

**processTrackedChangesForXPathLocations**

When nodes are located via an XPath expression and the nodes are deleted with Change Tracking (on page 2139) enabled, they are considered as being present by default (thus, the change tracking is ignored). If you set this argument to true and change tracking is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the change tracking is NOT ignored).
OpenInSystemAppOperation

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

resourcePath

An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables (on page 176) are expanded in the value of this parameter, before the expression is executed.

isUnparsedEntity

Possible values are true or false. If the value is true, the value of the resourcePath argument is treated as the name of an unparsed entity.

ReloadContentOperation

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

markAsNotModified

The possible values are true and false. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to true to prevent the editor from showing the content as modified.

RemovePseudoClassOperation

An operation that removes a pseudo-class from an element. Accepts the following parameters:

name

Name of the pseudo-class to be removed.

includeAllNodes

The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

elementLocation

The XPath location that identifies the element. If it is not defined, then the element at the cursor position is used. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

Example:

Suppose that there is a pseudo-class called myClass on the element paragraph and there are CSS styles matching the pseudo-class.

```xml
paragraph:myClass{
  font-size:2em;
  color:red;
}
```
In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue.

**RenameElementOperation**

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

- **elementName**
  
  The new element name.

- **elementLocation**
  
  The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

**ReplaceElementContentOperation**

An operation that replaces the content of the element at the cursor location (or fully selected element). The operation accepts the following parameters:

- **fragment**
  
  Specifies the fragment that will be inserted as the element content.

- **elementLocation**
  
  An XPath expression that identifies the element. If it is not defined, then the element at the cursor position is used.

**SetPseudoClassOperation**

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

- **elementLocation**
  
  An XPath expression that identifies the element that will have the pseudo-class set. If it is not defined, then the element at the cursor position is used.

- **name**
  
  The pseudo-class local name.

- **includeAllNodes**
  
  The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.
ShowElementDocumentationOperation

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

SurroundWithFragmentOperation

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: Arguments of SurroundWithFragmentOperation (on page 1723).

SurroundWithTextOperation

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

- **header**
  - The text that is placed before the selection.

- **footer**
  - The text that is placed after the selection.

TogglePseudoClassOperation

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

- **name**
  - Name of the pseudo-class to be toggled on/off.

- **includeAllNodes**
  - The possible values are yes and no. If set to yes, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.

- **elementLocation**
  - The XPath location that identifies one or more elements that will have the pseudo class toggled. If it is not defined, then the element at the cursor position is used.

**Example:**

```
paragraph:myClass{
  color:red;
}

paragraph{
  color:blue;
}
```
By default, the paragraph content is rendered in blue. Suppose that you have a
'TogglePseudoClassOperation' configured for the 'myClass' pseudo-class. Invoking it the first
time will set the 'myClass' pseudo-class and the paragraph will be rendered in red. Invoking
the operation again, will remove the pseudo-class and the visible result will be a blue rendered
'paragraph' element.

**ToggleSurroundWithElementOperation**
This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain
attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or
underline. The operation supports processing multiple selection intervals, such as multiple cells within a table
column selection. The arguments of the operation are:

- **element**
  The element to wrap or unwrap content.

- **schemaAware**
  This argument applies only on the surround with element operation and controls whether or not
  the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action
  will be broken up into smaller intervals until the wrapping action is valid. For example, if you try
to wrap a 'paragraph' element with a 'bold' element, it would not be valid, so the operation will wrap
  the text inside the paragraph instead, since it would be valid at that position.

**UnwrapTagsOperation**
This operation allows removing the element tags either from the current element or for an element identified
with an XPath location. The argument of the operation is:

- **unwrapElementLocation**
  An XPath expression that identifies the element to unwrap. If it is not defined, the element at the
cursor position is unwrapped.

**XQueryUpdateOperation**
Allows you to execute an XQuery Update script directly over content in Author mode.

*Note:* This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web
Author.

It supports the following arguments:

- **script**
  The XQuery Update script to be executed. The value can either be an XQuery script or a URL
  that points to the XQuery Update script. You can use the '${framework} (on page 181) or
  ${frameworkDir} (on page 181) editor variables to refer the scripts from the framework directory.

  The script will be executed in the context of the node at the cursor position. If the script declares
  the following variable, it will also receive the selected nodes (assuming that entire nodes are
  selected):
In the example below (on page 1712), you can see how this argument is used.

**externalParams**

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```xquery
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the **externalParams** to `param1=value1,param2=value2`.

**expandXincludeReferences**

Makes all Xinclude elements transparent to the XQuery transformer. When the Xinclude references are transparent, the XQueryUpdateOperation can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the Xinclude elements are not transparent.

An example of an XQuery Update Script that converts paragraphs to list items:

```xquery
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";

(: This variable will be linked to the selected nodes assuming that there are actually fully selected nodes. For example this selection will return null:
  <p>{SEL_START}text{SEL_END} in para</p>
  but this will give two "p" elements:
  {SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
  Again, only fully selected nodes will be passed.
:)
declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :)
let $toProcess := if (empty($oxyxq:selection)) then
  (.)
else
  ($oxyxq:selection)

return if (not(empty($toProcess))) then
  {
    (: Create the list :)
    let $ul :=
    <ul>
    |
```
for $sel in $toProcess
return
  <li>{$sel}</li>
}
</ul>

return
{
  (: Delete the processed nodes :) 
for $sel in $toProcess
return
  delete node $sel, 
(:, Inserts the constructed list :) 
insert node $ul 
  before $toProcess[1]
}
)
else
()
targetLocation
An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

script
The script content (XSLT or XQuery). The base system ID for this will be the framework file, so any include/import reference will be resolved relative to the .framework file that contains this action definition.

For example, for the following script, the imported xslt_operation.xsl needs to be located in the current framework directory.

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    version="1.0">
  <xsl:import href="xslt_operation.xsl"/>
</xsl:stylesheet>
```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the framework directory.
- The ${framework} editor variable (on page 181) can also be used to reference resources from the framework directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, http://www.oxygenxml.com/fr/testy.xsl) and map it in the catalog.xml file from the framework directory to a resource from the framework.

action
The insert action relative to the node determined by the target XPath expression. It can be:
Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

caretPosition
The position of the cursor after the action is executed. It can be: Preserve, Before, Start, First editable position, End, or After. If this parameter is not set, you can still indicate the position of the cursor by using the $caret editor variable (on page 180) in the inserted content.

**expandEditorVariables**

Parameter controlling the expansion of editor variables (on page 176) returned by the script processing. Expansion is enabled by default.

**suspendTrackChanges**

It has 2 possible values (true and false). The default value is false. When set to true, the Track Changes (on page 2139) feature is deactivated. When using this argument, after the action is finished, the state of the Track Changes feature is restored to its initial value.

**externalParams**

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```xml
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the externalParams to param1=value1,param2=value2.

**XSLTOperation Example: Sort a list with respect to the language declared on the root element:**

Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```xml
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```

The XSLTOperation needs to be configured as follows:

- **sourceLocation** is set to /* so that the script has access to the root element and its children.
- **targetLocation** is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```xml
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs oxy" version="2.0">
```
<xsl:template match="/">
  <!--
  sourceLocation parameter was set to /* to have a larger context.
  We can pinpoint the element that contained the caret
  using the oxy:current-element() function.
  -->
  <xsl:apply-templates select="oxy:current-element()"/>
</xsl:template>

<xsl:template match="ul">
  <!-- Because the sourceLocation parameter was set to /* we now have access to
  the root element and its attributes. -->
  <xsl:variable name="lang" select="/*/@xml:lang"/>
  <xsl:variable name="collationURI">
    <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=', $lang)"/>
  </xsl:variable>
  <xsl:copy>
    <xsl:copy-of select="@*"/>
    <!-- Copy the list items, but sorted. -->
    <xsl:apply-templates select="li">
      <xsl:sort collation="{$collationURI}" select="text()"/>
    </xsl:apply-templates>
  </xsl:copy>
</xsl:template>

<!-- This copy template will handle the contents of the list items. -->
<xsl:template match="@* | node()">
  <xsl:copy>
    <xsl:copy-of select="@* | node()"/>
  </xsl:copy>
</xsl:template>

Using Entities and Xincludes with the XSLTOperation

- **Entities** will be resolved in the result.
- **Xincludes** are also resolved in the result, and you can alter the XML obtained after the resolving using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.
Editor Variables in Author Mode Operations

Author mode operations can include parameters that contain the following editor variables (on page 176):

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

  ! Note: The ${caret} editor variable is available only for parameters that take XML content as values. It is replaced with the $UNIQUE_CARET_MARKER_FOR_AUTHOR macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in Author mode operations, or in a selection plugin.

- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value') editor variable. You can set the following parameters:
  - **'message'** - The displayed message. Note the quotes that enclose the message.
  - **'default-value'** - Optional parameter. Provides a default value.
  - **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the ${answer(@id)} editor variable.
  - **type** - Optional parameter, with one of the following values:

    ! Note: The title of the dialog box will be determined by the type of parameter and as follows:
    - For url and relative_url parameters, the title will be the name of the parameter and the value of the 'message'.
    - For the other parameters listed below, the title will be the name of that respective parameter.
    - If no parameter is used, the title will be "Input".

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Format: ${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td><strong>Format: ${ask('message', url, 'default_value')</strong>}</td>
</tr>
<tr>
<td>Description:</td>
<td>Input is considered a URL. Oxygen XML Editor Eclipse plugin checks that the provided URL is valid.</td>
</tr>
<tr>
<td>Example:</td>
<td>• ${ask('Input URL', url)} - The displayed dialog box has the name Input URL. The expected input type is URL.</td>
</tr>
<tr>
<td></td>
<td>• ${ask('Input URL', url, '<a href="http://www.example.com')%7D">http://www.example.com')}</a> - The displayed dialog box has the name Input URL. The expected input type is URL. The input field displays the default value <a href="http://www.example.com">http://www.example.com</a>.</td>
</tr>
<tr>
<td>password</td>
<td><strong>Format: ${ask('message', password, 'default')</strong>}</td>
</tr>
<tr>
<td>Description:</td>
<td>The input is hidden with bullet characters.</td>
</tr>
<tr>
<td>Example:</td>
<td>• ${ask('Input password', password)} - The displayed dialog box has the name 'Input password' and the input is hidden with bullet symbols.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Format: ${ask('message', type, 'default')}</td>
</tr>
<tr>
<td>-----------</td>
<td>------------------------------------------------</td>
</tr>
<tr>
<td><strong>generic</strong></td>
<td>Description: The input is considered to be generic text that requires no special handling.</td>
</tr>
<tr>
<td>Example:</td>
<td>- ${ask(&quot;Hello world!&quot;)} - The dialog box has a Hello world! message displayed.</td>
</tr>
<tr>
<td></td>
<td>- ${ask(&quot;Hello world!&quot;, generic, &quot;Hello again!&quot;)} - The dialog box has a Hello world! message displayed and the value displayed in the input box is 'Hello again!'.</td>
</tr>
<tr>
<td><strong>relative_url</strong></td>
<td>Description: Input is considered a URL. Oxygen XML Editor Eclipse plugin tries to make the URL relative to that of the document you are editing.</td>
</tr>
<tr>
<td>Example:</td>
<td>- ${ask('File location', relative_url, 'C:/example.txt')} - The dialog box has the name 'File location'. The URL inserted in the input box is made relative to the current edited document location.</td>
</tr>
<tr>
<td><strong>combobox</strong></td>
<td>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated value (real_value).</td>
</tr>
<tr>
<td>Example:</td>
<td>- ${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.</td>
</tr>
</tbody>
</table>
| Parameter | **Note:** In this example, the default value is indicated by the `osx` key. However, the same result could be obtained if the default value is indicated by Mac OS X, as in the following example: \(\{\text{ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}\}

- \(\{\text{ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':i-Os';'and':'Android'), 'Android')}\}

**Format:** \(\{\text{ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'})\}

**Description:** Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given rendered_value values. Choosing such a value will return its associated real value (real_value) or the value inserted when you edit a list entry.

**Note:** The 'default' parameter specifies the default-selected value and can match either a key or a value.

**Example:**
\(\{\text{ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}\} - The dialog box has the name 'Operating System'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.

| Parameter | **Note:** In this example, Mac OS X is the default-selected value and if selected, it would return osx for the output.

**Format:** \(\{\text{ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'})\}

**Description:** Displays a dialog box that offers a series of radio buttons. Each radio button displays a rendered_value and will return an associated real_value.

**Note:** The 'default' parameter specifies the default-selected value and can match either a key or a value.

**Example:**
\(\{\text{ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}\} - The dialog box has the name 'Operating System'. The radio button group allows you to choose between the three operating systems.
• **${timeStamp}** - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.

• **${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.

• **${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.

• **${cfn}** - Current file name without extension and without parent folder. The current file is the one currently open and selected.

• **${cfne}** - Current file name with extension. The current file is the one currently open and selected.

• **${cf}** - Current file as file path, that is the absolute file path of the current edited document.

• **${cfd}** - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.

• **${frameworksDir}** - The path (as file path) of the frameworks directory.

• **${pd}** - The file path to the folder that contains the current project file (.xpr).

• **${oxygenInstallDir}** - Oxygen XML Editor Eclipse plugin installation folder as file path.

• **${homeDir}** - The path (as file path) of the user home folder.

• **${pn}** - Current project name.

• **${env(VAR_NAME)}** - Value of the VAR_NAME environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **${system(var.name)}** editor variable.

• **${system(var.name)}** - Value of the var.name Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as -Dvar.name=var.value. If you are looking for operating system environment variables, use the **${env(VAR_NAME)}** editor variable instead.

• **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. Example: yyyy-MM-dd.

**Note:** This editor variable supports both the xs:date and xs:datetime parameters. For details about xs:date, go to: [http://www.w3.org/TR/xmlschema-2/#date](http://www.w3.org/TR/xmlschema-2/#date). For details about xs:datetime, go to: [http://www.w3.org/TR/xmlschema-2/#dateTime](http://www.w3.org/TR/xmlschema-2/#dateTime).

### How to Find More Information About the Arguments of an Operation

If you need to find more information about the arguments of an operation, there are several places where this information is available:

• In the API documentation for the particular operation.

• By invoking the `getArguments()` method on the operation.

• In the source code of the operation.

• In Oxygen XML Editor Eclipse plugin:

1. Go to **Options > Preferences > Document Type Association**, select a document type and click the **New, Edit, Duplicate, or Extend** button (on page 60).

2. Go to the **Author** tab and then the **Actions** subtab. At the bottom of this subtab, click **+ New** to open the **Action** dialog box (on page 68).
3. Locate the **Operation** field and click the **Choose** button on the right side. This will open a dialog box that displays the default operations.

4. Double-click the operation (or select it and click **OK**).

The arguments for the operation will now be displayed in the **Action dialog box (on page 68)**.

**Arguments of InsertFragmentOperation Operation**

**fragment**

This argument has a textual value. This value is parsed by Oxygen XML Editor Eclipse plugin as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

- **Prefixes that are not bound explicitly**

  For instance, the fragment:

  ```xml
  <x:item id="dty2"/>
  &ent;
  <x:item id="dty3"/>
  ```

  Can be correctly inserted in the document: ('|' marks the insertion point):

  ```xml
  <?xml version="1.0" encoding="UTF-8"?>
  <!DOCTYPE x:root [    <!ENTITY ent "entity"> ]>

  <x:root xmlns:x="nsp">
  |
  </x:root>
  ```

  Result:

  ```xml
  <?xml version="1.0" encoding="UTF-8"?>
  <!DOCTYPE x:root [    <!ENTITY ent "entity"> ]>

  <x:root xmlns:x="nsp">
  <x:item id="dty2"/>
  ```
• Default namespaces

If there is a default namespace declared in the document and the document fragment (on page 2134) does not declare a namespace, the elements from the fragment are considered to be in no namespace.

For instance, the fragment:

```xml
<item id="dty2"/>
<item id="dty3"/>
```

Inserted in the document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
 | 
</root>
```

Gives the result document:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  <item xmlns="" id="dty2"/>
  <item xmlns="" id="dty3"/>
</root>
```

**insertLocation**

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

**insertPosition**

Specifies where the insertion is made relative to the reference node selected by the insertLocation. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

**goToNextEditablePosition**

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the
fragment specifies a cursor position using the $\textit{caret}$ editor variable (on page 180). The possible values of this action are \textit{true} and \textit{false}.

\textit{schemaAware}

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a \textit{paragraph} element with a \textit{bold} element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

\textbf{Arguments of SurroundWithFragmentOperation}

\textit{fragment}

The XML fragment that will surround the selection. For example, consider the fragment:

\begin{verbatim}
<F>
  <A>
  <X>
  <Y>
  <Z>
</Z>
</Y>
</X>
</A>
</B>
</C>
</F>
\end{verbatim}

and the document:

\begin{verbatim}
<doc>
  <X/>
  <Y/>
  <Z/>
</doc>
\end{verbatim}

Considering the selected content to be surrounded is the sequence of elements \textit{X} and \textit{Y}, then the result is:

\begin{verbatim}
<doc>
  <F>
    <A>
      <X/>
      <Y/>
    </A>
    <B>
      <C/>
    </B>
  </F>
  <Z/>
</doc>
\end{verbatim}
Since the element \( \text{A} \) was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

**Note:** If the first leaf is not the desired location for the surrounded fragment, you can use \texttt{ro.sync.ecss.extensions.commons.operations.InsertOrReplaceFragmentOperation} and set the following arguments:

- **fragment**
  - The XML fragment that will surround the selection. Use the \texttt{${selection}}\text{editor} variable in the location you want to place the surrounded fragment.

- **schemaAware**
  - Set it to \texttt{false} to avoid moving the fragment if it is not valid at the given location.

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a \texttt{paragraph} element with a \texttt{bold} element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

### Adding a Custom Operation to an Existing Framework

This task explains how to add a custom Author mode operation to an existing framework (on page 2135) (document type).

1. Set up a sample project.
2. A variety of classes implement the \texttt{ro.sync.ecss.extensions.api.AuthorOperation} interface. Depending on your use-case, modify one of these classes.
3. Pack the operation class inside a Java JAR library.
4. Copy the JAR library to your framework directory (for example, \texttt{[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]}).
5. Open the Preferences dialog box (on page 47), go to Document Type Association, and edit the document type (you need write access to the \texttt{[OXYGEN_INSTALL_DIR]}) to open the Document Type configuration dialog box (on page 62).
   - a. In the Classpath tab, add a reference to your JAR library (for example, \texttt{${framework}/customAction.jar}).
   - b. Go to the Author tab, then go to the Actions subtab.
   - c. Click the \texttt{+ New} button and use the Action dialog box (on page 68) to create a new action that uses your custom operation.
   - d. Mount the action to the toolbars or menus. You can also define a shortcut key.
6. Share the modifications (on page 1594) with your colleagues. The files that should be shared are your \texttt{customAction.jar} library and the \texttt{.framework} configuration file from the \texttt{[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]} directory.
Customizing Frameworks and Author Mode Using Extensions

If you want to customize the Eclipse plugin, you can look at the Eclipse IDE Integration Sample Project to see how an Eclipse plugin can interact with the Oxygen APIs.

Configuring Frameworks and Author Mode through Extensions

You can add extensions (on page 2137) to your custom framework (on page 2135) (document type) by using the Extensions tab from the Document Type configuration dialog box (on page 62).

Configuring an Extensions Bundle

All extensions (on page 2137) that are provided by Oxygen XML Editor Eclipse plugin are included in a single bundle.

Note: The individual extensions can still be set (open the Preferences dialog box (on page 47), go to Document Type Association, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the ro.sync.ecss.extensions.api.ExtensionsBundle class. The provided implementation of the ExtensionsBundle is instantiated when the Document Type Association (on page 2134) rules defined for the custom framework (on page 2135) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another ExtensionsBundle instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a lib folder in the Java project folder and copy in it the oxygen.jar file from the [OXYGEN_INSTALL_DIR]/lib folder.

2. Create the class (for example, simple.documentation.framework.SDFExtensionsBundle) to extend the abstract class ro.sync.ecss.extensions.api.ExtensionsBundle.

   ```java
   public class SDFExtensionsBundle extends ExtensionsBundle {
   }
   ``..

3. A Document Type ID and a short description should be defined first by implementing the methods getDocumentTypeID and getDescription. The Document Type ID is used to uniquely identify the current
Such an ID must be provided especially if options related to the framework need to be persistently stored and retrieved between sessions.

For example:

```java
public String getDocumentTypeID() {
}

public String getDescription() {
    return "A custom extensions bundle used for the Simple Document" +
            " Framework document type";
}
```

4. To be notified about the activation of the custom Author Extension in relation with an open document, `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` should be implemented. The activation and deactivation events received by this listener should be used to perform custom initializations and to register or remove listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`. The custom Author Extension state listener should be provided by implementing the `createAuthorExtensionStateListener` method.

For example:

```java
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}
```

The AuthorExtensionStateListener is instantiated and notified about the activation of the framework when the rules of the Document Type Association match a document opened in the Author editing mode. The listener is notified about the deactivation when another framework is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` can be found in Implementing an Author Extension State Listener (on page 1738).

If Schema Aware mode (on page 110) is active in Oxygen XML Editor Eclipse plugin, all actions that can generate invalid content will be redirected toward the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingStyleHandler`. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `ro.sync.ecss.extensions.api.InvalidEditException`. The actions that are forwarded to this handler include typing, delete, or paste.

See Handling Schema-Aware Editing Events (on page 1764) for more details about this handler.

5. Customizations of the content completion proposals are permitted by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is `ro.sync.contentcompletion.xml.SchemaManagerFilter`. The filter can be applied on elements, attributes, or on their values. The `createSchemaManagerFilter` method is responsible for creating the content
A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the `Document Type Association` that contains the filter declaration.

For example:

```java
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemasManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler (on page 1732) section.

6. The **Author** mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `@id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```java
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder (on page 1756) section.

7. The drag and drop functionality can be extended by implementing the `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener` interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the **Author** editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in **Author** mode for both Oxygen XML Editor Eclipse plugin Eclipse plugin and standalone application. The **Text** mode corresponding listener is available only for Oxygen XML Editor Eclipse plugin Eclipse plugin and standalone application. The methods corresponding to each implementation are: `createAuthorAWTDndListener`, `createTextSWTDndListener`, and `createAuthorSWTDndListener`.

For more details about the **Author** mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener (on page 1734) section.

8. Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the `ref` element and the attribute indicating the referenced resource is `location`.

To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements `ro.sync.ecss.extensions.api.AuthorReferenceResolver`. The method responsible
for creating the custom references resolver is `createAuthorReferenceResolver`. The method is called each time a document opened in an **Author** editing mode matches the **Document Type Association** where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

For example:

```java
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the Configuring a References Resolver (on page 1734) section.

9. To be able to dynamically customize the default CSS styles for a certain `ro.sync.ecss.extensions.api.node.AuthorNode`, an implementation of `ro.sync.ecss.extensions.api.StylesFilter` can be provided. The extensions bundle method responsible for creating the `StylesFilter` is `createAuthorStylesFilter`. The method is called each time a document opened in an **Author** editing mode matches the **Document Type Association** where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

For example:

```java
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the Configuring CSS Styles Filter (on page 1755) section for more details about the styles filter extension.

10. To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided. The two methods from the `ExtensionsBundle` specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`.

For example:

```java
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}
```

```java
public AuthorTableColumnWidthProvider createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```
The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider (on page 1747) and Configuring a Table Column Width Provider (on page 1742) sections.

If the functionality related to one of the previous extension points does not need to be modified, then the developed ro.sync.ecss.extensions.api.ExtensionsBundle should not override the corresponding method and leave the default base implementation to return null.

11. An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the ro.sync.ecss.extensions.api.link.LinkTextResolver interface should be returned by the createLinkTextResolver method. This implementation is used each time the oxy_link-text() function (on page 1661) is encountered in the CSS styles associated with an element.

For example:

```java
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

12. Pack the compiled class into a JAR (on page 2135) file.

13. Copy the JAR file into your custom framework directory (for example, frameworks/sdf).

14. Add the JAR file to the class path. To do this, open the Preferences dialog box (on page 47), go to Document Type Association, select the document type (for example, SDF), click the Edit button, select the Classpath tab, and click the Add button. In the displayed dialog box, enter the location of the JAR file relative to the Oxygen XML Editor Eclipse plugin frameworks folder.

15. Register the Java class by going to the Extensions tab. Click the Choose button and select the name of the class (for example, SDFExtensionsBundle).

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Related Information:

Adding a Custom Image Decorator for Author Mode

The AuthorImageDecorator extension point allows you to add a custom decorator over images in Author mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

How to Implement an AuthorImageDecorator

To implement your own AuthorImageDecorator, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorImageDecorator interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1725), you can return the AuthorImageDecorator implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator() method.
   b. Specify the AuthorImageDecorator in the Author image decorator individual extension in the Extensions tab (on page 84) of the Document Type configuration dialog box (on page 62) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```java
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
     *     (ro.sync.exml.view.graphics.Graphics, int, int, int, int,
     *     ro.sync.exml.view.graphics.Rectangle,
     *     ro.sync.ecss.extensions.api.node.AuthorNode,
     *     ro.sync.ecss.extensions.api.AuthorAccess, boolean)
     */
    @Override
    public void paint(Graphics g, int x, int y, int imageWidth, int imageHeight,
                     Rectangle originalSize, AuthorNode element,
                     AuthorAccess authorAccess, boolean wasAnnotated) {
        if ("image".equals(CommonsOperationsUtil.getLocalName(element.getName()))) {
            g.drawString("[Double-click to edit image]",
                         // Draw near the top-left corner
                         x + 15,
```
Adding Custom Persistent Highlights

The Author API includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the AuthorPersistentHighlighter class that is accessible through the AuthorEditorAccess#getPersistentHighlighter() method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

Configuring the Automatic ID Generation and Unique Attributes Recognizer

The ro.sync.ecss.extensions.api.UniqueAttributesRecognizer interface can be implemented if you want to provide for your framework (on page 2135) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook frameworks (on page 2135). The following methods can be implemented to accomplish this:(assignUniqueIDs(int startOffset, int endOffset), isAutoIDGenerationActive())

- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current block element (on page 2132) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: boolean copyAttributeOnSplit(String attrQName, AuthorElement element)

**Tip:** The ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your framework (on page 2135). You can also check out the DITA and DocBook implementations of ro.sync.ecss.extensions.api.UniqueAttributesRecognizer to see how they were implemented and connected to the extensions bundle.
Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the `ro.sync.contentcompletion.xml.SchemaManagerFilter` interface.

```java
import java.util.List;
import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {

    public List<CIAttribute> filterAttributes(List<CIAttribute> attributes, WhatAttributesCanGoHereContext context) {
        // If the element from the current context is the 'table' element add the attribute named 'frame' to the list of default content completion proposals
        if (context.getParentElement() != null) {
            ContextElement contextElement = context.getParentElement();
            if (contextElement.getQName().equals("table")) {
                CIAttribute frameAttribute = new CIAttribute();
                frameAttribute.setName("frame");
                frameAttribute.setRequired(false);
                frameAttribute.setFixed(false);
                frameAttribute.setFixed(false);
            }
        }
    }
}
```

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor Eclipse plugin or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the `filterAttributes` method and changing the default content completion list of `ro.sync.contentcompletion.xml.CIAttribute` for the element provided by the current `ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext` context.

For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.
The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```java
public List<CIElement> filterElements(List<CIElement> elements, WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the 'td' element from the list of content completion proposals and add the 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = elementStack.peek();
            if ("header".equals(contextElement.getQName())) {
                if (elements != null) {
                    for (Iterator<CIElement> iterator = elements.iterator(); iterator.hasNext();) {
                        CIElement element = iterator.next();
                        // Remove the 'td' element
                        if ("td".equals(element.getQName())) {
                            elements.remove(element);
                            break;
                        }
                    }
                } else {
                    elements = new ArrayList<CIElement>();
                }
                // Insert the 'th' element in the list of content completion proposals
                CIElement thElement = new SDFElement();
                thElement.setName("th");
                elements.add(thElement);
            }
        }
    }
    return elements;
}
```
The elements or attributes values can be filtered using the `filterElementValues` or `filterAttributeValues` methods.

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

### Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the Text or Author modes.

**Interfaces for the Drag and Drop Listener**

- `ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener`
  Receives callbacks from the standalone application for Drag And Drop in Author mode.

- `com.oxygenxml.editor.editors.author.AuthorDnDListener`
  Receives callbacks from the Eclipse plugin for Drag And Drop in Author mode.

- `com.oxygenxml.editor.editors.TextDnDListener`
  Receives callbacks from the Eclipse plugin for Drag And Drop in Text mode.

**Note:** The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

To configure how dropped URLs or XHTML fragments are handled in documents, see Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode (on page 1766).

**Related Information:**

- Customizing Smart Paste Support (on page 1561)

### Configuring a Reference Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is `ref` and the attribute indicating the
referenced resource is location. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the `ro.sync.ecss.extensions.api.AuthorReferenceResolver` interface.

   ```java
   import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
   import ro.sync.ecss.extensions.api.AuthorAccess;
   import ro.sync.ecss.extensions.api.node.AttrValue;
   import ro.sync.ecss.extensions.api.node.AuthorElement;
   import ro.sync.ecss.extensions.api.node.AuthorNode;

   public class ReferencesResolver implements AuthorReferenceResolver {

   
   
   2. The `hasReferences` method verifies if the handler considers the node to have references. It takes `AuthorNode` as an argument that represents the node that will be verified. The method will return true if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name ref and it must have an attribute named location.

   ```java
   public boolean hasReferences(AuthorNode node) {
       boolean hasReferences = false;
       if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
           AuthorElement element = (AuthorElement) node;
           if ("ref".equals(element.getLocalName())) {
               AttrValue attrValue = element.getAttribute("location");
               hasReferences = attrValue != null;
           }
       }
       return hasReferences;
   }
   ```

3. The method `getDisplayName` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node that needs the display name. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the location attribute from the ref element.

   ```java
   public String getDisplayName(AuthorNode node) {
       String displayName = "ref-fragment";
       if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
           AuthorElement element = (AuthorElement) node;
           if ("ref".equals(element.getLocalName())) {
               AttrValue attrValue = element.getAttribute("location");
               if (attrValue != null) {
   ```
4. The method `resolveReference` resolves the reference of the node and returns a `SAXSource` with the parser and its input source. It takes `AuthorNode` as an argument that represents the node that needs the reference resolved, the `systemID` of the node, the `AuthorAccess` with access methods to the `Author` mode data model and a `SAX EntityResolver` that resolves resources that are already opened in another editor or resolve resources through the `XML Catalog` (on page 2139). In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```java
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
    SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));
                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if(inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }
                    XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
                    xmlReader.setEntityResolver(entityResolver);
                    saxSource = new SAXSource(xmlReader, inputSource);
                }
            }
        }
    }
    return saxSource;
}
```
logger.error(e, e);
} catch (SAXException e) {
    logger.error(e, e);
} catch (IOException e) {
    logger.error(e, e);
}

return saxSource;

5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```java
public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}
```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the `Author` mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```java
public String getReferenceSystemID(AuthorNode node, AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
```
if (attrValue != null) {
    String attrStringVal = attrValue.getValue();
    try {
        URL absoluteUrl = new URL(node.getXMLBaseURL(),
            authorAccess.getUtilAccess().correctURL(attrStringVal));
        systemID = absoluteUrl.toString();
    } catch (MalformedURLException e) {
        logger.error(e, e);
    }
    return systemID;
}

In the listing below, the XML document contains the ref element:

<ref location="referenced.xml">Reference</ref>

When no reference resolver is specified, the reference has the following layout:

**Figure 490. Reference with no specified reference resolver**

![Reference without a reference resolver]

When the above implementation is configured, the reference has the expected layout:

**Figure 491. Reference with reference resolver**

![Reference with a reference resolver]

### Configuring a State Listener for Author Mode

The ro.sync.ecss.extensions.api.AuthorExtensionStateListener implementation is notified when the Author mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;
```
When the association rules of the framework (on page 2135) (document type) configuration match that of a document open in the Author editing mode, the activation event received by this listener should be used to perform custom initializations and to register listeners such as ro.sync.ecss.extensions.api.AuthorListener, ro.sync.ecss.extensions.api.AuthorMouseListener, or ro.sync.ecss.extensions.api.AuthorCaretListener.

```java
public class SDFAuthorExtensionStateListener implements AuthorExtensionStateListener {
    private AuthorListener sdfAuthorDocumentListener;
    private AuthorMouseListener sdfMouseListener;
    private AuthorCaretListener sdfCaretListener;
    private OptionListener sdfOptionListener;

    public void activated(AuthorAccess authorAccess) {
        // Get the value of the option.
        String option = authorAccess.getOptionsStorage().getOption("sdf.custom.option.key", "");
        // Use the option for some initializations...
        // Add an OptionListener.
        authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

        // Add author DocumentListeners.
        sdfAuthorDocumentListener = new SDFAuthorListener();
        authorAccess.getDocumentController().addAuthorListener(sdfAuthorDocumentListener);

        // Add MouseListener.
        sdfMouseListener = new SDFAuthorMouseListener();
        authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

        // Add CaretListener.
        sdfCaretListener = new SDFAuthorCaretListener();
        authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

        // Other custom initializations...
    }
}
```

The authorAccess parameter received by the activated method can be used to gain access to specific Author mode actions and informations related to components such as the editor, document, workspace, tables, or the change tracking manager.

If options specific to the custom developed Author Extension need to be stored or retrieved, a reference to the ro.sync.ecss.extensions.api.OptionsStorage can be obtained by calling the getOptionsStorage method.
from the `authorAccess`. The same object can be used to register `ro.sync.ecss.extensions.api.OptionListener` listeners. An option listener is registered in relation with an option `key` and will be notified about the value changes of that option.

An `AuthorListener` can be used if events related to the `Author` mode document modifications are of interest. The listener can be added to the `ro.sync.ecss.extensions.api.AuthorDocumentController`. A reference to the document controller is returned by the `getDocumentController` method from the `authorAccess`. The document controller can also be used to perform operations involving document modifications.

To provide access to the `Author` mode component-related functionality and information, the `authorAccess` has a reference to the `ro.sync.ecss.extensions.api.access.AuthorEditorAccess` that can be obtained when calling the `getEditorAccess` method. At this level, `AuthorMouseListener` and `AuthorCaretListener` can be added to provide notification of mouse and cursor events that occur in the `Author` editor mode.

The deactivation event is received when another `framework` is activated for the same document, the user switches to another editor mode or the editor is closed. The `deactivate` method is typically used to unregister the listeners previously added on the `activate` method and to perform other actions. For example, options related to the deactivated `Author Extension` can be saved at this point.

```java
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption(
        "sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(
        sdfAuthorDocumentListener);

    // Remove MouseListener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.
    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

    // Other actions...
}
```

**Note:** The complete source code for `framework` customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.
## Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor Eclipse plugin offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```css
table{
  display:table;
  border:1px solid navy;
  margin:1em;
  max-width:1000px;
  min-width:150px;
}

table[width]{
  width:attr(width, length);
}

tr, header{
  display:table-row;
}

header{
  background-color: silver;
  color:inherit
}

td{
  display:table-cell;
  border:1px solid navy;
  padding:1em;
}
```

Suppose that in the schema, the `<td>` tag has the attributes `@row_span` and `@column_span` that are not automatically recognized by Oxygen XML Editor Eclipse plugin, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider (on page 1747).

Suppose the column widths are specified by the `@width` attribute of the `<customcol>` elements that are not automatically recognized by Oxygen XML Editor Eclipse plugin. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider (on page 1742).
The table from the example does not make use of the attributes @colsep and @rowsep (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider (on page 1750).

### Configuring a Table Column Width Provider

In a custom framework (on page 2135), the `<table>` element as well as the table columns can have specified widths. For these widths to be considered by Author mode, you need to provide the means for determining them. As explained in Configuring Tables (on page 1741), if you use the table element attribute `width` Oxygen XML Editor Eclipse plugin can determine the table width automatically. In this example the table has `<col>` elements with `@width` attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class `simple.documentation.framework.TableColumnWidthProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider implements AuthorTableColumnWidthProvider {

    public void init(AuthorElement tableElement) {
        this.tableElement = tableElement;
        AuthorElement[] colChildren = tableElement.getElementsByLocalName("customcol");
        if (colChildren != null && colChildren.length > 0) {
            for (int i = 0; i < colChildren.length; i++) {
                AuthorElement colChild = colChildren[i];
                if (i == 0) {
                    colsStartOffset = colChild.getStartOffset();
                }
                if (i == colChildren.length - 1) {
                    colsEndOffset = colChild.getEndOffset();
                }
            }
        }
    }

    // Determine the 'width' for this col.
    AttrValue colWidthAttribute = colChild.getAttribute("width");
```

2. Method `init` is taking as argument an `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element. In our case the column widths are specified in `<col>` elements from the `<table>` element. In such cases you must collect the span information by analyzing the `<table>` element.
String colWidth = null;
    if (colWidthAttribute != null) {
        colWidth = colWidthAttribute.getValue();
        // Add WidthRepresentation objects for the columns this 'customcol'
        // specification spans over.
        colWidthSpecs.add(new WidthRepresentation(colWidth, true));
    }
}
}
}

3. The method `isTableAcceptingWidth` should check if the table cells are a `<td>` element.

```java
public boolean isTableAcceptingWidth(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

4. The method `isTableAndColumnsResizable` should check if the table cells are a `<td>` element. This method determines if the table and its columns can be resized by dragging the edge of a column.

```java
public boolean isTableAndColumnsResizable(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}
```

5. Methods `getTableWidth` and `getCellWidth` are used to determine the table and column width. The table layout engine will ask this `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the `width` attribute. The methods must return `null` for the tables / cells that do not have a specified width.

```java
public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}

public List<WidthRepresentation>
getCellWidth(AuthorElement cellElement, int colNumberStart,
      int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
      toReturn = new ArrayList<WidthRepresentation>(colSpan);
      for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
        // Add the column widths
        toReturn.add(colWidthSpecs.get(i));
      }
    }
    return toReturn;
  }

6. Methods commitTableWidthModification and commitColumnWidthModifications are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

```java
public void commitTableWidthModification
    (AuthorDocumentController authorDocumentController,
     int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
  if ("td".equals(tableCellsTagName)) {
    if (newTableWidth > 0) {
      if (tableElement != null) {
        String newWidth = String.valueOf(newTableWidth);
        authorDocumentController.setAttribute(
          "width",
          new AttrValue(newWidth),
          tableElement);
      } else {
        throw new AuthorOperationException("Cannot find the table element.");
      }
    }
  }
}

public void commitColumnWidthModifications
    (AuthorDocumentController authorDocumentController,
     WidthRepresentation[] colWidths, String tableCellsTagName)
  throws AuthorOperationException {
  if ("td".equals(tableCellsTagName)) {
    if (colWidths != null && tableElement != null) {
      if (colsStartOffset >= 0 && colsEndOffset >= 0 && colsStartOffset < colsEndOffset) {
```
authorDocumentController.delete(colsStartOffset, colsEndOffset);
}
String xmlFragment = createXMLFragment(colWidths);
int offset = -1;
AuthorElement[] header = tableElement.getElementsByLocalName("header");
if (header != null && header.length > 0) {
    // Insert the cols elements before the 'header' element
    offset = header[0].getStartOffset();
}
if (offset == -1) {
    throw new AuthorOperationException("No valid offset to insert column width");
}
authorDocumentController.insertXMLFragment(xmlFragment, offset);
}
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol" +
                (width.getWidthRepresentation() != null ? " width=" + width.getWidthRepresentation() + "" : ")
            (ns != null && ns.length() > 0) {
                fragment.append(" xmlns=" + ns + """);
            }
        fragment.append(">");
    }
    return fragment.toString();
}

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

    public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
        return true;
    }
public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
    return true;
}

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

In the listing below, the XML document contains the table element:

```xml
<table width="300">
    <customcol width="50.0px"/>
    <customcol width="1*"/>
    <customcol width="2*"/>
    <customcol width="20%"/>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td>cs=1, rs=1</td>
        <td>cs=1, rs=1</td>
        <td row_span="2">cs=1, rs=2</td>
        <td row_span="3">cs=1, rs=3</td>
    </tr>
    <tr>
        <td>cs=1, rs=1</td>
        <td>cs=1, rs=1</td>
    </tr>
    <tr>
        <td>column_span="3">cs=3, rs=1</td>
    </tr>
</table>
```

When no table column width provider is specified, the table has the following layout:
Configuring a Table Cell Span Provider

In a custom framework (on page 2135), the `<table>` element can have cells that span over multiple columns and rows. As explained in Configuring Tables (on page 1741), you need to indicate Oxygen XML Editor Eclipse plugin a method to determine the cell spanning. If you use the `@rowspan` and `@colspan` attributes, Oxygen XML Editor Eclipse plugin can determine the cell spanning automatically. In the following example, the `<td>` element uses the `@row_span` and `@column_span` attributes that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
```
public class TableCellSpanProvider implements AuthorTableCellSpanProvider {

2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `<table>` element. In such cases, you must collect the span information by analyzing the `<table>` element.

```java
public void init(AuthorElement table) {
}
```

3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return `null` for all the cells that do not change the span specification.

```java
public Integer getColSpan(AuthorElement cell) {
    Integer colSpan = null;

    AttrValue attrValue = cell.getAttribute("column_span");
    if(attrValue != null) {
        String cs = attrValue.getValue();
        try {
            colSpan = new Integer(cs);
        } catch (NumberFormatException ex) {
            // The attribute value was not a number.
        }
    }
    return colSpan;
}
```

4. The row span is determined in a similar manner:

```java
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;

    AttrValue attrValue = cell.getAttribute("row_span");
    if(attrValue != null) {
        // The attribute was found.
    }
    return rowSpan;
}
```
String rs = attrValue.getValue();
if(rs != null) {
    try {
        rowSpan = new Integer(rs);
    } catch (NumberFormatException ex) {
        // The attribute value was not a number.
    }
}
return rowSpan;

5. The method `hasColumnSpecifications` always returns `true` considering column specifications always available.

```java
public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}
```

Note: The complete source code for framework customization examples can be found in the `oxygen-sample-framework` module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

6. In the listing below, the XML document contains the table element:

```xml
<table>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td>cs=1, rs=1</td>
        <td>column_span="2" row_span="2">cs=2, rs=2</td>
        <td>row_span="3">cs=1, rs=3</td>
    </tr>
    <tr>
        <td>cs=1, rs=1</td>
    </tr>
    <tr>
        <td>column_span="3">cs=3, rs=1</td>
    </tr>
</table>
```
When no table cell span provider is specified, the table has the following layout:

**Figure 494. Table layout when no cell span provider is specified**

![Table layout when no cell span provider is specified](image)

When the above implementation is configured, the table has the correct layout:

**Figure 495. Cells spanning multiple rows and columns.**

![Cells spanning multiple rows and columns](image)

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.
Configuring a Table Cell Row and Column Separator Provider

In a custom framework (on page 2135), the `<table>` element has separators between rows. As explained in Configuring Tables (on page 1741), you need to indicate a method to determine the way rows and columns are separated. If you use the `@rowsep` and `@colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor Eclipse plugin can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

```java
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider {

2. The `init` method takes the `ro.sync.ecss.extensions.api.node.AuthorElement` interface that represents the XML `<table>` element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when the cell separators are specified in the `<table>` element. In such cases, you should initialize your provider based on the given argument.

```java
public void init(AuthorElement table) {
}
```

3. The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns `false`, meaning there will not be column separators.

```java
/**
 * @return false - No column separator at the right of the cell.
 */
@override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
}
```

4. The row separators are determined in a similar manner. This time the example returns `true`, forcing a separator between the rows.

```java
/**
 * @return true - A row separator below each cell.
 */
@override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
```
return true;
}

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

5. In the example below, the XML document contains the table element:

```xml
<table>
  <header>
    <td>H1</td>
    <td>H2</td>
    <td>H3</td>
    <td>H4</td>
  </header>
  <tr>
    <td>C11</td>
    <td>C12</td>
    <td>C13</td>
    <td>C14</td>
  </tr>
  <tr>
    <td>C21</td>
    <td>C22</td>
    <td>C23</td>
    <td>C24</td>
  </tr>
  <tr>
    <td>C31</td>
    <td>C32</td>
    <td>C33</td>
    <td>C34</td>
  </tr>
</table>
```

When the borders for the `<td>` element are removed from the CSS, the row separators become visible:
Customizing Attribute Value Editors

The `CustomAttributeValueEditor` extension point allows you to customize the attribute value editing mechanisms in Oxygen XML Editor Eclipse plugin. It changes the `Browse` button found in the attribute editors to an `Edit` button. When a user clicks that `Edit` button, your custom attribute value editor will be presented.

The `Edit` button can be accessed in the following attribute editors:

- The `Attributes` view in Author mode (on page 344) (when the `Expand` button is used to reveal an expanded panel).
- The `Attributes` view in Text mode (on page 276) (when the `Expand` button is used to reveal an expanded panel).
- The In-place Attributes Editor (on page 346) when invoked in Author mode.
- The In-place Attributes Editor invoked in the Outline view (on page 273).

How to Implement a `CustomAttributeValueEditor`

To implement your own `CustomAttributeValueEditor`, follow this procedure:

1. Extend the `ro.sync.ecss.extensions.api.CustomAttributeValueEditor` abstract class.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1725), you can return the `CustomAttributeValueEditor` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor()` method.
   b. Specify the `CustomAttributeValueEditor` in the Author custom attribute value editor individual extension in the Extensions tab (on page 84) of the Document Type configuration dialog box (on page 62) for your particular document type.
Example
The following example creates a very simple custom attribute value editor:

```java
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "My custom attribute value editor";
    }

    /**
     * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
     * (ro.sync.ecss.extensions.api.EditedAttribute, java.lang.Object)
     */
    @Override
    public String getAttributeValue(EditedAttribute attribute, Object parentComponent)
            throws CancelledByUserException {
        // Show an input dialog for collecting the new value
        return JOptionPane.showInputDialog("Set a new value for " + attribute.getAttributeQName() + ":");
    }

    /**
     * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
     * (ro.sync.ecss.extensions.api.EditedAttribute)
     */
    @Override
    public boolean shouldHandleAttribute(EditedAttribute attribute) {
        // Handle all attributes
        return true;
    }
}
```

Example result: If a user were to click the Edit button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:
Customizing the CSS Styles Filter

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the Author mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Editor Eclipse plugin or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in this simple document example, the filter can change the value of the `KEY_FONT` property for the `<table>` element:

```java
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType() && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
        }
        return styles;
    }
}
```

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.
Customizing Elements that Wrap Profiled Content

For each framework (on page 2135) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider. This configuration is set by default for DITA and DocBook frameworks.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the DefaultElementLocatorProvider implementation (on page 1756) will be used by default. The interface that should be implemented for a custom link target reference finder is ro.sync.ecss.extensions.api.link.ElementLocatorProvider. As an alternative, the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider implementation can also be extended.

The used ElementLocatorProvider will be queried for an ElementLocator when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained ElementLocator will be queried for each element from the document.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the ro.sync.ecss.extensions.api.link.ElementLocatorProvider interface. As an alternative, your class could extend ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, the default implementation.

Note: The complete source code of the ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider, ro.sync.ecss.extensions.commons.IDElementLocator or ro.sync.ecss.extensions.commons.XPointerElementLocator can be found in the oxygen-sample-framework project.

Default Link Target Reference Finder

The DefaultElementLocatorProvider implementation is used by default to find link target references. It offers support for the most common types of links:

- Links based on ID attribute values (on page 1757).
- XPointer element() scheme (on page 1758).

The method getElementLocator determines what ElementLocator should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null IDTypeVerifier will always be provided if a schema is associated with the document type.
The link string argument is the anchor (on page 2132) part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```java
public ElementLocator getElementLocator(IDTypeVerifier idVerifier, String link) {
    ElementLocator elementLocator = null;
    try {
        if (link.startsWith("element(")) {
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    } catch (ElementLocatorException e) {
        logger.warn("Exception when create element locator for link: ", link + ". Cause: ", e, e);
    }
    return elementLocator;
}
```

### ID Element Locator

The IDElementLocator is an implementation of the abstract class ro.sync.ecss.extensions.api.link.ElementLocator for links that use an ID.

The constructor only assigns field values and the method `endElement` is empty for this implementation.

The method `startElement` checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is `xml:id`.
- The attribute type is ID.

The attribute type is checked with the help of the method `IDTypeVerifier.hasIDType`.

```java
public boolean startElement(String uri, String localName, String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if ("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
            }
        }
    }
    return elementFound;
}
```
String attrLocalName = 
    ExtensionUtil.getLocalName(atts[i].getQName());
String attrUri = atts[i].getNamespace();
    if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
        elementFound = true;
    }
}
}

return elementFound;

XPointer Element Locator

XPointerElementLocator is an implementation of the abstract class 
ro.sync.ecss.extensions.api.link.ElementLocator for links that have one of the following XPointer element() scheme patterns:

**element (elementID)**

Locate the element with the specified ID.

**element (/1/2/3)**

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

**element (elementID/3/4)**

A child sequence appearing after a NCName identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```java
public XPointerElementLocator(IDTypeVerifier idVerifier, String link) 
    throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element[".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
```
while (stringTokenizer.hasMoreTokens()) {
    xpointerPath[i] = stringTokenizer.nextToken();
    boolean invalidFormat = false;

    // Empty xpointer component is not supported
    if (xpointerPath[i].length() == 0) {
        invalidFormat = true;
    }

    if (i > 0) {
        try {
            Integer.parseInt(xpointerPath[i]);
        } catch (NumberFormatException e) {
            invalidFormat = true;
        }
    }

    if (invalidFormat) {
        throw new ElementLocatorException(
            "Only the element() scheme is supported when locating XPointer links."
            + "Supported formats: element(elementID), element(/1/2/3),
            element(elemID/2/3/4).");
    }
    i++;
}

if (Character.isDigit(xpointerPath[0].charAt(0))) {
    // This is the case when xpointer have the following pattern /1/5/7
    xpointerPathDepth = xpointerPath.length;
} else {
    // This is the case when xpointer starts with an element ID
    xpointerPathDepth = -1;
    startWithElementID = true;
}

The method `startElement` will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are

`uri`

The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

`localName`
Local name of the element.

\textit{qName}

Qualified name of the element.

\textit{atts}

Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns \texttt{true} if the processed element is found to be the one indicated by the link.

The \textit{XPointerElementLocator} implementation of the \texttt{startElement} will update the depth of the current element and keep the index of the element in its parent. If the \texttt{xpointerPath} starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```java
public boolean startElement(String uri, String localName,
         String name, Attr[] atts)
         {
     boolean linkLocated = false;
     // Increase current element document depth
     startElementDepth ++;

     if (endElementDepth != startElementDepth) {
         // The current element is the first child of the parent
         currentElementIndexStack.push(new Integer(1));
     } else {
         // Another element in the parent element
         currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
     }

     if (startsWithElementID) {
         // This the case when xpointer path starts with an element ID.
         String xpointerElement = xpointerPath[0];
         for (int i = 0; i < atts.length; i++) {
             if (xpointerElement.equals(atts[i].getValue())){
                 if(idVerifier.hasIDType(
                     localName, uri, atts[i].getQName(), atts[i].getNamespace())){
                     xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                     break;
                 }
             }
         }
     }
     }
if (xpointerPathDepth == startElementDepth) {
    // check if xpointer path matches with the current element path
    linkLocated = true;
    try {
        int xpointerIdx = xpointerPath.length - 1;
        int stackIdx = currentElementIndexStack.size() - 1;
        int stopIdx = startWithElementID ? 1 : 0;
        while (xpointerIdx >= stopIdx && stackIdx >= 0) {
            int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
            int currentElementIndex =
                ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
            if (xpointerIndex != currentElementIndex) {
                linkLocated = false;
                break;
            }
            xpointerIdx--;
            stackIdx--;
        }
    } catch (NumberFormatException e) {
        logger.warn(e, e);
    }
    return linkLocated;
}

The method endElement will be invoked at the end of every element in the XML document (even when the element is empty).

The XPointerElementLocator implementation of the endElement updates the depth of the current element path and the index of the element in its parent.

```java
public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the Outline view (on page 273) in Author mode, breadcrumb navigation bar (on page 320) in Author mode, Outline view (on page 273)
in Text mode, Content Completion Assistant (on page 2133) window, or DITA Maps Manager view (on page 1877).

There are two methods to provide an implementation of ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer:

• As a part of a bundle, returning it from the createXMLNodeCustomizer() method of the ExtensionsBundle associated with your document type in the Document type configuration dialog box (on page 62) (Extensions bundle field in the Extensions tab).
• As an individual extension, associated with your document type in the Document type configuration dialog box (on page 62) (XML node renderer customizer field in the Individual extensions section of the Extensions tab).

Support for Retina/HiDPI Displays
To support Retina or HiDPI displays, the icons provided by the XMLNodeRendererCustomizer should be backed up by a copy of larger size using the proper Retina/HiDPI naming convention (on page 429).

For example, for the <title> element, if the XMLNodeRendererCustomizer returns the path ${framework}/images/myImg.png, then to support Retina images with a scaling factor of 2, an extra file (myImg@2x.png) should be added to the same images directory (${framework}/images/myImg@2x.png). If the higher resolution icon (the @2x file) does not exist, the normal icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author Mode (on page 428) section.

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

• Customizing the Rendering of Elements (on page 1574)

Handling Author Mode Action Events
The AuthorActionEventHandler extension point allows you to handle certain Author mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press Enter instead of it opening the Content Completion Assistant (on page 2133).

How to Implement an AuthorActionEventHandler
To implement your own AuthorActionEventHandler, follow this procedure:
1. Implement the `ro.sync.ecss.extensions.api.AuthorActionEventHandler` interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1725), you can return the `AuthorActionEventHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()` method.
   b. Specify the `AuthorActionEventHandler` in the **Author action event handler** individual extension in the **Extensions tab** (on page 84) of the **Document Type** configuration dialog box (on page 62) for your particular document type.

**Example**

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses Enter in **Author** mode. It uses the `canHandleEvent` method to make sure the insertion will be performed in an element that will preserve the *new-line* character. Then the `handleEvent` method inserts the new line at the current cursor position.

```java
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler {
    
    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
     * (AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess, AuthorActionEventType type) {
        boolean canHandle = false;
        
        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController = authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getcaretOffset();
            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {
                    AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                    AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
                    if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                        canHandle = true;
                    }
                }
            } catch (BadLocationException ex) {
                if (logger.isDebugEnabled()) {
                    
                }
            }
        }
    }
}
```
Handling Schema-Aware Editing Events

The AuthorSchemaAwareEditingHandlerAdapter extension point allows you to handle certain Author mode actions in various ways. For example, implementing the AuthorSchemaAwareEditingHandlerAdapter makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor Eclipse plugin when pasting content (through the use of some specific methods (on page 1766)).

```java
logger.error(ex.getMessage(), ex);
}
}
}

    return canHandle;
}

/**
 * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent
 * (ro.sync.ecss.extensions.api.AuthorAccess,
 * ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
 */
@Override
public boolean handleEvent(AuthorAccess authorAccess,
AuthorActionEventType eventType) {
    int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    // Insert a new line
    authorAccess.getDocumentController().insertText(caretOffset, "\n");
    return true;
}

/**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
@Override
public String getDescription() {
    return "Insert a new line";
}
}
```
How to Implement an AuthorSchemaAwareEditingHandlerAdapter

For this handler to be called, the Schema Aware Editing option (on page 111) must be set to On or Custom in the Schema-Aware preferences page (on page 110). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an InvalidEditException.

To implement your own AuthorSchemaAwareEditingHandlerAdapter, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter extension.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, configure an extensions bundle (on page 1725) and return the AuthorSchemaAwareEditingHandlerAdapter implementation using the ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter() method.

Example

Typing events can be handled using the handleTyping method. For example, the AuthorSchemaAwareEditingHandler checks if the schema is not a learned one, was loaded successfully, and if the Smart paste and drag and drop option (on page 111) is selected. If these conditions are met, the event will be handled.

```java
public class AuthorSchemaAwareEditingHandlerAdapter extends AuthorSchemaAwareEditingHandler {

    /**
     * @see AuthorSchemaAwareEditingHandler#handleTyping
     * (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
     */
    public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess) throws InvalidEditException {
        boolean handleTyping = false;
        AuthorSchemaManager authorSchemaManager = authorAccess.getDocumentController().getAuthorSchemaManager();
        if (!authorSchemaManager.isLearnSchema() && !authorSchemaManager.hasLoadingErrors() && authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
            try {
                AuthorDocumentFragment characterFragment = authorAccess.getDocumentController().createNewDocumentTextFragment(String.valueOf(ch));
                handleTyping = handleInsertionEvent(offset, new AuthorDocumentFragment[]{characterFragment}, authorAccess);
            } catch (AuthorOperationException e) {
                throw new InvalidEditException(e.getMessage(), "Invalid typing event: "+ e.getMessage(), e, false);
            }
        }
    }
}
```
Methods for Improving the Paste Mechanism

getAncestorDetectionOptions

When pasting content in Author mode, if the result causes the document to become invalid, Oxygen XML Editor Eclipse plugin will propose solutions to make it valid. As a possible solution, Oxygen XML Editor Eclipse plugin might surround the pasted content in a sequence of ancestor elements. This getAncestorDetectionOptions method allows you to choose which parent elements might be a possible solution.

canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor Eclipse plugin. For example, when pasting an element inside an empty element with the same name, this canBeReplaced method allows Oxygen XML Editor Eclipse plugin to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

• AuthorDocumentFragment Class

Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode

The AuthorExternalObjectInsertionHandler extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in Author mode.

How to Implement an AuthorExternalObjectInsertionHandler

To implement your own AuthorExternalObjectInsertionHandler, follow this procedure:

1. Implement the ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the AuthorExternalObjectInsertionHandler in the Author extern object Insertion handler individual extension in the Extensions tab (on page 84) of the Document Type configuration dialog box (on page 62) for your particular document type.
b. Otherwise, you can configure an extensions bundle (on page 1725), then return the `AuthorExternalObjectInsertionHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler()` method.

3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

```java
ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)
```
and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the Classpath tab (on page 66) in the Document Type configuration dialog box (on page 62) for your particular document type.

### Example
The following example illustrates an implementation for the DITA framework:

```java
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#
 createExternalObjectInsertionHandler()
 */
@Override
public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler() {
    return new DITAExternalObjectInsertionHandler();
}

/**
 * @see ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler#
 getImporterStylesheetFileName(ro.sync.ecss.extensions.api.AuthorAccess)
 */
@Override
protected String getImporterStylesheetFileName(AuthorAccess authorAccess) {
    return "xhtml2ditaDriver.xsl";
}
```

> **Tip:** For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in Author mode. For more information, see Customizing Smart Paste Support (on page 1561).

### Presenting an Edit Properties Dialog Box for Actions in Author Mode
The `EditPropertiesHandler` extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in Author mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

### How to Implement an `EditPropertiesHandler`
To implement your own `EditPropertiesHandler`, follow this procedure:
1. Implement the `ro.sync.ecss.extensions.api.EditPropertiesHandler` interface.

2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle (on page 1725), you can return the `EditPropertiesHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler()` method.
   b. Specify the `EditPropertiesHandler` in the Author edit properties handler individual extension in the Extensions tab (on page 84) of the Document Type configuration dialog box (on page 62) for your particular document type.

**Example**

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `<image>` tag in Author mode (with tags displayed from the Tags display mode drop-down menu):

```java
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "Sample implementation that handles properties for a table element.";
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties
     * (ro.sync.ecss.extensions.api.node.AuthorNode)
     */
    @Override
    public boolean canEditProperties(AuthorNode authorNode) {
        // If this node is an image element we can edit its properties.
        return "image".equals(authorNode.getDisplayName());
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties
     * (ro.sync.ecss.extensions.api.node.AuthorNode,
     * ro.sync.ecss.extensions.api.AuthorAccess)
     */
    @Override
    public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
        // If we receive this call then it surely an image.
    }
}
```
AuthorElement imageElement = (AuthorElement) authorNode;
String currentValue = "";
AttrValue altValue = imageElement.getAttribute("alt");
if (altValue != null) {
    currentValue = altValue.getValue();
}
String newValue = JOptionPane.showInputDialog(
    (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
    "Alternate text",
    currentValue);

if (newValue != null) {
    authorAccess.getDocumentController().setAttribute("alt", new AttrValue(newValue), imageElement);
}

Example result: If a user were to double-click an `<image>` tag icon (image) in Author mode, the following dialog box would be displayed that allows the user to edit the `alternate text` property for the image:

![Dialog Box]

Extending Author Functionality Through the Java API

Oxygen XML Editor Eclipse plugin Author mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations (on page 1702)) and the execution of XPath expressions on the current document edited in Author mode. However, there are situations where you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.
To extend the Oxygen XML Editor Eclipse plugin Author mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Editor Eclipse plugin website. It includes the source code of the Author mode operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for Author mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor Eclipse plugin XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

⚠️ **Attention:** Make sure the Java classes of your custom Author mode operations are compiled with the same Java version used by Oxygen XML Editor Eclipse plugin. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Editor Eclipse plugin with a Java 1.8 virtual machine but the Java classes of your custom Author mode operations are compiled with a Java 9 or later virtual machine then the custom operations cannot be loaded and used by the Java 1.8 virtual machine.

⚠️ **Important:** From a legal standpoint, you can freely develop and share extensions using the Oxygen SDK ONLY if you have a legal, active license to use Oxygen XML Editor Eclipse plugin and ONLY if such extensions are used from inside Oxygen XML Editor Eclipse plugin. To use such extensions outside of Oxygen XML Editor Eclipse plugin (for example, a 3rd-party application that has Oxygen XML Editor Eclipse plugin built in to it), an additional license must be purchased to use the SDK according to the Oxygen XML SDK Licensing Policy.

Related Information:
  - AuthorOperation.html

### Example 1 - Simple Use of a Dialog Box from an Author Mode Operation

In this example, functionality is added for inserting images in a custom framework (on page 2135). The images are represented by the `<image>` element. The location of the image file is represented by the value of the `@href` attribute. In the Java implementation, a dialog box will be displayed with a text field where the user can enter a full URL or browse for a local file.

1. Set up a sample project following this set of instructions. The framework project is oxygen-sample-framework.

2. Modify the `simple.documentation.framework.InsertImageOperation` class that implements the `ro.sync.ecss.extensions.api.AuthorOperation` interface. This interface defines three methods: `doOperation`, `getArguments` and `getDescription`.

A short description of these methods follows:

- The `doOperation` method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
  - An object of type `ro.sync.ecss.extensions.api.AuthorAccess` and a map.
  - Argument names and values.
• The `getArguments` method is used by Oxygen XML Editor Eclipse plugin when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
• The `getDescription` method is used by Oxygen XML Editor Eclipse plugin when the operation is configured. It returns a description of the operation.

**Example:**

Here is the implementation of these three methods:

```java
/**
 * Performs the operation.
 */
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
            AuthorOperationException {

    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();
    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment =
            "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='" + href + "]/";

        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
        authorAccess.getDocumentController().insertXMLFragment(imageFragment, caretPosition);
    }
}

/**
 * Has no arguments.
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * Has no arguments.
 * @return null.
 */
```
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}

Note: The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

Important:
Make sure you always specify the namespace of the inserted fragments.

3. Package the compiled class into a JAR file. An example of an Ant script that packages the classes folder content into a JAR archive named sdf.jar is listed below:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
    <target name="dist">
        <jar destfile="sdf.jar" basedir="classes">
            <fileset dir="classes">
                <include name="**/*"/>
            </fileset>
        </jar>
    </target>
</project>
```

4. Copy the sdf.jar file into your custom framework directory (${OXYGEN_INSTALL_DIR}\frameworks\[CUSTOM_FRAMEWORK_DIR]}).

5. Add the sdf.jar to the class path. To do this, open the Preferences dialog box (on page 47), go to Document Type Association, select SDF, and click the Edit button.

6. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 62) and click the Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor Eclipse plugin frameworks folder.

7. Next, create the action that will use the defined operation. Go to the Actions subtab. Copy the icon files for the menu item and for the toolbar in your custom framework directory (${OXYGEN_INSTALL_DIR}\frameworks\[CUSTOM_FRAMEWORK_DIR]}).

8. Define the action's properties:
   • Set ID to insert_image.
9. Next, set up the operation. You want to add images only if the current element is a `<section>`, `<book>` or `<article>`.

- Set the value of XPath expression to:

```xml
local-name()='section' or local-name()='book'
or local-name()='article'
```

- Set the Invoke operation field to `simple.documentation.framework.InsertImageOperation`.

**Figure 497. Selecting the Operation**

10. Add the action to the toolbar, using the Toolbar panel.

To test the action, open or create an XML file and place the cursor at a valid location. Then click the button associated with the action from the toolbar. In the dialog box, select an image URL and click **OK**. The image is inserted into the document.

**Example 2 - Operations with Arguments - Report from Database Operation**

In this example, an operation is created that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully
configurable, it will have arguments for the *database connection string*, the *user name*, the *password* and the *SQL expression*.

1. Set up a sample project following this set of instructions. The *framework* project is **oxygen-sample-framework**.

2. Create the class `simple.documentation.framework.QueryDatabaseOperation`. This class must implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface.

```java
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation{

3. Now define the operation's arguments. For each of them, you will use a `String` constant representing the argument name:

```java
private static final String ARG_JDBC_DRIVER = "jdbc_driver";
private static final String ARG_USER = "user";
private static final String ARG_PASSWORD = "password";
private static final String ARG_SQL = "sql";
private static final String ARG_CONNECTION = "connection";
```

4. You must describe the argument name and type. To do this, implement the `getArguments` method that will return an array of argument descriptors:

```java
public ArgumentDescriptor[] getArguments() {
    ArgumentDescriptor args[] = new ArgumentDescriptor[] {
        new ArgumentDescriptor(
            ARG_JDBC_DRIVER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the Java class that is the JDBC driver."),
        new ArgumentDescriptor(
            ARG_CONNECTION,
            ArgumentDescriptor.TYPE_STRING,
            "The database URL connection string."),
        new ArgumentDescriptor(
            ARG_USER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the database user."),
        new ArgumentDescriptor(
            ARG_PASSWORD,
```
ArgumentDescriptor.TYPE_STRING,
    "The database password."),
    new ArgumentDescriptor(
        ARG_SQL,
        ArgumentDescriptor.TYPE_STRING,
        "The SQL statement to be executed."
    );
    return args;
}

These names, types and descriptions will be listed in the Arguments table when the operation is configured.

5. When the operation is invoked, the implementation of the doOperation method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```java
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
    throws IllegalArgumentException, AuthorOperationException {
    // Collects the arguments.
    String jdbcDriver =
        (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection =
        (String)map.getArgumentValue(ARG_CONNECTION);
    String user =
        (String)map.getArgumentValue(ARG_USER);
    String password =
        (String)map.getArgumentValue(ARG_PASSWORD);
    String sql =
        (String)map.getArgumentValue(ARG_SQL);

    int caretPosition = authorAccess.getCaretOffset();
    try {
        authorAccess.getDocumentController().insertXMLFragment(
            getFragment(jdbcDriver, connection, user, password, sql),
            caretPosition);
    } catch (SQLException e) {
        throw new AuthorOperationException(
            "The operation failed due to the following database error: ",
            e.getMessage(), e);
    } catch (ClassNotFoundException e) {
        throw new AuthorOperationException(
            "The JDBC database driver was not found. Tried to load ",
            e.getMessage(), e);
    }
}
```
6. The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a `<table>` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `<header>` element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '<' and '&' characters are replaced with the '&lt;' and '&amp;' character entities to ensure that the fragment is well-formed.

```java
private String getFragment(
    String jdbcDriver,
    String connectionURL,
    String user,
    String password,
    String sql) throws SQLException, ClassNotFoundException {
    Properties pr = new Properties();
    pr.put("characterEncoding", "UTF8");
    pr.put("useUnicode", "TRUE");
    pr.put("user", user);  
    pr.put("password", password);

    // Loads the database driver.  
    Class.forName(jdbcDriver);
    // Opens the connection
    Connection connection =
        DriverManager.getConnection(connectionURL, pr);
    java.sql.Statement statement =
        connection.createStatement();
    ResultSet resultSet =
        statement.executeQuery(sql);

    StringBuffer fragmentBuffer = new StringBuffer();
    fragmentBuffer.append("<table xmlns=" +
        "http://www.oxygenxml.com/sample/documentation">");

    //
    // Creates the table header.
    //
```
fragmentBuffer.append("<header>");
ResultSetMetaData metaData = resultSet.getMetaData();
int columnCount = metaData.getColumnCount();
for (int i = 1; i <= columnCount; i++) {
    fragmentBuffer.append("<td>");
    fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
    fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}
fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();
return fragmentBuffer.toString();

**Note:** The complete source code for framework customization examples can be found in the oxygen-sample-framework module of the Oxygen SDK, available as a Maven archetype on the Oxygen XML Editor Eclipse plugin website.

7. Package the compiled class into a JAR (on page 2135) file.

8. Copy the JAR file and the JDBC driver files into your custom framework directory (\OXYGEN_INSTALL_DIR\frameworks\[CUSTOM_FRAMEWORK_DIR]).
9. Add the JARs to the class path. To do this, open the Document Type Association preferences page (on page 60), select SDF and click the Edit button. Select the Classpath tab in the lower part of the Document Type configuration dialog box (on page 62) and click the + Add button. In the displayed dialog box, enter the location of the JAR file, relative to the Oxygen XML Editor Eclipse plugin frameworks folder.

10. Go to the Actions subtab. The action properties are:

   • Set ID to clients_report.
   • Set Name to Clients Report.
   • Set Menu access key to letter r.
   • Set Description to Connects to the database and collects the list of clients.
   • Set Toolbar icon to $(framework)/TableDB20.png (the TableDB20.png icon is stored in the frameworks/sdf folder).
   • Leave empty the Menu icon.
   • Set shortcut key to Ctrl + Shift + C (Command + Shift + C on OS X).

11. The action will work only if the current element is a section. Set up the operation as follows:

   • Set XPath expression to:

     ```
     local-name() = 'section'
     ```

   • Use the Java operation defined earlier to set the Invoke operation field. Click the Choose button, then select simple.documentation.framework.QueryDatabaseOperation. Once selected, the list of arguments is displayed. In the figure below the first argument, jdbc_driver, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: jdbc://<database_host>:<database_port>/<database_name>.

   The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

   ```
   SELECT userID, email FROM users
   ```

12. Add the action to the toolbar, using the Toolbar panel.
To test the action, open or create an XML file and place the cursor at a valid location. Then click the Create Report button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the Clients Report action.
18. Extension Points for the Oxygen Eclipse Plugin

The Oxygen XML Editor Eclipse plugin includes a number of extension (on page 2137) points, which can be implemented by other Eclipse plugins (on page 2137) that depend on it. All of them are listed in the plugin.xml file, along with samples of usage code. The following is a list with short descriptions for some of the most useful extension points:

Extension point: ditaKeyDefinitionManager

It can be used to provide an external keys manager, responsible of providing DITA keys that are then used for editing and resolving referenced content. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/ditaKeyDefinitionManager.exsd.

Extension point: actionBarContributorCustomizer

A very useful extension point that can add or remove actions from various menus, contextual menus, and toolbars that are contributed by the Oxygen XML Editor Eclipse plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/actionBarContributorCustomizer.exsd.

Extension point: customEditorInputCreator

Use this extension point to create your custom editor input for a certain resource that will be opened by the Oxygen XML Editor Eclipse plugin when clicking links. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/customEditorInputCreator.exsd.

Extension point: editorAdapterContributor

When an adapter is requested to the open XML editor you can provide your custom adapter from your external plugin. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/editorAdapterContributor.exsd.

Extension point: extensionsBundleContributor

Use this extension point to provide your own ExtensionsBundle implementation for a certain open XML resource. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/extensionsBundleContributor.exsd.

Extension point: stylesFilterContributor

Use this extension point to provide your own StylesFilter implementation for special visual rendering when an XML resource is opened in the Author editing mode. Its EXSD schema can be found in: OXYGEN_PLUGIN_DIR/exsd-schema/stylesFilterContributor.exsd.
Extension point: **XMLRefactoringContributor**

Contributes a folder that contains the additional XML Refactoring operation descriptor files and XQuery scripts that can be used by the batch XML refactoring actions. Its EXSD schema can be found in:

OXYGEN_PLUGIN_DIR/exsd-schema/xmlRefactoringContributor.exsd.

Extension point: **workspaceAccessPlugin**

Use this extension point to be notified when Oxygen XML Editor Eclipse plugin has started. Its EXSD schema can be found in:

Extension point: **AuthorStylesheet**

Use this extension point to provide a stylesheet layer that will be used when rendering any XML document in Author mode. Its EXSD schema can be found in:

OXYGEN_PLUGIN_DIR/exsd-schema/authorStylesheetContributor.exsd.

### How to Use a Custom View with the Oxygen XML Editor Eclipse plugin Distribution

**Question**

Is it possible to create a custom view in Eclipse that can insert certain XML fragments in the documents opened with the Oxygen XML Editor Eclipse plugin?

**Answer**

Here you can find more information about the Eclipse part of the Oxygen SDK:

https://www.oxygenxml.com/oxygen_sdk.html#oXygen_Eclipse_plugin

Use the provided Oxygen XML Editor Eclipse plugin sample project as a starting point.

From any custom view/component you can have singleton access to the using the ro.sync.exml.workspace.api.PluginWorkspaceProvider.getPluginWorkspace() API.

The Java code for inserting a certain XML fragment in the currently open editor (either in the Text or Author editing modes) would look like this:

```java
WSEditor currentEditorAccess = PluginWorkspaceProvider.getPluginWorkspace().getTypeEditorAccess().getCurrentEditorAccess(PluginWorkspace.MAIN_EDITING_AREA);

if (currentEditorAccess.getCurrentPage() instanceof WSXMLTextEditorPage) {
    WSXMLTextEditorPage tp = (WSXMLTextEditorPage) currentEditorAccess.getCurrentPage();

    // You can access an API to insert text in the XML content
    //      tp.getDocument().insertString(tp.getCaretOffset(), "<testTag/>", null);

    // This is the internal StyledText implementation
```
// tp.getTextComponent()

// You can use this XPath API to find the range of an XML element.

// tp.findElementsByXPath(xpathExpression)

} else if (currentEditorAccess.getCurrentPage() instanceof WSAuthorEditorPage) {
    // Editor opened in Author page

    // try {
    WSAuthorEditorPage authPage = (WSAuthorEditorPage)
currentEditorAccess.getCurrentPage();

    // Then you can do stuff like this to insert XML at cursor position

    // authPage.getDocumentController().insertXMLFragment("<testTag/>",
    authPage.getCaretOffset());

    // } catch (AuthorOperationException e) { 
    //   // TODO Auto-generated catch block
    //   e.printStackTrace();
    // }
Oxygen XML Editor Eclipse plugin includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the **Tools** menu and some of them can be launched through keyboard shortcuts or command-line scripts.

### Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor Eclipse plugin includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

### XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the **XML Refactoring** action from one of the following locations:

- The **XML Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Navigator view** (on page 221).
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager view** (on page 1877).

**Note:** The built-in refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished (on page 528) or previewed (on page 528) also appear in the **Refactoring** submenu of the contextual menu in the **DITA Maps Manager**.

### XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

- **Refactoring operations**
The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

**Figure 500. XML Refactoring Wizard**

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.
Figure 501. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 502. XML Refactoring - Scope and Filters Wizard Page

Scope section

In the Scope section, you can select from predefined resource sets (such as the current file, your whole project, the current DITA map (on page 2134) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a working set (on page 2139).

Filters

The Filters section includes the following options:
• Include files - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use build*.xml for the file pattern.
• Restrict only to known XML file types - When selected, only resources with a known XML file type will be affected by the operation.

Preview
You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish
After clicking the Finish button, the operation will be processed and Oxygen XML Editor Eclipse plugin provides no automatic means for reverting the operations. Any Undo action will only revert changes on the current document.

Troubleshooting: If an operation fails, a notification will be displayed in the Results panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip: If an operation takes longer than expected you can use the Stop button in the progress bar to cancel the operation.

Restriction: XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

**Built-in Refactoring Operations**
The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the Refactoring operations wizard page. You can also access the operations from the Refactoring submenu in the contextual menu of Author or Text mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip: Each operation includes a link in the lower part of the wizard that opens the XML / XSLT-FO-XQuery / XPath preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

**Refactoring Operations for Attributes**

Add/Change attribute
Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.

**Namespace**

The namespace of the affected attribute.

**Value**

The value for the affected attribute.

**Options section**

You can choose between one of the following options for the **Operation mode**:

**Add the attribute in the parent elements where it is missing**

Adds the attribute to all instances of the specified parent element.

**Change the value in the parent elements where the attribute already exists**

Replaces the value of the already existing attribute in all instance of the specified parent element.

**Both**

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

**Convert attribute to element**

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

**Parent element section**

**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Attribute section**

**Local name**

The local name of the affected attribute.
Namespace

The namespace of the affected attribute.

New element section

Local name

The local name of the new element.

Namespace

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute
The name of the attribute to be modified.

**Find / Replace section**

**Find**

The text fragments to find. You can use Perl-like regular expressions.

**Replace with**

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1, $2, etc.) from the find pattern.

**Refactoring Operations for Comments**

**Delete comments**

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

**Element**

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:** Comments that are outside the root element will not be deleted because the serializer preserves the content before and after the root.

**Refactoring Operations for DITA**

**Change topic ID to file name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS tables to simple tables**

Use this operation to convert DITA CALS tables to simple tables.

**Convert conrefs to conkeyrefs**

Use this operation to convert @conref attributes to @conkeyref attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs (on page 2009).

**Convert simple tables to CALS tables**

Use this operation to convert DITA simple tables to CALS tables.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1877))**

Use this operation on topics that contain nested <topic> elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1877))**
Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type (on page 1943).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type (on page 1943).

**Convert to Reference**

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type (on page 1943).

**Convert to Task**

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type (on page 1943).

**Convert to Topic**

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type (on page 1943).

**Convert to Troubleshooting**

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type (on page 1943).

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.

**Filters section**

Include files
Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Refactoring Operations for Elements**

**Delete element**

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element**

  The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Delete element content**

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element**

  The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Insert element**

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element section**
  - **Local name**
    
    The local name of the element to be inserted.
  
  - **Namespace**
    
    The namespace of the element to be inserted.

- **Location section**
  - **XPath**
    
    An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

  - **Position**
The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

**Rename element**

Use this operation to rename elements. This operation requires you to specify the following parameters:

**Target elements (XPath)**

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**New local name**

The new local name of the element.

**Unwrap element**

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

**Target elements (XPath)**

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrap element**

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

- **Local name**

  The local name of the **Wrapper element**.

- **Namespace**

  The namespace of the **Wrapper element**.

**Wrap element content**

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

**Target elements (XPath)**
The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Wrapper element section**

**Local name**

The local name of the *Wrapper element* that will surround the content of the target.

**Namespace**

The namespace of the *Wrapper element* that will surround the content of the target.

**Refactoring Operations for Fragments**

**Insert XML fragment**

Use this operation to insert an XML fragment. This operation allows you to specify the following:

**XML Fragment**

The XML fragment to be inserted.

**Location section**

**XPath**

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**Position**

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

**Replace element content with XML fragment**

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the content of the target element.

**Replace element with XML fragment**
Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

**Target elements (XPath)**

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

**XML Fragment**

The XML fragment with which to replace the target element.

**Refactoring Operations for JATSKit**

**Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0**

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

**Add Blue DOCTYPE - NISO JATS Publishing 1.1**

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

**Normalize IDs**

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

**Scope**

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, or just the Current file.

**Filters section**

**Include files**

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

**Restrict to known XML file types only**

Excludes non-XML file types from the operation.

**Refactoring Operations for Publishing Template**

These operations are for those who use Oxygen Publishing Templates for WebHelp Responsive output customization.

**Migrate HTML Page Layout Files to v21**

Use this operation to convert custom HTML page layout files (on page 1144) that are included in a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor Eclipse plugin version 21.0.

**Update HTML Pages**
Attention: This operation is only used by Oxygen XML Editor Eclipse plugin and should not be used manually.

Additional Notes

Note: There are some operations that allow `<any>` for the local name and namespace parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<no_namespace>` value can be used to select nodes that do not belong to a namespace.

Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the Options > Preferences > XML > XSLT-FO-XQUERY > XPath (on page 161) page. This preferences page can be easily opened by clicking the link in the note (Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section) at the bottom of the Configure Operation Parameters wizard page.

Custom Refactoring Operations

While Oxygen XML Editor Eclipse plugin includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An XQuery Update script or XSLT stylesheet that Oxygen XML Editor Eclipse plugin will run to refactor the XML files.
- An XML Operation Descriptor file that contains information about the operation (such as the name, description, and parameters).
All the defined custom operations are loaded by the XML Refactoring Tool and presented in the Refactoring Operations wizard page (on page 526), along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor Eclipse plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a safe mode, which implies the following:

- **When loading the document:**
  - The XInclude mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- **When saving the updated XML document:**
  - The DOCTYPE will be preserved.

  **Note:** This can be changed using Saxon extension functions in XSLT (on page 552).
  - The DTD entities will be preserved as they are in the original document when the document is saved.
  - The attribute values will be kept in their original form without being normalized.
  - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:** To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into
account when processing the input XML document since they are discarded when the transformed document is serialized.

⚠️ **Restriction:** Comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method (on page 552) to implement the new custom XML refactoring operation.

**Creating a Custom Refactoring Operation**

To create a custom refactoring operation, follow these steps:

1. Create an XQuery Update script (on page 544) or XSLT stylesheet file (on page 548).
2. Create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (on page 546) or XSLT stylesheet (on page 550).
3. Store both files in one of the locations that Oxygen XML Editor Eclipse plugin (on page 554) scans when loading the custom operations.

**Result:** Once you run the XML Refactoring tool again, the custom operation appears in the Refactoring Operations wizard page (on page 526).

**Related Information:**

- Storing and Sharing Refactoring Operations (on page 554)

**Custom Refactoring Script**

The first step in creating a custom refactoring operation is to create an XQuery Update script (on page 544) or XSLT stylesheet (on page 548) that is needed to process the refactoring operations. The easiest way to create this script file is to use the New document wizard to create a new XQuery or XSLT file and you can use the XQuery method example (on page 544) or XSLT method example (on page 548) to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script (on page 544) or XSLT stylesheet (on page 548). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the refactoring operation descriptor file that is associated with this operation.

**Note:** The XQuery Update processing is disabled by default in Oxygen XML Editor Eclipse plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario (on page 1068) and choose Saxon EE as the transformation engine. Also, you need to make sure the Enable XQuery update option is selected in the Saxon processor advanced options (on page 1023).
Custom Refactoring Operation Descriptor File

The next step in creating a custom refactoring operation is to create an XML Refactoring Operation Descriptor file contains the path to the XQuery Update script (on page 546) or XSLT stylesheet (on page 550).

Related Information:
- XQuery Update Script for Creating a Custom Operation (on page 544)
- XSLT Stylesheet for Creating a Custom Operation (on page 548)

Introduction to the Descriptor File

This file contains information (such as name, description, and id) that is necessarily when loading an XML Refactoring operation. It also contains the path to the XQuery Update script (on page 544) or XSLT stylesheet (on page 548) that is associated with the particular operation through the <script> element.

You can specify a category for your custom operations to logically group certain operations. The <category> element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is Other operations.

The descriptor file is edited and validated against the following schema: frameworks/xml_refactoring/operation_descriptor.xsd.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the parameters section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the XML Refactoring tool within the Configure Operation Parameters wizard page (on page 527) for that particular operation.

The value of the first <description> element in the <parameters> section will be displayed at the top of the Configure Operation Parameters wizard page (on page 527).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - **TEXT** - Generic type used to specify a simple text fragment.
Oxygen XML Editor Eclipse Plugin 22.0 | 19 - Tools | 1799

- **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor Eclipse plugin will use a text input with corresponding content completion and syntax highlighting.

  **Note:** The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

  **Note:** A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

  **Note:** When writing XPath expressions, you can only use prefixes declared in the Options > Preferences > XML > XSLT-FO-XQUERY > XPath (on page 161) options page.

- **NAMESPACE** - Used for editing namespace values.

- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.

- **REG_EXP_REPLACE** - Used along with **REG_EXP_FIND** to specify the replacement string.

- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor Eclipse plugin will display a text area specialized for inserting XML documents.

- **NC_NAME** - The parameter for NC_NAME values. It is useful when you want to specify the local part of a QName (on page 2137) for an element or attribute.

- **BOOLEAN** - Used to edit boolean parameters.

- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor Eclipse plugin renders each possible value as a radio button option.

- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.

- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```xml
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
  <value name="lastChild">Last child</value>
</possibleValues>
```

**Specialized Parameters to Match Elements or Attributes**

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor Eclipse plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

- **elementLocation**

  This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the
@label attribute is displayed in the application as the label of the text field. The @name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the @useCurrentContext attribute is set to true, the element name from the cursor position is used as proposed values for this parameter.

Example of an <elementLocation>:

```xml
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the @label attribute is displayed in the application as the label of the associated text fields. The @name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the element and attribute text fields. For example, if section is entered for the element and a title is entered for the attribute, the XPath expression would be computed as //section/@title. If the value of the useCurrentContext attribute is set to true, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an <attributeLocation>:

```xml
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
    <description>Element path description.</description>
  </element>
  <attribute label="Attribute">
    <description>Attribute path description.</description>
  </attribute>
</attributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the @label attribute is displayed in the application as label of the associated combo. The @name attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the @allowsAny attribute, the application will propose <ANY> as a possible value for the Name and Namespace combo boxes. You can also use the @useCurrentContext attribute and if
its value is set to true, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `<elementParameter>`:

```xml
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to true, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

---

**Note:** An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `<attributeParameter>`:

```xml
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

---

**Note:** All built-in operations are loaded from the `OXYGEN_INSTALL_DIR/refactoring` folder.

**Related Information:**

- Example of an Operation Descriptor File with an XSLT Stylesheet (on page 550)
- Example of an Operation Descriptor File with an XQuery Update script (on page 546)
XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 504. Example: Custom XML Refactoring Operation

An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file (on page 550) that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to Convert an Attribute to an Element

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
    version="2.0">
```

<xsl:param name="element_localName" as="xs:string" required="yes"/>
<xsl:param name="element_namespace" as="xs:string" required="yes"/>
<xsl:param name="attribute_localName" as="xs:string" required="yes"/>
<xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
<xsl:param name="new_element_localName" as="xs:string" required="yes"/>
<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @*">
  <xsl:copy>
    <xsl:apply-templates select="node() | @*"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="/*[xr:check-local-name($element_localName, ., true())
    and
    xr:check-namespace-uri($element_namespace, .)]">
  <xsl:variable name="attributeToConvert" select="@*[xr:check-local-name($attribute_localName, ., true())
    and
    xr:check-namespace-uri($attribute_namespace, .)]"/>

  <xsl:choose>
    <xsl:when test="empty($attributeToConvert)"/>
    <xsl:otherwise>
      <xsl:copy>
        <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
          <xsl:copy-of select="."/>
        </xsl:for-each>
      </xsl:copy>
    </xsl:otherwise>
  </xsl:choose>

  <!-- The new element namespace -->
  <xsl:variable name="nsURI" as="xs:string">
    <xsl:choose>
      <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
        <xsl:value-of select="''"/>
      </xsl:when>
      <xsl:otherwise>
        <xsl:choose>
          <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
            <xsl:value-of select="''"/>
          </xsl:when>
          <xsl:otherwise>
            ...
          </xsl:otherwise>
        </xsl:choose>
      </xsl:otherwise>
    </xsl:choose>
    ...
  </xsl:variable>
</xsl:template>
Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an XML Catalog (on page 2139) set in the XML Refactoring framework (on page 2135).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to Convert an Attribute to an Element

After you have developed the XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<refactoringOperationDescriptor
targetNamespace="http://www.oxygenxml.com/ns/xmlRefactoring"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
id="convert-attribute-to-element"
name="Convert attribute to element">
  <description>Converts the specified attribute to an element.
  The new element will be inserted as first child of the attribute's parent element.</description>
  <!-- For the XSLT stylesheet option uncomment the following line and comment
  the line referring the XQuery Update script -->
  <!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
  <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
  <parameters>
    <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
      <elementParameter id="elemID"
        <localName label="Name" name="element_localName" allowsAny="true">
<refactoringOperationDescriptor>
  
  <section label="Local Name">
    <localName>
      <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
      <description>Local name of the parent element</description>
    </namespace>
  </section>

  <section label="Attribute">
    <attributeParameter dependsOn="elemID">
      <localName label="Name" name="attribute_localName">
        <description>Name of the attribute to be converted.</description>
      </localName>
      <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</description>
      </namespace>
    </attributeParameter>
  </section>

  <section label="New element">
    <elementParameter>
      <localName label="Name" name="new_element_localName">
        <description>The name of the new element.</description>
      </localName>
      <namespace label="Namespace" name="new_element_namespace">
        <description>The namespace of the new element.</description>
      </namespace>
    </elementParameter>
  </section>

  </parameters>
</refactoringOperationDescriptor>

Note: If you are using an XSLT file, the line with the <script> element would look like this:

<script type="XSLT" href="convert-attribute-to-element.xsl"/>

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor Eclipse plugin when it loads the custom operation (on page 554). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:
Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script (on page 544) in that refactoring operations can only be performed on comments or processing instructions that are inside the root element. Thus, using the XQuery method, comments or processing instructions that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
    <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

- **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```xml
<!-- comment after root -->
<?pi after root ?>
```
• **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- Inserted comment -->
<root>
  <child>
  </child>
</root>
```

• **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<p: before root ?>
<root>
  <child></child>
</root>
```

• **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```xml
<!-- Inserted comment --><root>
  <child></child>
</root>
```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
    xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
  <xsl:template match="/">
    <!-- The comment content that will be inserted after the root element -->
    <xsl:variable name="commentAsText"> <!-- COMMENT ADDED FROM XR OPERATION-->
    </xsl:variable>
    <!-- Retrieve the content after the root element as is -->
    <xsl:variable name="after-root-content" as="xs:string"
    select="xrf:get-content-after-root()"/>
```
Note: The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Editor Eclipse plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A **refactoring** folder, created inside a directory that is associated to a framework you are customizing.
  To associate the parent directory to the framework, you need to add it in the Classpath tab of the Document type configuration dialog box (on page 66).
- A folder that you specify in the Load additional refactoring operations from text box (on page 156) in the XML Refactoring preferences page (on page 156).
- The **refactoring** folder from the Oxygen XML Editor Eclipse plugin installation directory ([OXYGEN_INSTALL_DIR]/refactoring/).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor Eclipse plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as framework (on page 2135) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor Eclipse plugin includes localization support for the XML refactoring operations.
The translation keys for the built-in refactoring operations are located in \( [OXYGEN\_INSTALL\_DIR]/\) refactoring/i18n/translation.xml.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation name, description, and category.
- The `<description>` of the `<parameters>` element.
- The label, description, and possibleValues for each parameter.

Translated refactoring information uses the following form:

\( \${i18n(translation_key)} \)

Oxygen XML Editor Eclipse plugin scans the following locations to find the translation.xml files that are used to load the translation keys:

- A refactoring/i18n folder, created inside a directory that is associated to a customized framework.
- A i18n folder, created inside a directory that is associated to a customized framework.
- An i18n folder inside any specified folder. In this case, you need to open the Preferences dialog box (on page 47), go to XML > XML Refactoring, and specify the folder in the Load additional refactoring operations from text box.
- The refactoring/i18n folder from the Oxygen XML Editor Eclipse plugin installation directory \( ([OXYGEN\_INSTALL\_DIR]/refactoring/i18n) \).

**Example: Refactoring Operation Descriptor File with i18n Support**

```xml
<refactoringOperationDescriptor

  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"

   name="${i18n(Remove_text_content)}"></refractioningOperationDescriptor>

  <description>${i18n(Remove_text_content_description)}</description>

  <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>

  <parameters>

    <description>${i18n(parameters_description)}</description>

    <parameter label="${i18n(Element_name)}" name="element_localName"

      type="NC_NAME">

      <description>${i18n(Element_name_descriptor)}</description>

      <possibleValues>

        <value default="true" name="value1">${i18n(value_1)}</value>

        <value name="value2">${i18n(value_2)}</value>

    </possibleValues>

    </parameter>

  </parameters>

</refactoringOperationDescriptor>
```
Generating Sample XML Files

Oxygen XML Editor Eclipse plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in XML Schema preferences page (on page 155).

To generate sample XML files from an XML Schema, use the Generate Sample XML Files action from the XML Tools menu. This action is also available in the contextual menu of the schema Design mode (on page 611). The action opens the Generate Sample XML Files dialog box that allows you to configure a variety of options for generating the files.

The Generate Sample XML Files dialog box contains three tabs with various configurable options. Default values for these options can be set in the Sample XML Files Generator preferences page (on page 147).

Schema Tab

The first set of options for the Generate Sample XML Files tool are found in the Schema tab.

![Generate Sample XML Files Dialog Box (Schema Tab)](image)

This tab includes the following options:

**URL**

- Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the Browse drop-down list.

**Namespace**

- Displays the namespace of the selected schema.

**Root Element**

- 

- 

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

**Output folder**

Path to the folder where the generated XML instances will be saved.

**Filename prefix and Extension**

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

**Number of instances**

The number of XML files to be generated.

**Open first instance in editor**

When selected, the first generated XML file is opened in the editor.

**Namespaces section**

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

**Options Tab**

The **Options** tab allows you to set specific options for namespaces and elements.
This tab includes the following options:

**Namespace / Element table**

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces ( `<ANY>` - `<ANY>` ). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

**Settings subtab**

**Namespace**

Displays the namespace specified in the table at the top of the dialog box.

**Element**

Displays the element specified in the table at the top of the dialog box.

**Generate optional elements**

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

**Generate optional attributes**
When selected, all attributes are generated, including the optional ones (having the use attribute set to optional in the schema).

**Values of elements and attributes**

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the Sample XML Files Generator preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

**Important:** If all of the following are true, the Generate Sample XML Files tool outputs invalid values:

- At least one of the restrictions is a regexp.
- The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

**Preferred number of repetitions**

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

**Maximum recursion level**

If a recursion is found, this option controls the maximum allowed depth of the same element.

**Type alternative strategy**

Used for the `<xs:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.
Choice strategy

Used for `<xs:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xs:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xs:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xs:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab

The **Advanced** tab allows you to set some options regarding output values and performance.

Figure 508. Generate Sample XML Files Dialog Box (Advanced Tab)
This tab includes the following options:

**Use incremental attribute / element names as default**

If selected, the value of an element or attribute starts with the name of that element or attribute.

For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

**Maximum length**

The maximum length of string values generated for elements and attributes.

**Discard optional elements after nested level**

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

**Export settings**

Use this button to save the current settings for future use.

**Import settings**

Use this button to load previously exported settings.

ℹ️ Tip: This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

### Converting Schema to Another Schema Language

The Generate/Convert Schema tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor Eclipse plugin generates an approximation of the source schema. Oxygen XML Editor Eclipse plugin uses the Trang multiple format converter to perform the actual schema conversions.

To use this tool, select the Generate/Convert Schema (Ctrl + Shift + BackSlash (Command + Shift + BackSlash on OS X)) action from the XML Tools menu. This action opens the Generate/Convert Schema dialog box that allows you to configure various options for conversion.
The **Generate/Convert Schema** dialog box includes the following options:

**Input section**

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

**Output section**

Allows you to select the language of the target schema.

**Options**

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

**Output file**

Specifies the path for the output file that will be generated.

**Close dialog when finished**

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

**Advanced options**

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

**XML 1.0 DTD Input section**

These options apply to the source DTD:
• **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.

• **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.

• **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.

• **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.

• **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.

• **annotation-prefix** - Default values are represented using a
  @prefix:defaultValue annotation attribute where prefix is the specified value and is bound to http://relaxng.org/ns/compatibility/annotations/1.0 as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.

• **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.

• **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element.

• **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.

• **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

**W3C XML Schema Output section**

This section is available if you select W3C XML Schema for the output.

• **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
• **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `@processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).

• **any-attribute-process-contents** - Specifies the value for the `@processContents` attribute of `<anyAttribute>` elements. The default is skip (corresponding to RELAX NG semantics).

---

**Converting Database to XML Schema**

Oxygen XML Editor Eclipse plugin includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.  
   
   **Result:** The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources preferences page (on page 51)** where you can configure data sources and connections.

3. In the **Format for generated schema** section, select one of the following formats:
   
   • **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
   
   • **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.  
   
   **Result:** The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
   
   a. Select the database column you want to configure.
   
   b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
   
   c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.  
   
   **Result:** The database structure is converted to an XML Schema and it is opened for viewing and editing.
Compiling an XSL Stylesheet for Saxon

As of Saxon 9.7, it is possible to export a compiled form of a stylesheet as an XML file (called a stylesheet export file or SEF). Oxygen XML Editor Eclipse plugin includes a simple tool called Compile XSL Stylesheet for Saxon (found in the XML Tools menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A stylesheet export file (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

  ```xml
  <script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
  <script>
  window.onload = function() {
    SaxonJS.transform({
      stylesheetLocation: "books.sef",
      sourceLocation: "books.xml"
    });
  }
  </script>
  ``

- **Use SEF to run transformations in Oxygen XML Editor Eclipse plugin** - You can also use a stylesheet export file (SEF) in Oxygen XML Editor Eclipse plugin to apply an XSLT transformation over an XML file. This requires Saxon-EE or Saxon-PE versions of the Saxon product and you must select one of those two versions for the Target when you configure the SEF file (on page 606). When configuring the XSLT transformation, you will specify the SEF file in the XSL URL field (on page 1004).

Compiling an SEF File

The Compile XSL Stylesheet for Saxon tool can be found in the XML Tools menu and it compiles a specified stylesheet as an XML file (stylesheet export file with a file extension of .sef).

Selecting this tool opens the Compile XSL Stylesheet for Saxon dialog box that allows you to configure some options for conversion.

Figure 510. Compile XSL Stylesheet for Saxon Dialog Box
This dialog box includes the following options:

**XSL URL**

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the  

**Target**

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

**Relocatable**

Can be used to control the Saxon  `--relocate` parameter. You can select this option to produce a relocatable export package (SEF) that can be deployed to a different location, with a different base URI.

**Output file**

You can specify the path where the output file will be saved by entering it in the text field, using the  

**Open in Editor**

Select this option to open the resulting stylesheet export file in the main Oxygen XML Editor Eclipse plugin editing pane.

**Use a configuration file (“-config”)**

Select this option if you want to use a Saxon 9.9.1.5 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the URL field, or by using the  

**Compile**

Use this button to generate the stylesheet export file according the options selected in this dialog box.

**JSON Tools**

Oxygen XML Editor Eclipse plugin includes some useful tools for converting JSON to and from XML, converting XSD to JSON Schema, and generating JSON instances or a JSON Schema.

**JSON to XML Converter**

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to XML. The **JSON to XML** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a JSON document to XML, follow these steps:
1. Select the **JSON to XML** action from the **XML Tools > JSON Tools** menu.

The **JSON to XML** dialog box is displayed:

![JSON to XML Dialog Box](image)

2. Choose or enter the **Input URL** of the JSON document.

3. Choose the path of the **Output file** that will contain the resulting XML document.

4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.

5. Click the **Convert** button.

**Result:** The original JSON document is now converted to an XML document.

![Example: XML to JSON Operation Result](image)

**Conversion Details**

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:
[
  "personnel": [  
    "person": [  
      {"name": "Boss"},  
      {"name": "Worker"}  
    ],  
    "id": "personnel-id"
  ]
]

it is converted to:

<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>
    <person>
      <name>Boss</name>
    </person>
    <person>
      <name>Worker</name>
    </person>
  </personnel>
  <id>personnel-id</id>
</JSON>

• If the JSON document is an array, the converted XML document will have a root element called <array> and for each item within the array, another <array> is created.

[
  {"name": "Boss"},
  {"name": "Worker"}
]

it is converted to:

<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
  <array>
    <name>Worker</name>
  </array>
</array>
• If the name of a JSON property contains characters that are not valid in XML element names (for example, $), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```json
{"$id": "personnel-id"}
```

is converted to:

```xml
<__X24_id>personnel-id</__X24_id>
```

**Online JSON to XML Converter**

For a simple ONLINE tool for converting a single JSON file to XML, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

**Related Information:**
- XML to JSON Converter *(on page 774)*

**XML to JSON Converter**

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting XML files to JSON. The **XML to JSON** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **XML Tools > JSON Tools** menu.

   **Step Result:** The **XML to JSON** dialog box is displayed:

   ![XML to JSON Dialog Box](image)

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

**Result:** The original XML document is now converted to a JSON document.
Conversion Details

- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```xml
<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
```

it is converted to:

```json
{  "personnel": [  {    "person": [      {        "id": "person.one",        "name": "Boss"      }    ]  }  ]}
```
• If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a #text property with its value set as the text content. If there are multiple text nodes, the subsequent #text properties will contain a number (i.e. #text1, #text2).

```xml
<person>
  <name>Boss <i>One</i>!</name>
</person>
```

is converted to:

```json
{
  "person": {
    "name": {
      "#text": "Boss",
      "i": "One"
    }
  }
}
```

• If the XML document contains element names that contain hexadecimal codes (for example, if they were escaped during a JSON to XML conversion (on page 772)), it will be converted to the normal character value in the converted JSON document.

```xml
<_X24_id>personnel-id</_X24_id>
```

is converted to:

```json
{"$id": "personnel-id"}
```

### Online XML to JSON Converter

For a simple ONLINE tool for converting a single XML file to JSON, or vice versa, go to: [https://www.oxygenxml.com/xml_json_converter.html](https://www.oxygenxml.com/xml_json_converter.html).

### Related Information:

• [JSON to XML Converter (on page 771)](https://www.oxygenxml.com/xml_json_converter.html)
XSD to JSON Schema Converter

Oxygen XML Editor Eclipse plugin includes a tool for converting an XML Schema file (XSD) to a JSON Schema file. The XSD to JSON Schema action for invoking the tool can be found in the Tools > JSON Tools menu. It requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor Eclipse plugin will present a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor Eclipse plugin and the XSD to JSON Schema action will invoke the tool.

To convert an XML Schema (XSD) to a JSON Schema, follow these steps:

1. Select the XSD to JSON Schema action from the Tools > JSON Tools menu.
   
   **Step Result:** The XSD to JSON Schema dialog box is displayed:

   ![XSD to JSON Schema Dialog Box](image)

2. Choose or enter the XSD URL of the XML Schema document. The conversion supports XSD versions 1.0 and 1.1.
3. Choose the path for the Output file.
4. Select the Open in Editor option to open the resulting JSON Schema document in the main editing pane.
5. Click the Convert button.

**Result:** The original XSD document is now converted to a JSON Schema document. The resulting JSON Schema will be *draft-07* and will contain:

- The $id of the schema, generated from XSD `targetNamespace`.
- The $definitions section, which declares complex and enum types.
- The anyOf section, which lists possible top-level elements as an array of objects.

**Other Possible Results:**

- If an XSD type extends another type, then its schema is combined with the schema of the base type using the allOf keyword.
- If an extension in XSD defines an element with the same name as an attribute in the base, a property named rest is generated to avoid name conflicts in JSON.
- If a property of a complex type is a collection property, the schema of the collection items will be wrapped in the JSON array schema.

**Conversion Mappings**

The following table lists the specific conversion mapping details.
<table>
<thead>
<tr>
<th>XML Schema Type</th>
<th>JSON Schema Representation</th>
</tr>
</thead>
<tbody>
<tr>
<td>anySimpleType</td>

<tr>
<td>date</td>
<td>string with &quot;format&quot;:&quot;date&quot;</td>
</tr>
<tr>
<td>time</td>
<td>string with &quot;format&quot;:&quot;time&quot;</td>
</tr>
</tbody>
</table>

**Conversion Limitations**

In most cases, the conversion creates an equivalent schema, but there are some limitations:

- Restrictions/facets are not taken into consideration when converting (*fractionDigits, pattern, totalDigits, whiteSpace, minInclusive, maxInclusive*, and the restrictions for length, except enumeration). However, extensions and indicators are properly converted (*minOccurs, maxOccurs, group, sequence, choice*).
- The `<documentation>` element is not converted into `<description>`.
- The `@substitutionGroup` attribute for an element that has no declared type becomes a reference to the element that can substitute it.
- The `@block` attribute is not taken into consideration during the conversion.

**Generating Sample JSON Files**

Oxygen XML Editor Eclipse plugin includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select **Generate Sample JSON Files** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure a variety of options for generating the files.
The Generate Sample JSON Files dialog box includes the following fields and options:

**Schema URL**

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the *Browse* drop-down list.

**Associate schema in the document**

If enabled, the specified schema will be associated with the generated files.

**Output folder**

Path to the folder where the generated JSON instances will be saved.

**File name**

The name of the instance(s) that will be generated. By default, `instance.json` is used.

**Number of instances**

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

**Property value**

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

**Generate optional properties**
If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

**Generate additional content**

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

**Choice strategy**

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either `oneOf` or `anyOf`). The following options are available:

- **First** - The first defined schema in `oneOf` or `anyOf` will be used.
- **Random** - A random schema defined in `oneOf` or `anyOf` will be used.

**Recursion level**

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

**Open first instance in editor**

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

### Generating JSON Schema from a JSON File

Oxygen XML Editor Eclipse plugin includes a tool for generating a sample JSON Schema from a JSON file. To generate a sample JSON Schema, select **Generate JSON Schema** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure a variety of options for generating the JSON Schema file.

**Figure 517. Generate JSON Schema Dialog Box**

The **Generate JSON Schema** dialog box includes the following fields and options:
JSON Document URL

The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

Output JSON Schema

Path to the folder where the generated JSON Schema will be saved.

Extract matching format for strings

If selected, the generator will try to find a format that matches the string values from the JSON Document.

Add default values for simple types

If selected, the *default* values (0 for number, "" for string, false for boolean) and *examples* for string will be added.

Restrict additional content

If selected, *additionalProperties* (for objects) and *additionalItems* (for arrays) will be set to *false* in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

Open in Editor

If selected, the generated JSON Schema is opened in the editor.

You can click **Generate** at any point to generate the JSON Schema.

Generate Documentation

Oxygen XML Editor Eclipse plugin includes a tool for generating documentation for XSLT, XML Schema, XQuery, and WSDL documents.

Generating Documentation for an XML Schema

Oxygen XML Editor Eclipse plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:** You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate XML Schema Documentation** action from the contextual menu of the **Navigator view** ([on page 221](#)).
The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the [Insert Editor Variables](#) button or the options in the [Browse](#) drop-down menu.

**Output Tab**

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in [HTML output format](#) (on page 671).
  - **PDF** - The documentation is generated in [PDF output format](#) (on page 674).
  - **DocBook** - The documentation is generated in [DocBook output format](#) (on page 674).
  - **DITA** - The documentation is generated in [DITA output format](#) (on page 674).
  - **Custom** - The documentation is generated in a [custom output format](#) (on page 674), allowing you to control the output. Click the **Options** button to open a [Custom format options](#) dialog box where you can specify a custom stylesheet for creating the output. There is also an option to [Copy additional resources to the output folder](#) and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the [Delete intermediate XML file](#) option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the [Insert Editor Variables](#) button or the options in the [Browse](#) drop-down menu.
• **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.

• **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor Eclipse plugin (in the current editor).

**Note:** To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

• **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (en-us, en-uk, etc.).

**Settings Tab**

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

![Figure 519. Settings Tab of the XML Schema Documentation Dialog Box](image)

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:
• **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the **Schema Design Properties** page.

• **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.

• **Namespace** - Displays the namespace for each component.

• **Location** - Displays the schema location for each component.

• **Type** - Displays the component type if it is not an anonymous one.

• **Type hierarchy** - Displays the types hierarchy.

• **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - `xs:all` - Its children will be separated by space characters.
  - `xs:sequence` - Its children will be separated by comma characters.
  - `xs:choice` - Its children will be separated by character.

• **Children** - Displays the list of component's children.

• **Instance** - Displays an XML instance generated based on each schema element.

• **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.

• **Properties** - Displays some of the component's properties.

• **Facets** - Displays the facets for each simple type.

• **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).

• **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.

• **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.

• **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.

• **Source** - Displays the text schema source for each component.

• **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XML Schema documentation.

**Tip:** This function can be executed from an automated command-line script, but it requires an additional **Oxygen XML Scripting License**. For more details, see [https://www.oxygenxml.com/oxygen_scripting.html](https://www.oxygenxml.com/oxygen_scripting.html).
Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom output format (on page 604), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the XSLT Stylesheet Documentation dialog box, select XSLT Stylesheet Documentation from the XML Tools > Generate Documentation menu or from the Generate Stylesheet Documentation action from the contextual menu of the Navigator view (on page 221).

Figure 520. XSLT Stylesheet Documentation Dialog Box

The XSL URL field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

Output Tab
The following options are available in the Output tab:

- Format - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format (on page 602).
  - Custom - The documentation is generated in a custom output format (on page 604), allowing you to control the output. Click the Options button to open a Custom format options dialog box (on page 605) where you can specify a custom stylesheet for creating the output. There is also an option...
to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the ![Insert Editor Variables](image) button or the options in the ![Browse](image) drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

**Note:** To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

**Settings Tab**

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

**Figure 521. Settings Tab of the XSLT Stylesheet Documentation Dialog Box**

The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **XSLT elements from referenced stylesheets**.

You can choose whether or not to include the following other details:
• **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  ◦ Oxygen XML Editor Eclipse plugin built-in XSLT documentation schema.
  ◦ A subset of DocBook 5 elements. The recognized elements are: `section`, `sect1` to `sect5`, `emphasis`, `title`, `ulink`, `programlisting`, `para`, `orderedlist`, `itemizedlist`.
  ◦ A subset of DITA elements. The recognized elements are: `concept`, `topic`, `task`, `codeblock`, `p`, `b`, `i`, `ul`, `ol`, `pre`, `sl`, `sli`, `step`, `steps`, `li`, `title`, `xref`.
  ◦ Full XHTML 1.0 support.
  ◦ XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  ◦ DOXSL documentation framework (on page 2135). Supported elements are: `codefrag`, `description`, `para`, `docContent`, `documentation`, `parameter`, `function`, `docSchema`, `link`, `list`, `listitem`, `module`, `parameter`, `template`, `attribute-set`.

  Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML `pre` element. You can change this behavior by using a custom format (on page 604) instead of the built-in HTML format (on page 602) and providing your own XSLT stylesheets.

• **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the `xsl:stylesheet` element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.

• **Namespace** - Shows the namespace for named XSLT elements.

• **Location** - Shows the stylesheet location for each XSLT element.

• **Parameters** - Shows parameters of templates and functions.

• **References** - Shows the named XSLT elements that are referenced from within an element.

• **Used by** - Shows the list of all the XSLT elements that reference the current named element.

• **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.

• **Overriding** - Shows the list of all the XSLT elements that override the current element.

• **Return type** - Shows the return type of the function.

• **Source** - Shows the text stylesheet source for each XSLT element.

• **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.

• **Generate index** - Creates an index with all the XSLT elements included in the documentation.

**Export settings** - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

**Import settings** - Reloads the settings from the exported file.

**Generate** - Use this button to generate the XSLT documentation.
Tip: This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

Related Information:
- XSLT Stylesheet Component Documentation Support (on page 588)

Generating HTML Documentation for an XQuery Document
To generate HTML documentation for an XQuery document, use the XQuery Documentation dialog box. It is opened with the XQuery Documentation action that is available from the XML Tools > Generate Documentation menu or from the Generate XQuery Documentation action from the contextual menu of the Navigator view (on page 221).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

![XQuery Documentation Dialog Box](image)

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - **URL File** - The URL of the file to be used for generating the documentation.
  - **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.

- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
• **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

• **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  ![Note:](image) To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

• **Output** - Allows you to specify where the generated documentation is saved on disk.

---

### Generating Documentation for WSDL Documents

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a **custom output format (on page 719)** by using a custom stylesheet.

![Note:](image) The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Navigator view (on page 221)**.

---

**Figure 523. WSDL Documentation Dialog Box**

![WSDL Documentation Dialog Box](image)
The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

**Output Tab**
The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - HTML - The documentation is generated in HTML output format (on page 718).
  - Custom - The documentation is generated in a custom output format (on page 719), allowing you to control the output. Click the Options button to open a Custom format options dialog box where you can specify a custom stylesheet for creating the output. There is also an option to Copy additional resources to the output folder and you can select the path to the additional Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the Delete intermediate XML file option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the Insert Editor Variables button or the options in the Browse drop-down menu.

- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  **Note:** To set the browser or system application that will be used, go to Window > Preferences > General > Web Browser and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

**Setting Tab**
When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.
The Settings tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  - **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
  - **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
  - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

- **Component Details**
  - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  - **Location** - Presents the location information for each WSDL or XML Schema component.
  - **Used by** - Presents the list of components that reference the current one.
  - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  - **Source** - Presents the XML fragment that defines the current component.
  - **Instance** - Generates a sample XML instance for the current component.

  **Note**: This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.

- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.

- **Generate index** - Displays an index with the components included in the documentation.
Include local elements and attributes - If selected, local elements and attributes are included in the documentation index.

Include resource hierarchy - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for generating the documentation from the command-line interface).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Tip: This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

Canonicalizing Files

You can select the canonicalization (on page 2133) algorithm to be used for a document from the dialog box that is displayed by using the Canonicalize action that is available from the Source submenu when invoking the contextual menu in Text mode or from the XML Tools menu.

Figure 525. Canonicalization Settings Dialog Box

The Canonicalize dialog box allows you to set the following options:

• Input URL - Available if the Canonicalize action was selected from the XML Tools menu. It allows you to specify the location of the input file.

• Exclusive - If selected, the exclusive (uncommented) canonicalization (on page 2133) method is used.

Note: Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace
declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments canonicalization (on page 2133) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) canonicalization (on page 2133) method is used.

**Note:** Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive Canonicalization is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive Canonicalization will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments canonicalization (on page 2133) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the Canonicalize action was selected from the XML Tools menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:
- Digital Signatures Overview (on page 556)

### Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the Sign action from the Source submenu when invoking the contextual menu in Text mode or from the XML Tools menu.
The following options are available:

**Note:** If Oxygen XML Editor Eclipse plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page (on page 156) where you can configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the XML Tools menu. Specifies the location of the input URL.

- **Transformation Options** - See the Digital Signature Overview (on page 556) section for more information about these options.
  - **None** - If selected, no canonicalization (on page 2133) algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) canonicalization (on page 2133) method is used.

**Note:** Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.
**Exclusive with comments** - If selected, the exclusive with comments *canonicalization (on page 2133)* method is used.

**Inclusive** - If selected, the inclusive (uncommented) *canonicalization (on page 2133)* method is used.

**Note:** *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

**Inclusive with comments** - If selected, the inclusive with comments *canonicalization (on page 2133)* method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the *Digital Signature Overview (on page 556)* for more information.
- **Detached** - If selected, the *detached* signature is used. See the *Digital Signature Overview (on page 556)* for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: RSA with SHA1, RSA with SHA256, RSA with SHA384, and RSA with SHA512.
- **Output** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor Eclipse plugin.

### Related Information:

- Digital Signatures Overview *(on page 556)*
- Verifying Signature *(on page 562)*
- Example of How to Digitally Sign XML Files or Content *(on page 563)*

### Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.
WSDL SOAP Analyzer Tool

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated WSDL SOAP Analyzer tool (available from the toolbar or WSDL menu).

Oxygen XML Editor Eclipse plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the WSDL SOAP Analyzer tool for the currently edited WSDL document do one of the following:

- Click the WSDL SOAP Analyzer toolbar button.
- Use the WSDL SOAP Analyzer action from the WSDL menu.
- Go to Open with > WSDL Editor in the contextual menu of the Navigator (on page 221) view.

Figure 527. WSDL SOAP Analyzer View

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
• **Action URL** - The script that serves the operation.

• **SOAP Action** - Identifies the action performed by the script.

• **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.

• **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor Eclipse plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is `http://schemas.xmlsoap.org/soap/envelope/` for SOAP 1.1 or `http://www.w3.org/2003/05/soap-envelope` for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The **Content Completion Assistant (on page 2133)** is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor Eclipse plugin remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.

• **Attachments List** - You can define a list of file URLs to be attached to the request.

• **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor Eclipse plugin prompts you to save them, then tries to open them with the associated system application.

• **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.

• **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor Eclipse plugin is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the **Testing Remote WSDL Files (on page 722)** section.

**Note:** SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

### Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:
1. Go to **Window > Show View > Other > Oxygen XML Editor Eclipse plugin > WSDL SOAP Analyzer**.

2. Click the **Choose WSDL** button and enter the URL of the remote WSDL file.

3. Click the **OK** button.

This will open the **WSDL SOAP Analyzer tool (on page 720)**. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

## XML Schema Regular Expressions Builder Tool

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **XML Tools** menu.

![XML Schema Regular Expressions Builder Dialog Box](image)

The dialog box contains the following:

**Regular expressions editor**

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space** (Command + Space on OS X).

**Error display area**
If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (●) highlights the error inside the regular expression.

**Category**

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the Available expressions table.

**Available expressions**

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous Category combo box. You can add an expression in the Regular expressions editor by double-clicking the expression row in the table. You will notice that in the case of Character categories and Block names, the expressions are also listed in complementary format.

**Evaluate expression on**

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the Test area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

**Test**

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The Insert button will become active when an editor is opened in the background and there is an expression in the Regular expressions editor.

The regular expression builder cannot be used to insert regular expressions in the Grid mode (on page 196) or schema Design mode (on page 198). Accordingly, the Insert button will be not available if the current document is edited in these modes.

**Note:** Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.
20. Common Problems

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor Eclipse plugin, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor Eclipse plugin.

Out of Memory on External Processes

Problem

Oxygen XML Editor Eclipse plugin throws an Out Of Memory error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the Preferences dialog box (on page 47), go to XML > XSLT-FO-XQuery > FO Processors, and increase the value of the Memory available to the built-in FOP option (on page 144).
- For external XSL-F0 processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the -Xmx parameter set to the Java virtual machine.

Related Information:

- FO Processors Preferences (on page 143)
- Custom Engines Preferences (on page 158)
- How to Enable Debugging for FO Processor Transformations (on page 1062)

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.
Cause

A possible cause is that the application needs more memory to run properly.

Solutions

• You can increase the maximum amount of memory available to Oxygen XML Editor Eclipse plugin by setting the -vmargs and -Xmx parameters in the command used to launch the Eclipse platform.

⚠️ Attention: The maximum amount of memory should be less than 75% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.

• 📋 Note:

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

<Address Family Not Supported by Protocol Family; Connect' Error

Problem

I have experienced the following error: "Address Family Not Supported by Protocol Family; Connect". How do I solve it?

Cause

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor Eclipse plugin prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution

A quick solution for this problem is to set the java.net.preferIPv4Stack Java property to true (java.net.preferIPv4Stack=true), by following this procedure:

1. Create a file named custom_commons.vmoptions and on a single line, add
   -Djava.net.preferIPv4Stack=true. Then save the file and copy it to the Oxygen XML Editor Eclipse plugin installation folder (may need admin access).
2. Restart Oxygen XML Editor Eclipse plugin.
3. Make sure the procedure was successful by going to Help > About > System properties and check that the value of the java.net.preferIPv4Stack property is true.
Application Takes Several Minutes to Start

Problem
Oxygen XML Editor Eclipse plugin seems to take an abnormally long amount of time to start.

Cause
Some anti-virus software can cause Java applications, such as Oxygen XML Editor Eclipse plugin, to start very slowly due to scanning compressed archives (such as the JAR libraries that all Java applications use).

Solution
A possible solution is to add the Oxygen XML Editor Eclipse plugin folder to the list of exceptions in the anti-virus software settings.

Compatibility Issue Between Java and Certain Graphics Card Drivers

Problem
Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in Author or Text mode) being displayed garbled.

Solution
If you encounter this problem, update your graphics card driver.

Damaged File Associations on OS X

Problem
After upgrading OS X and Oxygen XML Editor Eclipse plugin, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

Cause
The upgrade damaged the file associations in the LaunchService Database on your OS X machine.

Solution
You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor Eclipse plugin installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor Eclipse plugin installation kit on your desktop.
5. Copy the contents of the archive into the folder /Applications/Oxygen.
6. Run the following command in a Terminal:
7. Restart Finder with the following command:

   ```bash
   killall Finder
   ```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor Eclipse plugin icon.

10. Accept the confirmation.

**Result:** When you start Oxygen XML Editor Eclipse plugin, the file associations should work correctly.

---

**Details to Submit in a Request for Technical Support Using the Online Form**

**Problem**

What details should I add to my request for technical support on the online form in the product website?

**Solution**

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the Randomize XML text content action (on page 18) to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate an Oxygen XML Editor Eclipse plugin log file, follow these steps:

1. Create a text file called `log4j.properties` in the `lib` folder of the installed plugin folder, with the following content:

   ```properties
   log4j.rootCategory=debug, R2
   
   log4j.appender.R2=org.apache.log4j.RollingFileAppender
   log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
   log4j.appender.R2.MaxFileSize=12000KB
   log4j.appender.R2.MaxBackupIndex=20
   log4j.appender.R2.layout=org.apache.log4j.PatternLayout
   log4j.appender.R2.layout.ConversionPattern=%r %p [ %t ] %c - %m%n
   ```

2. Restart the application.

3. Reproduce the error.

4. Close the application.
5. Delete the log4j.properties file because it might cause performance issues if you leave it in the lib folder.

**Important:** The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the log4j.properties file when you are done with the procedure.

**Result:** The resulting log file is named oxygen#.log (for example, oxygen.log, oxygen.log.1, oxygen.log.2, etc.) and is located in the Desktop\oxygenLog folder.

### DITA Map Transformation Fails (Cannot Connect to External Location)

**Problem**

*DITA map (on page 2134)* transformation fails because it cannot connect to an external location.

**Solution**

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the **Network Connections**.

### DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

**Problem**

*DITA Map WebHelp* transformation fails with a message that indicates duplicate topic references were found.

**Cause**

By default the WebHelp transformation uses the `force-unique` parameter set to `true` to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

**Solution**

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
  ...
  <topicref href="../topics/MyTopic.dita"/>
  ...
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```
DITA-OT Transformation Takes a Long Time to Process

Problem
A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause
Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution
There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Editor Eclipse plugin (on page 1850). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem
The DITA to PDF transformation fails.
Cause
To generate the PDF output, Oxygen XML Editor Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2078).

Solution
If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 1918). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2134), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:
- How to Enable Debugging for FO Processor Transformations (on page 1062)

DITA PDF Processing Common Errors
There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF
The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```
**Solution: Cannot Save PDF**

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

**Problem: Table Contains More Cells Than Defined in Colspec**

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop] at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop] at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

**Solution: Table Contains More Cells Than Defined in Colspec**

To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 1877)) to find the original DITA topic where the table was generated.

**Problem: Broken Link**

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

**Solution: Broken Link**

To resolve this issue:
1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 1877) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor Eclipse plugin, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 1877)) to find the original DITA topic where the table was generated.

Related Information:
- How to Enable Debugging for FO Processor Transformations (on page 1062)

DITA to CHM Transformation Fails - Cannot Open File

Problem
The DITA to CHM transformation fails with the following error: [exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.

Cause
This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution
To solve this issue, close the CHM help file and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2134) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1918). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
- DITA Map CHM (Compiled HTML Help) Transformation (on page 2054)

DITA to CHM Transformation Fails - Compilation Failed

Problem
The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.
Cause 1
One possible cause for this error is that the processed file does not exist.

Solution 1
To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2
Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2
To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2134) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1918). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Error After Switching Oxygen Products in Eclipse

Problem
On an Eclipse deployment, after installing and using the Editor product, I later decided to uninstall it and use Author or Developer instead. After installing the new product, I received an error that looked like this:

```
java.lang.Exception
    at org.eclipse.ui.internal.ViewReference.createErrorPart(ViewReference.java:112)
    at org.eclipse.ui.internal.ViewReference.createPart(ViewReference.java:98)
    at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.createPart
        (CompatibilityPart.java:279)
    at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.create
        (CompatibilityPart.java:317)
    at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
    at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:62)
    at sun.reflect.DelegatingMethodAccessorImpl.invoke
        (DelegatingMethodAccessorImpl.java:43)
    at java.lang.reflect.Method.invoke(Method.java:498)
    ...
```

Solution
You need to manually delete the perspective for the product you uninstalled by following this procedure:
1. Go to Window > Preferences > General > Perspectives.
2. Select the perspective for the product you uninstalled (for example, <oXygen/> XML) and click Delete.
3. Restart Eclipse.
4. Go to Window > Open Perspective and select the perspective for the new product (for example, <oXygen/> > XML Author).

Hunspell Spell Checker is Unusable on Your Platform Error

Problem
When trying to use the Check Spelling option, I receive the error Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session.

Cause
There are instances where Oxygen XML Editor Eclipse plugin determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

Solution
To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Editor Eclipse plugin.
2. Open the %APPDATA%/com.oxygenxml folder and look for a file called something like HunspellCrashGuard*.txt. Delete that file.
3. Restart Oxygen XML Editor Eclipse plugin.

High Resolution Scaling Issues

Problem
I encounter scaling detection issues in a high resolution display. For example, some GUI components are too small.

Cause
This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution
You can use the com.oxygenxml.hidpi.scaling custom system property (on page 186) to force a specific scaling setting. For example: -Dcom.oxygenxml.hidpi.scaling=1.5 for 150% scaling.
Images Appear Stretched Out in the PDF Output

Problem
When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution
PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `<external-graphic>` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA-OT-DIR]/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`. The configuration file contains two XML elements called `<source-resolution>` and `<target-resolution>`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial RenderX XEP XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip: It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

![Save as PNG dialog](image.png)

This allows you to control the image resolution from the configuration file for all referenced images.
Increasing the Memory for the Ant Process

**Problem**

The Ant build process runs out of memory.

**Solution**

For details about setting custom JVM arguments to the Ant build process, see [JVM Arguments](on page 2069).

JPEG CMYK Color Space Issues

**Problem**

JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the Author mode.

**Solution**

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the `profileFileName.icc` to the `[OXYGEN_INSTALL_DIR]\lib` directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The **Unsupported Image Type** message is displayed above the image.

Mac Touch Bar Function Keys Do Not Work

**Problem**

I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Editor Eclipse plugin.

**Causes**

By default, the Touch Bar function keys are not enabled for Oxygen XML Editor Eclipse plugin.

**Solution**

To enable the Touch Bar function keys for Oxygen XML Editor Eclipse plugin, follow these steps:

1. Go to **System Preferences** and select **Keyboard**.
2. Click **Shortcuts**.
3. From the left sidebar, select **Function Keys**.
4. Click the + symbol, select **Oxygen** from the list of apps, and click **Add**.
Mac OS X Keyboard no Longer Works After Inserting Accented Characters

Problem

Mac OS X has a method for inserting accented characters that is triggered by holding a key and then selecting the desired character from a contextual menu. When using this method in OS X 10.14 (Mojave) to insert accented characters in Oxygen XML Editor Eclipse plugin, the keyboard can no longer be used unless I restart the application.

Causes

This problem is caused by some sort of incompatibility issue with Java 8 and OS X 10.14 (Mojave).

Solution

To prevent this problem, you should use an Oxygen XML Editor Eclipse plugin distribution that includes OpenJDK 12:

1. Uninstall Oxygen XML Editor Eclipse plugin:
   a. All data stored in the installation directory will be removed, including any customizations or any other data you have stored within that directory. Therefore, you should make a backup of any data you want to keep.
   b. Remove the application by manually deleting the installation folder and all its contents.
2. Reinstall Oxygen XML Editor Eclipse plugin using the distribution that includes OpenJDK:
   a. Go to the Oxygen Download page.
   b. In the Mac OS X tab, click on the macOS 10.11 and later (Includes OpenJDK 12.0.1) link to download this particular distribution.
   c. Follow the instructions to install the downloaded installation package.

Machine Signature Mismatch Error

Problem

I receive an error indicating that the current license was already activated on a License Server or that the License Server's Machine Signature does not match.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called Machine Signature) is sent to the Oxygen XML Editor Eclipse plugin servers, which in turn will sign the license key. The Machine Signature is computed from the list of network interfaces of the machine where you deployed the license.

When starting the license server, if you receive an error stating that your server's Machine Signature does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new machine that hosts your license server.
Solution

Revert to your previous configuration.

Possible Cause 2
A new network interface was changed, added, or activated in the machine that hosts your license server.

Note: A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the Oxygen support team.

Possible Cause 3
The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (/usr/local/apache-tomcat-V.V.V) with a symbolic link to the typical folder (/usr/local/tomcat). The server can be restarted from either location, but it is recommended to always restart from the typical folder (/usr/local/tomcat) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

MSXML 4.0 Transformation Issues

Problem
When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.

Cause
It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

Solution

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.
Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

Problem
When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: Navigation to the web page was canceled.

Cause
This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM open on a network drive.

Solution
As a workaround, copy the CHM file on your local system and view it there.

References Outside the Main DITA Map Folder

Problem
A reference to a DITA topic, map, or binary resource (for example, an image) that is located outside of the folder where the main DITA map (on page 2134) is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause
DITA-OT often has trouble resolving references that are outside the directory where the published DITA map is found. By default, it does not even copy the referenced topics to the output directory.

Solution
To solve this, try one of the following solutions:

• Create another DITA map that is located in a folder path above all referenced folders and reference the original DITA map from this new map. Then transform this DITA map instead.
• Edit the transformation scenario and in the Parameters tab, change the value of the fix.external.refs.com.oxygenxml parameter to true. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

Important: The fix.external.refs.com.oxygenxml parameter is only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin.

• For PDF output, you can edit the transformation scenario and in the Parameters tab set the value of the generate.copy.outer parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

Important: This method is recommended for transformation scenarios that use an external DITA-OT.
Syntax Highlights Not Available in Eclipse Plugin

Problem
I associated the .ext extension with Oxygen XML Editor Eclipse plugin in Eclipse but an .ext file opened with the Oxygen XML Editor Eclipse plugin does not have syntax highlights.

Solution
Associate an extension with Oxygen XML Editor Eclipse plugin in Eclipse versions 3.6-3.8, 4.2-4.14 by following these steps:

1. Associate the .ext extension with the Oxygen XML Editor Eclipse plugin:
   a. Open the Preferences dialog box (on page 47) and go to General > Editors > File Associations.
   b. Add *.ext to the list of file types.
   c. Select *.ext in the list by clicking it.
   d. Add Oxygen XML Editor Eclipse plugin to the list of Associated editors and make it the default editor.
2. Associate the .ext extension with the Oxygen XML content type:
   a. Open the Preferences dialog box (on page 47) and go to General > Content Types.
   b. Add *.ext to the File associations list for the Text > XML > Oxygen XML Editor Eclipse plugin content type.
3. Click the OK button in the Eclipse preferences dialog box.

Result: Now when an *.ext file is opened, the icon and the syntax highlights should be the same as for XML files opened with the Oxygen XML Editor Eclipse plugin.

TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem
The TocJS transformation of a DITA map (on page 2134) does not generate all the files needed to display the tree-like table of contents.

Solution
To get a complete set of output files, follow these steps:

1. Run the XHTML transformation on the same DITA map. Make sure the output gets generated in the same output folder as for the TocJS transformation.
2. Copy the content of the DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles folder to the transformation output folder.
3. Copy the DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html file to the transformation output folder.
5. Locate element <frame name="contentwin" src="concepts/about.html">.
6. Replace "concepts/about.html" with "index.html".
Windows Service Reports Incorrect Function Error When Starting (TCP Server)

Problem
My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

Cause
This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Solution
Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: [http://www.oracle.com/technetwork/java/javase/downloads/index.html](http://www.oracle.com/technetwork/java/javase/downloads/index.html).

Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

Problem
My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

Cause
This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (license.txt file in the license folder).

Solution
Re-deploy your license key. For more information, see the Setting up a Floating License Server section (on page 38).

XSLT Debugger Is Very Slow

Problem
When I run a transformation in the XSLT Debugger perspective (on page 2137), it is very slow.

Solution
If the transformation produces HTML or XHTML output, you can disable rendering of output in the XHTML output view (on page 160) during the transformation process. To view the XHTML output result do one of the following:
• Run the transformation in the **Editor perspective (on page 2137)** and make sure the **Open in Browser/System Application option (on page 1013)** is selected.

• Run the transformation in the **XSLT Debugger perspective (on page 2137)**, save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Internet Explorer).
21. DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural framework for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor Eclipse plugin features that are specific to working with DITA documents and concepts.

**DITA Resources**

For more general information and technical details about working with DITA, refer to the following resources:

- The DITA Specifications.
- The DITA Style Guide Best Practices for Authors.
- Various sample DITA topics and maps can be found in the [OXYGEN_INSTALL_DIR]/samples/dita folder.
Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor Eclipse plugin. Oxygen XML Editor Eclipse plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor Eclipse plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor Eclipse plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor Eclipse plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor Eclipse plugin, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor Eclipse plugin

To create a DITA topic (on page 1935):

1. Select File > New > Other > Oxygen XML Editor Eclipse plugin, or click the New button on the toolbar, and select New from Templates.

   **Step Result:** The New from Templates Wizard (on page 200) is displayed:
2. Go to **Framework templates > DITA > topic** and select the type of topic that you want to create, then click **Next**.

**Note:** If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.

4. Click **Finish**.

**Result:** Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map (on page 1872).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor Eclipse plugin provides for editing XML documents (on page 6) also apply to DITA topics. Oxygen XML Editor Eclipse plugin also provides additional specific DITA-related support for working with DITA topics (on page 1934), their associated DITA maps (on page 1876), and for creating DITA output (on page 2042).

**Role of Maps**

The basic method that DITA uses to express the relationship between topics is through a **DITA map (on page 2134)**. Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you
create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor Eclipse plugin

To create a map (on page 1892):

1. Select File > New > Other > Oxygen XML Editor Eclipse plugin, or click the New button on the toolbar, and select New from Templates.
2. Go to Framework templates > DITA Map > map and select the type of map you want to create.
3. Choose whether you want to open the map in the Editor or in the DITA Maps Manager (on page 1877). Usually, opening it in the DITA Maps Manager is the best choice. The DITA Maps Manager presents a view of the DITA map that is similar to a table of contents.

Adding Existing Topics to a Map in Oxygen XML Editor Eclipse plugin

There are several ways to add a topic reference to a map (on page 1895). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the DITA map in the DITA Maps Manager view (on page 1877) and choose Reference to the currently edited file from the Append Child, Insert Before, or Insert After submenu.

Step Result: This opens the Insert Reference dialog box (on page 1900) with all of the required fields already filled in for you.
3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

4. Select **Insert and close** to add a reference to your topic in the map.

5. Save the **DITA map**.

**Adding New Topics to a Map in Oxygen XML Editor Eclipse plugin**

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To **add a new topic to a map (on page 1895)**, follow these steps:

1. In the **DITA Maps Manager (on page 1877)**, right-click the node in the current map where you want to add the new topic.

2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box (on page 1937)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box (on page 1937)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box (on page 1937)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.
**Note:** The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the DITA > New topics preferences page (on page 58) into account. When the option is deselected, a unique ID is generated.

**Step Result:** The new topic is now referenced (as a `<topicref>`) in the DITA map at the location where you inserted it and the new topic is opened in the editor.

3. Save the DITA map.

You can also change the order and nesting of topics in the DITA Maps Manager view by doing either of the following:

- Select the topic to move while holding down the Alt key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

### Adding Submaps in Oxygen XML Editor Eclipse plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps (on page 1893). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map (on page 1893):

1. Right-click the parent DITA map in the DITA Maps Manager view (on page 1877) and choose Append child > Map reference.

   **Step Result:** This opens the Insert Reference dialog box (on page 1900) with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.

3. Select Insert and close to add a reference to your submap in the main map.

4. Save the main DITA map.

### Validating a Map in Oxygen XML Editor Eclipse plugin

Just as it is with your individual topics, it is important to validate your maps (on page 1918). Oxygen XML Editor Eclipse plugin provides a validation function for DITA maps that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
• Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the Validate and Check for Completeness button in the DITA Maps Manager view (on page 1877).
   
   **Step Result:** This opens the DITA Map Completeness Check dialog box (on page 1919).

2. Select any of the various options you want to check.

3. Click Check to run the validation process.

**Publishing Your Topics in Oxygen XML Editor Eclipse plugin**

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output (on page 2042) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor Eclipse plugin uses the transformations provided by the DITA Open Toolkit for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in DITA Open Toolkit transformations. In either case, Oxygen XML Editor Eclipse plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the Configure Transformation Scenario(s) button in the DITA Maps Manager view (on page 1877).

   **Step Result:** This opens the Configure Transformation Scenario(s) dialog box (on page 1078).
2. Select the appropriate transformation depending on the type of output you desire.

3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.

4. Click **Apply associated**.

**Result:** Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

**Related Information:**
- [DITA Authoring](#)
- [Editing XML Documents in Author Mode](#)

---

**Working with DITA Maps**

In the DITA standard architecture you create documents by collecting topics into maps.

**DITA Maps**

A [DITA map](#) organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor Eclipse plugin provides support for creating and managing DITA maps through the [DITA Maps Manager](#). There are also specialized types of DITA maps, such as a [bookmap](#), which is intended for creating the structure of a book.
Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps (on page 1893) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The DITA Maps Manager (on page 1877) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a DITA map and you can choose to open it in the DITA Maps Manager (on page 1877) or in the XML Editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the DITA Maps Manager, simply double-click it (or right-click it and select Open).
- To open a map in the XML editor from the DITA Maps Manager, right-click it and select Open Map in Editor.
- Drag a DITA map file from your system browser and drop it in the XML editor. This will open the map in the editor.
- To open a map in the DITA Maps Manager, you can right-click a map file in the Navigator view (on page 221) and select Open in DITA Maps Manager.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking) (on page 1918). To support this, Oxygen XML Editor Eclipse plugin provides an Edit Properties dialog box (on page 1910) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should validate your maps (on page 1918) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor Eclipse plugin provides a validation function for DITA maps that performs a comprehensive validation of a map and its topics.

For more information about DITA editing, watch our video demonstration:

https://www.youtube.com/embed/t2cG3Xe1TXY

- DITA Map Document Type (Framework) (on page 913)
- DITA Map Author Mode Actions (on page 1923)

DITA Maps Manager

Oxygen XML Editor Eclipse plugin provides a view for managing and editing DITA maps. The DITA Maps Manager view presents a DITA map as a Table of Contents. It allows you to navigate the topics and maps,
make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The **DITA Maps Manager** includes a variety of useful actions to help you edit and organize the structure of your **DITA maps** and topics. The actions that are available and their functions depend on the type of nodes that are selected in the **DITA Maps Manager**. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

![Figure 533. DITA Maps Manager View](image)

**Opening Maps in the DITA Maps Manager**

The **DITA Maps Manager** view supports opening multiple maps at the same time, with each one presented in its own tab. To open a **DITA map** in the **DITA Maps Manager**, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select **Open**).
- Right-click a map file in the **Navigator view (on page 221)** and select **Open in DITA Maps Manager**.

**Submap Nodes**

If your **root map (on page 2138)** (**main DITA map**) references other maps (submaps), they can be expanded and you can navigate their content in the **DITA Maps Manager**, but the references within those submaps are not editable unless you open the submap separately in its own tab. The references within submap nodes are shown with a gray background.
Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the Ctrl or Shift key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the Ctrl key. The mouse pointer changes to a symbol to indicate that a copy operation is being performed.

Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (Alt + LeftArrow) / Demote (Alt + RightArrow)

You can move nodes between child and parent nodes by using the Promote (Alt + LeftArrow) and Demote (Alt + RightArrow) operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the DITA Maps menu) and their availability depend on the nodes that are selected:

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open Drop-down Menu

You can use this drop-down menu to open new DITA maps or to reopen recently viewed maps.

The drop-down menu contains the following:

- List of recently viewed DITA maps that can be selected to reopen them.
- Clear history - Clears the history list of the recently viewed DITA maps.
- Open - Allows you to open the map in the DITA Maps Manager view (on page 1877). You can also open a map by dragging it from the file system explorer and dropping it into the DITA Maps Manager view (on page 1877).
- Browse workspace - Opens a file browser dialog box allowing you to select a file from the local workspace.
- Open URL - Displays the Choose DITA Map dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the Browse for remote file drop-down menu.

Save (Ctrl + S (Meta + S on Mac OS))

Saves the current DITA map.
Validate and Check for Completeness

Checks the validity and integrity (on page 1918) of the map.

Apply Transformation Scenario(s)

Applies the DITA Map transformation scenario (on page 981) that is associated with the current map.

Configure Transformation Scenario(s)

Opens the Configure Transformation Scenarios(s) dialog box (on page 1078) where you can edit or create transformation scenarios or associate a DITA Map transformation scenario (on page 1028) with the current map.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Editor Eclipse plugin, the DITA map is updated automatically.

Open Map in Editor with Resolved Topics

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action Edit Reference to open the topic for editing.

Tip: If you want to print the expanded content, you should consider changing the Styles drop-down to + Print ready.

Open Map in Editor

For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Note: You can also use this action to open referenced DITA maps in the Editor.

Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the DITA Maps Manager view. If enabled, it results in the following types of synchronizations:

• If you select a topic tab in the main editing area and it is referenced in the map currently opened in the DITA Maps Manager, the reference to that topic is selected in the DITA Maps Manager.
• If you have a map opened in both the DITA Maps Manager and the main editor, selecting the map tab in the main editing area opens that map in the DITA Maps Manager.
• If you have a map opened in both the **DITA Maps Manager** and the main editor (**Author** mode) and, selecting one or more topicrefs in the **DITA Maps Manager** will also select the same topicrefs in the main editor.
• If you have a map opened in both the **DITA Maps Manager** and the main editor (**Author** mode) and, selecting one or more topicrefs in the main editor will also select the same topicrefs in the **DITA Maps Manager**.

**Settings**

**Show extended toolbar**

Toggles whether or not the extended toolbar will be displayed in the **DITA Maps Manager** toolbar.

**Show root map toolbar**

Toggles whether or not the **Root map option (on page 1881)** will be displayed in the **DITA Maps Manager** toolbar.

**Show topic titles**

Toggles how topics are presented in the **DITA Maps Manager**. If selected, the title of each topic is shown. Otherwise, the file path (value of the @href attribute) for each topic is shown.

**Root Map Drop-down menu**

The drop-down menu displayed after **Context** can be used to specify the **DITA root map (on page 2138)** that Oxygen XML Editor Eclipse plugin uses to define a hierarchical structure of submaps and to establish a **key space (on page 2135)** that defines the keys that are propagated throughout the entire map structure. For more information, see **Selecting a Root Map (on page 1892)**.

**Choose Root Map Drop-down menu**

You can use this drop-down menu to browse for root maps with the following choices:

• **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local root map.
• **Browse workspace** - Allows you to select a root map from the local workspace.
• **Browse for remote file** - Displays the **Open using FTP/SFTP** dialog box (on page 213) that allows you to select a remotely stored root map.
• **Browse for archived file** - Displays the **Archive Browser (on page 1440)** that allows you to browse the content of an archive and choose a root map.
• **Browse Data Source Explorer** - Opens the **Data Source Explorer (on page 1445)** that allows you to browse the data sources defined in the **Data Sources preferences page (on page 51)**.
Tip: You can open the Data Sources preferences page by using the Configure Database Sources shortcut from the Open URL dialog box.

- Search for file - Displays the Find Resource dialog box to search for a root map.

Profiling/Conditional Text Drop-down Menu

You can use this drop-down menu to select and apply a defined profiling condition set (on page 2090) to filter the content based on that condition set. The drop-down menu also contains the following other options:

- Show Profiling Colors and Styles - Select this option to turn on conditional styling. To configure the colors and styles open the Preferences dialog box (on page 47) and go to Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles.
- Show Profiling Attributes - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the DITA Maps Manager view and in the Author view.
- Show Excluded Content - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the Outline (on page 273) and DITA Maps Manager views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.
- Profiling Settings - Opens the preferences page for adding and editing the profiling conditions that you can apply in the DITA Maps Manager view and the Author mode editing pane. When a profiling condition set (on page 384) is applied, the keys that are defined in the DITA map are gathered by filtering out the excluded content.

Insert Topic Reference

Opens the Insert Reference dialog box (on page 1900) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 1910).

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 344) topic.

Delete

Deletes the selected node.

Move Up

Moves the selected node up within the DITA map tree.
Move Down

Moves the selected node down within the DITA map tree.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

Contextual Menu of the DITA Maps Manager

Root Map

The following actions can be invoked from the contextual menu on the root map (on page 2138) of an opened DITA map (many of them are also available in the DITA Maps menu):

Open Map in Editor

For complex operations that cannot be performed in the simplified DITA Maps Manager view (for instance, editing a relationship table) you can open the map in the main editing area.

Open Map in Editor with Resolved Topics

Opens the DITA map in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action Edit Reference to open the topic for editing.

Export DITA Map

Opens a dialog box that allows you to choose a destination for exporting the DITA map. It also includes an Export as Zip archive option that allows you to package the DITA map as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map.

Find Unreferenced Resources

Allows you to search for orphaned resources that are not referenced in the DITA maps.

Show Feedback Comments Manager

Opens the Feedback Comments Manager view. This view is for those who use Oxygen Feedback to provide a commenting component in WebHelp output. This view makes it possible to see all the comments added by users in WebHelp output directly in Oxygen XML Editor Eclipse plugin.

Edit Properties
Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see **Edit Properties Dialog Box (on page 1910)**.

**Fast Create Topics**

Opens the **Fast Create Topics** dialog box (on page 1938) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the **DITA map (on page 2134)**.

**Append Child submenu**

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 1935).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the **Inserting References (on page 1900)** topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the **Inserting References (on page 1900)** topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a targeted key definition (on page 1910) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to define a key and a value inside a keyword (on page 1909).
- A set of actions that open the **Insert Reference** dialog box (on page 1900) that allow you to insert various reference specializations (such as **Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference**).

**Search References**

Searches all references to the current topic in the entire **DITA map (on page 2134)**. It also reports references that are defined as related links in relationship tables. If you have enabled **Master Files support (on page 2120)**, it also searches for references in the DITA maps added to the Master Files folder.

**Refactoring submenu**

The following actions are available from this submenu when invokes from a root map:

**Rename resource**

Allows you to change the name of a resource linked in the edited **DITA map (on page 1897)** and you have the option of updating all the references to the renamed DITA resource. If you have enabled
Master Files support (on page 2120), it also searches for references in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

Move resource

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 1897) and you have the option of updating all the references to the moved DITA resources. If you have enabled Master Files support (on page 2120), it also searches for references in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions
For your convenience, the last 5 XML Refactoring tool operations *(on page 525)* that were finished or previewed will also appear in this submenu.

**XML Refactoring**

Opens the XML Refactoring tool wizard *(on page 525)* that presents refactoring operations to assist you with managing the structure of your XML documents.

**Check Spelling in Files**

Allows you to spell check multiple files *(on page 244)*.

**Paste**

Allows you to paste content from the clipboard into the *DITA map*.

**Paste Before**

Pastes the content of the clipboard (only if it is a part of the *DITA map*) before the currently selected *DITA map* node.

**Paste After**

Pastes the content of the clipboard (only if it is a part of the *DITA map*) after the currently selected *DITA map* node.

**Expand All**

Allows you to expand the entire *DITA map* structure.

**Collapse All**

Allows you to collapse the entire *DITA map* structure.

**Editable Child Nodes**

The following actions are available when the contextual menu is invoked on an editable child node of a *DITA map* (submaps need to be opened in the *DITA Maps Manager* to access these actions since they are in a read-only state in the parent map): 

**Note:** If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

**Open**

Opens the selected resource in the editor.

**Edit Properties**

Opens the *Edit Properties* dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see *Edit Properties Dialog Box*(on page 1910).

**Fast Create Topics**
Opens the Fast Create Topics dialog box (on page 1938) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2134).

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 1935).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 1900) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 1900) topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 1910) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 1909).
- A set of actions that open the Insert Reference dialog box (on page 1900) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Insert Before submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 1935).
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References (on page 1900) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References (on page 1900) topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition (on page 1910) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword (on page 1909).
- A set of actions that open the Insert Reference dialog box (on page 1900) that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Insert After submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic *(on page 1935).*
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References *(on page 1900)* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References *(on page 1900)* topic.
- **Key Reference** - Opens an Insert Key Definition dialog box that allows you to insert a targeted key definition *(on page 1910)* (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an Insert Key Definition dialog box that allows you to define a key and a value inside a keyword *(on page 1909).*
- A set of actions that open the Insert Reference dialog box *(on page 1900)* that allow you to insert various reference specializations (such as Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference).

Search References

Searches all references to the current topic in the entire DITA map *(on page 2134).* It also reports references that are defined as related links in relationship tables. If you have enabled Master Files support *(on page 2120)*, it also searches for references in the DITA maps added to the Master Files folder.

Refactoring submenu

The following actions are available from this submenu:

**Convert Markdown to DITA Topic (Available for Markdown documents)**

Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic *(on page 1993).*

**Rename resource**

Allows you to change the name of a resource linked in the edited DITA map *(on page 1897)* and you have the option of updating all the references to the renamed DITA resource. If you have enabled Master Files support *(on page 2120)*, it also searches for references.
in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

**Move resource**

Allows you to change the location on disk of a resource linked in the edited DITA map (on page 1897) and you have the option of updating all the references to the moved DITA resources. If you have enabled Master Files support (on page 2120), it also searches for references in the DITA maps added to the Master Files folder and it provides the option of updating all the references even for non-DITA resources.

**Extract to New DITA Map**

Use this operation to extract editable topics into a new DITA map. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click Create to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

**Rename Key**

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1877))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1877))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

**Convert to General Task**

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A
DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations (on page 525) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard (on page 525) that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to spell check multiple files (on page 244).

Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the DITA map.

Paste Before

Pastes the content of the clipboard (only if it is a part of the DITA map) before the currently selected DITA map node.

Paste After
Pastes the content of the clipboard (only if it is a part of the DITA map) after the currently selected DITA map node.

Delete

Deletes the currently selected node from the DITA map.

Remove from Disk

This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the Also remove all descendants option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links. If you have enabled Master Files support (on page 2120), it also searches for references in the DITA maps added to the Master Files folder.

Organize

Allows you to organize the DITA map with the several submenu actions:

- Move Up - Moves the selected node up within the DITA map tree.
- Move Down - Moves the selected node down within the DITA map tree.
- Promote - Moves the selected node up one level to the level of its parent node.
- Demote - Moves the selected node down one level to the level of its child nodes.

Expand All

Allows you to expand the entire DITA map structure.

Collapse All

Allows you to collapse the entire DITA map structure.

Other Nodes

The following additional actions are available when the contextual menu is invoked from other nodes, such as a submap node or a relationship table:

Open Map in Editor (available when invoking on a submap)

Opens the currently selected DITA map in the editor.

Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)

Opens the parent DITA map of the currently selected reference in the DITA Maps Manager.

Edit Attributes (only available for relationship table nodes)
Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode (on page 344) topic.

**Edit Profiling Attributes (only available for relationship table nodes)**

Allows you to change the profiling attributes (on page 378) defined on the selected node.

For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

**Related Information:**
- DITA Map Validation and Completeness Check (on page 1918)
- DITA Map Author Mode Actions (on page 1923)

## Creating a Map

To create a DITA map (on page 2134), subject scheme map (on page 2139), bookmap (on page 2132), or other types of DITA maps, follow these steps:

1. Use the **New Document** wizard (on page 200) to start creating your map.

   **Tip:** If you want the map to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the DITA Maps Manager (on page 1877)) and selecting New from the Append Child, Insert Before, or Insert After submenu.

2. Select one of the DITA Map templates from the Framework templates folder.

3. Click the **Next** button.

4. Select a parent folder and the file name and click **Finish**.

5. Save the map after opening it in the DITA Maps Manager (on page 1877) or the Editor.

**Related Information:**
- Customizing Profiling Values with a Subject Scheme Map (on page 2097)
- Managing DITA Maps (on page 1894)

## Selecting a Root Map

Oxygen XML Editor Eclipse plugin allows you to select a root map (on page 2138) (a master DITA map (on page 2134)) that defines a hierarchical structure of submaps and establishes a key space (on page 2135) that defines the keys used in all the other DITA maps and topics in the project. Specifying the correct root map
helps to prevent validation problems when you work with keyrefs and also acts as the foundation for content completion. All the keys that are defined in a root map are available in the submaps that are contained within the root map.

There are several ways to select or change the root map:

- The easiest method is to use the Root map drop-down menu (on page 1881) in the DITA Maps Manager (on page 1877) toolbar to select the appropriate root map.
- If you insert a key reference using the Cross Reference action from the Link drop-down menu (from the toolbar or Link submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.
- If you insert a content key reference or key reference using the Reuse Content action (from the toolbar, DITA menu, or Reuse submenu of the contextual menu) and keys are not gathered from the expected DITA map, you can change the root map by using the Change Root Map link in the Choose Key dialog box that is opened when you click the Choose Key Reference button.

For more information about the DITA root map support, watch our video demonstration:

https://www.youtube.com/embed/e81r3Y1qjnE

Creating DITA Submaps

You can break up a large DITA map (on page 2134) into more manageable pieces by creating submaps. A submap is simply a DITA map that is included by another DITA map. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an existing topic into a map (on page 1895), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a mapref element or a topicref element with the format attribute set to ditamap. In most cases, Oxygen XML Editor Eclipse plugin takes care of this for you.

Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select Append Child > New. To insert the submap as a sibling to the current node, select Insert After > New or Insert Before > New.

**Step Result:** This opens a New DITA file dialog box (on page 1935) that allows you to select the type of document and assists you with naming it.
3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file should have a `.ditamap` file extension).

4. Click **Create** to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see **Managing DITA Maps (on page 1894)**.

### Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a **bookmap (on page 2132)** to organize your topics into a book. A DITA **bookmap** is a specialized type of map, intended for creating output that is structured like a book. A **bookmap** allows you to add book-specific elements such as `<frontmatter>`, `<part>`, `<chapter>`, `<appendix>`, and `<backmatter>` to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the **DITA documentation** for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor Eclipse plugin.

To create a book in DITA using a **bookmap**, follow these steps:

1. Create a new **bookmap (on page 1894)** (`File > New > Framework templates > DITA Map > map > Bookmap`). If you want the **bookmap** to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager (on page 1877)**) and selecting **New** from the **Append Child, Insert Before, or Insert After** submenus.

2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a **bookmap**, or children to a section, right-click the **bookmap** or section icon and choose any of the reference actions in the **Append child** menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the **DITA documentation** to fully understand the structure of a DITA **bookmap** and where to create each element.

3. Create special elements such as an **index (on page 1917)** and **table of contents (on page 1916)**. The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. **Add topics (on page 1895)** to your chapters to add content to your book. You may find it easier to manage if you **use submaps (on page 1893)** to create the content of your chapters. This keeps your **bookmap** from becoming long and difficult to manage.

### Managing DITA Maps

You may want to manage your **DITA maps (on page 2134)** in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
• Change other properties of the items in a map.
• Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage DITA maps and resources. For more information about the DITA Maps Manager view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/oFZz6YZMCY

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

• By dragging and dropping topics within the DITA Maps Manager (on page 1877).
• By showing the extended DITA Maps Manager (on page 1877) toolbar (click the Settings icon on the DITA Maps Manager (on page 1877) toolbar and select the extended toolbar) and then using the node moving buttons (↑↓→←) on the toolbar to move topics around in the map.

To understand how to organize topics in a DITA map using the DITA Maps Manager (on page 1877), you can examine and experiment with the sample map called flowers.ditamap, located in the {OXYGEN_INSTALL_DIR}/samples/dita folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor Eclipse plugin supports both approaches.

A DITA map (on page 2134) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the <topicref> element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Editor Eclipse plugin provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box
The Insert Reference dialog box (on page 1900) allows you to create various reference types and configure the most commonly used attributes. You can open the Insert Reference dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select Append Child, Insert Before, or Insert After and select the type of reference to enter.
- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select Reference to the currently edited file.
- Selecting an item in the map and click the Insert Reference button from the DITA Maps Manager (on page 1877) toolbar.
- Select Insert Reference from the DITA Maps menu.

Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a DITA map by dragging and dropping the file into the DITA Maps Manager (on page 1877). You can drag and drop files from any of the following:

- Your OS file system explorer.
- The Navigator view (on page 221).

Adding topics this way will not open the Insert Reference dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting Edit Properties.

Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the DITA Maps Manager (on page 1877), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - Append Child > New - Select this action to insert the new topic as a child of the selected node. This action opens a New file dialog box (on page 1937) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - Insert Before > New - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a New file dialog box (on page 1937) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - Insert After > New - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a New file dialog box (on page 1937) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click Create.
   - Duplicate - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click OK.
Note: The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the **DITA > New topics preferences page (on page 58)** into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a `<topicref>` ) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.

### Adding Multiple Skeleton Topics at Once

Oxygen XML Editor Eclipse plugin includes a feature in the **DITA Maps Manager (on page 1877)** that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the **DITA map (on page 2134)**.

To access this feature, right-click a node in the **DITA Maps Manager** where you want the new topics to be inserted and select **Fast Create Topics**. This opens the **Fast Create Topics** dialog box where you can configure the structure for the new topics.

For more information, see **Fast Create Multiple DITA Topics (on page 1938)**.

### Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor Eclipse plugin allows you to reuse entire topics by adding multiple references to the same topic in a **DITA map**. Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager (on page 1877)**, an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the topic is referenced in the **DITA map**. It also includes navigation arrows that allow you to jump to the next or previous reference.

### Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press the **Delete** key on your keyboard.
- Highlight the topic and click the **Delete** button on the **DITA Maps Manager (on page 1877)** extended toolbar.

### Moving and Renaming Resources

You can move or rename resources on disk directly from Oxygen XML Editor Eclipse plugin and you have the option of updating all the references to the moved or renamed DITA resources. For DITA resources (such
as topics and maps), you can do this from the **DITA Maps Manager** view (on page 1877). For non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can do this from the **Navigator** view (on page 221). If you have enabled Master Files support (on page 2120), you will also have the option to update all the references to the moved or renamed non-DITA resource.

### Moving or Renaming DITA Resources (Topics or Maps)

To move or rename normal DITA resources (such as topics or maps), use one of the following actions available in the **Refactoring** submenu of the contextual menu when invoked on the resource in the **DITA Maps Manager** view (on page 1877):

**Refactoring > Move resource**

This action allows you to change the location of a resource linked in the edited **DITA map**, using the **Move resource** dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Select this checkbox to update all references of the file in the edited **DITA map** and in the files referenced from the **DITA map**, preserving the **completeness** of the **DITA map**.
- **Preview** - Select this button to display a preview of the changes **Oxygen XML Editor Eclipse plugin** is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the **Move resource** operation. No changes are applied.

**Refactoring > Rename resource**

This action allows you to change the name of a resource linked in the edited **DITA map** (on page 2134), using the **Rename resource** dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Select this checkbox to update all references of the file in the edited **DITA map** and in the files referenced from the **DITA map**, preserving the **completeness** of the **DITA map**.
- **Preview** - Select this button to display a preview of the changes **Oxygen XML Editor Eclipse plugin** is about to make.
- **Rename** - Executes the **Rename resource** operation.
- **Cancel** - Cancels the **Rename resource** operation. No changes are applied.

**Note:** If a **root DITA map** (on page 2138) is not defined, the move and rename actions are executed in the context of the current **DITA map**.

### Moving or Renaming Non-DITA Resources and Updating the References to Them

To move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can simply follow the procedures described in **Moving/Renaming Resources**
in the Navigator View (on page 227). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on non-DITA resources while also updating all the references to them, use the following sets of procedures:

1. Enable Master Files support and add your root DITA map (on page 2138) to the Master Files folder by following the procedure found here: How to Enable Master Files Support in DITA (on page 2121).
2. Move or rename resources and update the references to them by following the procedure found here: Moving or Renaming Non-DITA Resources and Updating the References to Them (on page 2121).

Related Information:

- Master Files Support in DITA (on page 2120)
- Finding Resources Not Referenced in DITA Maps (on page 1899)

**Finding Resources Not Referenced in DITA Maps**

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from DITA maps (on page 2134). To assist you with organizing project resources, Oxygen XML Editor Eclipse plugin includes the Find Unreferenced Resources action, that searches for such resources.

To perform this search, open the DITA map in the DITA Maps Manager (on page 1877), invoke the contextual menu on the map, and select the Find Unreferenced Resources action. This action opens the Find Unreferenced Resources dialog box, shown below.
The **Find Unreferenced Resources** dialog box includes the following options:

- **DITA Maps** - Provides a list of *DITA maps* to be included in the search and allows you to **Add** maps to the list or **Remove** them.
- **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders. All files from this list of folders that are not referenced from the maps specified in the **DITA Maps** list will be reported.
- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

  **Note:** In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the `?` and `*` wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the **Find** button, if the search operation finds unreferenced resources, they are displayed in the **Results** panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select **Remove from Disk**. If you want to see the resource before deciding what to do with it, you can right-click its result and select **Show in Explorer**.

### Inserting References in DITA Maps

A **DITA map (on page 2134)** may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the **Insert Reference** dialog box (on page 1900).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a **DITA map**.

### Insert Reference Dialog Box

The **Insert Reference** dialog box allows you to insert and configure references in **DITA maps (on page 2134)**. There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:

- Select **Reference, Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child, Insert Before, and Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager (on page 1877)**.
  - To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the Insert After submenu.

To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the Insert Before submenu.

**Note:** The content of these submenus depends on the node that is selected in the DITA map tree when the contextual menu is invoked. For example, if the selected node is a topic reference ( `<topicref>` ), its possible child nodes include the following elements: `<anchorref>`, `<chapter>`, `<keydef>`, `<mapref>`, `<topicgroup>`, `<topichead>`, `<topicref>`, `<topicset>`, and `<topicsetref>`.

- Click the **Insert Reference** button on the DITA Maps Manager extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select **Insert Reference** from the DITA Maps menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the **Reference** or **Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the Insert Reference dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor Eclipse plugin will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the **Append Child**, **Insert Before**, and **Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**.

**Target Tab**
Figure 535. Insert Reference Dialog Box - Target Tab

The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target **URL**.

**Href**

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.

**Note**: If the Reference type is a Navigation Reference, the **Href** field is changed to **Mapref**, since a `<navref>` element requires a `@mapref` attribute instead.

**Keys Tab**
The **Keys** tab allows you to use and **define keys (on page 1908)** for indirect referencing. For more information, see **Working with Keys in DITA (on page 1994)**. This tab includes the following:

**Define keys**

Use this text field to define the `@keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `@keyscope` attribute. **Key scopes** allow you to specify different sets of key definitions for different map branches.

**Key reference**

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current **root map (on page 2138)**.

**Attributes Tab**

![Insert Reference Dialog Box - Attributes Tab](image)
The **Attributes** tab of the **Insert Reference** dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 57). For references to DITA resources, you can enforce the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).

**Collection type**

This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a **DITA map** (for example, unordered, sequence, choice, family, -dita-use-conref-target ).

**Type**

Allows you to select a `@type` attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 57).

**Scope**

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 57).

**Format**

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 57).

**Processing Role**

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target ).

**Other attributes table**
This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the Value column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**

**Figure 538. Insert Reference Dialog Box - Metadata Tab**

The Metadata tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>` , `<linktext>` , `<shortdesc>` , `<keyword>` , `<indexterm>` ). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

**Profiling Tab**

**Figure 539. Insert Reference Dialog Box - Profiling Tab**

The Profiling tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2138) references a DITA subject scheme map (on page 2139) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.
When you modify a selection of values in this tab, the change will also automatically be reflected in the Attributes tab. For more information, see DITA Profiling / Conditional Text (on page 2082).

**Finalizing Your Insert Reference Configuration**
Once you click Insert or Insert and close, the configured reference is added in the map.

ℹ️ Tip: You can easily insert multiple references by keeping the Insert Reference dialog box opened, using the Insert button.

---

- Working with Keys in DITA (on page 1994)

---

**Inserting Topic Headings**

The `<topichead>` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `<topicref>` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child, Insert Before**, or **Insert After** submenus when invoking the contextual menu in the DITA Maps Manager view (on page 1877).
- Open the **DITA map** in the XML editor (on page 1877) and select the ➡️ **Insert Topic Heading** action from the main toolbar (or from the Insert submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box (on page 1900) that allows you to easily insert a `<topichead>` element. A **Navigation title** (@navtitle attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.)
Inserting Topic Groups

The `<topicgroup>` element identifies a group of topics (such as concepts, tasks, or references) or other resources. A `<topicgroup>` can contain other `<topicgroup>` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `<topicgroup>` and its children. You can set the collection-type of a container `<topicgroup>` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager view** (on page 1877).
- Open the **DITA map** in the XML editor (on page 1877) and select the [Insert Topic Group] action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group dialog box** (on page 1900) that allows you to easily insert a `<topicgroup>` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)
Defining Keys in DITA Maps

DITA uses keys (on page 1994) to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2138). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a keyword.
- Key with a target (for example, to target a resource such as an image or external link).

The following example is a DITA map (on page 2134) (a key definition submap) that contains some key definitions with various values for the product key and some targets to external URLs:

```xml
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
```

Related Information:
- Insert Reference Dialog Box (on page 1900)
Key Definition with a Keyword Value

To define a key with a value inside a *keyword*, follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 1893) that will contain all of your key definitions and reference the submap in your main (root) *map* (if you don't already have one created).
2. Open that map in the DITA Maps Manager (on page 1877).
3. Right-click the map or an item in the map where you want to add the reference and select *Key Definition with Keyword* from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the *key definition*). This opens an Insert Key Definition dialog box.
4. Enter the name of the key in the *Key* field.
5. Enter the key's value in the *Keyword* field.
6. Click Insert and close.

**Tip:** If you need to profile the key or add other attributes, you can right-click the key definition in the DITA Maps Manager, select 🔄 Edit properties, and configure them in the Profiling tab or Attributes tab, respectively.
**Key Definition with a Target**
To insert a targeted key definition (for example, to target a resource such as an image or external link), follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 1893) that will contain all of your key definitions and reference the submap in your main (root) map (if you don't already have one created).
2. Open that map in the DITA Maps Manager (on page 1877).
3. Right-click the map or an item in the map where you want to add the reference and select Key Definition from the Append Child, Insert Before, or Insert After submenu (depending on where you want to insert the key definition in the DITA map). This opens an Insert Key Definition dialog box.
4. Go to the Keys tab and enter the name of the key in the Define keys field.
5. Go to the Target tab and select a target resource (such as an image or external link).

   **Tip:** You can profile the key by using the Profiling tab and other attributes can also be defined in the Attributes tab.
6. Once you are done configuring the targeted key definition, click Insert and close.

**Related Information:**
- Working with Variable Text in DITA (on page 2022)
- Working with Keys in DITA (on page 1994)
- DITA 1.3 Specification: Indirect Key-based Addressing

**Edit Properties Dialog Box**
The DITA Maps Manager view (on page 1877) includes a feature that allows you to view and edit the properties of a selected node. The Edit properties action is available on both the DITA Maps Manager toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a DITA map (on page 2134) document in Author mode. The action opens the Edit Properties dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node where the action was invoked.

**Note:** If you select multiple sibling nodes and invoke the Edit properties action, only the Profiling tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the Edit Properties dialog box to modify or define attributes, metadata, profiling, or keys in DITA maps or topics. You can also use it to modify the title of root maps (on page 2138).

At the top of the Edit Properties dialog box, the Reference type drop-down list displays the type of the selected node and it depends on the node where the action was invoked.

The main section of the dialog box includes the following tabs: Target, Keys, Attributes, Metadata, and Profiling. The availability of the tabs and their functions depend on the selected node. For example, if you
invoke the action on a root map (on page 2138), only the Attributes, Metadata, and Profiling tabs are accessible and the Title property can be configured. Also, if you select multiple nodes, only the Profiling tab is available.

**Target Tab**

![Edit Properties Dialog Box - Target Tab](image)

The Target tab of the Edit Properties dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

**Choose a file location section**

You can browse for and select the source target file by using the file window in this section. You can use the File filter drop-down menu to narrow the list of possible file types that will be displayed.

**URL**

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

**ID**

The drop-down list displays all of the target elements that are available for the selected target URL.

**Href**

The selected target automatically modifies this value to point to the corresponding @href attribute of the target element.
Note: If the Reference type is a Navigation Reference, the Href field is changed to Mapref, since a `<navref>` element requires a `@mapref` attribute instead.

**Keys Tab**

**Figure 543. Edit Properties Dialog Box - Keys Tab**

The **Keys** tab allows you to use and define keys (on page 1908) for indirect referencing. For more information, see Working with Keys in DITA (on page 1994). This tab includes the following:

**Define keys**

Use this text field to define the `@keys` attribute for the target.

**Key scopes**

Use this text field to define or edit the value of a `@keyscope` attribute. Key scopes allow you to specify different sets of key definitions for different map branches.

**Key reference**

Use this combo box (or the Choose key reference button) to select a key that is already defined in the root map (on page 2138).

**Attributes Tab**
The Attributes tab of the Edit Properties dialog box allows you to insert and edit attribute values for the target node where the action was invoked.

If the target is a root map (on page 2138), the tab displays the title of the map. You can change it in the Title text field and assign it to an Attribute, Element, or All.

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

**Navigation title**

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Navigation title checkbox for the Always fill values for attributes option in the DITA preferences page (on page 57). For references to DITA resources, you can enforce the use of the specified title by selecting the Lock checkbox (otherwise, the topic <title> takes precedence).

Tip: You can also select the Prefer navigation title for topicref rendering option in the DITA preferences page (on page 57) to always enforce the use of the @navtitle value rather than selecting this Lock option on individual topics.

**Collection type**
This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a DITA map (for example, unordered, sequence, choice, family, -dita-use-conref-target).

**Type**

Allows you to select a `@type` attribute (such as topic, task, concept, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the Type checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 57).

**Scope**

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Scope checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 57).

**Format**

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the Format checkbox for the **Always fill values for attributes** option in the DITA preferences page (on page 57).

**Processing Role**

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, resource-only, normal, -dita-use-conref-target).

**Other attributes table**

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the Value column allows you to use the combo box to enter, edit, or select attribute values.

**Metadata Tab**
The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

**Profiling Tab**

The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your root map (on page 2138) references a DITA subject scheme map (on page 2139) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the ▶️ Expand All/ ▼️ Collapse All buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see DITA Profiling / Conditional Text (on page 2082).
Note: If you invoke the Edit properties action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the Profiling tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this Profiling tab and the changes will be applied to all the selected nodes.

![Figure 548. Profiling Conflict Panel](image)

**Finalizing Your Modifications**

Once you click OK, all your changes are applied to the target node.

**Related Information:**
- DITA Profiling / Conditional Text (on page 2082)
- Working with Keys in DITA (on page 1994)

**Generating a Table of Contents in DITA**

In DITA, the order and hierarchy of the table of contents of a document is based directly on the **DITA map that defines the document (on page 1876)**. In most cases, the processor generates a table of contents (TOC) based on the hierarchy of the topics in a DITA map. By default, each `<topicref>` element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the `<toc>` element in a **bookmap (on page 1894)** (as in the example below). For more information about the `<toc>` element, see [https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html](https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html).

**Example:**

```xml
<bookmap>
  ....
```

Creating an Index in DITA

In DITA, indexes are created from `<indexterm>` elements. You can insert index term elements in the following:

- **The header of a topic**: In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page where the topic starts, even if it is not the page in which the indexed term occurs.

- **In the `<topicref>` element in a map that references the topic**: This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page where the topic starts.

- **In the body of a topic**: In paginated media, this results in an index entry that points to the page where the `<indexterm>` element occurs, even if that is not the page where the topic starts.

To add index terms to the text of a topic or the topic header, create the elements as you normally would in Oxygen XML Editor Eclipse plugin (on page 1940). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a `bookmap (on page 2132)`, you need to add an `<indexlist>` element to the `<backmatter>` of the book.

1. Open your `bookmap (on page 1894)` in the DITA Maps Manager (on page 1877).
2. Right-click the `bookmap` and select **Append Child > Backmatter**.
   The Insert Reference dialog box (on page 1900) appears.
3. Click **Insert and Close** to insert the `<backmatter>` element.
4. Right-click the `<backmatter>` element and create a `<booklists>` element using **Append Child > Book Lists**.
5. Use the same steps to create an `<indexlist>` element.

**CAUTION:** Adding index entries and an `<indexlist>` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

Resolving Topic References Through an XML Catalog

There are situations where you want to resolve URIs with an XML Catalog (on page 2139):
You customized your DITA map (on page 2134) to reference topics using URIs instead of local paths.

You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor Eclipse plugin. The DITA Maps Manager view (on page 1877) will solve the displayed topic refs through the added XML catalog, as well as DITA map transformations (for PDF output, XHTML output, etc.)

To add an XML catalog to the DITA framework (on page 2135), follow these steps:

1. Create an XML catalog using the guidelines described in Working with XML Catalogs (on page 512).
2. Open the Preferences dialog box (on page 47) and go to Document Type Association.
3. Select the DITA document type and use the Edit, Duplicate, or Extend button to open a Document type configuration dialog box (on page 62).
4. Go to the Catalogs tab (on page 82).
5. Click on the + Add button to open a dialog box that allows you to add your created XML Catalog to the list.
6. After adding your catalog, click OK. You may need to reopen any currently edited files that use the new catalog or run a manual Validate action (on page 477) for the changes to take effect.

Note: You could also add your created catalog to the list of global catalogs in the XML Catalog preferences (on page 149) page.

**Chunking DITA Topics**

By default, when a DITA map (on page 2134) is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as chunking.

To chunk DITA topics, you set the chunking attribute on the <topicref> that contains the sub-topics in a DITA map. There are several values that you can set on the chunking attribute (for example, by-topic or to-content). See the DITA documentation for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the @toc and @collection-type attributes on the sub-topics or container topic to suitable values. See the DITA documentation for details.

You can set the @collection-type attribute on your topics using the Edit Properties action in the DITA Maps Manager (on page 1877). To set the @toc and @chunk attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon in the DITA Maps Manager (on page 1877) to open the map in the editor).
DITA Map Validation and Completeness Check

You should validate your DITA maps (on page 2134) regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In the DITA Maps Manager view (on page 1877), make sure that the tab that holds your root map (on page 2138) is selected and that the Root map selection is set either to the name of your root map or to <current map>.
2. It is a good practice to refresh your DITA map before running the validation process. To do so, select the DITA map in the DITA Maps Manager view and click File > Refresh (F5).
3. Click the Validate and Check for Completeness button on the DITA Maps Manager toolbar to open the DITA Map Completeness Check dialog box (on page 1919).
4. If you are using profiling, check the Use DITAVAL filters box and select the appropriate option.
5. Select any other options you want to check.
6. Click Check to run the validation process.

Result: The progress of the operation is shown as a task in the Progress view and the operation can be stopped from there.

Validation Process

The validation process of a DITA map includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an @href attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another DITA map is referenced in the main one, the referenced DITA map is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The DITA Map Completeness Check dialog box allows you to configure the DITA map validation.
Figure 549. DITA Map Completeness Check Dialog Box

You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

**Batch validate referenced DITA resources**

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario (*on page 487*).

**Note**: If you want your DITA topics to be validated against a Relax NG schema, this checkbox must be selected.

**Check the existence of non-DITA references resources**

Extends the validation of referenced resources to non-DITA files.

**Include remote resources**
Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

**Use DITAVAL filters**

The content of the map is filtered by applying a profiling condition set (on page 2082) before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager view** (on page 1877). Clicking the 📚 **Details** icon opens a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to create a profiling condition set.

- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.

- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the **DITA map**.

- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the 📦 **Insert Editor Variables** (on page 176) button, or the browsing actions in the ⚙ • **Browse** drop-down list.

**Report references to resources outside of the DITA map folder**

If selected, it will report any references to DITA resources that are located outside the **main DITA map** (on page 2138) folder.

**Report links to topics not referenced in DITA maps**

Checks that all the topics referenced by other topics are also linked in the **DITA map**.

**Report multiple references to the same topic**

If selected, it will report warnings when a topic is referenced multiple times in the **DITA map**, unless a unique **@copy-to** attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will not report a warning if there is a topic referenced twice, but the second `<topicref>` has a **@copy-to** attribute set:

```xml
<topicref href="topic.dita"/>
......
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it will report a warning if there is a topic referenced twice and none of the reference-type elements has a **@copy-to** attribute set or both of them have the **@copy-to** attribute set to the same value:
Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the DITA map for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the @keys attribute, all references will point to the first one encountered and the other will be ignored.

Note: This option takes key scopes (on page 2024) into account. For example, if you have something like this:

```xml
<topicref href="t2.dita" keys="k2"/>
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2"/>
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a key scope (on page 2024) on the second occurrence.

Report unreferenced key definitions

Checks the entire DITA map and reports any key definitions that are not referenced anywhere. Note that if the Use DITAVAL filters option (on page 1921) is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire DITA map and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an ID specified in the following types of topic references:

- Any <topicref> that contains a @processing-role attribute set to resource-only.
- Any other referenced topic that contains elements that are reused elsewhere through a @conref or @conkeyref.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a CALS table, if a cell has a vertical span greater than the available rows count.
- For a CALS table, if the number of <colspecs> is different than the number of columns detected from the table @cols attribute.
- For a CALS table, if the number of columns detected from the table @cols attribute is different than the number of columns detected in the table structure.
• For a CALS table, if the value of the @cols, @rowsep, or @colsep attributes are not numeric.
• For a CALS table, if the @namest, @nameend, or @colname attributes point to an incorrect column name.

**Identify possible conflicts in profile attribute values**

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

**Report attributes and values that conflict with profiling preferences**

Looks for profiling attributes and values that are not defined in the Profiling / Conditional Text preferences page (on page 103) (you can click the Profiling Preferences button to open this preferences page). It also checks if profiling attributes defined as single-value have multiple values set in the searched topics.

**Additional Schematron checks**

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the Insert Editor Variables (on page 176) button, or the browsing actions in the Browse drop-down list.

**Export settings**

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

**Import settings**

Allows you to import settings for this dialog box from an XML file that was created by the Export settings action.

**Check**

Use the Check button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

**Tip:** This function can be executed from an automated command-line script, but it requires an additional Oxygen XML Scripting License. For more details, see https://www.oxygenxml.com/oxygen_scripting.html.

**Related Information:**

- DITA Maps Manager (on page 1877)

**DITA Map Author Mode Actions**

A variety of actions are available for DITA map documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2133).
DITA Map Toolbar and Menu Actions

When a DITA map is opened in Author mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the DITA menu and in various submenus of the contextual menu):

- **Insert New DITA Resource**
  Opens a New DITA file dialog box (on page 1935) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
  Opens the Insert Reference dialog box (on page 1900) where you can configure a topic reference and inserts it at the current position within the map.

- **Insert Key Definition with Keyword**
  Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

- **Reuse Content**
  Opens the Reuse Content dialog box (on page 2010) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

- **Insert Topic Heading**
  Opens the Insert Reference dialog box (on page 1900) that allows you to insert a topic heading at the cursor position.

- **Insert Topic Group**
  Opens the Insert Reference dialog box (on page 1900) that allows you to insert a topic group at the cursor position.

- **Insert Relationship Table**
  Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

- **Relationship Table Properties**
  Allows you to change the properties of rows in relationship tables.

- **Insert Relationship Row**
  Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

- **Insert Relationship Column**
  Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.
Deletes the table column where the cursor is located.

Delete Relationship Row

Deletes the table row where the cursor is located.

Move Up

Moves the selected node up one position on its same level.

Move Down

Moves the selected node down one position on its same level.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

DITA Map Contextual Menu Actions

The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DITA menu at the top of the interface):

Edit Properties

Opens the Edit Properties dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box (on page 1910).

Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a @conref attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The conref attribute will point to this ID value.

Paste as content key reference
Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (on page 2134)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 1881) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 1881) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA Map framework:

- **Insert New DITA Resource**
  
  Opens a New DITA file dialog box (on page 1935) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

- **Insert Topic Reference**
Opens the **Insert Reference** dialog box ([on page 1900](#)) where you can configure a topic reference and inserts it at the current position within the map.

**Insert Key Definition with Keyword**

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

**Reuse Content**

Opens the **Reuse Content** dialog box ([on page 2010](#)) that allows you to insert and configure a content reference (@conref), or a content key reference (@conkeyref) at the cursor position.

**Insert Topic Heading**

Opens the **Insert Reference** dialog box ([on page 1900](#)) that allows you to insert a topic heading at the cursor position.

**Insert Topic Group**

Opens the **Insert Reference** dialog box ([on page 1900](#)) that allows you to insert a topic group at the cursor position.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. &#65
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. &#x41

**Relationship Table > Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

**Generate IDs**

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.
**Note:** The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

**Search References**

Finds the references to the `@href` or `@keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current DITA map (opened in the DITA Maps Manager view (on page 1877)). The current topic/map reference element must have an `@href` or `@keys` attribute defined to complete the search.

**Show Key Definition**

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the DITA map (on page 2134) that contains the definition of the key with the element that defines that key selected.

**Select submenu**

This submenu allows you to select the following:

- **Element**
  
  Selects the entire element at the current cursor position.

- **Content**
  
  Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

- **Parent**
  
  Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

- **To Lower Case**
  
  Converts the selected content to lower case characters.

- **To Upper Case**
  
  Converts the selected content to upper case characters.

- **Capitalize Sentences**
  
  Converts to upper case the first character of every selected sentence.

- **Capitalize Words**
  
  Converts to upper case the first character of every selected word.

- **Count Words**
  
  Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.
Note: The content marked as deleted with change tracking (on page 2139) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 248). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or ox prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to ←

Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 250).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

▲ Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent block elements (on page 2132) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or
**Backspace** keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 87) is selected in the Content Completion preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 87) is not selected in the Content Completion preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with [tag] (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

**Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**Attributes Refactoring Actions**

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

**Add/Change attribute**

Allows you to change the value of an attribute or insert a new one.

**Convert attribute to element**

Allows you to change an attribute into an element.

**Delete attribute**
Allows you to remove one or more attributes.

**Rename attribute**

Allows you to rename an attribute.

**Replace in attribute value**

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

**Comments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

**Delete comments**

Allows you to delete comments found inside one or more elements.

**Elements Refactoring Actions**

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

**Delete element**

Allows you to delete elements.

**Delete element content**

Allows you to delete the content of elements.

**Insert element**

Allows you to insert new elements.

**Rename element**

Allows you to rename elements.

**Unwrap element**

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

**Wrap element**

Allows you to surround elements with element tags.

**Wrap element content**

Allows you to surround the content of elements with element tags.

**Fragments Refactoring Actions**

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

**Insert XML fragment**

Allows you to insert an XML fragment.
Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the Track Changes (on page 2139) support for the current document.

Accept Change(s) and Move to Next

Accepts the Tracked Change (on page 2139) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

Accept All Changes

Accepts all Tracked Changes (on page 2139) in the current document.

Reject Change(s) and Move to Next

Rejects the Tracked Change (on page 2139) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

Reject All Changes

Rejects all Tracked Changes (on page 2139) in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2139). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.
Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 374).

Folding submenu

This submenu includes the following actions:

- **Toggle Fold**
  
  Toggles the state of the current fold.

- **Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))**
  
  Folds all the elements except the current element.

- **Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))**
  
  Folds the elements indented with one level inside the current element.

- **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))**
  
  Unfolds all child elements of the currently selected element.

- **Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))**
  
  Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the CSS Inspector view (on page 353) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode preferences page (on page 94) where you can configure various options with regard to the Author editing mode.
DITA Map Drag/Drop Actions

Dragging a file from the **Navigator view** (on page 221) or **DITA Maps Manager view** (on page 1877) and dropping it into a *DITA map* document that is edited in **Author mode** creates a link to the dragged file (a `<topicref>` element, `<chapter>`, `<part>`, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a *DITA map* is opened in **Author mode**, you can click the ⬇️ icon to the left of a topic to open that particular topic in the editor.

**Tip:** For information about customizing **Author mode** actions for a particular *framework* (on page 2135) (document type), see the Customizing the Editing Experience for a Framework (on page 1552) section.

Related Information:

**Working with DITA Topics**

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

**Information Types**

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

**Text Structure**

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `<p>`, `<ol>`, and `<simpletable>`. The **DITA markup** specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

**Semantic Structure**

Semantic structure is structure that shows the meaning of things. For example:

- A `<task>` element specifies that a block of content contains the description of a task.
- A `<codeblock>` element specifies that a block of text consists of programming code.
- A `<uicontrol>` element specifies that a word is the name of a control in a computer GUI.
• The @platform profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

**Document Semantics**

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

**Subject Matter Semantics**

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (<wintitle>), or to mark a piece of text as applying only to a particular product.

**Audience Semantics**

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an <audience> element to capture audience metadata.

**Creating Topic Structures**

Oxygen XML Editor Eclipse plugin provides a number of tools to help you create topic structures:

• **Content Completion Assistant (on page 2133)** - Shows you which elements can be created at the current position.
• **Model view (on page 278)** - Shows you the complete structure supported by the current element.
• **Outline view (on page 273)** - Shows you the current structure of your document.
• **DITA toolbar** - Helps you to easily insert many common structures.

**Related Information:**

• **Getting Started with DITA (on page 1870)**
• **DITA Topics Document Type (Framework) (on page 892)**
Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- **Topic** - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- **Task** - For procedural information such as how to use a dialog box.
- **Concept** - For general, conceptual information such as a description of a product or feature.
- **Reference** - For reference information.

Oxygen XML Editor Eclipse plugin also supports numerous other specialized topic types that you will find templates for in the various folders in the **New DITA file dialog box (on page 1937)**. They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and **DITA map (on page 2134)** types such as Glossentry, Troubleshooting, Bookmap (on page 2132), and Subject Scheme Map (on page 2139).

To create a new DITA topic and add a reference to it in your **DITA map (on page 2134)**, follow these steps:

1. In the **DITA Maps Manager (on page 1877)**, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box (on page 1937)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box (on page 1937)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box (on page 1937)** that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Note:** The value of the root ID is generated taking the **Use the file name as the value of the root ID attribute** option from the **DITA > New topics preferences page (on page 58)** into account. When the option is deselected, a unique ID is generated.

**Step Result:** The new topic is now referenced (as a `<topicref>`) in the **DITA map** at the location where you inserted it and the new topic is opened in the editor.

3. Save the **DITA map**.
New DITA File Dialog Box

The New DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

Figure 550. New DITA File Dialog Box

Note: The templates that appear in this dialog box include all templates that have an associated .properties file and the type property is set to dita, as well as templates that do not have an associated properties file or the type property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates (on page 207).

The New DITA file dialog box includes the following features and options:

**Choose a file template**

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

Tip: You can use the text filter field at the top of the dialog box to search for a specific template.

**Title**

Depending on the selected file template, the value of the Title field is set in:

- The `<title>` element of a DITA topic file. The `<title>` element needs to be the first child of the root element.
- The `<glossterm>` element of a Glossentry file.
New Topics Preferences

Pressing this button opens the DITA New Topics preference page (on page 58)

Save as

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the Browse drop-down menu.

Create

When you click this button, a reference (<topicref>) to the new topic is added to the current DITA map and the new topic is opened in the editor.

Related Information:
- Getting Started with DITA (on page 1870)
- Adding Topics to a DITA Map (on page 1895)
- Working with Markdown Documents in DITA (on page 1992)
- Fast Create Multiple DITA Topics (on page 1938)

Fast Create Multiple DITA Topics

The DITA Maps Manager (on page 1877) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the DITA map (on page 2134). A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

Note: The Fast Create Topics feature works for the following types of local and remote resource protocols: file, http, https, ftp, ftsp.

To access this feature, right-click a node in the DITA Maps Manager where you want the new topics to be inserted and select Fast Create Topics. This opens the Fast Create Topics dialog box where you can configure the structure for the new topics.
Figure 551. Fast Create Topics Dialog Box

The **Fast Create Topics** dialog box includes the following features and options:

**Hierarchy Text Pane**

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (Tab or Space). Topic references will be created in the DITA map according to the hierarchy you enter in this section.

**File name generation rules**

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the **File name generation rules** link to configure the rules (on page 58) for how those file names will be generated.

**Tip:** If you have added a file name prefix or suffix to the properties file (on page 209) for DITA document templates, the generated file name will include that prefix or suffix.

**File name prefix**

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file (on page 209) for DITA document templates, the prefix you enter here will override the one from the properties file.

**File name suffix**

Use this option to add a specified suffix to the file name. If you have added a file name suffix to the properties file (on page 209) for DITA document templates, the suffix you enter here will override the one from the properties file.
Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file (on page 209) for DITA document templates, the suffix you enter here will override the one from the properties file.

**Topic type**

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the **Change** button to select a different type from a list of possible DITA templates.

**Tip:** You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types (on page 1943).

**Add created topic hierarchy relative to the selection as**

By default, the hierarchy of topics will be added to the **DITA map** as the **First Child** of the node where the action was invoked. You can change this to **Last Child**, **Preceding Sibling**, or **Following Sibling** if the selected node allows topics to be inserted as such.

**Create**

When you click **Create**, the specified hierarchy is added as topic references in the **DITA map**. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

**Tip:** You can easily change the order of the topics in the **DITA map** (on page 1895) at a later time.

**Related Information:**

- Adding Topics to a DITA Map (on page 1895)
- Converting DITA Topics to Another Type (on page 1943)

**Editing DITA Topics**

Oxygen XML Editor Eclipse plugin provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor Eclipse plugin provides for editing XML documents also apply to DITA topics. Oxygen XML Editor Eclipse plugin also provides extensive additional support specifically for DITA.

**Opening a DITA Topic**

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the **DITA Maps Manager** (on page 1877) (or right-click the topic and select **Open**).
- Double-click the file in the **Navigator view** (on page 221) (or right-click the file and select **Open**).
• If you have a DITA map (on page 2134) opened in the XML editor, you can click the icon to the left of the topic.
• Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an XML format (on page 6), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor Eclipse plugin provides a graphical view of your topics in Author mode (on page 197). Your topics will likely open in Author mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in Author mode, just click Author at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- Author mode is not a WYSIWYG view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor Eclipse plugin has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat Author mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. Author mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to Text mode (on page 196). You, or someone in your organization, can change how the Author view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. Author mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
- Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the Author view (though there are some exceptions) and cannot be edited directly in the Author view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press Alt+Enter to bring up the attribute editor. Alternatively, you can use the Attributes view (on page 344) to edit attributes.

Tip: You can select Hints from the Styles drop-down menu (available on the Author Styles toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1589) section.

Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differs from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they
mean, Oxygen XML Editor Eclipse plugin has a number of Content Completion Assistant (on page 2133) features.

- **The Enter key:** In Author mode, the Enter key does not create line breaks, it brings up the Content Completion Assistant to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element `<p>` in DITA) and tools insert the line breaks in the output and on-screen.

  **Figure 552. Content Completion Assistant**

  The Content Completion Assistant not only suggests new elements you can add. If you press Enter at the end of a block element (on page 2132) (such as a paragraph) it suggests creating a new element of the same type. If you press Enter in the middle of a block element, it suggests splitting that element into two elements.

  A useful consequence of this behavior is that you can create a new paragraph simply by hitting Enter twice (just as you might in a text editor).

  As you highlight an element name, a basic description of the element is displayed. Select the desired element and press Enter to create it.

  To wrap an element around an existing element or piece of text, simply select it and press Enter and use the Content Completion Assistant to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the Model view (on page 278) (Window > Show View > Model, if the view is not already open). The Model view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

  **Tip:** You can also select Inline actions from the Styles drop-down menu (available on the Author Styles toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles (on page 1589) section.

**DITA Editing Actions**

A variety of actions are available in the DITA framework (on page 2135) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the DITA menu, the DITA (Author Custom Actions) toolbar, or the Content Completion Assistant.

The DITA toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).
If the DITA toolbar is not displayed, right-click anywhere on the toolbar area, select Configure Toolbars, and select it from the displayed dialog box.

Note: The DITA toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press Enter to open the Content Completion Assistant.

Whenever the current document in the editor is a DITA document, the DITA menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA framework-specific actions (on page 1972), the contextual menu also includes various general Author mode contextual menu actions (on page 462).

- Getting Started with DITA (on page 1870)
- DITA Topic Author Mode Actions (on page 1972)

Converting DITA Topics to Another Type

Oxygen XML Editor Eclipse plugin includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

DITA Conversion Refactoring Operations for DITA

The following conversion operations are available:

**Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1877))**

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.

**Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 1877))**

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the DITA Maps Manager as the first child topics of the original topic.
Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Methods for Accessing the DITA Conversion Refactoring Operations

To access the conversion operations, use one of the following methods:

Single Document Method

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 1877)), go to the Refactoring submenu, and choose whichever operation is appropriate for your needs.

Multiple Documents At Once Method

Select XML Refactoring from the XML Tools menu (or from the Refactoring submenu when you right-click one or more documents in the Navigator view (on page 221)or the DITA Maps Manager view (on page 1877)). Then select whichever operation is appropriate for your needs.

XML Refactoring Wizard Dialog Box

When you select any of the operations, Oxygen XML Editor Eclipse plugin proceeds to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 1944), the wizard page allows you to choose a scope for the operation and some filtering options:
• **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, **Selected reference**, and others depending on the context.

• **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the **Single Document Method** (**on page 1944**), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

**Preview**

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

⚠️ **Warning**: It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

**Finish**

When you use the **Finish** button, behind the scenes Oxygen XML Editor Eclipse plugin maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

**Handling Special Characters When Generating New File Names**

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, Ä is changed to AE). If an ASCII equivalent does not exist, it will be replaced with an underline character (_). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

```
{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/utils/character-map.xsl
```

**Converting To and From DITA Specialization Document Types**

If you use your own **DITA specialization document type** (**on page 2116**), you can modify mappings for the predefined conversion operations to work with your specialization.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory (and its subdirectories):

```
{OXYGEN_INSTALL_DIR}/frameworks/dita/refactoring/.
```
Note: The stylesheets for converting entire files (from one type to another) are located in the `dita-files-conversion-stylesheets` folder. Each of these conversion operations has a stylesheet with the word `entrypoint` at the end of its name. Edit the appropriate `*-entrypoint.xsl` file (for example, to modify the Convert to Task operation, edit the `convert-resource-to-task-entrypoint.xsl` file).

2. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
   a. Modify the values of the declared `root-element`, `public-literal-target`, and `system-literal-target` variables to match your specialization's DTD information.
   b. Modify the value of the declared `schema-location` variable to match the location of your specialization's XML schema.
   c. Modify the value of the declared `xml-model-location` variable to match your Relax NG specialization.

3. For the Convert Nested Topics to New Topics and Convert Sections to New Topics operations, if your DITA specialization uses your own custom URN or DOCTYPE, you can replace the default mappings in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/utils/dita-formats.xsl` stylesheet with your own values for the `DOCTYPE` or `xml-model`.

4. If you want to change the name of the operation that will be displayed in Oxygen XML Editor Eclipse plugin, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory:
      `[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/` (for example, for the Convert to Task operation, it is `convertResource2Task.xml`).
   b. Edit that XML file and change the `name` attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).

5. Save your changes to all modified files.

6. Restart Oxygen XML Editor Eclipse plugin

**Result:** You should now see your changes when accessing the conversion operations (on page 1944).

Tip: You can also create your own customized refactoring operations. For more information, see Custom Refactoring Operations (on page 537).

## Working with Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

### Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:
1. Place the cursor in the position you want the graphic to be inserted.
2. Select the ‗Insert Image‘ action. The ‗Insert Image‘ dialog box appears.

![Insert Image Dialog Box](image)

3. Configure the options in this dialog box and click Insert.

The ‗Insert Image‘ dialog box includes the following options and features for inserting images into a DITA document:

**Location**

Use this option to specify a URL for the image as the value of an ‗@href‘ attribute inside the ‗<image>‘ element. You can type the URL of the image you want to insert or use browsing actions in the ‗Browse‘ drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a ‗@keyref‘ attribute inside the ‗<image>‘ element. All keys that are presented in the dialog box are gathered from the root map (on page 2138) of the current DITA map. You can use the Choose Key Reference button to open the Choose Key dialog box that presents the list of keys available in the selected root map.

Note: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the Change Root Map link in the Choose Key dialog box or change it in the Root map option in the toolbar of the DITA Maps Manager.

**Figure title**

Use this text box to insert a ‗<title>‘ and ‗<image>‘ element inside a ‗<fig>‘.

**Alternate text**
Use this text box to insert an `<alt>` element inside the `<image>`.

**Size**

Use this section to configure the **Width** and **Height** of the image, or **Scale** the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

**Layout**

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

**Preview**

The **Preview** box shows a thumbnail of the selected image so that you can see a preview of the image before clicking **Insert**.

**Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions**

You can drag images from your system explorer or the **Navigator view** (on page 221) and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```
<image href="../images/image_file.png"/>
```

**Tip:** To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor Eclipse plugin will automatically update the reference to the new image.

**Adding an Image in a Figure Element**

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.
3. Add an `<image>` element (on page 1946) to the `<fig>` element.

**Note:** The `<fig>` element has a number of other child elements that may be appropriate to your content. See the DITA documentation for complete information about `<fig>`.

**Note:** The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

**Floating Images in DITA Topics for PDF or XHTML Output**

Oxygen XML Editor Eclipse plugin provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `@outputclass` attribute on the `<image>` element. The possible values are:
• float-left
• float-right

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```dita
<p>
  <image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/>

  <b>Lilac</b> (<i>Syringa</i>) is a genus of about 20-25 species of flowering plants in the olive family (<i>Oleaceae</i>), native to Europe and Asia.
</p>
```

Figure 554. Image Floated to the Right

Searching for References to Images

You can search for all references to an image by selecting Search References from the contextual menu. The result depends on how the image is defined, as follows:

• If the action is invoked on an `<image>` element that contains an `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified `ID` are also reported.

• If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified `ID` are also reported.

Related Information:

• Image Maps in DITA (on page 1953)

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in Author mode and in all HTML5-based outputs.

There is a toolbar button (鼫) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the Navigator view (on page 221) and drop them into your documents (or copy and paste them).
Table 47. Supported Media Types

</table>

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the Insert Media Resource action from the toolbar. The Insert Media dialog box appears.

Note: You can also drag media files from your system explorer or the Navigator view (on page 221) and drop them into your documents (or copy and paste them). Note that this method will bypass the Insert Media dialog box, so if you need to adjust the size you will need to adjust the @width or @height attributes manually.
3. Configure the options in this dialog box and click **Insert**.

The **Insert Media** dialog box includes the following options:

**Location**

Use this option to specify a URL for the media resource as the value of a `@data` attribute inside the `<object>` element. You can type the URL of the resource you want to insert or use browsing actions in the **Browse** drop-down menu (there is also a history drop-down).

**Key**

Use this option to insert the selected key as the value of a `@datakeyref` attribute inside the `<object>` element. All keys that are presented in the dialog box are gathered from the root map (on page 2138) of the current DITA map. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected root map.

**Note:** If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong root map. You can change the root map by using the **Change Root Map** link in the **Choose Key** dialog box or change it in the **Root map** option in the toolbar of the DITA Maps Manager.

**Type**

Oxygen XML Editor Eclipse plugin detects and automatically selects the media type based upon the specified resource in the **URL field** (on page 1951). You can manually change the type, but keep in mind that in the publishing stage the **object element is converted to an HTML5 element** (on page 1952) based upon the type selected here. You can choose between: **audio**, **video**, or **iframe**.

**Size**
Use this section to configure the **Width** and **Height** of the frame for the media resource. Specifying a value in these options inserts a [@width] and [@height] attribute, respectively. For audio clips, only the **Width** can be adjusted.

**Result in Author Mode:** A reference to the specified video, audio, or embedded HTML frame is inserted in an `<object>` element and it is rendered in Author mode so that it can be played directly from there.

⚠️ **Attention:**

- On Mac OS X, if you receive a **Blocked Plug-in** error message, you need to update your *Flash Player* to the latest version.
- On Ubuntu 17.10, if you receive an error when trying to play videos in Author mode, you need to install the *libavformat57* library.

**Result in Output:** In the publishing stage, the `<object>` element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The `<object>` element is converted to an HTML5 `<video>` element.
- **Audio Clips** - The `<object>` element is converted to an HTML5 `<audio>` element.
- **Embedded HTML Frames** - The `<object>` element is converted to an HTML5 `<iframe>` element.

**Tip:** There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select *Copy embed code*), you can then paste the contents of the clipboard in the **URL** field (on page 1951) and the **Type** (on page 1951) will automatically be set on iframe, while the **Width** and **Height** (on page 1951) will be populated according to the detected size, and an **allowfullscreen** parameter will automatically be added (set the value of this parameter to **true** to allow videos to play in full screen mode once the document is converted to XHTML output).

**Inserting Media in HTML Outputs That Do Not Support Embedded Media**

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor Eclipse plugin provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. **Edit the DITA transformation scenario** (on page 2059) for the output type that does not support embedded objects (for example, DITA Map CHM).
2. Go to the **Parameters** tab (on page 2065) and click the **New** button to add a new parameter.
3. For the **Name**, enter: *com.oxygenxml.xhtml.linkToMediaResources*.
4. For the **Value**, enter: **true**.
5. Click **OK** and continue on to run the transformation.

**Result:** The media object will appear in the output as a plain link instead of an embedded object.
Image Maps in DITA

Oxygen XML Editor Eclipse plugin includes support for image maps in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual Author editing mode includes an Image Map Editor that helps you to easily create and configure image maps.

![Image Map Editor in DITA](image)

**Image Map Editor Interface in DITA**

The interface of the Image Map Editor consists of the following sections and actions:

**Toolbar**

- **New Rectangle**
  
  Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

**New Polygon**

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

**New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

**Duplicate**

Use this button to create a duplicate of the currently selected shape.

**Delete**

Use this button to delete the currently selected shape.

**Undo**

Use this button to undo the last action.

**Redo**

Use this button to redo the last action that was undone.

**Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

**Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

**Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

**Send Shape Backward**

Use this button to send the currently selected shape back one layer.

**Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.
• **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

🔍🔍🔍 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

**Image Pane**

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

**Mouse Controls and Keyboard Shortcuts**

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the `Ctrl` key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down `Shift` while using the arrow keys to move the shape further or `Alt` to move it 1 pixel at a time.
- To zoom in or out, you can use the `NumPad +` or `NumPad -` keys respectively. Use `Ctrl + NumPad 0` to reset the zoom level to its default value.
- You can use `Ctrl + Z` to undo an action or `Ctrl + Y` to redo the last action that was undone.

**Contextual Menu Actions Available in the Image Pane**

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

**Add Point**

Adds a point to *Polygon* or *Free Form* shapes.

**Remove Point**

Removes the current point from *Polygon* or *Free Form* shapes.

**Duplicate**

Create a duplicate of the currently selected shape.

**Delete**

Delete the currently selected shape.

**New Rectangle**
Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

- **New Circle**
  Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

- **New Polygon**
  Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

- **Undo**
  Use this action to undo the last action.

- **Redo**
  Use this action to redo the last action that was undone.

**Shape Table**
The table at the right of the Image Pane is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the Image Pane.

**Properties**

- **Type**
  Displays information about the selected coordinate.

- **Target**
  Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the Link drop-down menu to the right of the text field. You can choose between the following types of links: Cross Reference, File Reference, or Web Link. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA (on page 2035) by using the identical Link drop-down menu from the main toolbar. When you click OK to finalize your changes in the Image Map Editor, an `&lt;xref&gt;` element will be inserted with either an `@href` attribute or a `@keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor Eclipse plugin (on page 2035).

**Description**
You can enter an optional description for the selected area (shape) that will be
displayed in the Image Map Details section (on page 1957) in Author mode and as
a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA
To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select Image Map Editor.
   
   **Step Result:** This action will apply an image map to the current image and open the Image Map Editor
dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (New Rectangle, New Circle, or
   New Polygon).

3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size
   or form. You can use the other buttons on the toolbar (on page 1953) to adjust its layer and color, or to
   perform other editing actions.

   **Tip:** You can right-click any of the points, shapes, or anywhere in the Image Pane to access various
   helpful contextual menu actions (on page 1955). For example, the easiest way to remove a point is to
   right-click the point and select Remove Point.

4. With the shape selected, use one of the linking options (on page 1956) in the Link drop-down menu
to select a target resource (or enter its path in the Target (on page 1956) text field).

5. (Optional) Enter a Description (on page 1956) for the selected area (shape).

6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate
   steps.

7. When you are finished creating hyperlinks, click OK to process your changes.

**Result:** The image map is applied on the image and the appropriate elements and attributes are automatically
added. In Author mode, the image map is now rendered over the image. If the image includes an <alt>
element, its value will be displayed under the image. The following two buttons will also now be available
under the image in Author mode:

- **Image Map Editor** - Click this button to open the Image Map Editor.

- **Image Map Details** - Click this button to expand a section that displays the details of the image map and
  allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change
  the shape in this section, you also need to add or remove coordinates to match the requirements of the
  new shape.
How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select Image Map Editor.
- Click the Image Map Editor button below the image.

All three methods open the Image Map Editor where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the Text editing mode.

You can also click the Image Map Details button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the Image Map Editor, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the Show/Hide Numbers button on the Image Map Editor toolbar (on page 1953)). To change the layer order for a shape, use the layer buttons on the Image Map Editor toolbar (on page 1953) (↑, ↓, ⇕, ⇕). If you insert a shape and all of its coordinates are completely inside another shape, the Image Map Editor will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Related Information:
- DITA ’imagemap’ Element Specifications
- Working with Images in DITA Topics (on page 1946)

Adding Tables in DITA Topics

You can use the Insert Table action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:
• **DITA Simple table model** *(on page 1959)* - This is the most commonly used model for basic tables.

• **CALS table model (OASIS Exchange Table Model)** *(on page 1960)* - This is used for more advanced functionality.

• **DITA Choice table model** *(on page 1963)* - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.

• **DITA Properties table model** *(on page 1964)* - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor Eclipse plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

### Inserting a Simple Table Model

To insert a **Simple** DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table Model.

#### Figure 558. Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the **Simple** table model:

**Title**

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

⚠️ **Note:** The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

**Inserting a CALS Table Model (OASIS Exchange Table)**

To insert an OASIS Exchange Table (CALS), select the **Insert Table** action on the toolbar or from the contextual menu (or the Table submenu from the DITA menu). The Insert Table dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the Simple model.
Figure 559. Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the CALS table model:

**Title**
If this checkbox is selected, you can specify a title for your table in the adjacent text box.

**Table Size**
Allows you to choose the number of **Rows** and **Columns** for the table.

**Generate table header**
If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Column widths**
Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @colwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @colwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @colwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width (@colwidth attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the colspecs (column specifications) section above the table or in Text.
mode. The following units are allowed: pt (points), cm (centimeters), mm (millimeters), pi (picas), in (inches).

Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- none - No border will be added.
- all - A border will be added to all frames.
- top - A border will be added to the top frame.
- topbot - A border will be added to the top and bottom frames.
- bottom - A border will be added to the bottom frame.
- sides - A border will be added to the side frames.
- -dita-use-conref-target - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row separator

Specifies whether or not to include row separators (@rowsep attribute). The allowed values are:

- 0 (no separator) and 1 (include separators).

Column separator

Specifies whether or not to include column separators (@colsep attribute). The allowed values are:

- 0 (no separator) and 1 (include separators).

Alignment

Specifies the alignment of the text within the table (@align attribute). The allowed values are:

- left - Aligns the text to a left position.
- right - Aligns the text to a right position.
- center - Aligns the text to a centered position.
- justify - Stretches the line of text so that it has equal width.

Note: The justify value cannot be rendered in Author mode, so you will only see it in the output.

- char - Aligns text to the leftmost occurrence of the value specified on the @char attribute for alignment.
- -dita-use-conref-target - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.
Note: The options in the Insert Table dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click Insert, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the colspecs (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the Author mode (on page 197), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 560. CALS Table in DITA

Inserting a Choice Table Model

To insert a Choice table within a <step> element in a DITA Task document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select choicetable from the Content Completion Assistant (on page 2133). The Insert Table dialog box appears. Select Simple for the table Model.

Figure 561. Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a Choice table model within a DITA Task:

Table Size

   Allows you to choose the number of Rows and Columns for the table.

Generate table header

   If selected, an extra row will be inserted at the top of the table to be used as the table header.
Column widths

Allows you to specify the type of properties for column widths (@colwidth attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a @relcolwidth attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, relcolwidth="1* 2* 3*" causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in Author mode, the values of the @relcolwidth attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the @relcolwidth attribute is 1*.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in Author mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click Insert, a Choice table is inserted into your DITA Task document at the current cursor position (within a <step> element).

Inserting a Properties Table Model

To insert a Properties table within a <refbody> element in a DITA Reference document, select the Insert Table action on the toolbar or in the Insert submenu from the contextual menu (or the Table submenu from the DITA menu), or select properties(wizard) from the Content Completion Assistant (on page 2133). The Insert Table dialog box appears. Select Properties for the table Model.
Figure 562. Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a Properties table model within a DITA Reference:

**Table Size**

Allows you to choose the number of Rows and Columns for the table.

**Generate table header**

If selected, an extra row will be inserted at the top of the table to be used as the table header.

**Frame**

Allows you to specify a value for the @frame attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **@dita-use-conref-target** - Normally, when using a @conref, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the @conref target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

When you click Insert, a Properties table is inserted into your DITA Reference document at the current cursor position (within a `<refbody>` element).
Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the Attributes view (on page 344) (Window > Show View > Attributes). See the DITA documentation for a full explanation of these attributes.

You can also use the Table Properties (Ctrl + T (Command + T on OS X)) (on page 1968) action from the toolbar or contextual menu (or DITA menu) to modify many of the properties of the table (on page 1968).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to Text mode (on page 196).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor Eclipse plugin includes a Smart Paste feature (on page 330) that preserves certain style and structure information when pasting content.

Tip: When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:

- Editing Tables in Author Mode (on page 391)

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- CALS table model (on page 1966)
- Simple table model (on page 1967)
- Choice table model (on page 1967)
- Properties table model (on page 1967)

CALS Table Model Layout

The CALS table model allows for more flexibility and table customization than other models. When choosing a CALS table model from the Insert Table dialog box, you have access to more configurable properties. The layout of a CALS table includes a colspecs section that allows you to easily configure some properties without opening the Table Properties dialog box. For example, you can change the value of column widths (@colwidth attribute) or the text alignment (@align attribute). Although they appear as part of the Author mode (on page 197), the colspecs link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.
Simple Table Model Layout

When choosing a Simple table model from the Insert Table dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Choice Table Model Layout

A Choice table model is used within a <step> element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The <choicetable> element is a useful device for documenting options within a single step of a task. You can insert Choice tables in DITA Task documents either by selecting choicetable from the Content Completion Assistant (on page 2133) (within a <step> element) or by using the Insert Table action on the toolbar or from the contextual menu). The options and layout of a Choice table is similar to the Simple table model.

Properties Table Model Layout

A Properties table model is used within a <refbody> element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert Properties tables in DITA Reference
documents either by selecting properties(wizard) from the Content Completion Assistant (on page 2133) (within a `<refbody>` element) or by using the Insert Table action on the toolbar (or from the contextual menu) and selecting Properties for the Model. The layout of a Properties table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 566. DITA Properties Table

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Property Value</th>
<th>Property Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>B</td>
<td>C</td>
</tr>
</tbody>
</table>

Table Validation in DITA

Oxygen XML Editor Eclipse plugin reports table layout problems that are detected in manual or automatic validations. When you validate a DITA map (on page 2134) with the Validate and Check for Completeness action, if the Report table layout problems option is selected in the DITA Map Completeness Check dialog box (on page 1922), table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

**CALS Tables**

- A row has fewer cells than the number of columns detected from the table @cols attribute.
- A row has more cells than the number of columns detected from the table @cols attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table @cols attribute.
- The number of columns detected from the table @cols attribute is different than the number of columns detected in the table structure.
- The value of the @cols, @rowsep, or @colsep attributes are not numeric.
- The @namestart, @nameend, or @colname attributes point to an incorrect column name.

**Simple or Choice Tables**

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the Table Properties (Ctrl + T (Command + T on OS X)) action from the toolbar or the Table submenu of the contextual menu (or DITA menu). This opens the Table properties dialog box.

The Table properties dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note: Some properties allow the following special values, depending on the context and the current properties or values:
• `<not set>` - Use this value if you want to remove a property.
• `<preserve>` - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

**Edit Table Properties for a CALS Table Model**

For a CALS table model, the **Table properties** dialog box includes four tabs of options:

• **Table** tab - The options in this tab apply to the entire table.
• **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
• **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
• **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in the four tabs include a **Preview** pane that shows a representation of the modification.

![Figure 567. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)](image)

The options in the four tabs include the following:

**Horizontal alignment (Available in the Table, Column, and Cell tabs)**

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

• **left** - Aligns the text to a left position.
• **right** - Aligns the text to a right position.
• **center** - Aligns the text to a centered position.
• **justify** - Stretches the line of text so that it has equal width.

**Note:** The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

• **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

• **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

### Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`@valign` attribute). The allowed values are as follows:

• **top** - Aligns the text at the top of the cell.
• **middle** - Aligns the text in a vertically centered position.
• **bottom** - Aligns the text at the bottom of the cell.

• **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see [https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html](https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html).

### Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `@colsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `@rowsep` attribute. The allowed values are: 0 (no separator) and 1 (include separators).

### Frame (Available only in the Table tab)

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

• **none** - No border will be added.
• **all** - A border will be added to all frames.
• **top** - A border will be added to the top frame.
• **topbot** - A border will be added to the top and bottom frames.
• **bottom** - A border will be added to the bottom frame.
• **sides** - A border will be added to the side frames.

• **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the
value of this particular attribute from the `<conref>` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a Simple, Choice, Properties table model, the Table properties dialog box only allows you to edit a few options.

**Table tab**

**Frame**

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `<conref>` target, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `<conref>` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

**Row tab (not available for Properties tables)**

**Row type**

Allows you to change the row to a body or header type of row.

Related Information:

- Adding Tables in DITA Topics (on page 1958)
- Editing Tables in Author Mode (on page 391)

Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document using one of the following methods:

- Embed MathML directly into a DITA topic. You can use **Insert > Σ Insert Equation** from the contextual menu to insert a MathML equation. Clicking on the equation will open a MathML Editor where you can edit the code.
- Reference an external MathML file as an image, using the **Insert Image** action that is available on the DITA toolbar (or from the **DITA > Insert** menu).
Publishing Notes:

- MathML equations contained in DITA topics can be published out-of-the-box in PDF using the DITA PDF transformation scenario.
- The DITA Map PDF - based on HTML5 & CSS transformation scenario (on page 1264) support MathML equations (on page 1397).
- For details about HTML output, see MathML Equations in HTML Output (on page 454).
- For other publishing formats, you might need to employ additional customizations for handling MathML content.

Adding LaTeX Equations in DITA Topics

LaTeX is a high-quality typesetting system that includes features designed for the production of technical and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format. By default, web browsers and PDF readers do not have support to show mathematical equations written in LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.

Adding support for writing LaTeX equations in a DITA topic implies three stages:

1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD specialization and add a new element (for example, called `<latex>` and it extends the DITA `<foreign>` element). Alternatively, you can directly use the DITA `<foreign>` element with a specific `@outputclass` attribute value:

   ```xml
   <!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
   <topic id="testEquation">
     <title>Test equation</title>
     <body>
       <p><foreign outputclass="embed-latex">L' = \sqrt{1-\frac{v^2}{c^2}}</foreign></p>
     </body>
   </topic>
   ```

2. If you want Oxygen XML Editor Eclipse plugin to properly present the LaTeX equation when editing in the Author visual mode, you need a plugin that converts the equation content to an image. There is a sample plugin that does that here: https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support. You can download and copy the plugin folder `latex-images-support` to the Oxygen XML Editor Eclipse plugin `plugins` folder, then restart Oxygen XML Editor Eclipse plugin.

3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: https://github.com/oxygenxml/dita-latex.

DITA Topic Author Mode Actions

A variety of actions are available for DITA documents that can be found in DITA menu, toolbar, contextual menu, and the Content Completion Assistant (on page 2133).
DITA Toolbar Actions

The following default actions are available on the DITA toolbar when editing in Author mode (by default, most of them are also available in the DITA menu and in various submenus of the contextual menu):

- **Bold**
  Surrounds the selected text with a `<b>` tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

- **Link Actions Drop-Down Menu**

  The following link actions are available from this menu:

  - **Cross Reference**
    Opens the Cross Reference (xref) dialog box (on page 2035) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2134) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2035).

  - **File Reference**
    Opens the File Reference dialog box (on page 2036) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2035).

  - **Web Link**
    Opens the Web Link dialog box (on page 2036) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2035).

  - **Related Link to Topic**
    Opens the Cross Reference (xref) dialog box (on page 2036) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been
selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2035).

**Tip:** You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements.

**Related Link to File**

Opens the File Reference dialog box (on page 2036) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2035).

**Related Link to Web Page**

Opens the Web Link dialog box (on page 2037) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2035).

**Insert Image**

Opens the Insert Image dialog box (on page 1946) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

**Insert Media Resource**

Opens the Insert Media dialog box (on page 1949) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an <object> element and it is rendered in Author mode so that it can be played directly from there.

**Insert Section Drop-Down Menu**

The following insert actions are available from this menu:

**Insert Section**

Inserts a new <section> element in the document, depending on the current context.

**Insert Concept**
Inserts a new `<concept>` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

**Insert Task**

Inserts a new `<task>` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

**Insert Topic**

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Reference**

Inserts a new `<reference>` element, depending on the current context. A reference is a top-level container for a reference topic.

**Insert Paragraph**

Inserts a new paragraph at current cursor position.

**Reuse Content**

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2010) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (`@conref`) (on page 2011), content key references (`@conkeyref`) (on page 2013), or key references to metadata (`@keyref`) (on page 2016).

**Insert step or list item**

Inserts a new list or step item in the current list type.

**Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

**Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

**Sort**

Sorts cells or list items in a table.

**Insert Table**
Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

**Insert Row**
Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**
Deletes the table row located at cursor position or multiple rows in a selection.

**Insert Column**
Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**
Deletes the table column located at cursor position or multiple columns in a selection.

**Table Properties**
Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**
Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**
Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

**DITA Contextual Menu Actions**
The following actions are available in the contextual menu when editing in Author mode (most of them are also available in the DITA menu at the top of the interface):

**Edit Attributes**
Displays an in-place attributes editor that allows you to manage the attributes of an element.

**Edit Profiling Attributes**
Allows you to change the profiling attributes (on page 378) defined on all selected elements.

**Cut (Ctrl + X (Command + X on OS X))**

Removes the current selected content from the document and places it in the clipboard.

**Copy (Ctrl + C (Command + C on OS X))**

Places a copy of the current selected content in the clipboard.

**Paste (Ctrl + V (Command + V on OS X))**

Inserts the current clipboard content into the document at the cursor position.

**Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA framework:

**Paste as content reference**

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

**Paste as content key reference**

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from DITA maps (on page 2134). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 1881) points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Paste as link**

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

**Paste as link (keyref)**

Inserts a link to the element that you want to reference. To use this action, you must first do the following:
1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.

2. In the DITA Maps Manager view, make sure that the Root map combo box (on page 1881) points to the correct map that stores the keys.

3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager, select Edit Properties, and enter a value in the Keys field.

**Insert submenu**

This submenu includes the following insert actions that are specific to the DITA framework:

- **Insert Table**
  
  Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a block element (on page 2132)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

  **Note:** If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that Only lists, paragraphs, or inline content can be converted to tables.

- **Insert Image**
  
  Inserts an image reference (on page 423) at the cursor position. Depending on the current location, an image-type element is inserted.

- **Insert Media Resource**
  
  Opens a Choose Media dialog box (on page 451) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in Author mode so that it can be played directly from there.

- **Insert Equation**
  
  Opens the XML Fragment Editor that allows you to insert and edit MathML notations (on page 453).

- **Insert Paragraph**
  
  Inserts a new paragraph at current cursor position.

- **Insert Section**
Inserts a new `<section>` element in the document, depending on the current context.

**Insert Topic**

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

**Insert Entity**

Allows you to insert a predefined entity or character entity. Surrogate character entities (range `#x10000` to `#x10FFFF`) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. `#65`
- `&#<decimal value>` - e.g. `&#65`
- `#x<hexadecimal value>` - e.g. `#x41`
- `&#x<hexadecimal value>` - e.g. `&#x41`

**Style submenu**

This submenu includes the following text styling actions:

- **Bold**
  
  Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

- **Italic**
  
  Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

- **Underline**
  
  Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

- **Subscript**
  
  Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

- **Superscript**
  
  Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

**Image Map Editor**

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the *Image*
**Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

**Table Actions**

The following table editing actions are available in the contextual menu when it is invoked on a table:

- **Insert Rows**
  
  Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (Above or Below the current row).

- **Delete Row(s)**
  
  Deletes the table row located at cursor position or multiple rows in a selection.

- **Insert Columns**
  
  Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (Above or Below the current column).

- **Delete Column(s)**
  
  Deletes the table column located at cursor position or multiple columns in a selection.

- **Join Cells**
  
  Joins the content of the selected cells (both horizontally and vertically).

- **Split Cell**
  
  Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

- **Sort**
  
  Sorts cells or list items in a table.

- **Table Properties**
  
  Opens the Table properties dialog box that allows you to configure properties of a table (such as frame borders).

**Other Actions submenu**

This submenu give you access to all the usual contextual menu actions.

- **Link submenu**

The following link actions are available from this submenu:

- **Cross Reference**
  
  Opens the Cross Reference (xref) dialog box (on page 2035) that allows you to insert a link to a target DITA resource at the current location within a document.
The target resource can be the location of a file or a key that is already defined in your DITA map (on page 2134) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics (on page 2035).

**File Reference**

Opens the File Reference dialog box (on page 2036) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2035).

**Web Link**

Opens the Web Link dialog box (on page 2036) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. For more information, see Linking in DITA Topics (on page 2035).

**Related Link to Topic**

Opens the Cross Reference (xref) dialog box (on page 2036) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2035).

**Related Link to File**

Opens the File Reference dialog box (on page 2036) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2035).

**Related Link to Web Page**

Opens the Web Link dialog box (on page 2037) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your
Oxygen XML Editor Eclipse Plugin 22.0 | 21 - DITA Authoring | 1982

DITA map structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics (on page 2035).

Sort

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the ID Options dialog box that are found in the current selection.

Note: The Generate IDs action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

- **Reuse Content**

  This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2010) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references ( @conref ) (on page 2011), content key references ( @conkeyref ) (on page 2013), or key references to metadata ( @keyref ) (on page 2016).

- **Push Current Element**

  Opens the Push current element dialog box (on page 2018) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

- **Edit Content Reference**

  This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details ( @conref / @conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2010).

- **Replace Reference with Content**

  Replaces the referenced fragment ( @conref or @conkeyref ) at the cursor position with its content from its source. This action is useful if you want to make changes
to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component (on page 2021).

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component (on page 2022).

**Search References** (Ctrl + Shift + G (Command + Shift + G on OS X))

Finds the references to the @id attribute value for the element at the current cursor position, in all the topics contained in the current DITA map (on page 2134) (opened in the DITA Maps...
Manager view (on page 1877)). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

![Figure 568. Search References to Ancestors Dialog Box](image)

Tip: If you are invoking the action on an image, see Searching for References to Images (on page 1949) for details about what will be reported.

Find Similar Topics

Opens the Open/Find Resource view and performs a search using text content from the <title>, <shortdesc>, <keyword>, and <indexterm> elements. It is helpful for quickly finding related topics that can be added as related links.

Show Key Definition

Available for elements that have a @conkeyref or @keyref attribute set (or elements with an ancestor element that has a @conkeyref or @keyref attribute). It computes the key name and opens the DITA map (on page 2134) that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the DITA Style Guide Best Practices for Authors in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the About Element sub-menu), in the DITA menu, and in some of the documentation tips that are displayed by the Content Completion Assistant (on page 2133).

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element
Selects the entire element at the current cursor position.

**Content**

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

**Parent**

Selects the entire parent element at the current cursor position.

**Text submenu**

This submenu contains the following actions:

**To Lower Case**

Converts the selected content to lower case characters.

**To Upper Case**

Converts the selected content to upper case characters.

**Capitalize Sentences**

Converts to upper case the first character of every selected sentence.

**Capitalize Words**

Converts to upper case the first character of every selected word.

**Count Words**

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:** The content marked as deleted with change tracking (on page 2139) is ignored when counting words.

**Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on OS X))**

Converts a sequence of hexadecimal characters to the corresponding Unicode character (on page 248). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to E
- 0X0125 to #
- 265 to #
- 2190 to ←
Note: For more information about finding the hexadecimal value of a character, see Finding the Decimal, Hexadecimal, or Character Entity Equivalent (on page 250).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

**Toggle Comment**
Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

**Move Up (Alt + UpArrow)**
Moves the current node or selected nodes in front of the previous node.

**Move Down (Alt + DownArrow)**
Moves the current node or selected nodes after the subsequent node.

**Split Element**
Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

**Join Elements**
Joins two adjacent block elements (on page 2132) that have the same name. The action is available only when the cursor position is between the two adjacent block elements. Also, joining two block elements can be done by pressing the Delete or Backspace keys and the cursor is positioned between the boundaries of these two elements.

**Surround with Tags (Alt + Shift + E)**
Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 87) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 87) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

**Surround with [tag]** (Alt + Shift + ForwardSlash)
Surround the selected content with the last tag used.

**Rename Element**
The element from the cursor position, and any elements with the same name, can be renamed according with the options from the Rename dialog box.

**Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the Delete or Backspace keys.

**Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

**DITA Refactoring Actions**

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

**Change Topic ID to File Name**

Use this operation to change the ID of a topic to be the same as its file name.

**Convert CALS Tables to Simple Tables**

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert conrefs to conkeyrefs**

Use this operation to convert @conref attributes to @conkeyref attributes.

**Convert Simple Tables to CALS Tables**

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

**Convert to Concept**

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).
Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA General Task is a less restrictive alternative to the Strict Task information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.
Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:
**Track Changes**

Enables or disables the Track Changes (on page 2139) support for the current document.

**Accept Change(s) and Move to Next**

Accepts the Tracked Change (on page 2139) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is accepted.

**Accept All Changes**

Accepts all Tracked Changes (on page 2139) in the current document.

**Reject Change(s) and Move to Next**

Rejects the Tracked Change (on page 2139) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a deletion or insertion change, only the selected content is rejected.

**Reject All Changes**

Rejects all Tracked Changes (on page 2139) in the current document.

**Comment Change**

Opens a dialog box that allows you to add a comment to an existing Tracked Change (on page 2139). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

**Highlight**

Enables the highlighting tool that allows you to mark text in your document.

**Colors**

Allows you to select the color for highlighting text.

**Stop highlighting**

Use this action to deactivate the highlighting tool.

**Remove highlight(s)**

Use this action to remove highlighting from the document.

**Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who
inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the Review view (on page 374).

Manage IDs submenu

This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the Rename XML ID dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the Select the scope for the Search and Refactor operations (on page 517) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the Select the scope for the Search and Refactor operations (on page 517).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))
Unfolds all elements in the current document.

**Inspect Styles**

Opens the [CSS Inspector view](on page 353) that allows you to examine the CSS rules that match the currently selected element.

**Options**

Opens the [Author mode preferences page](on page 94) where you can configure various options with regard to the Author editing mode.

**DITA Drag/Drop (or Copy/Paste) Actions**

Dragging a file from the [Navigator view](on page 221) or [DITA Maps Manager view](on page 1877) and dropping it into a DITA document that is edited in Author mode, creates a link to the dragged file (the `<xref>` DITA element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the [Navigator view](on page 221) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `<image>` element with an `@href` attribute).

**Tip:** For information about customizing Author mode actions for a particular framework (on page 2135) (document type), see the [Customizing the Editing Experience for a Framework](on page 1552) section.

**Related Information:**

- [Customizing the Editing Experience for a Framework](on page 1552)

---

**Working with Markdown Documents in DITA**

Oxygen XML Editor Eclipse plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the DITA tab in the Preview pane provides a visualization of how the DITA topic will look after conversion. Likewise, the XDITA tab in the Preview pane provides a visualization of how a Lightweight DITA topic will look after conversion. Keys that are defined in the root map are also resolved in the Preview pane.

**Export Markdown as a DITA Topic**

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The [Export as DITA Topic](on page 13) action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the Text editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.
Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor Eclipse plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the DITA Maps Manager (on page 1877). The following features are available for Markdown documents in the DITA Maps Manager view:

- **Insert Reference to Markdown Document** - You can use the New, Reference, and Reference to the currently edited file actions from the Append Child, Insert Before, or Insert After submenu when invoking the contextual menu in the DITA Maps Manager to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (topicref element) with the format attribute set to markdown.

- **Validate Markdown Documents in DITA Maps** - When you use the Validate and Check for Completeness action from the DITA Maps Manager toolbar to check the integrity of the structure of a DITA map, Markdown documents that are referenced in the DITA map will be converted to DITA topics in the background and validated the same as any other DITA topic.

- **Transforming DITA Maps with Markdown Documents** - When transforming DITA maps that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.

- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the DITA Maps Manager and select Refactoring > Convert Markdown to DITA Topic. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

![Convert Markdown to DITA Topic Dialog Box](image)

This dialog box includes the following options:

**Destination**

The destination path for the new DITA topic.

**File Name**

Presents the current name and allows you to change it.

**Update references**
Select this option to update all references of the file in the DITA map and in the files referenced from the DITA map.

Delete Markdown file
If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

Preview
Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.

Convert
Select this button to perform the conversion. If the Markdown file has format="markdown", it will be converted to a DITA topic. If it has format="mdita", it will be converted to a LightWeight DITA topic.

Tip: Oxygen XML Editor Eclipse plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the Navigator view (on page 221), open the sample.xpr project, and navigate to the dita/markdown-dita folder.

- Markdown DITA Syntax Reference

Working with Keys in DITA
DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.
Defining Keys in DITA Maps

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the main (root) map (on page 2138). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a `<keyword>`. To define this type of key, follow these instructions: [Key Definition with a Keyword Value](on page 1909).
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: [Key Definition with a Target](on page 1910).

Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see [Working with Variable Text in DITA](on page 2022).

Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the `<topicref>` element:

```xml
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the `<topicref>` element in its DITA map (on page 2134)) is to use the Keys tab in the Edit Properties dialog box (on page 1912). In the DITA Maps Manager (on page 1877), invoke the contextual menu on the topic that will have the key assigned and select Edit Properties. Go to the Keys tab and enter the name of the key in the Define keys field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link (on page 2035) to it using `<xref keyref="feature.quick-heat"/>`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic (on page 1895) by key: `<topicref keyref="feature.quick-heat"/>`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to insert a content reference (on page 2006). In this case, the content reference uses the key to locate the topic to pull content from. It uses a `@conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure"/>`. In this example, `feature.quick-heat` is the key, and `preheat-procedure` is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.
Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file (on page 1910)) and then insert the image using the key (on page 1946).

Example of a key definition for a targeted image file:

```xml
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="image1" href="../img/image1.png" format="png"/>
</map>
```

Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the main (root) map (on page 2138). The actual glossary terms are small glossary entry topics that are referenced in the glossary map. You can add links to the glossary terms (on page 1997) in the output and you can even define abbreviated forms (on page 1997) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Editor Eclipse plugin

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. Create a new submap (on page 1893) for your glossary and embed it in your main map.
2. Create a glossary entry topic (`<glossentry>`) for each glossary term. The `<glossentry>` element may contain numerous optional glossentry elements, but every glossentry topic must contain a `<glossterm>` and `<glossdef>` element. The `<glossterm>` is the name of the term while the `<glossdef>` is its definition.

Here is a simple example:

```xml
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>
```

The easiest way to create a glossentry topic in Oxygen XML Editor Eclipse plugin:
a. Click the New file wizard button on the toolbar.
b. Type glossentry in the search field at the top of the dialog box.
c. Select the Glossentry DITA topic type, configure the name and optionally the title, and click Create.

3. Reference each glossary entry topic in your glossary submap using the `<glossref>` element. This element requires a `@keys` attribute. Please make sure the `@print` attribute is set to `yes` to show the glossary also in the PDF output.

```
<glossref keys="gloss_ddl" href="ddl.dita" print="yes"/>
```

The easiest way to reference a glossentry in Oxygen XML Editor Eclipse plugin:

a. With the glossary entry topic opened in the main editor, open the glossary submap in the DITA Maps Manager, right-click the map node and select Append Child > Reference to the currently edited file (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select Insert After > Reference to the currently edited file).

**Step Result:** This opens the Insert Reference dialog box (on page 1900).
b. Go to the Keys tab and enter a name in the Define keys field.
c. Go to the Attributes tab and select Glossary Reference from the Reference type drop-down list at the top of the dialog box.
d. Click Insert and Close.

**Tip:** You could also group multiple glossentry topics into a single collection by using the `<glossgroup>` element.

**How to Create Links to Glossary Terms**

To specify that a link is generated in the output from the glossary term to its definition, use the `<term>` element (or `<abbreviated-form>` element as described in the next section (on page 1997)) with a `@keyref` attribute that references the corresponding key specified in the `<glossref>`. Of course, the glossref points to the glossentry topic where the glossary term is defined.

```
<term keyref="gloss_ddl"/>
```

In the output, the text specified in the `<glossterm>` element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a `<term>` element and reference the glossary term in Oxygen XML Editor Eclipse plugin:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the DITA Reusable Componts view (on page 2027), go to the Keys tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select Insert as Keyref > More > Term.

**Using Abbreviated Forms (Acronyms) with Glossary Terms**

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to
define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```
<abbreviated-form keyref="gloss_ddl"/>
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc.

### Related Information:

### Reusing DITA Content

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Editor Eclipse plugin provides support for each of these methods.

**Reusing Topics in DITA Maps**

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps (on page 2001).

**Reusing Content with References and Keys**

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (on page 2002) (conref, conkeyref, coderef). A conref (content reference) (on page 2004) creates a direct reference to a specific element of another topic. A conkeyref (content key
reference) (on page 2006) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a `conkeyref` is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A `coderef` references an external file that contains literal code.

Oxygen XML Editor Eclipse plugin provides support for all of these mechanisms.

While the `conref` and `conkeyref` mechanisms can be used to reference any content element, it is considered best practice to only `conref` or `conkeyref` content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by the reference. Oxygen XML Editor Eclipse plugin can help you create a reusable component from your current content.

**Reusing Content with Reusable Components**

DITA allows you to select content in a topic, create a reusable component (on page 2020) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

**Reusing Content with Variables**

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content (on page 2022), which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

**Reusing Content with DITA 1.3 Concepts**

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. **Key Scopes (or scoped keys) (on page 2024)** allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. **Branch Filtering (on page 2025)** allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

**DITA Reusable Components View**

If you use a large amount of keys or reusable components in your DITA project, the **DITA Reusable Components view (on page 2027)** can be quite helpful. It collects all of the keys and reusable components that are defined in the root map (on page 2138) and presents them in a dynamic table where you can easily locate and insert references to them.

**Reuse Actions in Oxygen XML Editor Eclipse plugin**

Oxygen XML Editor Eclipse plugin includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the **DITA menu**, and some are available on the toolbar.
Reuse Content

This action provides a mechanism for reusing content fragments. It opens the Reuse Content dialog box (on page 2010) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (@conref) (on page 2011), content key references (@conkeyref) (on page 2013), or key references to metadata (@keyref) (on page 2016).

Push Current Element

Opens the Push current element dialog box (on page 2018) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref / @conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2010).

Replace Reference with Content

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

Replace All References with Content

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an @href attribute, while the rest of the content for the keyref is replaced with its source content.
If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.

**Create Reusable Component**

Creates a reusable component from the selected fragment of text. For more information, see *Creating a Reusable Content Component (on page 2021).*

**Insert Reusable Component**

Inserts a reusable component at cursor location. For more information, see *Inserting a Reusable Content Component (on page 2022).*

**Related Information:**

## Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same map (on page 1897)) using one of the following procedures:

### Reuse Topics Using the DITA Maps Manager

1. Make sure the *DITA map (on page 2134)* is opened in the *DITA Maps Manager (on page 1877).*
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this *DITA map*, do one of the following:
      • Simply drag the topic and press Ctrl (or Alt on OS X) at the new location within the map (or use the Copy and Paste contextual menu actions).
      • If the topic is the current open document in the main editor, determine the new location in the map (in the *DITA Maps Manager (on page 1877)*), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
   b. If the topic already exists in another *DITA map*, do one of the following:
      • Open the other map in the *DITA Maps Manager (on page 1877)*, right-click the topic, select Copy, switch back to the original *DITA map* in the DITA Maps Manager, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
      • If the topic is the current open document in the main editor, determine the new location in the map (in the *DITA Maps Manager (on page 1877)*), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.
c. If the topic exists in the project, but has not yet been added to a DITA map, do one of the following:
   • Right-click the topic in the Navigator view (on page 221) (or the file system), select Copy, switch to the DITA Maps Manager (on page 1877) view, determine the new location in the map, right-click a parent or sibling topic, and use one of the Paste contextual menu actions (Paste, Paste Before, or Paste After).
   • If the topic is the current open document in the main editor, determine the new location in the map (in the DITA Maps Manager (on page 1877)), right-click a parent or sibling topic, and select Append Child > Reference to the currently edited file or Insert After > Reference to the currently edited file.

3. If your topic uses a key reference (on page 1994), set up the appropriate key definition in your map (on page 1908).

4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2041).

5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 1918) on the toolbar in the DITA Maps Manager.

Reuse Topics Using Author Mode Editor

1. Open the DITA map (on page 1877) in the Author mode editor.
2. Add a reference to an existing topic by dragging it from the Navigator view (on page 221) (or the file system) and dropping it in the desired location in the DITA map opened in Author mode. You can also accomplish the same thing by using the Copy and Paste contextual menu actions.
3. If your topic uses a key reference (on page 1994), set up the appropriate key definition in your map (on page 1908).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map (on page 2041).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the Validate and Check for Completeness action (on page 1918) on the toolbar in the DITA Maps Manager.

Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the DITA Maps Manager (on page 1877), an indicator will appear in the top-right corner of the Author mode editor that shows the number of times the current topic is referenced in the DITA map. It also includes navigation arrows that allow you to jump to the next or previous reference in the DITA Maps Manager.
Working with Content References

The DITA content reference feature lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place. The source content can be referenced using the DITA @conref or @conkeyref attributes.

There are several strategies for managing content references:

- **Reusable components** - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.

- **Single-source content references** - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.

- **Arbitrary content references** - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

A reference to the external content is created by adding a @conref or @conkeyref attribute to an element in the local document. The @conref or @conkeyref attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Editor Eclipse plugin displays it in Author mode as if it is there in the referencing file. If you do not want referenced content displayed, open the Preferences dialog box (on page 47), go to Editor > Edit modes > Author, and deselect the Display referenced content option (on page 95).

**Note:** A reference also displays tracked changes (on page 2139) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select Edit Reference.

**Tip:** To search for references made through a direct content reference, use the Search References action from the contextual menu.

Accessing Referenced Content

When you reference reusable content using a @conref or @conkeyref attribute, the content is grayed out in the document and can only be edited from the source document. To edit the source of the referenced content, click the Edit Content icon at the beginning of the inserted content. This will open the source document where you can edit the referenced content.
Creating a DITA Content Reference

DITA Content Reference

A DITA content reference, or `conref`, is one of the main content reuse features of DITA. It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

Assigning an ID to the Referenced Content

To add an `id` to a DITA element in a topic, place the cursor on the element and select `Edit Attributes` from the contextual menu to open the in-place attribute editor. Enter `id` as the Name of the attribute and a value of your choice in the Value field. You can also use the Attributes view to enter a value in the `id` attribute.

Note: The element may already have an `id`, since in some cases, Oxygen XML Editor Eclipse plugin automatically generates an ID value when the `id` attribute is created.

Creating a Content Reference

To create a content reference, follow these steps:

1. Make sure the element you want to reference has an ID assigned to it.
2. In Author mode, place the cursor at the location where you want the reused content to be inserted.
3. Select the Reuse Content action on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box is displayed.
4. In the Location field of the Reuse Content dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the Target ID of the element (or elements) to have their content inserted, and verify the content in the Preview pane. The `id` value of the element that you select is automatically added to the Reference to (`conref`) field.
6. Make any other selections you need in the Reuse Content dialog box (on page 2010). If you select multiple elements, the Expand to (conrefend) field is automatically filled with the id value of the last element in your selection.

7. Click Insert or Insert and close to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor Eclipse plugin also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 111) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (conref) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the Paste as Content Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

• You can use the Components tab in the DITA Reusable Components view (on page 2031) to easily insert content references.

• An alternate way to reuse content is to use the Oxygen XML Editor Eclipse plugin Create Reusable Component (on page 2021) and Insert Reusable Component (on page 2022) actions (available in the DITA menu and the Reuse submenu of the contextual menu). They handle the details of creating an ID and conref and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.

• You can also insert reusable content using content key references (on page 2006). This may also make reusable content easier to manage, depending on your particular situation and needs.

• Other topics in this section include information about more specialized or advanced ways of reusing content, such as code references (on page 2018), the conref push mechanism (on page 2018), variable text (on page 2022), key scopes (on page 2024), and branch filtering (on page 2025).

Related Information:

• Reuse Content Dialog Box (on page 2010)

• DITA Reusable Components View (on page 2027)

• Creating a DITA Content Key Reference (on page 2006)

• Editing DITA Content References (on page 2007)

• Working with Reusable Components (on page 2020)
Creating a DITA Content Key Reference

DITA Content Key Reference

A DITA content key reference, or `@conkeyref`, is a mechanism for inserting a piece of content from one topic into another. It is a version of the DITA content reference mechanism (on page 2004) that uses keys (on page 1994) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a `conref`, a `conkeyref` requires that the element to be reused has an `@id` attribute. It also requires the topic that contains the reusable content to be assigned a key (on page 1994) in a map. As with all uses of keys, you can substitute multiple maps or use profiling (on page 2082) to create multiple definitions of keys in a single map. This allows the same `@conkeyref` to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

Creating a Content Key Reference

To create a content key reference (`@conkeyref`), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the DITA map and the element you want to reference has an `ID` assigned to it.
2. In Author mode (on page 197), place the cursor at the location where you want the reused content to be inserted.
3. Select Reuse Content on the main toolbar (or from the DITA menu or Reuse submenu of the contextual menu). The Reuse Content dialog box (on page 2010) is displayed.
4. Select the Key radio button for the content source and use the Choose Key Reference button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the Key field). The elements that you can reference from the source are presented in the table in the middle of the Reuse Content dialog box.
5. Select the Target ID of the element (or elements) that you want to insert, and verify the content in the Preview pane. The `@id` value of the element that you select is automatically added to the Reference to (`conkeyref`) field.
6. Make any other selections you need in the Reuse Content dialog box (on page 2013). If you select multiple elements, the Expand to (`conrefend`) field is automatically filled with the `@id` value of the last element in your selection.
7. Click Insert or Insert and close to create the content reference.

**Note:** If you are using Text mode (on page 196), when you insert a `@conkeyref` attribute, after you enter the first quote (`conkeyref`), the Content Completion Assistant will list all the defined keys that you can select from. Also, after you select the key, the Content Completion Assistant will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.
Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor Eclipse plugin also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from DITA maps. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a DITA map. Also, the location in the document where you paste the element must be valid, although as long as the Smart paste and drag and drop option (on page 111) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (@conkeyref) using copy/paste actions, follow these steps:

1. In the DITA Maps Manager view (on page 1877), make sure that the Root map combo box (on page 1881) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 1877), select Edit Properties, and enter a value in the Keys field.
3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.
5. Select the Paste as Content Key Reference action from the Paste Special submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the Components tab in the DITA Reusable Components view (on page 2031) to easily insert content key references.
- You can also insert reusable content using content references (conref) (on page 2004).
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as code references (on page 2018), the conref push mechanism (on page 2018), variable text (on page 2022), key scopes (on page 2024), and branch filtering (on page 2025).

Related Information:
- Reuse Content Dialog Box (on page 2010)
- DITA Reusable Components View (on page 2027)
- Creating a DITA Content Reference (on page 2004)
- Editing DITA Content References (on page 2007)
- Working with Reusable Components (on page 2020)
- Accessing Referenced Content (on page 2003)
Editing DITA Content References

Oxygen XML Editor Eclipse plugin also includes some actions that allow you to quickly edit existing content references. When the element that contains a content reference (@conref or @conkeyref) is selected, the following actions are available in the DITA menu and the Reuse submenu of the contextual menu:

**Edit Content Reference**

This action is available for elements with a @conref or @conkeyref attribute. It opens the Edit Content Reference dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (@conref / @conkeyref and @conrefend attributes). For more information, see Reuse Content Dialog Box (on page 2010).

**Replace Reference with Content**

Replaces the referenced fragment (@conref or @conkeyref) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

**Replace All References with Content**

Replaces all referenced fragments (@keyref, @conref, or @conkeyref) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a -dita-use-conref-target value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for @id attributes.

For keyrefs inside <xref> or <link> elements, the @keyref attribute is changed to an href attribute, while the rest of the content for the keyref is replaced with its source content.

If the source content includes references to other topics/resources (hrefs), the operation also resolves those references relative to the new location.

**Remove Content Reference**

Removes the content reference (@conref or @conkeyref) inside the element at the cursor position.
Converting Conrefs to Conkeyrefs

Oxygen XML Editor Eclipse plugin includes a DITA refactoring operation called Convert conrefs to conkeyrefs that will find all content references (that reference content outside the current document) and convert them to content key references. You can also use it to quickly convert all content references in the current document or multiple documents at once.

To access the Convert conrefs to conkeyrefs operation, use one of the following methods:

**Single Document Method**

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the DITA Maps Manager (on page 1877)), go to the Refactoring submenu, and choose Convert conrefs to conkeyrefs.

**Multiple Documents At Once Method**

Select ➡️ XML Refactoring from the XML Tools menu (or from the Refactoring submenu when you right-click a document in the Navigator view (on page 221) or the DITA Maps Manager view (on page 1877)). Then select Convert conrefs to conkeyrefs from the DITA section and click Next.

Either method will proceed to the XML Refactoring Wizard. If you used the Multiple Documents At Once Method (on page 2009), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the Project, All opened files, Current DITA map hierarchy, or just the Current file.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the Single Document Method (on page 2009), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

- **Preview**
  
  You can use the Preview button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

  **⚠️ Warning:** It is always recommended to use the Preview button to make sure the operation is not going to do something unexpected and after you click the Finish button, any Undo action will only revert changes on the current document.

- **Finish**
When you use the **Finish** button, the operation will be processed and all *content references* will be converted to *content key references* (either all *content references* in the current document or all *content references* in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the *DITA Map (on page 2134)*, so you still need to manually define each key in your *DITA map (on page 1908)*.

- Defining Keys in DITA Maps (on page 1908)

### Reuse Content Dialog Box

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `@conref`, `@conkeyref`, and `@keyref` attributes can be used to insert references to reusable content. The `@conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `@conkeyref` attribute uses *keys (on page 1994)* to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `@keyref` attribute also uses *keys (on page 1994)* and can be used to indirectly reference metadata that may have different values in various circumstances.

**Note:** For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `@id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `@conref` and `@conkeyref` attributes, go to https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html.

**Note:** For the purposes of using a `@keyref`, keys are defined at map level and referenced afterwards. For more information about the DITA `@keyref` attribute, go to https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html.

Oxygen XML Editor Eclipse plugin displays the referenced content (on page 315) of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA-OT transformation needs an *XML Catalog (on page 2139)* to map the URIs to local paths, you need to add the catalog in Oxygen XML Editor Eclipse plugin (on page 512). If the URIs can be resolved, the referenced content is displayed in **Author** mode and in the transformation output.

In **Author** mode, a reference to reusable content (`@conref`, `@conkeyref`, or `@keyref`) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Click the ![Reuse Content](image) action on the main toolbar.
- In the contextual menu of the editing area, go to **Reuse > ![Reuse Content](image)**.
• Go to **DITA > Reuse Content.**

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor Eclipse plugin will insert a `@conref`, `@conkeyref`, or `@keyref`.

If you select **Location** for the content source, a **content reference** (`@conref`) will be inserted. If you select **Key** for the content source, keys will be used to insert a **content key reference** (`@conkeyref`) or a **key reference** (`@keyref`).

**Content Reference ( @conref ) Options Using the Reuse Content Dialog Box**

![Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)](image)

**Choose the content source** Section

When **Location** is selected for the content source, a **content reference** (`@conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:
Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the @conref attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor Eclipse plugin automatically fills this text field with the @id value of the last element in your selection. This value will be inserted as a @conrefend attribute, defining the end of the conref range.
Content Key Reference (@conkeyref) Options Using the Reuse Content Dialog Box

Figure 571. Insert Content Key Reference Options

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2138) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 2027) for similar purposes.
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 1892).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `@keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2134) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a **content key reference** (`@conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the **Href** column. Keys that do not have a value in the **Href** column are for referencing metadata with a `@keyref` attribute. Therefore, to insert a `@conkeyref`, you need to select a key that does have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a **content key reference** has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `@conkeyref`:

- **Select an element from the content source Section**

  **Show elements of type**

  You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

  **Text Filter Field**
You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

**Element Table**

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

**Preview Pane**

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

**Source Pane**

Displays the source code of the element to be referenced.

**Reference details Section**

**Reference type**

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that **conkeyref** value is automatically selected.

**Reference to**

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the **@conkeyref** attribute to be inserted. However, you can edit this value if need be.

**Fallback to (conref)**

You can select this option to define a **@conref** attribute to be used as a fallback to determine the content reference relationship if the specified **conkeyref** cannot be resolved.

**Reference to range end (conrefend)**

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor Eclipse plugin automatically fills this text field with the **@id** value of the last element in your selection. This value will be inserted as a **@conrefend** attribute, defining the end of the **conkeyref** range.
Key Reference to Metadata (@keyref) Options Using the Reuse Content Dialog Box

Figure 573. Insert Key Reference Options

Choose the content source Section

When Key is selected for the content source, you can use keys to reference content. You can use the Choose Key Reference button to open the Choose Key dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2138) (you can also select one from the drop-down list in the Key field).

Note: If the current DITA map is not selected as the root map, no keys will be listed.

Tip: You can also use the DITA Reusable Components view (on page 2027) for similar purposes.

Figure 574. Choose Key Dialog Box
The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 1892).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the @keys attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the <navtitle> or <keyword> element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an href attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2134) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

To insert a key reference to metadata (@keyref), select the key you want to reference. Keys that do not have a value in the Href column are for referencing metadata with a @keyref attribute. Therefore, to insert a @keyref, you need to select a key that does not have a value (file path) in the Href column.

After you select a key, click OK to return to the Reuse Content dialog box.

When a key that references metadata has been selected, the Reuse Content dialog box offers the following additional options for inserting a @keyref:

**Select an element from the content source Section**

This section is not used when referencing metadata.

**Reference details Section**

**Reference type**

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that keyref value is automatically selected.

**Reference to**

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the @keyref attribute to be inserted.

**Element name**

Oxygen XML Editor Eclipse plugin automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

**Finalizing Your Content Reference Configuration**

Once you click Insert or Insert and close, the configured content reference is inserted into your document.
Tip: You can easily insert multiple content references by keeping the Reuse Content dialog box opened, using the Insert button.

Working with Code References

Code References

The DITA `<coderef>` element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the `<coderef>` is processed, the referenced code file is imported and delimiting characters (such as `<` or `&`) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.

Example of using a Coderef

```xml
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference push mechanism (conref push).

The conref push mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements before or after a named element, or replaces the named element. Assuming the source topic is included in the DITA map (on page 2134), the conref push will be processed during publishing stage for the DITA map.
Example of a Conref Push Scenario

An example of a scenario where a `conref push` would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a `conref push` technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor Eclipse plugin includes an action that allows you to easily reference content with a `conref push` mechanism. The **Push Current Element** action is available in the **DITA** menu and in the **Reuse** subfolder of the contextual menu when editing in **Author** mode. Selecting this action opens the **Push current element** dialog box that allows you to select a target resource and element, and where to insert the current element content.

![Push Current Element Dialog Box](image)

This dialog box allows you to configure the following options for the `conref push` action:

**Choose the target resource**

- Allows you to select a **Location** URL or a **Key** for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

**Select the target element**

- The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

**Push action**
Allows you to choose one of the following options for where you want to insert the current element content:

**replace the target element**

The target element will be replaced with the current element content.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushreplace` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

**push before**

The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

**push after**

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

You can also use the Preview panel to view the content that will be pushed and the Source panel to see the XML code for the content to be pushed. After you click OK, the conref push mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the DITA map.

**Working with Reusable Components**

In DITA, the content of almost any element can be made reusable simply by adding an `@id` attribute to the element. The DITA content reference mechanism can reuse any element with an `ID`. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.
To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.

Oxygen XML Editor Eclipse plugin allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the Create Reusable Component and Insert Reusable Component actions.

Related Information:
- DITA Reusable Components View (on page 2027)

Creating a Reusable Content Component

Oxygen XML Editor Eclipse plugin makes it easy to create reusable content components from existing topic content.

**Note:** To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Editor Eclipse plugin creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In Author mode, select the content you want to make into a reusable component.

2. Select the Create Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.
   The Create Reusable Component dialog box is displayed.

3. Use the Reuse Content drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.

4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.

5. If you want to replace the extracted content with a reference to the new component you should leave the Replace selection with content reference option selected. This is recommended, since the point of reuse is to maintain only one copy of the content.

6. Select a file name and location to save the topic containing the reusable component and click Save. It is considered best practice to save or store reusable components in an area set aside for that purpose. If the Replace selection with content reference option was selected, Oxygen XML Editor Eclipse plugin replaces the current content with a @conref attribute. The content of the content reference will be displayed in your current topic with a gray background, but it will no longer be editable since it is stored.
in a separate file. To edit the source of the reusable component, click the Edit Content icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu. You can also reference this new reusable component by using a content reference (on page 2004) or content key reference (on page 2006).

Inserting a Reusable Content Component

Oxygen XML Editor Eclipse plugin includes an Insert Reusable Content action that allows you to easily insert a reusable content component that you created using the Create Reusable Component action (on page 2021).

⚠️ CAUTION: This action is only designed to insert reusable components created using the Oxygen XML Editor Eclipse plugin Create Reusable Component action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The Insert Reusable Content action creates a DITA @conref to insert the content, and creates a parent element for the @conref attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the @conref. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the Create Reusable Component action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.

2. Select the Insert Reusable Component action that is available in the DITA menu or the Reuse submenu of the contextual menu.

   The Insert Reusable Component dialog box is displayed.

3. Locate the reusable content file that you want to insert its content.

4. If you select Content reference in the Insert as drop-down list, the action will add a @conref attribute to the DITA element at the current location. If you select Copy in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).

5. Click Insert to perform the action.

Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several
products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

The quick-heat feature allows [product-name] to come up to temperature quickly.

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the @product profiling attribute, as in the following example:

```xml
<p>The quick-heat feature allows <ph product="basic">Basic Widget</ph> to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```xml
<p>The quick-heat feature allows <ph keyref="product"/> to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```xml
<keydef keys="product" product="basic">
    <topicmeta>
        <keywords>
            <keyword>Basic Widget</keyword>
        </keywords>
    </topicmeta>
</keydef>

<keydef keys="product" product="pro">
    <topicmeta>
        <keywords>
            <keyword>Pro Widget</keyword>
        </keywords>
    </topicmeta>
</keydef>
```

When the content is published, the value defined in the product key will be inserted for each product.

**Inserting a Keyref**

To insert a defined key reference (on page 1908) into a document in Oxygen XML Editor Eclipse plugin Author mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Editor Eclipse plugin feature you prefer):
• **DITA Reusable Components View Method**

  Use the [DITA Reusable Components view](on page 2027) to insert a variable reference to the defined key ([on page 1908](#)). For example, in the **Keys** tab, find a key defined as a variable and double-click it. Oxygen XML Editor Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Code Template Method**

  Add the source code pattern of the defined key ([on page 1908](#)) to a code template ([on page 130](#)) so that it appears in the list of proposals in the [Content Completion Assistant](on page 2133). For example, the code pattern could be something like `<ph keyref="product"> for defined product key.

• **Reuse Content Dialog Box Method**

  Use the [Reuse Content](#) action on the main toolbar to open the [Reuse Content](on page 2010) dialog box. Use the **Key** option to select a key that is defined as a variable (key reference to metadata) ([on page 2016](#)) and Oxygen XML Editor Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Manual Method**

  Manually insert the `@keyref` attribute using the attributes editor as follows:

  1. Press **Enter** and select a DITA element (for example, `<ph>`) that supports the `@keyref` attribute.
  2. Select **Edit Attributes** from the contextual menu to bring up the attributes editor ([on page 346](#)).
  3. In the **Name** field, select `keyref`.
  4. In the **Value** field, select or enter the name of the defined key ([on page 1908](#)).

**Related Information:**

- [DITA Reusable Components View](on page 2027)
- [Defining Keys in DITA Maps](on page 1908)

**Working with DITA 1.3 Key Scopes**

DITA 1.3 includes the possibility of using a concept called **Key Scopes** (or scoped keys). It allows you to reuse a topic in multiple places within the same [DITA map](on page 2134), but with slightly different content in each instance.

**Key Scopes Use-Case**

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 **Key Scopes** mechanism, you can define multiple values for the same key depending on the context.
How to Use Key Scopes in Oxygen XML Editor Eclipse plugin

To use DITA 1.3 key scopes in Oxygen XML Editor Eclipse plugin, follow these steps:

1. **Define the keys** *(on page 1994)* to be used in multiple places within your *DITA map*.
2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the **DITA Maps Manager** *(on page 1877)* and select 📂 Edit properties.
   b. In the **Keys tab** *(on page 1912)*, enter a value (or multiple values) in the **Key scopes** field.
   c. Click **OK** to save your changes.
3. Save the *DITA map*.

**Result:** In the **DITA Maps Manager** *(on page 1877)*, you can now see the key scopes in brackets and when you open each topic reference.

![Figure 576. Key Scopes in DITA Maps Manager](image)

The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the *DITA map*, the scoped keys will be reflected in the published content.

**Resources**

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the **DITA 1.3 Key Scopes - Next Generation of Reuse** blog post.
- You can also watch our **DITA 1.3 video tutorial** to see how key scopes can be used in Oxygen XML Editor Eclipse plugin.

**Related Information:**

- Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse
- Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

**Working with DITA 1.3 Branch Filtering**

DITA 1.3 allows you to use a mechanism called **Branch Filtering** that enables you to set filtering conditions for specific branches of a *DITA map*(on page 2134). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.
**Branch Filtering Use-Case**

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 Branch Filtering mechanism, you can reuse content multiple times within the same map, each time using different filters.

**How to Use Branch Filtering in Oxygen XML Editor Eclipse plugin**

To use DITA 1.3 branch filtering in Oxygen XML Editor Eclipse plugin, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page (on page 56).
2. Assuming you have already defined your profiling attributes (on page 379), create a DITAVAL filter file (on page 2103).
3. Insert a reference to the DITAVAL filter file in the DITA map:
   a. Right-click the DITA map reference in the DITA Maps Manager (on page 1877) and select Append Child > DITAVAL Reference.
   b. Select the DITAVAL file.
   c. Click Insert and Close.
4. Save the DITA map.

**Result:** You can now see the ditaval files referenced in the DITA Maps Manager (on page 1877) and when you transform the DITA map, filtered content will be reflected in the published output.

**Figure 577. Branch Filtering in DITA Maps Manager**

![DITA Maps Manager with ditaval files](image)

**Resources**

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the DITA 1.3 Branch Filtering - Next Generation of Reuse blog post.
- You can also watch our DITA 1.3 video tutorial to see how branch filtering can be used in Oxygen XML Editor Eclipse plugin.
DITA Reusable Components View

The **DITA Reusable Components** view is helpful if you use a large amount of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the root map (on page 2138) and presents them in a side view where you can easily locate and insert references to them. It re-collects the keys anytime the root map is changed (on page 1892) or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from Window > Show View > Other. By default, it will appear in the bottom-right section of the editor.

It includes the following tabs:

- **Keys (on page 2027)** - Displays all the keys that are defined in the root map (on page 2138) and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.

- **Components (on page 2031)** - Displays all the reusable components found in the root map (on page 2138) and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Editor Eclipse plugin looks for any `topicref` in the root map (on page 2138) that is marked as `resource-only` and then looks for elements with an assigned `@id` attribute value. This tab includes a search field, some filtering options, and some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

Keys Tab

The **DITA Reusable Components** view collects all the keys that are defined in the current root map (on page 2138) and displays them in the **Keys** tab. This tab has two view modes. The default tiles style view mode and a table style view mode.

Tiles Mode

The default tiles mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small width. Each block (card) displays the name of the key (the value of the `@keys` attribute), followed by its description and/or `@href` value, followed by the name of the DITA map file where the key is defined.
Table Mode

You can switch to a table style display mode by selecting the Table mode toggle action from the Settings menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in the Description column, while keys that are defined with a value in an `@href` attribute have that href value listed in the Href column.

Both display modes in the Keys tab include a variety of features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

**Sorting**

**Tiles Mode:** In the default tiles display mode, to sort the keys alphabetically in ascending order, select Sort by key name from the Settings menu.
**Table Mode:** In the *table* display mode, the following columns can be sorted by clicking on the heading:

- **Key** - The name of the key (the value of the `@keys` attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an `@href` attribute have that href value listed in this column.
- **Definition Location** - The name of the *DITA map (on page 2134)* where the key is defined.

**Double-Click Mechanism**

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `@href` value, it is inserted as a cross reference link (*xref* *(on page 2035)*).
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a variable reference (*ph* *(on page 2022)*).

**Drag and Drop Mechanism**

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an `@href` value, it is inserted as a cross reference link (*xref* *(on page 2035)*).
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a variable reference (*ph* *(on page 2022)*).

**Contextual Menu Actions**

**Insert as Link**

Inserts a cross reference link (*xref* *(on page 2035)*) to the selected key at the current cursor position or surrounding the current selection.

**Insert as Variable**

Inserts a variable reference (*ph* *(on page 2022)*) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `<image>` element.

**Insert as Keyref**
Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a `<keyref>` attribute and its value set to the selected key.

**Rename Key**

Opens a refactoring wizard (on page 529) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

**Notes:**

- This action does not work on DITA 1.3 key scopes.
- This action is only available if the DITA map opened in the DITA Maps Manager is also selected as the Root map.

**Go to Definition**

Opens the DITA map where the key is defined.

**Search References**

Searches for all references to the selected key in the entire DITA map structure.

**Group by Definition Location (Available in Table mode only)**

A toggle action that can be used to group (and sort) all the keys based upon the value in the Definition Location column.

**Settings Menu**

This menu includes the following options:

**Filtering Options**

- **Show all** - Shows all defined keys found in the current root map (on page 2138).
- **Show only variables** - Filters the keys to show only those defined as variable references (on page 2022).
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

**Sort by key name (Available in Tiles mode only)**

Sorts the keys alphabetically in ascending order.

**Table mode**

A toggle action that switches between the table and tiles display modes.
Components Tab

The DITA Reusable Components view collects all the topics from the current root map (on page 2138) that are marked as resource-only, then collects the reusable components from those topics, and displays them in the Components tab. To set a topic as resource-only, the <topicref> in the DITA map file needs to have a @processing-role attribute set like this:

```
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The DITA Reusable Components view considers topic references that contain processing-role="resource-only" to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an ID specified. These reusable components are displayed in the Components tab along with the file name and the specific names of the elements that contain an ID attribute.

![DITA Reusable Components View - Components Tab](image)

The Components tab includes the following features and options:

**Search Filter**

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards ( * or ? ), boolean operators ( AND, OR, NOT ), fuzzy searches ( ~ ), boosting searches ( ^ ), and more.

**Settings Menu**

This menu includes the following options:

**Compact Mode**

You can use this toggle action to switch the display for the Components tab to a compact visualization mode. When switched to Compact mode, fewer details are shown for each component, but more components are displayed in the view.
Reindex

You can use this action force a re-indexing of the reusable components.

Show Elements of Type

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.

Source File(s)

You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

Double-Click Mechanism

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 2006).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 2004).

Drag and Drop Mechanism

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (conkeyref) (on page 2006).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (conref) (on page 2004).

Hover and Click Actions

If you hover over a component shown in the preview window, you have access to the following link actions:

Insert

Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (conkeyref) (on page 2006). Otherwise, it is inserted as a content reference (conref) (on page 2004).

Open

Opens the source file that contains the reusable component.
Contextual Menu Actions

Insert Content Reference

Inserts the component as a content reference (conref) (on page 2004) at the current cursor position or replaces the current selection.

Insert Content Key Reference

Inserts the component as a content key reference (conkeyref) (on page 2006) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

Go to Definition

Opens the source file that contains the reusable component.

Search References

Searches for all references to the selected component in the entire DITA map (on page 2134) structure.

Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor Eclipse plugin provides support for all forms of linking in DITA.

Linking Between Parent, Child, and Sibling Topics

A DITA map (on page 2134) creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.
Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA \texttt{collection-type} attribute (on page 1913).

**In-Line Linking in the Content of a Topic**

DITA supports linking within the text of a topic using the `<xref>` element. The destination of the link can be expressed directly using the \texttt{@href} attribute or indirectly using the \texttt{@keyref} attribute. If you use the \texttt{@keyref} attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

**Linking Between Related Topics**

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the \texttt{Related Links} section of a topic and relationship tables in maps. To add related links, select \texttt{Related Link to Topic}, \texttt{Related Link to File}, or \texttt{Related Link to Web Page} from the \texttt{Link} drop-down menu from the toolbar (or the \texttt{Link} submenu in the contextual menu or DITA menu).

Tip: You can use the \texttt{Find Similar Topics} action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the \texttt{Open/Find Resource} view and performs a search using text content from the \texttt{<title>}, \texttt{<shortdesc>}, \texttt{<keyword>}, and \texttt{<indexterm>} elements.

**Managing Links**

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The \texttt{DITA Maps Manager} (on page 1877) provides a way to validate all the links in the documents that are included in the map (on page 1918). This can include validating all the profiling conditions that are applied.

**Hierarchical Linking in DITA Maps**

To create hierarchical linking between the topics in a \texttt{DITA map} (on page 2134), you set the appropriate value of the \texttt{@collection-type} attribute on the map. See the \texttt{DITA documentation} for the meaning of each of the values of the \texttt{@collection-type} attribute.

Note: Publishing scripts determine when and how to create hierarchical links. The \texttt{@collection-type} attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for
different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the `@linking` attribute.

To add the `@collection-type` to an item in a map:

1. Right-click the topic and choose ☑️ Edit Properties. The Edit Properties dialog box is displayed.
2. In the Attributes tab, select the appropriate value from the Collection type drop-down list.
3. You can use the Other attributes table to add a value to the `@linking` attribute.

## Linking in DITA Topics

### Direct Links

Inline links can be created DITA topics using the `<xref>` element. The destination of the link can be expressed directly by using the `@href` attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct related links to topics, files, or websites in a DITA topic using the `<related-links>` element.

### Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys (on page 1994) to create either inline links or related links (with the `@keyref` attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- **Key Definition** - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps (on page 1908).
- **Key Reference** - Created in an `<xref>` element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the `<topicref>` element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

## Inserting a Link in Oxygen XML Editor Eclipse plugin

To insert a link in Author mode (on page 197), use the actions available in the ☑️ • Link drop-down menu from the toolbar (or the ☑️ Link submenu in the contextual menu or DITA menu). You can choose between the following types of inline links:

**Cross Reference**

Opens the Cross Reference (xref) dialog box (on page 2037) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target
resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `<xref>` - Used to link to other topics or another location within the same topic and points to the target using the `@href` or `@keyref` attribute.
- `<fragref>` - A logical reference to a fragment element within a syntax diagram and points to the target using the `@href` or `@keyref` attribute.

File Reference

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select Location for the target, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2038).

Web Link

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select URL for the target resource, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2038).

Related Link to Topic

Opens the Cross Reference (xref) dialog box (on page 2037) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element.

Tip: You can use the Find Similar Topics action (available in the contextual menu or DITA menu) to quickly find related topics that can be added as related links. It opens the Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File
Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select Location for the target, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2038).

**Related Link to Web Page**

Opens the Web Link dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your DITA map structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a `related-links` element. If you select URL for the target resource, the link is expressed in an `@href` attribute. If you select Key for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the Choose Key Reference button to use the Choose Key dialog box (on page 2038).

**Cross Reference (xref) Dialog Box**

The Cross Reference (xref) dialog box is displayed when you insert a Cross Reference or Related Link to Topic (from the Link drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a Cross Reference link) or in a related links section (for a Related Link to Topic). The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource.
This dialog box includes the following sections and fields:

**Choose the Target Resource Section**

**Location**

If you select **Location** for the target, the link is expressed in an `@href` attribute.

**Key**

If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can use the `Choose Key Reference` button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the root map (on page 2138) (you can also select one from the drop-down list in the **Key** field).

**Tip:** You can also use the **DITA Reusable Components** view (on page 2027) for similar purposes.
Figure 582. Choose Key Dialog Box

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a root map (on page 1892).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key (the value of the `@keys` attribute).
  - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
  - **Href** - Keys that are defined with a value in an `@href` attribute have that href value listed in this column.
  - **Definition Location** - The name of the DITA map (on page 2134) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

**Select the Target Element Section**

This section can be used to target a specific element inside the target resource.

**Show elements of type**

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

**Text Filter Field**

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.
Element Table

Presents all the element IDs defined in the source topic. Use this table to select the Target ID of the element that you want to reference.

Preview Pane

Displays the content that will be referenced.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click Insert or Insert and close, the configured cross reference is inserted into your document.

Tip: You can easily insert multiple cross references by keeping the dialog box opened, using the Insert button.

Using Copy/Paste or Drag/Drop Actions to Insert a Cross Reference

Oxygen XML Editor Eclipse plugin also includes support for inserting cross reference links with simple copy/paste or drag/drop actions (additionally, you can insert them using the Paste as Link or Paste as Link (keyref) actions found in the Paste Special submenu from the contextual menu). The copied/dragged content must be an entire DITA XML element with an @id attribute or a <topicref> element. Also, the location in the document where you paste or drop the link must be valid, although as long as the Smart paste and drag and drop option (on page 111) is selected in the Schema Aware preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

When the link is inserted, Oxygen XML Editor Eclipse plugin automatically tries to populate certain attributes based on detected values. The @format, @scope, and @type attributes are populated if their corresponding options are selected in the Insert Link section of the DITA preferences page (on page 58). Even if their corresponding options are not selected, the @format and @scope attributes are populated if their detected values are different than the default values.

Note: For the sake of performance, the @type attribute is never automatically computed in the following cases:

- Drag/drop or copy/paste actions from the DITA Maps Manager view (on page 1877) or from the Keys tab of the DITA Reusable Components view (on page 2027).
- Paste as Link or Paste as Link (keyref) from the DITA Maps Manager view (on page 1877) with <topicref> elements that do not have the @type attribute defined.

Typically, cross reference links are inserted with an @href attribute, but it is also possible to insert them with a @keyref attribute using the Paste as Link (keyref) contextual menu action or copy/paste or drag/drop actions. For the latter method, follow these steps:

1. In the DITA Maps Manager view (on page 1877), make sure that the Root map combo box (on page 1881) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the DITA Maps Manager (on page 1877), select **Edit Properties**, and enter a value in the **Keys** field.

3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a `<topicref>` from a **DITA map**.

4. Place the cursor at a location, where you want to insert the link.

5. Select the **Paste as Link (keyref)** action from the **Paste Special** submenu from the contextual menu.

**Linking with Relationship Tables in DITA**

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:

1. If the map is currently open in the DITA Maps Manager (on page 1877), double-click the map icon (_ctr) to open the map in **Author** mode. If it opens in **Text** mode, click **Author** at the bottom left to switch to **Author** mode.

2. Move the insertion point inside the **map** root element (usually `<map>`, but it might be `<bookmap>`, or another specialization of the `<map>` element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the **map** root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the **map** root element.

3. Select the **Insert Relationship Table** action on the toolbar or from the **Relationship Table** submenu of the contextual menu.
   The **Insert Relationship Table** dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click **Insert**.
5. Enter the type of the topics in the header of each column.
   The header of the table (the `<relheader>` element) already contains a `<relcolspec>` element for each table column. You should set the value of the @type attribute of each `<relcolspec>` element to a value such as concept, task, or reference. When you click in the header cell of a column (that is a `<relcolspec>` element), you can see all the attributes of that `<relcolspec>` element, including the @type attribute in the Attributes view (on page 344). You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select Insert Reference (on page 1935) from the contextual menu or the DITA Map toolbar.

7. To add a new row to the table or remove an existing row use Insert Relationship Row/Delete Relationship Row from the contextual menu or the DITA Map toolbar.

8. To add a new column to the table or remove an existing column, use Insert Relationship Column/Delete Relationship Column contextual menu or the DITA Map toolbar. If you double-click the relationship table (or select it and press Enter, or choose Open from the contextual menu) the DITA map is opened in the editor with the cursor positioned inside the corresponding relationship table.

9. To add topic references to your relationship table, drag and drop topics from the DITA Maps Manager (on page 1877) or the Navigator (on page 221) view into the appropriate cell in the relationship table. See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the Relationship Table submenu of the contextual menu) or by editing the underlying XML in Text mode.

10. Save the DITA map.
    Relationship tables are also displayed in the DITA Maps Manager view (on page 1877), along with the other elements in its DITA map.

Figure 583. Relationship Table

You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the DITA Maps Manager (on page 1877).
- Select the relationship table in the DITA Maps Manager (on page 1877) and press Enter.
- Select Open from the contextual menu of the relationship table in the DITA Maps Manager (on page 1877).
Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your DITA map (on page 2134) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Editor Eclipse plugin publishes DITA content to various output sources using a bundled version of the DITA Open Toolkit. The DITA-OT is an open-source publishing engine that can publish DITA content to various output sources such as XHTML, PDF, or Windows Help (CHM). Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Editor Eclipse plugin using a transformation scenario or you can run it directly from a command line: http://www.dita-ot.org/dev/topics/building-output.html.

The DITA-OT that comes bundled with Oxygen XML Editor Eclipse plugin contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output.

You can download and install extra publishing plugins either from the DITA Open Toolkit registry or from the list of free plugins (on page 2112) on the Oxygen XML Editor Eclipse plugin GitHub account.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform DITA maps (on page 2134) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor Eclipse plugin also includes a special Run DITA-OT Integrator (on page 995) that can be used to integrate a DITA-OT plugin and a DITA Map Metrics Report transformation that generates a statistics report for your DITA map. All of them are listed in the DITA Map section in the Configure Transformation Scenario(s) dialog box (on page 1078).

A variety of transformations scenarios are available for DITA maps (on page 2134):

- Built-in transformation scenarios allow you to transform a DITA map to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- Run DITA-OT Integrator (on page 995) - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2108). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- DITA Map Metrics Report - Use this type of transformation scenario if you want to generate a DITA map statistics report. It contains information such as:
  - The number of processed maps and topics.
  - Content reuse percentage.
  - Number of elements, attributes, words, and characters used in the entire DITA map structure.
  - DITA conditional processing attributes used in the DITA maps.
  - Processing instructions.
External links.
All `@outputclass` attribute values gathered from the DITA project.

Important: If you have cross references that point to content outside the scope of the DITA map, that referenced content will not be counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features (on page 1087) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor Eclipse plugin also provides numerous possibilities for customizing the WebHelp Responsive output (on page 1161).

WebHelp Responsive Transformation Scenario

To publish a DITA map (on page 2134) as WebHelp Responsive output, follow these steps:

1. Select the Configure Transformation Scenario(s) action from the DITA Maps Manager (on page 1877) toolbar.
2. Select the DITA Map WebHelp Responsive scenario from the DITA Map section.
3. If you want to configure the transformation, click the Edit button.

Step Result: This opens an Edit scenario configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab (on page 2059) - This tab contains a set of built-in publishing templates (on page 1129) that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones (on page 1161).
- Parameters Tab (on page 2065) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
- Feedback Tab (on page 2066) - This tab is for those who want to add the Oxygen Feedback comments component at the bottom of each WebHelp page so that you can interact with your readers.
- Filters Tab (on page 2066) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab (on page 2067)** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab (on page 2069)** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

**Result:** When the DITA Map WebHelp Responsive transformation is complete, the output is automatically opened in your default browser.

**General Parameters for Customizing WebHelp Responsive Output**

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

- **default.language**
  This parameter is used if the language is not detected in the DITA map. The default value is `en-us`.

- **clean.output**
  Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

- **editlink.remote.ditamap.url**
  Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the main DITA map. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

- **editlink.web.author.url**
  This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

- **editlink.present.only.path.to.topic**
  When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.remote.ditamap.url` and `editlink.web.author.url` parameters are ignored.

- **fix.external.refs.com.oxygenxml** (Only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin)
  The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed DITA map. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the
DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

**force.unique**

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

**use.stemming**

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

**webhelp.custom.resources**

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

**webhelp.favicon**

The file path that points to an image to be used as a favicon in the WebHelp output.

**webhelp.reload.stylesheet**

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

**webhelp.search.custom.excludes.file**

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

**webhelp.search.japanese.dictionary**

The file path of the dictionary that will be used by the Kuromoji morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be UTF8.

**webhelp.search.enable.pagination**

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

**webhelp.search.page.numberOfItems**

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

**webhelp.search.ranking**

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the Search tab (default setting is `true`).

**webhelp.show.changes.and.comments**
When set to **yes**, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is **no**.

**webhelp.sitemap.base.url**

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. The value of a `<loc>` element is computed as the relative file path from the `@href` attribute of a `<topicref>` element from the *DITA map*, appended to this base URL value. The `<loc>` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

**webhelp.sitemap.change.frequency**

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

**webhelp.sitemap.priority**

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

**Parameters Specific to Oxygen WebHelp Responsive**

**webhelp.fragment.feedback**

You can integrate *Oxygen Feedback* with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an *Oxygen Feedback* site configuration, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

**webhelp.default.collection.type.sequence**

Specifies if the `sequence` value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

**webhelp.enable.search.autocomplete**

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is **yes**.

**webhelp.fragment.after.body**

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.logo_and_title**
In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.main.page.search**

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.toc_or_tiles**

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.after.top_menu**

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.body**

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.logo_and_title**

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.main.page.search**

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.toc_or_tiles**

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.before.top_menu**

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.footer**
In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Important:** This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

**webhelp.fragment.head**

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.fragment.welcome**

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**webhelp.merge.nested.topics.related.links**

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, Related Tasks, Related References, Related Information) are merged into a single group. The default value is **yes**.

**webhelp.search.stop.words.exclude**

Specifies a list of words that will be excluded from the default list of stop words that are filtered out before the search processing. Use comma separators to specify more than one word (for example: if, for, is).

**webhelp.show.breadcrumb**

Specifies if the breadcrumb component will be presented in the output. The default value is **yes**.

**webhelp.show.child.links**

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is **no**.

**webhelp.show.indexterms.link**

Specifies if an icon that links to the index will be presented in the output. The default value is **yes**.

**webhelp.show.main.page.tiles**

Specifies if the tiles component will be presented in the main page of the output. For a **tree style** layout, this parameter should be set to **no**.

**webhelp.show.main.page.toc**

Specifies if the table of contents will be presented in the main page of the output. The default value is **yes**.
webhelp.show.navigation.links
Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link
Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.related.links
Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is yes. The webhelp.merge.nested.topics.related.links parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc
Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc
Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each <section> within the current topic that contains an @id attribute and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu
Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.publication.toc.hide.chunked.topics
Specifies if the table of contents will contain links for chunked topics. The default value is yes.

webhelp.publication.toc.links
Specifies which links will be included in the table of contents. The possible values are:

- chapter (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor’s siblings), and the parent chapter.
- topic - The TOC will only include links for the current topic and its direct children.
- all - The TOC will include all links.

webhelp.publication.toc.tooltip.position
By default, if a topic contains a <shortdesc> element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- left (default)
- right
• top
• bottom
• hidden - The tooltip will not be displayed.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of 0 means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are collapsed or expanded (default value).

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Editor Eclipse plugin includes a built-in DITA Map PDF - based on HTML5 & CSS transformation scenario based on a DITA-OT CSS-based PDF Publishing plugin that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

• Oxygen PDF Chemistry - A built-in processor that is bundled with Oxygen XML Editor Eclipse plugin. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.
• Prince Print with CSS (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
• Antenna House Formatter (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

How to Create the Transformation Scenario

To create a DITA Map PDF - based on HTML5 & CSS transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 1877) toolbar.
2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

3. If you want to configure the transformation, click the **Edit** button.

**Step Result:** This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab (on page 2059)** - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

- **Parameters Tab (on page 2065)** - This tab includes numerous parameters that can be set to customize the transformation.

- **Filters Tab (on page 2066)** - This tab allows you to filter certain content elements from the generated output.

- **Advanced Tab (on page 2067)** - This tab allows you to specify some advanced options for the transformation scenario.

- **Output Tab (on page 2069)** - This tab allows you to configure options that are related to the location where the output is generated.

4. In the **Parameters** tab, configure any of the following parameters (if applicable):

- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.

- **css.processor.type** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry, Prince XML, or Antenna House**.

- **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, the transformation will use the processor specified in the **CSS-based Processors preferences page (on page 146)**.

- **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.

- **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.

- **show.changes.and.comments** - When set to **yes**, user comments, replies to comments, and **tracked changes** are published in the PDF output. The default value is **no**.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

**Customizing the Output**

For information about customizing the output, see **CSS-based DITA to PDF Customization (on page 1264)**.
DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting DITA maps to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a DITA Map PDF - based on XSL-FO transformation scenario, follow these steps:

1. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager toolbar.
2. Select DITA Map PDF - based on XSL-FO and click the Edit button (or use the Duplicate button if your framework is read-only).
3. Use the various tabs to configure the transformation scenario. In the Parameters tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - **show.changes.and.comments**: If set to yes, user comments, replies to comments, and tracked changes are published in the PDF output.
   - **customization.dir**: Specifies the path to a customization directory.
   - **editlink.remote.ditamap.url**: When this parameter is set to “true”, the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click OK and then the Apply Associated button to run the transformation scenario.

DITA Map MS Office Word Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario that allows you to convert DITA maps to Microsoft Office Word documents. It utilizes the DITA to Word plugin created by Jarno Elovirta. This plugin contains a Word document named Normal.docx (located in: \[OXYGEN_INSTALL_DIR\]/frameworks/dita/DITA-OT3.x/plugins/com.elovirta.ooxml/resources) that is used by the transformation scenario as a template to generate the final Word document.

**Tip:** You can make general modifications to the Normal.docx template file to alter the published output.
Configuring the Transformation Scenario

To configure a DITA Map to MS Office Word transformation scenario, follow these steps:

1. Open the DITA map in the DITA Maps Manager (on page 1877).
2. Click the Configure Transformation Scenario(s) button from the DITA Maps Manager (on page 1877) toolbar.
3. Select DITA Map MS Office Word.
4. For advanced customizations, in the Parameters tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - dotx.file - Specifies the path to a Word template file (.docx) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the Normal.docx file that is used by default.
   - document.flat.xsl - Specifies the path to a pre-process clean-up stylesheet.
   - core.xsl - Specifies the path to a core metadata stylesheet.
   - custom.xsl - Specifies the path to a custom metadata stylesheet.
   - document.xsl - Specifies the path to a main document stylesheet.
   - comments.xsl - Specifies the path to a comments stylesheet.
   - numbering.xsl - Specifies the path to a list and title numbering stylesheet.
   - footnotes.xsl - Specifies the path to a footnote stylesheet.
   - document.xml.xsl - Specifies the path to a document relations metadata stylesheet.
   - inkscape.exec - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click OK and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

- Editing a Transformation Scenario (on page 1075)
- Configure Transformation Scenario(s) Dialog Box (on page 1078)
- Migrating MS Office Documents to DITA (on page 2126)

DITA Map CHM (Compiled HTML Help) Transformation

To perform a Compiled HTML Help (CHM) transformation, Oxygen XML Editor Eclipse plugin needs Microsoft HTML Help Workshop to be installed on your computer. Oxygen XML Editor Eclipse plugin automatically detects if HTML Help Workshop is installed and uses it.

Note: HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the .hhp and .hhc files. If the transformation fails to produce the CHM output but the .hhp (HTML Help Project) file is already generated, you can manually try to build the CHM output using HTML Help Workshop.
Changing the Output Encoding

Oxygen XML Editor Eclipse plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the Compiled HTML Help (CHM) transformation. By default, the DITA Map CHM transformation scenario that comes bundled with Oxygen XML Editor Eclipse plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the toolbar or the XML menu.
2. Select the DITA Map CHM transformation scenario and click the Edit button.
3. In the Parameter tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:** The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (e.g., `en`, for example) and `CC` represents the country code (e.g., `US`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to [http://www.rfc-editor.org/rfc/rfc5646.txt](http://www.rfc-editor.org/rfc/rfc5646.txt).

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
  1. Create the custom CSS.
  2. Select the DITA Map CHM transformation scenario and click the Edit button.
  3. In the Parameter tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to `yes` to instruct the transformation to copy the custom CSS to the output folder.
  4. Run the transformation.

- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT3.x/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
  - `map2hhcImpl.xsl` - This file is used to compile the table of contents.
  - `map2hhpImpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the HTML Help Workshop when creating the output.

DITA Map Kindle Transformation

Oxygen XML Editor Eclipse plugin requires KindleGen to generate Kindle output from DITA maps (on page 2134). To install KindleGen for use by Oxygen XML Editor Eclipse plugin, follow these steps:
1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor Eclipse plugin and open a DITA map in the DITA Maps Manager view (on page 1877).
4. Click the Configure Transformation Scenario(s) button.
5. Select the DITA Map Kindle transformation and click the Edit button to edit it.
6. Go to Parameters tab and set the kindlegen.executable parameter as the path to the KindleGen directory.
7. Accept the changes.

Run DITA-OT Integrator Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario designed to integrate DITA-OT plugins (on page 2137). These DITA-OT plugins are used for various customizations. It is called Run DITA-OT Integrator and is found in the DITA Map section of the Configure Transformation Scenario(s) dialog box (on page 1078).

⚠️ Attention: The integration will be performed on the DITA-OT version specified in the DITA Open Toolkit section of the DITA preferences page (on page 56).

Running the Transformation Scenario

To integrate a DITA-OT plugin, follow these steps:

1. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.
2. Select the Apply Transformation Scenario(s) or Configure Transformation Scenario(s) (on page 1078) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1083)).
3. Select the Run DITA-OT Integrator transformation scenario. If the integrator is not visible, select the Show all scenarios action that is available in the Settings drop-down menu.
4. Apply the scenario (on page 1078).
5. Check the Results panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.

Related Information:
- Configure Transformation Scenario(s) Dialog Box (on page 1078)
- Installing a DITA-OT Plugin (on page 2108)
- Integrating a DITA Specialization (on page 2116)
DITA Topic Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the DITA section in the Configure Transformation Scenario(s) dialog box (on page 1078).

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.

- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.

- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called Oxygen PDF Chemistry. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

  For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. Another advantage of this transformation scenario is that you can use the same customization CSS (on page 1292) or publishing template (on page 1274) that you use for converting entire DITA maps.

  The transformation scenario automatically detects the currently selected context DITA map (root map) (on page 1881) so that keys and references are properly resolved (the detected context map is set as the value of the args.root.map parameter (this can be changed in the Parameters tab). It also automatically detects the currently applied profiling condition set (on page 2090) to be used as the default filtering option in the transformation scenario (this can be changed in the Filters tab).

  The transformation scenario also supports a parameter named args.enable.root.map.key.processing that can be used to specify whether or not the values for @keyref and @conkeyref attributes within the transformed topics are resolved. The possible values are:

  - **no** - This means that the values for all @keyref and @conkeyref attributes are ignored in the transformation. This results in lower processing times.

  - **yes** - This means that the values for any @keyref and @conkeyref attributes found in the transformed topic are processed and resolved using the value of the args.root.map parameter.

  - **auto** - This means that the process will search for any @keyref and @conkeyref attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the args.root.map parameter. If none are found, the @keyref and @conkeyref attributes are ignored.

- **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an xsl:fo processor.

**Related Information:**

- Editing a Transformation Scenario (on page 1075)

- Configure Transformation Scenario(s) Dialog Box (on page 1078)

- Applying Associated Transformation Scenarios (on page 1078)
Running a DITA Transformation Scenario

To select and run a transformation scenario on your DITA map, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button on the **DITA Maps Manager** toolbar (on page 1879). The **Configure Transformation Scenario(s)** dialog box (on page 1078) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor Eclipse plugin provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.

2. Select the transformation scenario you want to run and click **Apply Associated**. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor Eclipse plugin while the transformation is running. If there are errors or warnings, Oxygen XML Editor Eclipse plugin displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor Eclipse plugin opens the output in the appropriate application.

3. To rerun the same scenario again, click the **Apply Transformation Scenario(s)** button.

Creating or Editing a DITA-OT Transformation

Creating a DITA-OT Transformation Scenario

To create a DITA-OT Transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu. Then click the **New** button and select **DITA-OT Transformation**.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **DITA-OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.
Figure 584. DITA Transformation Type Dialog Box

Select the desired type of output and click OK. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

**Editing a DITA-OT Transformation Scenario**

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s)** (Alt + Shift + T, C (Command + Alt + T, C on OS X)) action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu.

   **Step Result:** The **Configure Transformation Scenario(s)** dialog box *(on page 1078)* is opened.

2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

   **Note:** Since transformation scenarios that are associated with built-in frameworks *(on page 2135)* are read-only, these scenarios will prompt you to use the **Duplicate** button and then edit the duplicated scenario *(on page 1077)*.

**Result:** This will open an **Edit scenario** configuration dialog box *(on page 1075)* that contains several tabs that allow you to configure the options that control the transformation.

**Related Information:**

- Creating a DITA-OT Plugin *(on page 2105)*
- Installing a DITA-OT Plugin *(on page 2108)*
- DITA Open Toolkit Documentation
Templates Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Templates tab is available for DITA-OT transformations with WebHelp Responsive or PDF - based on HTML5 & CSS output types and it provides a set of built-in publishing templates (on page 1129). You can use one of them to publish your documentation or as a starting point for a new publishing template.

![Figure 585. Templates Tab](image)

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an Online preview icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
  - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`
Custom Templates Locations

Oxygen XML Editor Eclipse plugin scans the locations specified in the DITA > Publishing preferences page (on page 59) to find custom templates to display in the dialog box. You can access that preferences page directly from the Template tab by clicking on the Configure Publishing Templates Gallery link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the Choose Custom Publishing Template link to select your template.

You can also add your custom templates (on page 1163) to the list of templates displayed in the Templates tab. To do this, store them in a directory, then click the Configure Publishing Templates Gallery link to open the DITA > Publishing preferences page (on page 59) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the Save template as button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1281). Clicking this button will open a template package configuration dialog box (on page 2062) that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the Templates tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

⚠️ Some templates could not be loaded: More details

If you click the More details link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠️) will be displayed on the template's image (in the Templates tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to Options > Preferences > DITA > Publishing (on page 59) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to Project Options.
4. Share your project file (.xpr).

For more information about customizing publishing templates, watch our video demonstration:
Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template (on page 1281). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

**Name**

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

**Description**

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

**Parameter Table**

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

**Note:** Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

**Include WebHelp Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** (on page 983) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1275)).
This option specifies that the custom template will include a WebHelp Responsive customization.

**Include HTML Page Layout Files**

For **WebHelp Responsive** customizations, select this option if you want to copy the default *HTML Page Layout Files (on page 1144)* into your template package. They are helpful if you want to change the structure of the generated HTML pages.

**Include PDF Customization**

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive (on page 983)** or **DITA Map to PDF - based on HTML5 & CSS (on page 990)**). This option specifies that the custom template will include a PDF customization.

**Save as**

Use this field to specify the name and path of the ZIP file where the template will be saved.

FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs. The FO Processor tab is available for DITA-OT transformations with a PDF output type.

This tab allows you to select an FO Processor to be used for the transformation.

![Figure 587. FO Processor Configuration Tab](image)

You can choose one of the following processors:

**Apache FOP**

The default processor that comes bundled with Oxygen XML Editor Eclipse plugin.

**XEP**

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the FO Processors option page (on page 143).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor Eclipse plugin installation directory.

**Antenna House**

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:
• Environment variable set by Antenna House installation (the newest installation version will be used).
• Antenna House was added as an external FO Processor in the Oxygen XML Editor Eclipse plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters tab (on page 2065).**
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related Information:

- FO Processors Preferences (on page 143)
- XSL-FO (Apache FOP) Processor for Generating PDF Output (on page 1059)

**Parameters Tab (DITA-OT Transformations)**

When you **create a new transformation scenario (on page 1003)** or **edit an existing one (on page 1075),** a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA-OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an **editor variable (on page 176)** selector to simplify setting a file path as the value of a parameter.

**Note:** To input parameter values at runtime, use the **ask editor variable (on page 177)** in the **Value** column.

Below the table, the following actions are available for managing parameters:

**New**

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the **Insert Editor Variables (on page 176)** button or the **Browse** button.
Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the Edit Parameter dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an Oxygen Publishing Template (on page 1274) descriptor file are displayed in italics. After creating a publishing template (on page 1281) and adding it to the templates gallery (on page 1163), when you select the template in the Templates tab (on page 2059), the Parameters tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:

• DITA Open Toolkit Documentation

Feedback Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Feedback tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the DITA Map WebHelp Responsive transformation type. To add a comments component in the output, you need to use Oxygen Feedback to create a site configuration for the website where your WebHelp output is published and use this Feedback tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the Oxygen Feedback administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the Edit button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an Oxygen Publishing Template (on page 1274), either as an HTML fragment extension point (on page 1138) or as a transformation parameter (on page 1136) (the webhelp.fragment.feedback parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

• The fragment specified directly in the Feedback tab.
• The fragment specified in a publishing template as an HTML fragment extension point.
• The fragment specified in a publishing template as a transformation parameter.
Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Filters tab allows you to add filters to remove certain content elements from the generated output.

Figure 588. Edit Filters Tab

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a DITAVAL file associated with the DITA map (on page 2134), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the ➔ Insert Editor Variables (on page 176) button, or the browsing actions in the ➕ • Browse drop-down list. You can find out more about constructing a DITAVAL file in the DITA Documentation.

⚠️ Attention: If a filter file is specified in the args.filter parameter (in the Parameters tab (on page 2065)), that file takes precedence over a DITAVAL file specified here.

Use profiling condition set

Sets the profiling condition set (on page 2090) that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the ✧ New, ◀ Edit, or ✗ Delete buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.
Advanced Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The Advanced tab allows you to specify advanced options for the transformation scenario.

![Figure 589. Advanced Settings Tab](image)

You can specify the following parameters:

**Custom build file**

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the build.xml file from the dita.dir parameter that is configured in the Parameters tab (on page 2065) is used. You can specify the path by using the text field, the Insert Editor Variables (on page 176) button, or the Browse button.

**Build target**

Optionally, you can specify a build target for the build file. If no target is specified, the default init target is used.

**Additional arguments**

You can specify additional command-line arguments to be passed to the transformation (such as -verbose).

**Ant Home**

You can choose between the default or custom Ant installation to run the transformation.
Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

**Note:** It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the Java Home text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to `-Xmx384m`, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid Out of Memory error messages (OutOfMemoryError).

Libraries

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (JAR files or additional class paths) to be used by the transformer.

**Tip:** You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1003) or edit an existing one (on page 1075), a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.
You can specify the following parameters:

**Base directory**

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the `Insert Editor Variables` button, or the `Browse` button.

**Temporary files directory**

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the `Insert Editor Variables` button, or the `Browse` button.

**Output directory**

The folder where the content of the final output is stored. You can specify the path by using the text field, the `Insert Editor Variables` button, or the `Browse` button.

**Note:** If the DITA map or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

**Open in Browser/System Application**

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows PDF files are often opened in Acrobat Reader).
Oxygen XML Editor Eclipse Plugin 22.0 | 21 - DITA Authoring | 2071

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to Window > Preferences > General > Web Browser and specify it there.

• **Output file** - When Open in Browser/System Application is selected, you can use this button to automatically open the default output file at the end of the transformation.

• **Other location** - When Open in Browser/System Application is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the ![Insert Editor Variables](on page 176) button, or the ![Browse](button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Customizing DITA Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

• Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Editor Eclipse plugin allows you to set parameters *(on page 2065)* on a transformation scenario and you can save and share them with others *(on page 1083)*. You can also use the ![$(ask)](editor variable *(on page 177)* in the Parameters tab to instruct Oxygen XML Editor Eclipse plugin to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.

• If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file *(on page 2073)*. Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor Eclipse plugin provides full editing and debugging support from XSLT and CSS stylesheets *(on page 1524)*, which you can use to modify transformation code.

• You can also write your own transformation code (and execute it using a custom build file *(on page 2073)*)) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor Eclipse plugin provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor Eclipse plugin transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:
- **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section (on page 1087).
- **PDF** - For information about customizing PDF output generated from DITA content, see XSL FO-based DITA to PDF Customization (on page 1420).

**Publishing Customizations**

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually \OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT3.x) to a location where you have full write access so that you have the ability to install new DITA-OT plugins (on page 2108).
2. Go to Options > Preferences > DITA, select Custom for the DITA Open Toolkit option and set the Location to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Editor Eclipse plugin at anytime without affecting the publishing system.
3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as Travis CI or Jenkins).

**Customizing XHTML-based Output**

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you edit an XHTML transformation scenario (on page 2058), there is a parameter called args.css that can be set to point to your custom CSS and a parameter called args.copy.css that as long as it is set to yes, the CSS is copied to the output folder.

You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For for information, see: [http://blog.oxygenxml.com/2013/12/creating-simple-dita-open-toolkit.html](http://blog.oxygenxml.com/2013/12/creating-simple-dita-open-toolkit.html). A list with all DITA-OT XSLT extension points can be found here: [http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html](http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html).

**Customizing WebHelp-based Output**

The DITA-OT that comes bundled in Oxygen XML Editor Eclipse plugin includes specific plugins that provide the ability to publish DITA content to WebHelp Responsive (on page 1087) output.

For information about customizing WebHelp Responsive output, see Customizing the WebHelp Responsive Output (on page 1161).

**Customizing PDF-based Output**

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA-OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see XSL FO-based DITA to PDF Customization (on page 1420).
There is also a book called DITA For Print that contains details about how to customize various aspects.

**Customizing PDF Output with CSS**

Oxygen XML Editor Eclipse plugin also includes a transformation scenario called DITA Map PDF - based on HTML5 & CSS (on page 2051) that is based on a DITA-OT CSS-based PDF Publishing plugin that allows you to convert DITA maps (on page 2134) to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with xsl:fo customizations. For more information about customizing PDF output using this transformation scenario, see Customization CSS (on page 1292).

**Related Information:**
- DITA Open Toolkit Documentation

**Using a Custom Build File**

You can use a Custom Build File to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the Configure Transformation Scenario(s) action to open the Configure Transformation Scenario(s) dialog box (on page 1078).
2. Select the transformation scenario and click Edit.
3. Go to the Advanced (on page 2067) tab and change the Custom build file path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA-OT, your custom build file would have the following content:

```xml
<project basedir="." default="dist">

<!--[DITA-OT default build file]-->

<import file="build.xml"/>

<target name="dist">

<! You could run your script here -->

<!--<exec></exec>-->\n
<! Call the DITA-OT default target -->

<antcall target="init"/>

</target>

</project>
```

**Note:** If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor Eclipse plugin, it is located in the [OXYGEN_INSTALL_DIR]/tools/ant directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor Eclipse plugin Ant lib directory.
Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a DITA map (on page 2134) transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

   ```css
   body {
     background-image: url(MyWatermarkImage.png);
   }
   ```

2. Edit a DITA Map XHTML transformation scenario and in the Parameters tab set the value of the `args.css` parameter as the path to your watermark image.

3. Set the value of the `args.copycss` parameter to `yes`.

4. Apply the transformation scenario.

5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:
- Adding a Watermark to PDF Output (on page 1424)

Adding Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. Oxygen XML Editor Eclipse plugin provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the `@outputclass` attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the `@outputclass` attribute on the `<codeblock>` element and set its value to one of the predefined language values. The Content Completion Assistant offers a list of the possible values when adding the `@outputclass` attribute in Text mode but there are also two very simple ways to set the value in Author mode:

- Select the `<codeblock>` element in the editor and in the Attributes view, click on the Value cell for the `@outputclass` attribute and select one of the predefined values (for example, `language-xml`).
- Select the `<codeblock>` element in the editor and use the `Alt + Enter` keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the Value drop-down menu.

The predefined values that can be selected are:

- `language-bourne`
- `language-c`
- `language-cpp`
- `language-csharp`
Oxygen XML Editor Eclipse Plugin 22.0 | 21 - DITA Authoring | 2075

- language-css
- language-ini
- language-java
- language-javascript
- language-json
- language-lua
- language-perl
- language-php
- language-python
- language-ruby
- language-sql
- language-xml
- language-xquery

⚠️ Attention: It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

**Example:**

This codeblock:

```xml
<codeblock outputclass="language-xml">
  <p>This code is an example of how to use a coderef.</p>
  <coderef href="MyExternalCode.xsl"/></codeblock>
</codeblock>
```

would look like this in the output:

```
<p>This code is an example of how to use a coderef.</p>
<codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

**Publishing with a DITA-OT Project File**

The *DITA Open Toolkit* project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: [https://www.dita-ot.org/dev/topics/using-project-files.html](https://www.dita-ot.org/dev/topics/using-project-files.html).

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the Configure Transformation Scenario(s) dialog box *(on page 1078)*:

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:
Troubleshooting DITA Transformation Problems

This section contains some topics to help you troubleshoot DITA transformation issues.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

*DITA map* (on page 2134) transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the DITA Transformation tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

*DITA Map WebHelp* transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the *force-unique* parameter set to *true* to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique *@copy-to* attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```xml
<map>
...
<topicref href="../topics/MyTopic.dita"/>
```
DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the Output tab, select a local directory for Temporary files directory and Output directory).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called args.grammar.cache that only works for DTD-based DITA topics.
- You can increase the memory available to Oxygen XML Editor Eclipse plugin (on page 1850). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the Advanced tab, enter logger org.apache.tools.ant.listener.ProfileLogger in the Additional arguments field. Then go to Options > Preferences > DITA > Logging and select Always for the Show console output option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.
DITA PDF Transformation Fails

Problem
The DITA to PDF transformation fails.

Cause
To generate the PDF output, Oxygen XML Editor Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors (on page 2078).

Solution
If your transformation fails, you can detect some of the problems that caused the errors by running the Validate and Check for Completeness action (on page 1918). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the DITA map (on page 2134), broken links, and missing external resources.

You can analyze the Results tab of the DITA transformation and search for messages that contain text similar to [fop] [ERROR]. If you encounter this type of error message, edit the transformation scenario you are using and set the clean.temp parameter to no and the retain.topic.fo parameter to yes. Run the transformation, go to the temporary directory of the transformation, open the topic.fo file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to Help > About > Components > Frameworks and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:
• How to Enable Debugging for FO Processor Transformations (on page 1062)

DITA PDF Processing Common Errors
There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF
The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
.............
Solution: Cannot Save PDF
Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec
One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

Solution: Table Contains More Cells Than Defined in Colspec
To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.  
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 1877)) to find the original DITA topic where the table was generated.

Problem: Broken Link
There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:
Solution: Broken Link
To resolve this issue:

1. Use the Validate and Check for Completeness action available in the DITA Maps Manager view (on page 1877) to find such problems.
2. If you publish to PDF using a DITAVAL filter, select the same DITAVAL file in the DITA Map Completeness Check dialog box.
3. If the Validate and Check for Completeness action does not discover any issues, edit the transformation scenario and set the clean.temp parameter to no.
4. Run the transformation, open the topic.fo file in Oxygen XML Editor Eclipse plugin, and search for the unresolved ID references (for example: unique_4_Connect_42_wrongID).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the Find/Replace in Files action in the DITA Maps Manager view (on page 1877)) to find the original DITA topic where the table was generated.

Related Information:
- How to Enable Debugging for FO Processor Transformations (on page 1062)

DITA to CHM Transformation Fails - Cannot Open File

Problem
The DITA to CHM transformation fails with the following error:

```
```

Cause
This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution
To solve this issue, close the CHM help file and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2134) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1918). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:
- DITA Map CHM (Compiled HTML Help) Transformation (on page 2054)
DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: [exec] HHC5003: Error: Compilation failed while compiling fileName.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the DITA map (on page 2134) before executing the transformation scenario. To do so, run the Validate and Check for Completeness action (on page 1918). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the DITA map), broken links, and missing external resources.

Related Information:

- DITA Map CHM (Compiled HTML Help) Transformation (on page 2054)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the DITA map (on page 1918) by using the Validate and Check for Completeness action that is available on the DITA Maps Manager (on page 1877) toolbar and in the DITA Maps menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario (on page 1028).
4. If the transformation results in errors or warnings, they are displayed in the Results panel (on page 281) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - *Informational* - The transformation encountered a condition of which you should be aware.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.

6. If you need to contact the Oxygen technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the Options > Preferences > DITA preferences page and set the Show console output option to Always.
   b. Execute the transformation scenario again. The console output messages are displayed in the DITA-OT view.
   c. Copy the entire log, save it in a text file, then send it to the Oxygen technical support team.
   d. After your issue has been solved, go back to the Options > Preferences > DITA preferences page and set the Show console output option to When build fails.

Related Information:

- Troubleshooting DITA Transformation Problems (on page 2076)

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor Eclipse plugin, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing.

Oxygen XML Editor Eclipse plugin includes a Profiling/Conditional Text preferences page (on page 103) where you can create and manage profiling attributes and condition sets. Oxygen XML Editor Eclipse plugin also offers convenient support for customizing and controlling profiling attribute values with a subject scheme (on page 2097) or DITAVAL file (on page 2101).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes ( @product , @platform , @audience , @rev , @props , and @otherprops ). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the @platform profiling attribute:
For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA (on page 2083).

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For more information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA (on page 2088).

For more information about DITA profiling, watch our video demonstration:

https://www.youtube.com/embed/Gfyd4TkRQAw

Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets (on page 2088).

Defining Profiling Attributes for DITA Content

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Editor > Edit modes > Author > Profiling / Conditional Text.

   **Information:** The Profiling Attributes section (on page 104) is used to define the attributes and their values. For DITA documents, the default attributes are included (@audience, @platform, @product, @props, @otherprops, and @rev), but if a Subject Scheme Map (on page 2097) is used for profiling your content, you will see the attributes defined in your subject scheme map instead.

2. To add new attributes and values, click the + New button at the bottom of the Profiling Attributes table.

   To customize existing attributes and their values, select an attribute and click the Edit button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.
The following options are available in this dialog box:

**Document type**
Select the document type (*framework (on page 2135)*).

ℹ️ **Tip:** You can use the * or ? wildcards in this combo box. For example, DITA* would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

**Attribute name**
The name of the profiling attribute.

**Display name**
This optional field is used for descriptive rendering in profiling dialog boxes.

**Attribute Values Table**
This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (➕ New, 📡 Edit, ✗ Delete). The columns are as follows:

- **Value** - The attribute value. You can also define profiling attribute groups using the following format: ParentAttrValue(SubAttrValue1 SubAttrValue2). For more information, see *Conditional Profiling Attribute Groups (on page 2096)*.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in Author mode (*Edit Profiling Attributes dialog box (on page 2086)*), *Condition Set dialog box (on page 2088)*, *Profiling tab in the Edit Properties*.
dialog box (on page 1915), DITA Maps Manager (on page 1877)). If the Label is not specified, the Value will be used as its rendered name.

- **Description** - A description for the attribute value that will be displayed in this table.

**Single value**

Select this option if you want the attribute to only accept a single value.

**Multiple values separated by**

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between space, comma, and semicolon, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

3. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the Profiling Attributes configuration dialog box.

4. Click **Apply** to save the changes.

**Result:** You should see your changes in the Profiling Attribute table.

You can also use the Profiling Condition Sets section to apply more complex filters on your DITA content.

### Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor (on page 327) in Author mode, the Attributes view (on page 344), or in the source code in Text mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the Edit Profiling Attributes action (from the contextual menu in Author mode) on the new value, the Profiling Values Conflict dialog box will appear and it includes an Add these values to the configuration action that will automatically add the new value to the particular profiling attribute. It also includes an Edit the configuration action that opens the Profiling / Conditional Text preferences page (on page 103) where you can edit the profiling configuration.

**Note:** If the Allow contributing extra profiling attribute values (on page 104) option is not selected in the Profiling / Conditional Text preferences page, the Profiling Values Conflict dialog box will never appear, so this automatically adding value not be possible.
Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes (on page 2083) as follows:

**DITA Topics**

To profile DITA topics, right-click a topic reference in the DITA Maps Manager (on page 1877), select ✉ Edit Properties from the contextual menu, go to the Profiling tab, and select the appropriate values.

**DITA Content**

To profile DITA content in Author mode, highlight the content and select Edit Profiling Attributes from the contextual menu and select the appropriate values in the Edit Profiling Attributes dialog box.

**DITA Elements**
To profile specific XML elements in **Author** mode, position the cursor inside the element, right-click, select **Edit Profiling Attributes** (you can also right-click the element in the breadcrumb (on page 320) or Outline (on page 273) view), and select the appropriate values in the **Edit Profiling Attributes** dialog box. You can also use the Attributes view (on page 344) to set the profiling attributes on the element at the current cursor position.

**Figure 593. Edit Profiling Attributes Dialog Box**

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor Eclipse plugin. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/ **Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your **root map** (on page 2138) references a DITA **subject scheme map** (on page 2139) that defines values for the profiling attributes (on page 2097), those values are used. Oxygen XML Editor Eclipse plugin collects all the profiling values from the **subject scheme map** that is referenced in the map that is currently opened in the **DITA Maps Manager** (on page 1877) (or set as the **root map** (on page 1892)). In the image above (on page 2087) (taken from the Oxygen XML Editor Eclipse plugin documentation project), you see values for eight products. They are the only values that are defined in the **subject scheme map** and thus, are the only ones that appear in the dialog box.
- If you have defined profiling attribute values (on page 2083) for the DITA document type in the **Profiling/ Conditional Text** preferences page (on page 103), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.
The attribute names and values selected in the Edit Profiling Attributes dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the Show Profiling Attributes option (on page 388) (available in the Profiling / Conditional Text toolbar menu) is selected, a green border is painted around profiled text in the Author mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 594. Profiling Attribute Value Form Control Pop Up

- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2094)

Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets
To create a new profiling condition set, follow these steps:

1. Open the Preferences dialog box (on page 47) and go to Editor > Edit modes > Author > Profiling/Conditional Text.

   Information: The Profiling Condition Sets section (on page 105) is used to define condition sets.
2. To add new condition set, click the **New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

**Step Result:** In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

![Condition Set Configuration Dialog Box](image)

The following options are available in this dialog box:

**Name**

The name of the new condition set.

**Document type**

Select the document type (*framework (on page 2135)*) that has profiling attributes defined.

**Use DITAVAL file**

For DITA projects, select this option if you want the **Profiling Condition Set** to reference a **DITAVAL file** (*on page 2101*). You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (*on page 176*) button, or the browsing actions in the **Browse** drop-down list.

**Include the content matching the following conditions**

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this
particular condition set. If you have defined a lot of profiling attributes, you can use the filter text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click OK to confirm your selections and close the Condition Set configuration dialog box.

4. Click Apply to save the condition set.

- Showing and Filtering Profiled Content in DITA (on page 2092)
- Customizing Colors and Styles for Rendering Profiling in Author Mode (on page 2094)

Applying Profiling Condition Sets in DITA

All defined Profiling Condition Sets (on page 2088) are available as shortcuts in the Profiling / Conditional Text toolbar menu (on page 388). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the Author mode, Outline view (on page 273), and DITA Maps Manager view (on page 1877). Your selection will also be used as the default condition set (on page 2104) in transformation scenarios (this can be changed in the Filters tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:

Suppose that you have the following document:
If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.

This is how the document looks in **Author** mode after you apply the condition set:

```
Spray painting

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]
```

- Creating and Editing Profiling Attributes in DITA *(on page 2083)*
Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the Profiling/Conditional Text drop-down menu that is located on the DITA Maps Manager (on page 1877) toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

**Show Profiling Colors and Styles**

Select this option to show colors and styles for profiled content in Author mode and the DITA Maps Manager (on page 1877). You can configure the colors and styles or specify whether or not this option is selected by default in the Profiling/Conditional Text > Colors and Styles preferences page (on page 106).

**Show Profiling Attributes**

Select this option to display the values of the profiling attributes at the end of profiled content in Author mode and next to the nodes in the DITA Maps Manager (on page 1877). You can specify whether or not this option is selected by default in the Profiling/Conditional Text > Attributes Rendering preferences page (on page 105).

**Show Excluded Content**

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in Author mode, the DITA Maps Manager (on page 1877), and the Outline (on page 273) view. When this option is selected and a condition set is selected in this drop-down menu (on page 2092), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 2092), the filtered content is hidden. You can specify whether or not this option is selected by default in the Profiling/Conditional Text preferences page (on page 105).

**Choose Condition Set (Available if more than 15 condition sets are defined)**

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

**List of Defined Condition Sets**

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in Author mode and the DITA Maps Manager (on page 1877) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the More submenu or by using the Choose Condition Set option (on page 2092) to access a dialog box that presents all of them.
Opens the **Profiling/Conditional Text preferences page** (on page 103) where you can add and edit profiling attributes and condition sets.

**Figure 596. Example: Profiling Controls in Author Mode**

If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

**Figure 597. Profiling Attribute Value Form Control Pop Up**

Also, the following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:

- ■ - The topic contains profiling attributes.
- □ - The topic inherits profiling attribute from its ancestors.
- ▽ - The topic contains and inherits profiling attributes.
- (dash) - The topic neither contains, nor inherits profiling attributes.
Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in Author mode and the DITA Maps Manager (on page 1877) so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in Author mode and excluded nodes are grayed-out or hidden in the DITA Maps Manager (on page 1877).
Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

### Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles** option (on page 388) from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings** (on page 388) from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text preferences page** (on page 103).
3. Go to the **Colors and Styles preferences page** (on page 106) to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes Rendering preferences page** (on page 105) to configure how you want the profiling attributes to appear in Oxygen XML Editor Eclipse plugin.

**Result:** The styling is now applied in the **Author editing mode**, the **Outline view** (on page 273), and in the **DITA Maps Manager view** (on page 1877). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes dialog box** (on page 379) and in the inline form control pop-up that allows you to quickly set the profiling attributes.
Figure 600. Profiling Attribute Value Form Control Pop Up

Alternate Method with a DITAVAL File: If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2103) topic.

Conditional Profiling Attribute Groups

Overview
Conditional processing attributes can be specified using grouped values. Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (operations and support) and they use the @audience attribute with the values ops and support, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (L1, L2, and L3) as subcategories for the support value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as @product, @audience, @otherprops) and specify multiple attribute subcategories.

Creating a Conditional Profiling Attribute Group
To create a group in Oxygen XML Editor Eclipse plugin:
1. Open the Preferences dialog box (on page 47) and go to Editor > Edit modes > Author > Profiling / Conditional Text.

2. To add new attributes and values, click the + New button at the bottom of the Profiling Attributes table.
To customize existing attributes and their values, select an attribute and click the 🛠 Edit button.

   **Step Result:** In either case, this opens a Profiling Attribute configuration dialog box where you can define attributes that exist in your schema.

3. Specify the appropriate values for the Document type, Attribute name, and Display name.

   For information about the Profiling Attribute configuration dialog box, see Defining Profiling Attributes for DITA Content (on page 2083).

4. Click the + New button at the bottom of the attribute values table.

5. In the Value field of the resulting dialog box, define groups using the following format:
   
   ParentAttrValue(SubAttrValue1 SubAttrValue2) . For example:
   
   support(L1 L2 L3)

6. Click OK and Apply to save and apply the changes.

**Using Conditional Groups in Conjunction with a DITAVAL File**

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2101) the values. For example, suppose the company described in the example in the Overview section (on page 2096) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```
<val>
  <prop action="include" att="support" val="L1"/>
  <prop action="include" att="support" val="L2"/>
  <prop action="exclude" att="support" val="L3"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 2088) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2104) and content profiled with the L1 and L2 values would be included while content with the L3 value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (L1, L2, L3) by simply excluding the support value (since L1, L2, and L3 are subcategories of it):

```
<val>
  <prop action="exclude" att="support"/>
</val>
```

For more information about creating conditional profiling attribute groups, watch our video demonstration:

[https://www.youtube.com/embed/YRi9XPK6CcY](https://www.youtube.com/embed/YRi9XPK6CcY)

Customizing Profiling Values with a Subject Scheme Map

Overview

A subject scheme map (on page 2139) allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in Author mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use subject scheme maps to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in Author mode or the transformed output.

The highest level of map (main DITA map (on page 2138)) that uses the set of profiling values must reference the subject scheme map where the profiling values are defined and the @type attribute needs to be set to subjectScheme for the reference, as in the following example:

```xml
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

Creating a Subject Scheme Map

To create and configure a subject scheme map, follow this procedure:

1. Use the New Document wizard (on page 200) to create a new Subject Scheme document (New from Templates > Framework templates > DITA Map > map > Subject Scheme).
2. Use the controls in Author mode to define the hierarchical tree of values for your subject scheme (see the Author mode example below (on page 2099)) or switch to Text mode and define it there if you prefer (see the Text mode example below (on page 2100)).

Note: The pre-defined subject scheme template includes Navigation Titles (<navtitle> element). This element is not required, but if you use it, the text that you enter for the <navtitle> will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Editor Eclipse plugin (on page 2101). An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Editor Eclipse plugin.

3. Bind the particular attribute to the key you define for the tree of values using the <attributedef> and <subjectdef> elements inside the <enumerationdef> element. Notice that in the examples below (on page 2099), the audience attribute is bound to the audienceKey value.
Tip: By default, attributes can accept multiple values, but you can use `outputclass="single_value"` to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Editor Eclipse plugin with radio buttons instead of checkboxes. For example:

```xml
<enumerationdef outputclass="single_value">
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>
```

4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the examples below (on page 2099)). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Editor Eclipse plugin (on page 2101).

5. Save your subject scheme file.

6. Reference your subject scheme in the highest level of map (main DITA map (on page 2138)) that will use the set of profiling values and set its type to `subjectScheme`. The easiest way to do this is:
   a. With your subject scheme file opened in the editor, go to the DITA Maps Manager view, right-click the main DITA map, and select Append Child > Reference to the currently edited file.
   b. In the Insert Topic Reference dialog box, go to the Attributes tab and in the Type field, enter or select `subjectScheme`.
   c. Click the Insert and Close button and save your main DITA map.

Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag (on page 2101) the entire tree of values. For example, suppose one of the values for the `audience` attribute in a hierarchical subject scheme is `surgeon` and it has two subordinate values of `neuro-surgeon` and `plastic-surgeon` (see the examples below (on page 2099)). You could create a DITAVAL file with the following content:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a condition set (on page 2088) to filter content in Author mode or during the transformation stage to filter content in the output (on page 2104) and the `neuro-surgeon` and `plastic-surgeon` values would be excluded by the filter since the subject scheme defines them as subordinate values of the `surgeon` value.

Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute

This example uses typical audience values for medical personnel (therapist, oncologist, physicist, radiologist, surgeon, and so on). The `audience` attribute is bound to the `audienceKey` value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (`props` and `otherprops`) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Editor Eclipse plugin (on page 2101).

Example using Author mode controls:
Figure 601. Subject Scheme Author Mode Controls

Example code in Text mode:

```xml
<subjectScheme>
  <!-- A scheme that defines audience user values -->
  <subjectdef keys="audienceKey">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physicist"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
</subjectScheme>

<enumerationdef>
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>
```

```xml
<enumerationdef>
  <attributedef name="otherprops"/>
  <subjectdef keyref="otherprops"/>
</enumerationdef>
```
Where the Profiling Attributes are Available in Oxygen XML Editor Eclipse plugin

When you edit a DITA topic in the Text or Author mode, Oxygen XML Editor Eclipse plugin collects all the profiling values from the subject scheme map (on page 2139) that is referenced in the map that is currently opened in the DITA Maps Manager (on page 1877) (or set as the root map (on page 1892)). The values of profiling attributes defined in a Subject Scheme Map are available in the following places in Oxygen XML Editor Eclipse plugin (regardless of their mapping in the Profiling/Conditional Text preferences page (on page 103)):

- The Profiling tab of the Edit Properties dialog box (on page 1915).
- The Edit Profiling Attribute dialog box (on page 2087).
- The inline profiling controls in Author mode (on page 2093).
- The proposals for the attribute values in the Content Completion Assistant (on page 2133).

For more information about using a DITA subject scheme map, watch our video demonstration:

[https://www.youtube.com/embed/RgkVRg6k6zo](https://www.youtube.com/embed/RgkVRg6k6zo)

Related Information:

- Filtering Profiling Values with a DITAVAL File (on page 2101)
- DITA 1.3 Specifications: Subject Scheme Maps

Filtering Profiling Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

DITAVAL Filtering Use-Case

Suppose that a medical publication uses the audience profiling attribute to profile the content for the following types of users: therapist, physician, and surgeon. Suppose that in the output, you want to exclude any content that is profiled as surgeon value for the @audience attribute.
You could use a DITAVAL filter file to exclude anything that is profiled as surgeon:

```xml
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main DITA map (on page 2134) and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as surgeon.

**DITAVAL Filter File Editor in Author Mode**

The **Author** editing mode in Oxygen XML Editor Eclipse plugin offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

**Figure 602. DITAVAL File Editor in Author Mode**

Use the +... button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the DITAVAL FILTER File title, allows you to insert the following elements:

- **Style Conflict** - Inserts a `<style-conflict>` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `@foreground-conflict-color` and `@background-conflict-color` attributes.

- **Filter** - Inserts a `<prop>` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are `include`, `exclude`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, and `@background` attributes.

- **Flag** - Inserts a `<revprop>` element that identifies a value in the `@rev` attribute that should be flagged in some manner. The allowed actions are `include`, `passthrough`, and `flag`. If you select the `flag` action, you can use the drop-down menus to select values for the `@style`, `@color`, `@background`, and `@changebar` attributes.

See the DITAVAL Element Specifications for more details about the allowed filters and flags.
How to Create a DITAVAL Filter File

To create a DITAVAL filter file, follow these steps:

1. Go to File > New.
2. Scroll to the Framework templates > DITAVAL folder.
3. Select the Filter template file and click Create.
4. Define your filters in the DITAVAL file (in Text or Author mode).
5. Save the DITAVAL file.

Result: The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a Profiling Condition Set using the Use DITAVAL File option in the Condition Set configuration dialog box (on page 2088).
- You can use the Import from DITAVAL option (on page 104) in the Profiling/Conditional Text preferences page (on page 103) to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the DITAVAL file in the transformation scenario (on page 2067).
- You can use the filter file in the DITA Map Completeness Check dialog box (on page 1919) when validating your DITA map (on page 2134).
- DITAVAL files are also used when working with the DITA 1.3 Branch Filtering mechanism. For more details, see: Working with DITA 1.3 Branch Filtering (on page 2025).
- You can define the colors and styles to be used for rendering profiled condition sets (on page 2103) in Author mode and the DITA Maps Manager (on page 1877) view by using a Flag filter in the DITAVAL file.

Related Information:

- DITAVAL Element Specifications
- Working with DITA 1.3 Branch Filtering (on page 2025)
- Customizing Profiling Values with a Subject Scheme Map (on page 2097)
- Styling the Rendering of Profiled Content Using a DITAVAL File (on page 2103)
- Conditional Profiling Attribute Groups (on page 2096)

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in Author mode and the DITA Maps Manager (on page 1877) by defining the styles in a flag filter that is set in a DITAVAL file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file (on page 2103) to define your profiling condition set (on page 2088).
2. In **Author** mode, define the filters for your condition set *(on page 2102)*.

3. Select **Flag** from the drop-down menu on in a particular **Filter** or **Flag Revision** to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.

4. Save the DITAVAL file.

**Result:** Test your changes by opening profiled content in **Author** mode or the **DITA Maps Manager** *(on page 1877)* and use the options in the **Profiling / Conditional Text** drop-down menu to see how the changes in your DITAVAL flag are rendered.

**EXAMPLE:**

Using a **Flag** on a **Filter** to define the styling for a condition set like this:

```
DITAVAL Filter file ...
```

```
Filter exclude @ product = editor

Filter flag @ product = editor

style color background

bold maroon silver
```

will render the styling of the profiled content in **Author** mode to look like this:

```
Shortcut Keys - Many of the shortcut keys
```

and will render the styling in the **DITA Maps Manager** view *(on page 1877)* to look like this:

```
Editing Schematron Quick Fix Files product [developer]
Editing SVG Files product [author, developer, editor]
Editing XHTML Documents product [author, author, Eclipse, developer]
Editing Markdown Documents product [author, author, Eclipse, developer]
Creating New Markdown Documents product [author, author]
```

**Related Information:**

- Filtering Profiling Values with a DITAVAL File *(on page 2101)*

**Publishing Profiled DITA Content**

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor Eclipse plugin includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current **profiling condition set** *(on page 2090)* into account during the transformation, as defined in the **Filters tab** *(on page 2066)* when creating a DITA transformation *(on page 1028)*. You can also specify a **DITAVAL file** *(on page 2101)* that defines filters for your profiled content.
DITA Open Toolkit Support

The DITA Open Toolkit is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Editor Eclipse plugin includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA-OT plugin (on page 2137), and how to use an external instance of the DITA Open Toolkit.

Related Information:
- DITA Open Toolkit Documentation

DITA-OT Plugins

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Editor Eclipse plugin already has lots of plugins pre-installed but you can also install additional plugins (on page 2137) or create your own.

Creating a DITA-OT Plugin

Oxygen XML Editor Eclipse plugin provides the ability to install additional DITA Open Toolkit plugins (on page 2108) that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins). It is also possible to create your own plugin.

To create a DITA-OT plugin, follow these steps:

1. Create a new folder in the plugins folder located in your DITA-OT directory (for example, if you are using DITA 3.4, the path would look like this: [OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT3.x/plugins/MyNewPlugin).
2. Create a plugin.xml file in that same folder. This file will contain the extension points for the plugin. For example, references to the XSLT stylesheets that will be used to style the output.

   **Note:** You can easily create this file by using the DITA-OT Plugin new document template that is included in Oxygen XML Editor Eclipse plugin (from the New from templates wizard (on page 206) you can find this template in Framework templates > DITA > plugin.

   **Example:**
Tip: Oxygen XML Editor Eclipse plugin includes special editing support when adding extension points in the plugin.xml file. If you place the cursor in the value of the @extension attribute and press Ctrl+Space, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the plugin.xml file, see: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Install the newly created DITA-OT plugin (on page 2108) by running the built-in transformation scenario called Run DITA-OT Integrator (on page 2056) from the Apply Transformation Scenario(s) (on page 981) or Configure Transformation Scenario(s) dialog box (on page 1078).

Note: If the integrator is not visible, select the Show all scenarios option in the Settings drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions (on page 2108).

Related Information:
- DITA Open Toolkit Documentation
- Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 2110)

Example: Creating a DITA-OT Plugin for Embedding Video Resources

To offer a detailed example of the steps required to create a new DITA Open Toolkit plugin (on page 2137), this topic uses an example of creating an XSLT customization plugin that provides support for referencing video and audio content using the DITA <object> element and then publishing to HTML and PDF output formats. This plugin (com.oxygenxml.media) is available in the DITA Open Toolkit distribution that comes bundled with the latest version of Oxygen XML Editor Eclipse plugin, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the plugin:

1. Create a folder for your plugin in the DITA-OT plugins folder (DITA-OT-DIR/plugins/).
2. Create a plugin.xml file (in the same plugin folder) that contains the extension points of the plugin.

Note: You can easily create this file by using the DITA-OT Plugin template that is included in Oxygen XML Editor Eclipse plugin (from the New from templates wizard (on page 206) you can find this template in Framework templates > DITA > plugin).

Example: Media Plugin File
<plugin id="com.oxygenxml.media">
  <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
  <feature extension="package.support.email" value="support@oxygenxml.com"/>
  <feature extension="package.version" value="21.0"/>
  <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
  <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
</plugin>

The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other DITA-OT plugin extension points here: http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html.

3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called xhtmlMedia.xsl (in the same plugin folder).

Tip: You can find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. For example, suppose you want to overwrite HTML content produced from a DITA codeblock element. Since a DITA object element has the @class attribute value - topic/object, you can take part of the class attribute value (topic/object) and search the DITA-OT resources for a similar stylesheet. The search might find the XSLT stylesheet DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xsh.html/xsl/html/dita2htmlImpl.xsl.

You can use it as a starting point to overwrite the xhtmlMedia.xsl stylesheet. For example, the results might be:

```
<xsl:template
  match="*[contains(@class, ' topic/object ')][contains(@outputclass, 'video')]">
  <video class="embed-responsive-item">
    <xsl:call-template name="commonattributes"/>
    <xsl:call-template name="setidname"/>
    <xsl:call-template name="copySource"/>
  </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called pdfMedia.xsl (in the same plugin folder).

In this case, you might find an appropriate XSLT stylesheet called DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl to use as a starting point to overwrite the pdfMedia.xsl stylesheet, with results looking something like this:

```
<!--Treat video, audio or iframe objects as links-->
<xsl:template
  match="*[contains(@class, ' topic/object ')[@outputclass = 'video']">
  <xsl:variable name="target" select="@data"/>
```
5. To install the created plugin in the DITA-OT, run the built-in transformation scenario called Run DITA-OT Integrator (on page 2056) by executing it from the Apply Transformation Scenario(s) dialog box (on page 981). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu. For more information, see Installing a DITA-OT Plugin (on page 2108).

Results of running the integrator using the media plugin example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

a. For the HTML output, in the XSLT stylesheet DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl, a new import automatically appeared:

```xml
<xsl:import href="../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: http://www.w3.org/TR/xslt#import.

b. Likewise, for the PDF output, in the top-level stylesheet DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl, a new import statement appeared:

```xml
<xsl:import href="../../../../com.oxygenxml.media/pdfMedia.xsl"/>
```

Now, you can distribute your plugin folder to anyone that has a DITA-OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA-OT distribution to the other.

Related Information:

- DITA Open Toolkit Documentation
Installing a DITA-OT Plugin

Oxygen XML Editor Eclipse plugin comes bundled with various DITA-OT plugins (on page 2137), but the architecture of the DITA Open Toolkit also allows you to install additional plugins that can be found from various sources (for example, Oxygen's public GitHub repository includes some DITA-OT plugins).

⚠️ Warning: Oxygen XML Editor Eclipse plugin has only been tested with DITA-OT plugins that come bundled with the product. Be aware that installing additional plugins or modifying the bundled plugins may affect the default functionality of the application.

Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional plugin to the location of the DITA-OT version you are using (by default, DITA-OT-DIR\plugins directory).

   ⚠️ Note: If the plugin is only supported in DITA-OT 3.4 version, make sure that you copy the plugin to the {OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x directory.

2. Select the Configure Transformation Scenario(s) (on page 1078) action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1083)).

3. Select the Run DITA-OT Integrator transformation scenario (on page 2056). If the integrator is not visible, select the Show all scenarios option that is available in the Settings drop-down menu.

   ⚠️ Important: The folder where the DITA-OT is located needs to have full write access permissions set to it. For example, in Windows, if you are integrating plugins in the DITA-OT folder bundled with Oxygen XML Editor Eclipse plugin and your application is installed in the Program Files folder, you can start the Oxygen XML Editor Eclipse plugin main executable with administrative rights for the integrator process to be able to modify resources in the DITA-OT folder.

4. Apply the scenario (on page 1078).

5. Check the Results panel at the bottom of the application to make sure the build was successful.

   ⚠️ Note: Starting with version 17.0, if the DITA-OT plugin declares a transtype (transformation type), Oxygen XML Editor Eclipse plugin detects that transformation type declaration from the DITA-OT plugin and presents descriptions in the DITA Transformation Type dialog box (on page 1028). Oxygen XML Editor Eclipse plugin also shows the contributed parameters from the plugin in the transformation scenario’s Parameters tab (on page 2065).

   ⚠️ Tip: You can declare the transformation type and allowed parameters by following the procedure found in: Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin (on page 2110).

Related Information:

- Creating a DITA-OT Plugin (on page 2105)
- Installing the DITA For Publishers Package
Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin

Custom DITA-OT plugins may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a transtype, Oxygen XML Editor Eclipse plugin detects that transformation type declaration and presents descriptions in the DITA Transformation Type dialog box (on page 1028) and the contributed parameters in the transformation scenario's Parameters tab (on page 2065).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, create a DITA-OT plugin.xml file (on page 2105) (you can easily create this file by using the DITA-OT Plugin new document template in the New from templates wizard (on page 206)).

2. In the plugin.xml file, define the transformation type details by using the <transtype> element to specify a name, description, and the transtype it extends.

   <transtype name="xhtml" extends="base-html" desc="HTML">
   ...
   </transtype>

3. Define allowed parameters by using the <param> element to specify the name, description, and information about the default and allowed set of values. For more information, see: https://www.dita-ot.org/3.1/topics/plugin-configfile.html.

   <param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
     <val>yes</val>
     <val default="true">no</val>
   </param>

   Depending on the type declared for a parameter, Oxygen XML Editor Eclipse plugin will help you pick values for each parameter edited in the Parameters tab of the transformation scenario configuration dialog box. For example, for parameters of type "enum", Oxygen XML Editor Eclipse plugin will present a combo box for choosing the proper value for the parameter.

4. You can also extend various extension points in your plugin.xml. For more information, see: https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html.

Plugin Extension Example - Promote Parameters:

It is possible to promote certain transformation parameters so that they appear above the table of allowed parameters and values in the Parameters tab of the transformation scenario configuration dialog box. To do this, you could create a pluginExtension.xml file in the root folder of the DITA-OT plugin and use the <promotedParams> element to define the promoted parameters. Here is an example:

<extensionPlugin>
  <transtype name="pdf-css-html5">
    <promotedParams>
      ...
    </promotedParams>
  </transtype>
</extensionPlugin>
<param name="args.css" promotedName="CSS"/>
<param name="args.css.param.numbering" promotedName="Numbering"/>
<param name="args.chapter.layout" promotedName="Chapter layout"/>

</promotedParams>
</transtype>
</extensionPlugin>

The example above results in the Parameters tab looking like this:

Figure 604. Promoted Parameters

5. Install the plugin (on page 2108).

Note: If the plugin is installed using an external command line, you may need to restart Oxygen XML Editor Eclipse plugin to properly re-detect the newly contributed transtypes and parameters.

Example of a plugin.xml File:

```
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
  <feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt"/>
  <feature extension="dita.conductor.target.relative" value="integrator.xml" type="file"/>
  <feature extension="dita.transtype.print" value="pdf-prince"/>
  <transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)"/>
  <param name="princeExecPath" type="file" desc="Path to the Prince executable"/>
</plugi

Built-in Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 3.4 distribution that is bundled with Oxygen XML Editor Eclipse plugin includes some pre-installed third-party open-source plugins that add extra publishing formats and functionality.

The plugins that come bundled with Oxygen XML Editor Eclipse plugin include:

- **DITA For Publishers** - These plugins allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** - This plugin allows users to publish DITA content to MS Word.
- **DITA Community** - These plugins allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

Extra Free Publishing Plugins

The DITA Open Toolkit publishing engine comes with support for predefined output formats such as HTM5, PDF, and Eclipse Help. As the architecture of the publishing engine is plugin-based, over time we have developed lots of useful plugins in the Oxygen XML GitHub account that enhance the publishing and in this blog post, I will enumerate some of them. For the plugins that are already installed within Oxygen XML Editor's DITA Open Toolkit engine, I added the [Bundled] marker.

**Plugin that Converts DITA Maps to PDF Using CSS 3 [Bundled]**

Maybe our most important work so far, this plugin can publish DITA to PDF using CSS. As a publishing engine, it can use either our Oxygen XML Chemistry processor (freely bundled with Oxygen XML Editor) or the Antenna House or Prince XML engines.

**DITA Metrics Report [Bundled]**

This is a very useful open-source plugin that generates an HTML report from an existing DITA project and contains a lot of useful information, including:

- Total number of maps and topics that are part of the project.
- Total number of elements used in topics and maps along with a table presenting all element names and their usage counter.
- The used elements for each DITA domain.
- Total number of attributes used in topics and maps along with a table presenting all attribute names and their usage counter.
- Statistics about the conditional attributes used in the project.
- Information about content reuse.
- Text and content statistics, including both total words (word count) and unique words (vocabulary).
- List of largest and smallest topics and the number of words each one uses.
- Listing of all links to resources outside of the project.
- A metrics evolution report between different versions of your documentation.
Export DITA Map Plugin [Bundled]
You can use this free plugin to create a ZIP file from your entire DITA project. The plugin also takes filters/profiling into account when including topics.

Publish DITA Content with References to Video and Audio Resources. [Bundled]
A DITA Open Toolkit plugin that converts the DITA `<object>` element to various HTML 5 structures such as `<video>`, `<audio>`, or `<iframe>`.

Show Consecutive Codeblocks in Multiple Tabs for WebHelp Output
This open-source plugin allows you to display consecutive DITA `<codeblock>` elements in separate tabs.

Add Edit Links in HTML or PDF-based Outputs [Bundled]
This plugin adds edit links in the HTML or PDF-based outputs allowing subject matter experts to give feedback on the published content directly using a DITA web editing tool (such as Oxygen XML Web Author).

Create Single Merged XML Document From Entire DITA Project [Bundled]
This plugin produces a merged output from the entire DITA map structure without further processing. It is useful if you want to further process the merged XML document for producing various reports.

Dynamically Publish Excel Content as DITA
A DITA Open Toolkit plugin that dynamically converts to DITA Excel files referenced with `format="excel"` in DITA maps.

Dynamically Use JSON Content in DITA Topics
A DITA Open Toolkit plugin that dynamically converts to DITA JSON files referenced with `format="json"` in DITA maps.

Dynamically Publish ASCIIDoc content as DITA
A DITA Open Toolkit plugin that dynamically converts to DITA ASCIIDoc files referenced with `format="ant-parser"` in DITA Maps.

Embed HTML Content in DITA Topics [Bundled]
A plugin that allows embedding well-formed HTML content in a DITA topic inside a special element.

Embed LaTeX Equations in DITA Content
A DITA Open Toolkit plugin that allows publishing embedded Latex mathematical equations to HTML and PDF.

Embed UML Diagrams in DITA Content
A DITA Open Toolkit plugin that allows publishing embedded UML diagrams equations to HTML and PDF.
Float Images in HTML and PDF Outputs
A plugin that allows floating an image referenced in a DITA topic left or right depending on the `@outputclass` attribute value specified on it.

Embed Referenced MathML and SVGZ Images in HTML Output
A DITA Open Toolkit plugin that allows you to embed referenced MathML and SVG images in the HTML5 and XHTML output.

Dynamically Convert DITA Tables to Graphs
A DITA Open Toolkit plugin that converts DITA tables having a certain structure to SVG graphs.

Show Oxygen Change Tracking Information in the PDF Output [Bundled]
This plugin allows you to see Oxygen XML Editor track changes (insertions, deletions, or comments) in the PDF output.

Sample Customization Plugin for Classic PDF (XSL-FO) Output
This sample DITA Open Toolkit PDF customization plugin is a good starting point if you want to:

- Customize fonts
- Customize a cover page to provide custom logos and coloring
- Customize page headers and footers

PDF (XSL-FO) - Generate Numbers Before Topic's Title
A DITA-OT PDF2 customization plugin that can be installed to generate numbers before each topic's title.

Presents Chapters With Landscape Orientation in PDF (XSL-FO) output
A PDF customization folder that allows you to define landscape orientation for a certain chapter.

Using an External DITA Open Toolkit in Oxygen XML Editor Eclipse plugin
Oxygen XML Editor Eclipse plugin comes bundled with a DITA Open Toolkit, located in the `DITA-OT-DIR` directory. Starting with Oxygen XML Editor Eclipse plugin version 17, if you want to use an external DITA-OT for all transformations and validations, you can open the Preferences dialog box (on page 47) and go to the DITA page (on page 56), where you can specify the DITA-OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the Parameters tab change the value for the dita.dir parameter to point to the new directory.
2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the Advanced tab, click the Libraries button and deselect Allow Oxygen to add high priority libraries to classpath.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the Document Type Association preferences page (on page 60), edit the DITA and DITA
Map document types and modify the catalog entry in the **Catalogs** tab to point to the custom catalog file `catalog-dita.xml`.

---

**DITA Open Toolkit Project**

The *DITA Open Toolkit* project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: [https://www.dita-ot.org/dev/topics/using-project-files.html](https://www.dita-ot.org/dev/topics/using-project-files.html).

Oxygen XML Editor Eclipse plugin has special support for creating, editing, validating, and publishing DITA Open Toolkit project files represented in XML format. It can also use such files to detect connections between DITA resources in the entire project and to apply root map and filter pairs when editing.

**Editing DITA Open Toolkit Project Files**

The *New Document wizard* *(on page 200)* includes a template to help you create DITA Open Toolkit project files (with an `.xml` file extension). The template is located in the *Framework templates* > *DITA-OT* folder. There is also a sample project file that can be found in the application samples folder: `OXYGEN_INSTALL_DIR/samples/dita/mobile-phone/mobilePhoneProjectFile.xml`.

Content completion is done according to the associated schema and it is enhanced with proposals for ID references, available transformation types, parameter names, and values.

The validation support has enhanced Schematron rules that report invalid references to non-existing contexts.

When working with a DITA-OT project file in the **Author** visual editing mode, you can see a compact representation of the file by default. You can switch to the **Edit** style in the **Styles** toolbar drop-down menu to edit the file using form controls and inline buttons. The additional **View as YAML** style can be selected to see a visual representation of the same document in YAML.

**Publishing DITA Open Toolkit Project Files**

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the **Configure Transformation Scenario(s) dialog box** *(on page 1078)*:

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:
• project.file - Specifies the path to the project file.
• dita-ot.dir - Specifies the directory where DITA-OT, used in transformation is installed.
• additional.args - Specifies the additional arguments used in transformation.
• deliverable.id - Specifies the id of the deliverable. This parameter is only available in the Publish DITA-OT Project (select deliverable) transformation.

Master Files Support for DITA Open Toolkit Project Files

If you enable master files support at project level (on page 2120), you can choose to detect all top-level DITA Open Toolkit project files and to add them to the Master Files folder. You could also manually add the top-level files for your DITA-OT project in the Master Files folder. The benefit of this is that whenever you rename or move files in the Navigator view, the references to those resources will automatically be updated.

Tip: The Resource Hierarchy/Dependencies view (on page 2122) also works for DITA-OT project files.

Editing Contexts Detected from DITA Open Toolkit Project Files

Once a DITA-OT project file is added to the Master Files folder, the root map drop-down menu on the DITA Maps Manager toolbar will contain context DITA maps defined in the project file and the Profiling/Conditional Text menu will contain filter pairs gathered from the project file. When you select one of them in the drop-down menu, the application gathers the keys from the context DITA map and applies the filters specified in that context.

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see DITA 4 Practitioners: DITA Configuration and Specialization Tutorials.

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor Eclipse plugin.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following:

• DTD - For configuration and specialization tutorials, see http://dita4practitioners.github.io/dita-specialization-tutorials/.
A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the `@class` attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor Eclipse plugin, use one of the following methods:

**DITA-OT Plugin Method**

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional `plugin` to the location of the DITA-OT version you are using (by default, `DITA-OT-DIR\plugins` directory).

   **Important:** The application needs to have full write access permissions to the DITA-OT directory.

2. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.

3. Select the `Configure Transformation Scenario(s) (on page 1078)` action from the DITA Maps Manager toolbar (you could also use the same action on the main toolbar or open the Transformation Scenarios view (on page 1083)).

4. Select the Run DITA-OT Integrator transformation scenario (on page 2056).

   **Tip:** If you don't see that scenario in the `Configure Transformation Scenario(s) (on page 1078)` dialog box or Transformation Scenarios view (on page 1083), click the Settings button and select the Show all scenarios option, but don't forget to change it back to Show only the scenarios available for the editor after you are finished with this procedure.

5. Apply the scenario (on page 1078).

6. Check the Results panel at the bottom of the application to make sure the build was successful.

7. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.

   **Tip:** Oxygen XML Editor Eclipse plugin detects new document templates (on page 207) contributed by the DITA-OT plugin as long as you do the following:

   1. Create a new folder called `template_folders` inside your DITA OT plugin's folder. For example: `DITA-OT-DIR\plugins\my_custom_plugin\template_folders`.

   2. Create one or more subfolders inside the `template_folders` directory that contain the new document templates. The new document templates found in those subfolders will be available in the New document wizard.

**Alternative Methods**

If the DITA specialization is not available as a DITA-OT plugin, you have the following options:
• If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA-OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DITA files and is needed for both validation and transformation of the DITA maps or topics. The DITA-OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.

• If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA-OT, these new stylesheets must be called from the DITA-OT Ant build scripts.

**Important:** If you are using DITA specialization elements in your DITA files, it is recommended that you activate the Enable DTD/XML Schema processing in document type detection option in the Document Type Association preferences page (on page 60).

• You could create your own document templates (on page 207), store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Editor Eclipse plugin uses by adding the directory to the list in the Document Templates Preferences (on page 136) page.

Related Information:
- DITA Configuration and Specialization Tutorials

**Editing DITA Map Specializations**

In addition to recognizing the default DITA map (on page 2134) formats (<map> and <bookmap>), the DITA Maps Manager view (on page 1877) can also be used to open and edit specializations of DITA maps.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the DITA Maps Manager view (on page 1877) are collected from the target files by matching the `@class` attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the DITA Map document type from the Document Type Association preferences page (on page 60) and edit the table actions to insert the element names as specified in your specialization. See Creating/Extending a Custom Framework (on page 1551) for more details.

Related Information:
- DITA Configuration and Specialization Tutorials
- Integrating a DITA Specialization (on page 2116)
Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in Author mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the Document Type Association preferences page (on page 60) and edit the actions to insert the element names, as specified in your specialization. See Creating/Extending a Custom Framework (on page 1551) for more details.

- Integrating a DITA Specialization (on page 2116)

Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a Content Management System (CMS) or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the DITA reusable content features (on page 1998).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

Note: If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, https://www.maxprograms.com/products/fluenta.html).

Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the Simplified Technical English vocabulary).
2. Avoid reusing inline elements other than product names. The following DITA Users List discussion describes the reasons for this: https://lists.oasis-open.org/archives/dita/201301/msg00029.html.

3. Avoid profiling/filtering content at inline level, for similar reasons.

General DITA Project Structure
It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

General Translation Workflow
When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The Oxygen Translation Package Builder Add-on could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as "localization service provider").
4. Receive translated DITA content back from the translation agency and integrate it in each language-specific project folder (on page 2120).

Publishing Translated Content
All of your translated DITA maps and topics should have the xml:lang attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain static text (such as the word Table followed by the table number, Figure following by the number, or Note appearing before the content of each DITA <note> element). The DITA Open Toolkit includes support for various languages for HTML-based output and PDF-based output. You can also add support for other languages: Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the Oxygen WebHelp Responsive output, see Adding a New Language (on page 1195).

Liability
Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.

Other Resources
Here are some links to other resources that might help you with translating DITA projects:

- DITA Translation: Organizing Your DITA Files
- DITA Translation: Using XLIFF to Translate DITA Projects
- WhP Localization Services Blog Page
Master Files Support in DITA

Oxygen XML Editor Eclipse plugin includes a feature that allows you to define Master Files (on page 2136) at project level. This feature is typically used in Oxygen XML Editor Eclipse plugin for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor Eclipse plugin since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the DITA Maps Manager (on page 1877), the root map (on page 2138) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the DITA Maps Manager. Also, when moving DITA resources in the DITA Maps Manager, you have to do it one at a time.

You can use the Master Files support in DITA to update all the references to moved or renamed resources in the scope of the Master Files, and since the root map (on page 2138) will be set as the Master File, you achieve the same result as if you were moving or renaming them in the DITA Maps Manager. It also allows you to move multiple DITA resources (or entire folders) at once in the Navigator view (on page 221), instead of the DITA Maps Manager, while still giving you the option of updating all the references.

How to Enable Master Files Support in DITA

To use the Master Files support in DITA, follow these steps:

1. Go to the Navigator view (on page 221) and select Enable Master Files Support from the contextual menu of the project root folder.
2. Add the main DITA map (root map) (on page 2138) to the Master Files folder by doing one of the following:
   - Right-click the project root folder or the Master Files folder and select Detect Master Files from Project.
   - Manually add the root map (on page 2138) to the Master Files folder by right-clicking a file from your project and selecting Add to Master Files from the contextual menu (or simply drag and drop it into the Master Files folder).

   Tip: You can set multiple maps in the Master Files folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the DITA Maps Manager toolbar (on page 1881).
3. [Alternative] If you have a defined DITA Open Toolkit project XML file (on page 2116) you can add it to the Master Files folder. Once you do that the application will know the dependencies between all resources directly and indirectly referenced from the project file, including DITA maps, topics, binary resources and DITAVAL filter files.

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the Master Files support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire
folders) in the **Navigator view (on page 221)** and Oxygen XML Editor Eclipse plugin will offer the option of updating all the references to the moved or renamed resources in the scope of the **Master Files** (in this case, the **main DITA map (root map) (on page 2138)**).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable **Master Files** support and add your **root DITA map (on page 2138)** to the **Master Files** folder as described in the **How to Enable Master Files Support in DITA (on page 2121)** section above.
2. Go to the **Navigator view (on page 221)**, and use one of the following methods to move or rename the resources:

   **Moving Resources**
   
   To move resources in the **Navigator view (on page 221)**, do one of the following:
   - Simply drag and drop the resource to the new location in the tree structure.
   - Use the **Move** action (or **Copy** and **Paste** actions) from the contextual menu.
   - Right-click the resource and select **Refactoring > Move resource** action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the **Move resource** dialog box.

   **Result:** In all cases, a **Move resource** dialog box will be presented.

   **Renaming Resources**
   
   To rename resources in the **Navigator view (on page 221)**, do one of the following:
   - Select the resource and press **F2**, or simply left-click again, until the in-place editor allows you to change the file name.
   - Right-click the resource and select **Rename** or **Refactoring > Rename resource**.

   **Result:** In all cases, a **Rename resource** dialog box will be presented.

3. Make sure the **Update references of the moved resource(s)** option is selected in the resulting **Move** or **Rename** dialog box and keep the scope as **master files** to make sure all the references to the moved or renamed resource are updated.

**DITA Resource Hierarchy/Dependencies View**

The **Resource Hierarchy/Dependencies** view displays the hierarchy or dependencies for resources included in an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the hierarchy or dependencies for a DITA resource (maps or topics), right-click a resource in the **Navigator view (on page 221)** and either select **Show Resource Hierarchy** or **Show Resource Dependencies**.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the **Show Dependencies** button on the toolbar of the **Resource Hierarchy/Dependencies** view, select the **All files** filter in the file browser, find the particular resource, and double-click it.
The following actions are available on the toolbar of the Resource Hierarchy/Dependencies view:

- **Refresh**
  Refreshes the Hierarchy/Dependencies structure.

- **Stop**
  Stops the hierarchy/dependencies from computing.

- **Show Hierarchy**
  Compute the hierarchy structure.

- **Show Dependencies**
  Compute the dependencies structure.

- **Configure dependencies search scope**
  Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple working sets (on page 2139). If the **Use only Master Files, if enabled** checkbox is selected, the scope of the search is restricted to the Master Files directory (on page 2120).

- **History**
  Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the Resource Hierarchy/Dependencies view contains the following actions:

- **Open**
  Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.
Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Opens the **Move resource** dialog box where the following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - As long as **Master Files support is enabled** *(on page 2120)*, you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Rename resource

Opens the **Rename resource** dialog box where the following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - As long as **Master Files support is enabled** *(on page 2120)*, you can select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

**Tip:** When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon  ç. 
Search and Rename Actions for IDs in DITA

Oxygen XML Editor Eclipse plugin allows you to search references to ID attributes (either direct references using the `@href` and `@conref` attributes or indirect references using `@keyref` or `@conkeyref` attributes) or to rename the id attribute in all the declared and referenced locations. The main benefit of this feature is the fact that it allows you to rename `@id` attributes (or search for their references) in the scope of the entire project. It also works for IDs defined inside DITA maps and then referenced in maps and topics.

In **Author** mode, these operations are available for DITA documents in the contextual menu (grouped in the **Manage IDs** submenu). In **Text** mode, these actions are also available in the **Quick Assist** menu. To access it, place the cursor inside the value of an `@id` attribute and click the yellow light bulb icon.

The possible actions include:

- **Rename in**
  Renames the ID and all of its occurrences. Selecting this action opens a dialog box where you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

- **Rename in File (Available in the Text mode only)**
  Renames the ID you are editing and all its occurrences in the current file.

- **Search References**
  Searches for the references of the ID. By default, the scope of this action is the current project.

- **Search References in**
  Searches for the references of the ID and you can choose the scope of the operation or configure working sets to use for the scope.

- **Search Declarations (Available in the Text mode only)**
  Searches for the declaration of the ID reference. By default, the scope of this action is the current project.

- **Search Declarations in (Available in the Text mode only)**
  Searches for the declaration of the ID reference and you can choose the scope of the operation or configure working sets to use for the scope.

- **Search Occurrences in file**
  Searches for the declaration and references of the ID in the current document and presents the results in the message panel at the bottom of the application.

- **Change scope (Available in the Quick Assist menu in Text mode only)**
  Opens a dialog box where you can choose the scope of the operation or configure working sets to use for the scope.

**Tip:** A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on OS X)** navigation.
Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Editor Eclipse plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

### Metadata

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

#### Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `<prolog>` element of a topic or inside the `<topicref>` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

#### Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using *subject scheme maps* (on page 2139). When you are authoring, many of the values you choose from have been defined in *subject scheme maps*.

### Migrating MS Office Documents to DITA

Oxygen XML Editor Eclipse plugin integrates the entire [DITA for Publishers plugins suite](#) and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see [Migrating Various Document Formats to DITA](#) (on page 2128).

Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

#### Smart Paste (Single Document)

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor Eclipse plugin and create a new DITA topic.
3. Paste the selected content in **Author** mode. The *Smart Paste functionality (on page 330)* will attempt to convert the content to DITA.

**HTML to DITA (Single Document)**

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
   * In Oxygen XML Editor Eclipse plugin, select **File > Import > HTML File** to import it as XHTML. Then, open the XHTML in Oxygen XML Editor Eclipse plugin and use one of the **XHTML to DITA Transformation Scenarios (on page 926)** to convert the content to DITA.
   * Open the HTML file in any Web browser, select all of its content, and copy it. Then, open Oxygen XML Editor Eclipse plugin, create a new **DITA** topic, and paste the selected content in **Author** mode. The *Smart Paste functionality (on page 330)* will attempt to convert the HTML content to DITA.

**Word to **LibreOffice** to DITA (Single Document)**

1. Open the document in the free **LibreOffice** application and save it as **DocBook**.
2. Open the **DocBook** document in Oxygen XML Editor Eclipse plugin.
3. Run the built-in transformation scenario called **DocBook to DITA (on page 1001)**.
4. You may need to make some manual adjustments for elements that couldn't be mapped.

**Word to DITA using DITA For Publishers (Single Document)**

1. Save the document in the MS Word DOCX format.
2. Open it in the **Archive Browser view (on page 1440)** in Oxygen XML Editor Eclipse plugin and then open the **document.xml** file contained in the archive.
3. Run the built-in transformation scenario (on page 2058) called **DOCX DITA**. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a **DITA map** and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content. The XSLT conversion is part of the **DITA For Publishers** plugins and there is documentation for it available here: [http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html](http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html).

**Word to DocBook to DITA (Multiple Documents)**

1. Use a tool to convert the documents to **DocBook**. For example, **Pandoc** is a free document converter engine that can convert **DOCX** documents to **DocBook** and according to **Pandoc's manual**, you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted **DocBook** documents somewhere in your project.
3. Perform a **batch transformation (on page 1082)** on all the newly converted **DocBook** documents:
   a. Select all the **DocBook** documents in the **Navigator view (on page 221)**.
   b. Right-click the selected files and choose **Transform > Configure Transformation Scenario(s)**.
   c. Apply the built-in transformation scenario called **DocBook to DITA (on page 1001)**.
4. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

**Migrating Excel and Other Types of Spreadsheets to DITA**

It is possible to convert Microsoft Excel (or other similar types of documents) to DITA. To do this, copy the spreadsheet content and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 330) will attempt to convert the content to DITA.

Related Information:
- Migrating Various Document Formats to DITA (on page 2128)
- Smart Paste Mechanism (on page 330)
- Importing Data (on page 1512)
- Working with Archives (on page 1440)

**Migrating Various Document Formats to DITA**

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

**Migrating Microsoft Office and Other Similar Types of Documents to DITA**

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see Migrating MS Office Documents to DITA (on page 2126).

**Migrating DocBook Content to DITA.**

Since DocBook content is already in XML format, migrating it to DITA is more straightforward than with other non-XML formats:

1. Convert the DocBook content to a single large DITA composite file by performing a batch transformation (on page 1082) on all the DocBook documents:
   a. Select all the DocBook documents in the Navigator view (on page 221).
   b. Right-click the selected files and choose Transform > Configure Transformation Scenario(s).
   c. Apply the built-in transformation scenario called DocBook to DITA (on page 1001).
2. You may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.
Tip: There is also a utility XSLT stylesheet available on the Oxygen XML GitHub account that can be used to convert a DITA composite file to a DITA map with separate DITA topic files. It can be found here: https://github.com/oxygenxml/old-userguide-docbookbased/blob/master/split-DITA-topic.xsl.

Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:

- Copy the content from Google Docs and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 330) will attempt to convert the content to DITA.
- Save the Google document as OpenDocumentFormat (ODF), then open it in the free LibreOffice application and save it as DocBook. Next, open the DocBook document in Oxygen XML Editor Eclipse plugin and run the built-in transformation scenario called DocBook to DITA (on page 1001).

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating Markdown Content to DITA

The DITA Open Toolkit publishing engine bundled with Oxygen XML Editor Eclipse plugin allows you to reference Markdown files directly in a DITA map and either publish them directly or export the Markdown files to DITA one by one. For details, see Working with Markdown Documents in DITA (on page 1992).

Migrating HTML Content to DITA

There are several possibilities to convert HTML content to DITA:

- Copy the HTML content and paste it in an open DITA topic in Author mode. The Smart Paste functionality (on page 330) will attempt to convert the content to DITA.
- Convert the HTML file to XHTML by selecting File > Import > HTML File. Then, open the XHTML file and use one of the XHTML to DITA Transformation Scenarios (on page 926) to convert the content to DITA.

Migrating Unstructured FrameMaker to DITA

There is a FrameMaker plugin that can be used for this type of conversion: http://leximation.com/tools/info/fm2dita.php.

Migrating MadCap Content to DITA

Some recent MadCap versions seem to have facilities to export content directly to DITA. Otherwise, you will need to convert XHTML content to DITA with a custom XSLT stylesheet to preserve variable references.

Migrating Other Formats to DITA

You may find third-party applications (such as Pandoc) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.
DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor Eclipse plugin includes support for some DITA 1.3 features. The Oxygen XML Editor Eclipse plugin publication of the full DITA 1.3 specifications can be found at https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor Eclipse plugin:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Editing</th>
<th>Publishing [DITA Open Toolkit 3.4 is used]</th>
</tr>
</thead>
<tbody>
<tr>
<td>DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.</td>
<td>New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3 Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements</td>
<td>N/A</td>
</tr>
<tr>
<td>Learning Object and Group maps</td>
<td>New document templates</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>Troubleshooting specialization</td>
<td>Create and edit new troubleshooting topics</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td>XML markup domain</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Equation and MathML domain</td>
<td>Validation and content completion Display and Insert equations</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>SVG domain</td>
<td>Validation and content completion Display referenced SVG content</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Other new DITA 1.3 elements (div, strike-through, overline, etc)</td>
<td>Validation and Content Completion</td>
<td>Special rendering in PDF and XHTML-based outputs</td>
</tr>
<tr>
<td>Feature</td>
<td>Editing</td>
<td>Publishing [DITA Open Toolkit 3.4 is used]</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td>Release management domain</td>
<td>Validation and Content Completion</td>
<td>No specific support implemented</td>
</tr>
<tr>
<td><strong>Scoped keys (on page 2024)</strong></td>
<td>Define key scopes</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td></td>
<td>Validate and check for completeness</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Resolve <strong>keyrefs</strong> and <strong>conkeyrefs</strong> taking key scopes into account</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Key scope information is displayed in a tooltip</td>
<td></td>
</tr>
<tr>
<td></td>
<td>when hovering over an item in the <strong>DITA Maps Manager</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Branch filtering (on page 2025)</strong></td>
<td>Display, create, and edit <strong>ditavalref</strong> elements</td>
<td>Partially implemented (Various issues may still be encountered)</td>
</tr>
<tr>
<td>Key-based cross deliverable addressing</td>
<td>Special display for references to <strong>DITA maps</strong> with <strong>scope=“peer”</strong> and a defined <strong>keyscope</strong></td>
<td>Not implemented.</td>
</tr>
<tr>
<td></td>
<td>Gather and present keys from peer maps</td>
<td></td>
</tr>
<tr>
<td>Shorthand to address syntax that identifies elements in the same topic</td>
<td>Properly resolved for validation, links, and conrefs</td>
<td>Implemented</td>
</tr>
<tr>
<td>Various table attributes (orientation, rotation, scope, and headers on cells)</td>
<td>Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view</td>
<td>Not implemented.</td>
</tr>
<tr>
<td>New Map <strong>topicref</strong> attributes (cascade, deliveryTarget)</td>
<td>Allow setting new attributes, propose proper values for them</td>
<td>Implemented</td>
</tr>
</tbody>
</table>

Related Information:
- Watch our DITA 1.3 video tutorial for more information about key scopes and branch filtering.
22. Glossary

Active Cell

*Active cell* refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The active cell is bounded by a heavy border.

Alternate CSS Style

The *Alternate CSS Style* refers to the choices in the bottom half of *Styles* drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in *Author* mode and the output without having to edit the CSS stylesheets. By default, the alternate styles are applied like layers, they are merged sequentially with the *main CSS style (on page 2136)*, and you can activate any number of them. However, if you deselect the *Enable multiple selection of alternate CSSs option (on page 68)* in the *CSS* subtab of the *Document Type* configuration dialog box (on page 62), the alternate styles are treated like *main CSS styles (on page 2136)* and you can only select one at a time. For more information, see *Configuring and Managing Multiple CSS Styles for a Framework (on page 1589)*.

Anchor

An *Anchor* is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the *@href* attribute with a # symbol followed by the anchor that is defined in a target ID (for example *href="MyTopic.dita#anchor"*).

Apache Ant

*Apache Ant* (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A *block element* is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.

Bookmap

A *bookmap* is a specialized *DITA map* used for creating books. A *bookmap* supports book divisions such as chapters and book lists such as indexes.
Callout

A callout is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor Eclipse plugin uses callouts to present comments and other types of review modifications.

Canonicalize

To canonicalize something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The Content Completion Assistant refers to a very helpful mechanism in Oxygen XML Editor Eclipse plugin that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode (on page 333)
- Content Completion Assistant in Text Mode (on page 266)
- Content Completion Assistant in Grid Mode (on page 308)
- Content Completion in XSLT Stylesheets (on page 569)
- Content Completion in XML Schema (on page 649)
- Content Completion in XQuery (on page 687)
- Content Completion in WSDL Documents (on page 702)
- Content Completion in CSS Stylesheets (on page 724)
- Content Completion in Relax NG Schemas (on page 732)
- Content Completion in NVDL Schemas (on page 747)
- Content Completion in JavaScript Documents (on page 786)
- Content Completion in Schematron Documents (on page 795)
- Content Completion in SQF (on page 819)

Dockable

A Dockable window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.
**Document Fragment**

A *document fragment* represents a portion of an XML document's tree of nodes or content.

**Document Type Association**

In general terms, a *Document Type Association* is a set of rules that associate a document type with a *framework (on page 2135)*. In Oxygen XML Editor Eclipse plugin, *Document Type Association* also specifically refers to a *preferences page (on page 60)* where you can create new custom *frameworks* or edit existing ones. Note that *frameworks* (document types) that come built-in with Oxygen XML Editor Eclipse plugin are read-only, but you can *Extend (on page 61)* or *Duplicate (on page 60)* them to configure them as custom *frameworks*.

**DITA Map**

A *DITA map* is a component of the DITA *framework (on page 2135)* that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension *.ditamap*.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or *bookmap (on page 2132)* to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

**DITA-OT-DIR**

*DITA_OT_DIR* refers to the default directory that is specified for your DITA Open Toolkit distribution in the *Window > Preferences > Oxygen XML Editor Eclipse plugin > DITA preferences page (on page 56)*.

For example, if you are using DITA-OT 3.4 that comes bundled with Oxygen XML Editor Eclipse plugin, the default directory is: *{OXYGEN_INSTALL_DIR}/frameworks/dita/DITA-OT3.x*. You can also specify a custom directory.

**Foldable Element**

A *foldable element* refers to elements that can be collapsed and expanded in Oxygen XML Editor Eclipse plugin. *Foldable elements* are marked with a small triangle ( ▼ / ▲) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (*Collapse Other Folds, Collapse Child Folds, Expand Child Folds, Expand All*).
Framework

A framework refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. A framework is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Editor Eclipse plugin includes a Document Type Configuration Dialog Box (on page 62) that allows you to define the set of rules and customize various authoring mechanisms for new or existing frameworks.

For advanced details about customizing your own framework, see the Creating and Configuring Custom Frameworks (on page 1551) section.

IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An inline element is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are inline elements. It is distinct from a block element, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. JAR files are built on the ZIP file format and have the .jar file extension. Computer users can create or extract JAR files using the jar command or an archive tool.

Key Space

The concept of a Key Space in DITA refers to a set of all possible keys that can be used in a DITA map structure. A Key Space is established when a root map (on page 2138) defines a set of effective key bindings. When Oxygen XML Editor Eclipse plugin processes key references, it determines the effective binding of a given key to a resource in the context of the specified root map (on page 1892).

Keystore

A Keystore is an encrypted file that contains private keys and certificates. There are two types of keystores that are supported in Oxygen XML Editor Eclipse plugin:

- Java Key Store (JKS)
- Public-Key Cryptography Standards version 12 (PKCS-12)
Main CSS Style

The **Main CSS Style** refers to the selection in the top half of the **Styles** drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in **Author** mode and the output without having to edit the CSS stylesheets. The *main CSS* applies to the whole document and you can also select one or more alternate styles (on page 2132) (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the *main CSS style*.

For more information, see Configuring and Managing Multiple CSS Styles for a Framework (on page 1589).

Master File

A **Master File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the Master Files Support (on page 229) section.

Named User

**Named User** is defined as an individual full or part-time employee who is authorized by *You* (the individual or entity who owns the rights for Oxygen XML Editor Eclipse plugin) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, **Named User** licenses cannot be shared among multiple individuals and separate **Named User** licenses must be purchased for each individual user.

A **Named User** license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the **Named User’s** employment with your company.
- (b) Permanent reassignment of a **Named User** to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an Oxygen license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the **Named User** license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

**Note:** This definition is taken from the Oxygen XML Editor Eclipse plugin End User License Agreement.

Oxygen Publishing Template

**Oxygen Publishing Template** defines all the aspects related with the **look and feel**(*layout and styles*) for the WebHelp Responsive output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the WebHelp Responsive output.

Related Information:

- Publishing Template Package Contents for WebHelp Responsive Customizations (on page 1132)
Perspective

In Oxygen XML Editor Eclipse plugin, a **perspective** refers to an interface layout geared towards a specific editing environment. Each perspective includes a unique set of interface objects, toolbars, views, and features. You can change the perspective by selecting the respective icon in the top-right corner of Oxygen XML Editor Eclipse plugin or by selecting the perspective from the Window > Perspective > Open Perspective menu.

The perspectives that are available in Oxygen XML Editor Eclipse plugin are:

- **Editor (on page 189)** - The most commonly used perspective and it is used to edit XML documents.
- **XSLT Debugger (on page 191)** - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.
- **XQuery Debugger (on page 192)** - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment.
- **Database (on page 193)** - Used to browse and manage databases.

Plugin

A **plugin** (also referred to as add-on or extension) is a component that adds specific features to an existing application. Oxygen XML Editor Eclipse plugin supports plugins to enable numerous customizations.

Pretty-Print

**Pretty-print** refers to formatting and indenting the source code in Text mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor Eclipse plugin include:

- **Format and Indent Element** - Available in the Source submenu of the contextual menu for the current element.
- **Format and Indent** - Available on the toolbar for the entire current document.
- **Format and Indent** - Available in the contextual menu of the Text view (on page 1014) and applies to all the content in that view.
- **Format and Indent Files** - Available in the contextual menu of the Navigator view (on page 221) for one or more selected files.

QName

**QName** stands for "qualified name" and defines a valid identifier for elements and attributes. QNames are used as URI references to reference particular elements or attributes within XML documents.
Quick Assist

The **Quick Assist** feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor in **Text** mode. You can also invoke the quick assist menu by using the **Ctrl + 1** (**Meta 1** on Mac OS X) keyboard shortcuts.

Quick Fix

The **Quick Fix** support in Oxygen XML Editor Eclipse plugin helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. **Quick Fixes** are available in **Text** mode and **Author** mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the **Quick Fix** proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in **Author** mode, the **Quick Fix** proposals are presented in a small drop-down menu.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a **Quick Fix** icon (💡) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the **Quick Fix** menu by pressing **Ctrl + 1** (**Command + 1** on OS X) on your keyboard.

Oxygen XML Editor Eclipse plugin also provides support for defining and customizing a library of **Quick Fixes** using the Schematron language (on page 808).

Root Map

A **Root Map** (or master map) specifies a [DITA map (on page 2134)](#) that defines a hierarchical structure of submaps that are contained within the **root map**. Essentially, the **root map** defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a [key space (on page 2135)](#)).

In Oxygen XML Editor Eclipse plugin, the **DITA Maps Manager** includes an option on its toolbar where you can easily specify the **root map (on page 1881)**, but there are also several other ways to select or change the **root map (on page 1892)**.

Space-Preserved Element

A **spaced-preserved element** refers to elements that require white spaces and line endings to be preserved (for example, DITA `<codeblock>` and `<pre>` elements).
Subject Scheme Map

A **Subject Scheme Map** allows you to create custom controlled attribute values and to manage metadata. **Subject scheme maps** use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the *subject scheme map* where those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include therapist, oncologist, surgeon, radiologist, and so on). In a *subject scheme map*, you can define a list of these audience values and you can then use these values to profile your content. For more information, see [Customizing Profiling Values with a Subject Scheme Map](on page 2097).

Track Changes

The **Track Changes** feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view** (on page 374).

For more information about this feature, see [Managing Tracked Changes](on page 355).

WebHelp Output Directory

*WebHelp_OUTPUT_DIR* refers to the output directory where WebHelp transformation files will be generated. The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

Working Set

A **Working Set** refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more **working sets** to restrict the scope to that specified set of files.

XML Catalog

An **XML Catalog** maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced
schemas and stylesheets), the use of an XML Catalog becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor Eclipse plugin includes default global catalogs as well as default catalogs for each of the built-in frameworks (on page 2135), and you can also create your own. Oxygen XML Editor Eclipse plugin uses these XML Catalogs to resolve references for document validation and transformations. For more information, see Working with XML Catalogs (on page 512).
